1 About the DataWarp Installation and Administration Guide

Scope and Audience

XC[™] Series DataWarp[™] Installation and Administration Guide (S-2564) covers DataWarp installation, configuration and administrative concepts and tasks for Cray XC[™] series systems installed with DataWarp SSD cards. It is intended for experienced system administrators.

IMPORTANT: Due to the deprecation of Static DataWarp and the introduction of the CLE 6.0 configuration management system (CMS), the DataWarp installation procedure is greatly simplified. Therefore, this document supersedes the *DataWarp Installation Guide* (S-2547), which is no longer published.

Release Information

XC[™] Series DataWarp Installation and Administration Guide (S-2564) supports the Cray Linux Environment (CLE) 6.0.UP04 release. Changes to this document since CLE 6.0.UP03 include the following new and updated topics:

- *Initial DataWarp Service (DWS) Installation* on page 17 the new installation process is done using configuration worksheets rather than an interactive configurator session.
- Configure the cray dws Worksheet on page 28 new installation procedure
- Ensure that cray_ipforward, cray_lnet, cray_munge, and cray_dw_wlm are Enabled on page 22 new installation procedure
- Set Up DataWarp Persistent Storage on page 27 new installation procedure
- Update cray_node_groups for DataWarp on page 19 new installation procedure
- DataWarp Limitations on page 10 new topic
- DataWarp Accounting on page 44 new section
- dwmd Daemon Triggers a Crash on page 118 new topic
- MUNGE Authentication Error on page 118 new topic
- Assign Nodes to a Storage Pool on page 77, Drain Storage Nodes on page 86, Change a Node's Pool on page 83, Remove Nodes From a Storage Pool on page 82, Examples Using dwcli on page 88 - includes new dwcli update extended syntax for multiple nodes
- Over-provision an Intel P3608 SSD on page 65 includes support for multiple P3608 SSD models

Related Documents

Although this publication is all that is necessary for installing SMW and CLE software, the following publications contain additional information that may be helpful.

- **1.** XC[™] Series Configurator User Guide (S-2560)
- 2. XC[™] Series DataWarp[™] User Guide (S-2558)
- **3.** XC[™] Series Software Installation and Configuration Guide (S-2559)
- **4.** XC[™] Series System Administration Guide (S-2393)

Typographic Conventions

Monospace	Indicates program code, reserved words, library functions, command-line prompts, screen output, file/path names, key strokes (e.g., Enter and Alt-Ctrl-F), and other software constructs.
Monospaced Bold	Indicates commands that must be entered on a command line or in response to an interactive prompt.
Oblique Or Italics	Indicates user-supplied values in commands or syntax definitions.
Proportional Bold	Indicates a graphical user interface window or element.
\ (backslash)	At the end of a command line, indicates the Linux® shell line continuation character (lines joined by a backslash are parsed as a single line). Do not type anything after the backslash or the continuation feature will not work correctly.
smaller font size	Some screenshot and code examples require more characters than are able to fit on a line of a PDF file, resulting in the code wrapping to a new line. To prevent
	wrapping, some examples are displayed with a smaller font to preserve the file formatting.

Command Prompt Conventions

Host name and account in command prompts

Host name The host name in a command prompt indicates where the command must be run. The account **and account in** that must run the command is also indicated in the prompt.

- The root or super-user account always has the # character at the end of the prompt.
- Any non-root account is indicated with account@hostname>. A user account that is neither root nor crayadm is referred to as user.

smw#	Run the command on the SMW as root.
cmc#	Run the command on the CMC as root.

sdb#	Run the command on the SDB node as root.
crayadm@boot>	Run the command on the boot node as the crayadm user.
user@login>	Run the command on any login node as any non-root user.
hostname#	Run the command on the specified system as root.
user@hostname>	Run the command on the specified system as any non-root user.
smw1# smw2#	For a system configured with the SMW failover feature there are two SMWs—one in an active role and the other in a passive role. The SMW that is active at the start of a procedure is <i>smw1</i> . The SMW that is passive is <i>smw2</i> .
smwactive# smwpassive#	In some scenarios, the active SMW is <i>smw1</i> at the start of a procedure—then the procedure requires a failover to the other SMW. In this case, the documentation will continue to refer to the formerly active SMW as <i>smw1</i> , even though <i>smw2</i> is now the active SMW. If further clarification is needed in a procedure, the active SMW will be called <i>smwpassive</i> .

Command prompt inside chroot

If the chroot command is used, the prompt changes to indicate that it is inside a chroot environment on the system.

```
smw# chroot /path/to/chroot
chroot-smw#
```

in command prompt

Directory path Example prompts do not include the directory path, because long paths can reduce the clarity of examples. Most of the time, the command can be executed from any directory. When it matters which directory the command is invoked within, the cd command is used to change into the directory, and the directory is referenced with a period (.) to indicate the current directory.

For example, here are actual prompts as they appear on the system:

```
smw:~ # cd /etc
smw:/etc# cd /var/tmp
smw:/var/tmp# ls ./file
smw:/var/tmp# su - crayadm
crayadm@smw:~> cd /usr/bin
crayadm@smw:/usr/bin> ./command
```

And here are the same prompts as they appear in this publication:

```
smw# cd /etc
smw# cd /var/tmp
smw# ls ./file
smw# su - crayadm
```

S2564 7 crayadm@smw> cd /usr/bin
crayadm@smw> ./command

2 About DataWarp

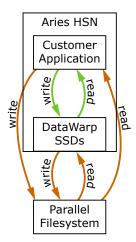

Cray DataWarp provides an intermediate layer of high bandwidth, file-based storage to applications running on compute nodes. It is comprised of commercial SSD hardware and software, Linux community software, and Cray system hardware and software. DataWarp storage is located on server nodes connected to the Cray system's Aries high speed network (HSN). I/O operations to this storage complete faster than I/O to the attached parallel file system (PFS), allowing the application to resume computation more quickly and resulting in improved application performance. DataWarp storage is transparently available to applications via standard POSIX I/O operations and can be configured in multiple ways for different purposes. DataWarp capacity and bandwidth are dynamically allocated to jobs on request and can be scaled up by adding DataWarp server nodes to the system.

Each DataWarp server node can be configured either for use by the DataWarp infrastructure or for a site specific purpose such as a Hadoop Distributed File System (HDFS).

IMPORTANT: Keep in mind that DataWarp is focused on performance and not long-term storage. SSDs can and do fail.

The following diagram is a high level view of how applications interact with DataWarp. SSDs on the Cray high-speed network enable compute node applications to quickly read and write data to the SSDs, and the DataWarp file system handles staging data to and from a parallel filesystem.

Figure 1. DataWarp Overview

2.1 DataWarp Use Cases

There are four basic use cases for DataWarp:

Parallel File System (PFS) cache DataWarp can be used to cache data between an application and the PFS. This allows PFS I/O to be overlapped with an application's computation. In this release there are two ways to use DataWarp to influence data movement (staging) between DataWarp and the PFS. The first

requires a job and/or application to explicitly make a request and have the DataWarp Service (DWS) carry out the operation. In the second way, data movement occurs implicitly (i.e., readahead and write-behind) and no explicit requests are required. Examples of PFS cache use cases include:

- Checkpoint/Restart: Writing periodic checkpoint files is a common fault tolerance practice
 for long running applications. Checkpoint files written to DataWarp benefit from the high
 bandwidth. These checkpoints either reside in DataWarp for fast restart in the event of a
 compute node failure or are copied to the PFS to support restart in the event of a system
 failure.
- Periodic output: Output produced periodically by an application (e.g., time series data) is
 written to DataWarp faster than to the PFS. Then as the application resumes computation,
 the data is copied from DataWarp to the PFS asynchronously.
- Application libraries: Some applications reference a large number of libraries from every rank (e.g., Python applications). Those libraries are copied from the PFS to DataWarp once and then directly accessed by all ranks of the application.

Application scratch

DataWarp can provide storage that functions like a /tmp file system for each compute node in a job. This data typically does not touch the PFS, but it can also be configured as PFS cache. Applications that use out-of-core algorithms, such as geographic information systems, can use DataWarp scratch storage to improve performance.

Shared storage

DataWarp storage can be shared by multiple jobs over a configurable period of time. The jobs may or may not be related and may run concurrently or serially. The shared data may be available before a job begins, extend after a job completes, and encompass multiple jobs. Shared data use cases include:

- **Shared input**: A read-only file or database (e.g., a bioinformatics database) used as input by multiple analysis jobs is copied from PFS to DataWarp and shared.
- Ensemble analysis: This is often a special case of the above shared input for a set of similar runs with different parameters on the same inputs, but can also allow for some minor modification of the input data across the runs in a set. Many simulation stategies use ensembles.
- In-transit analysis: This is when the results of one job are passed as the input of a subsequent job (typically using job dependencies). The data can reside only on DataWarp storage and may never touch the PFS. This includes various types of workflows that go through a sequence of processing steps, transforming the input data along the way for each step. This can also be used for processing of intermediate results while an application is running; for example, visualization or analysis of partial results.

Compute node swap

When configured as swap space, DataWarp allows applications to over-commit compute node memory. This is often needed by pre- and post-processing jobs with large memory requirements that would otherwise be killed.

2.2 DataWarp Limitations

For optimal use, it is important to understand DataWarp's limitations, including bugs, clarification on functionality, or warnings about the state of components.

SSD Write Protection

SSD write protection limitations include:

- I/O to swap files does not count against the SSD write protection policies.
- Violation of the write window policy is calculated on a per server basis. This can result in some processes seeing EROFS (Read-only file system) errors while others see no errors when interacting with the DataWarp file system.

Cache

Due to several problems identified with striped access mode for the cache file system, Cray advises customers not to use this feature at this time. However, load balanced access mode for the cache file system is functional.

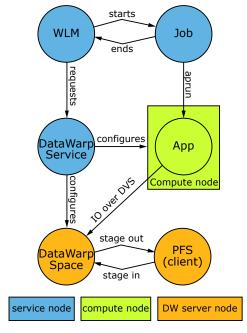

Scratch

The currently known caveats for scratch DataWarp are:

- 1. Scratch file system recovery
 - When a DataWarp server crashes, recovery is reliable when all file system servers are rebooted. If only
 the crashed DataWarp server is rebooted, the file system may not function properly.
- 2. Load balance
 - Scratch load balance functionality is not yet implemented.
- 3. Staging
 - Staging through the WLM interface is susceptible to timeouts. See *Stage In or Out Fails When Transferring a Large Number of Files* on page 121 for information on extending the timeout.
- 4. Striping
 - The libdatawarp dw_set_stripe_configuration() functionality is not implemented and returns ENOSYS.
- 5. Limits
 - Scratch file systems may have a directory depth up to 1000 directories deep. DataWarp service
 management tasks are subject to various resource limits, such as maximum open file descriptors. By
 default, the maximum number of open file descriptors per process is 1024. If a user creates a directory
 structure larger than 1000 directories deep, stage activity and teardown activity may fail. If deeper than
 1000 directories deep is needed, the maximum number of open file descriptors per process limit can be
 increased on the DataWarp servers.

2.3 Overview of the DataWarp Process

Figure 2. DataWarp Component Interaction - bird's eye view

The diagram above provides a high level visual representation of the DataWarp process, as described here.

- 1. A user submits a job to a workload manager (WLM). Within the job submission, the user must specify: the amount of DataWarp storage required, how the storage is to be configured, and whether files are to be staged from the parallel file system (PFS) to DataWarp or from DataWarp to the PFS.
- 2. The WLM provides queued access to DataWarp by first querying the DataWarp service for the total aggregate capacity. The requested capacity is used as a job scheduling constraint. When sufficient DataWarp capacity is available and other WLM requirements are satisfied, the WLM requests the needed capacity and passes along other user-supplied configuration and staging requests.
- 3. The DataWarp service (DWS) dynamically assigns the storage and initiates the stage in process.
- **4.** After this completes, the WLM acquires other resources needed for the batch job, such as compute nodes.
- **5.** After the compute nodes are assigned, the WLM and DWS work together to make the configured DataWarp accessible to the job's compute nodes. This occurs prior to execution of the batch job script.
- **6.** The batch job runs and any subsequent applications can interact with DataWarp as needed (e.g., stage additional files, read/write data).
- 7. When the batch job ends, the WLM stages out files, if requested, and performs cleanup. First, the WLM releases the compute resources and requests that the DWS make the previously accessible DataWarp configuration inaccessible to the compute nodes. Next, the WLM requests that additional files, if any, are staged out. When this completes, the WLM tells the DWS that the DataWarp storage is no longer needed.

The following diagram includes extra details regarding the interaction between a WLM and the DWS as well as the location of the various DWS daemons.

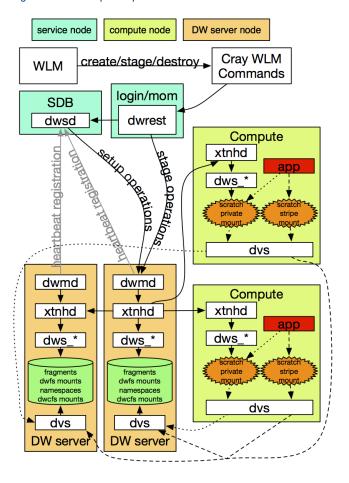

Figure 3. DataWarp Component Interaction - detailed view

2.4 DataWarp Blade

The DataWarp blade is an I/O blade with the addition of solid-state drive (SSD) PCI cards, which allow the blade to run the DataWarp $^{\text{TM}}$ application I/O accelerator software. This software allocates storage dynamically in either private (dedicated) or shared modes.

The SSDs are half-height and half-length, off-the-shelf PCIe cards.

The DataWarp blade is a standard I/O blade with these characteristics:

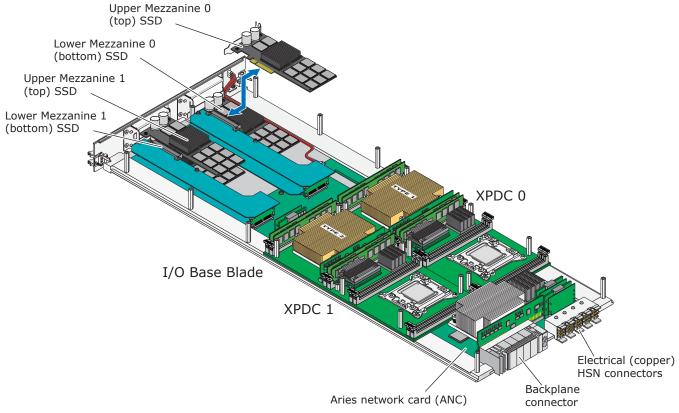

- Each node has a PDC with two Intel[®] Xeon[®] sockets, one of which is empty.
- Each node has two PCIe Gen3 x8 expansion slots.
- Both slots are populated with NVMe SSDs (Non-Volatile Memory Express host-controller interface). Note: SanDisk SSDs used on some early systems are not NVMe.

Either all Samsung or all Intel SSDs must be used on a node. Each Samsung SSD is a single device and therefore shows to the host as a single device. Each Intel SSD comprises two PCIe devices and therefore shows to the host as two devices.

At the lowest level, DataWarp uses the Linux logical volume manager to stripe all the local SSD devices into a single logical device. For Samsung there are two; and for Intel four devices show up on the PCIe buses. Each blade has a supported capacity of up to 6.4TB.

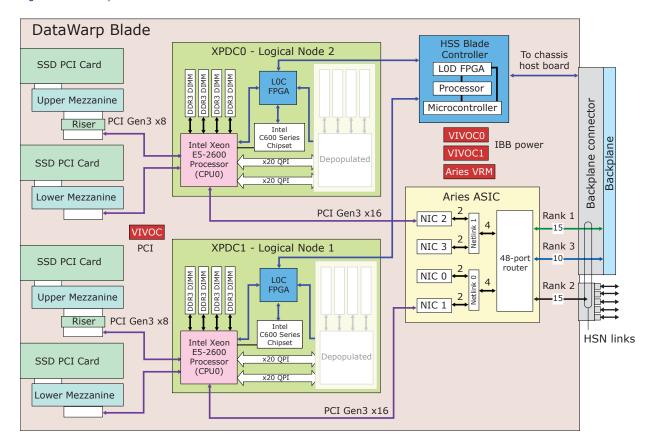

The DataWarp blade is physically laid out as shown in this figure.

Figure 4. DataWarp Blade Component Locations

The DataWarp blade functions logically as shown in the following figure. This is an I/O blade using the PCI cards to hold SSD cards. Details of components in this figure are described in I/O Base Blade (IBB) and I/O Blade.

Figure 5. DataWarp Blade Architecture

Reporting SSD Status

SSD modules and other components on the DataWarp blade are reported and identified as follows.

• xtcheckssd(8) command checks SSDs at boot and every 24 hours, with output to the console such as:

```
PCIe slot#:1,Name:INTEL SSDPECME040T4,SN:CVF8515300094P0DGN-1,Size: 4000GB,Remaining life:100%,Temperature:22(c)
```

xtdiagdata(8) displays diagnostic records in two formats.

xtdiagdata ssd

capmc(8) creates a JSON table of the SSDs.

```
module load capmc
capmc get ssd diags
```

- xtcheckhss(8) validates the health of HSS.
- xthwinv(8) gets information about ASIC, processor chip, and memory DIMMs on specified modules such as the DataWarp blade.

SSD products used in the DataWarp blade are made by Intel, Samsung, and Sandisk. When an SSD is replaced, the replacement must be from the same manufacturer and have the same size and performance as the one being replaced.

2.5 Identify Nodes with SSD Hardware

Identification of the nodes with SSD hardware is necessary to complete the DataWarp service installation. Use the xtcheckhss command if this information is not readily available.

The following example shows that the system has three nodes with SSD hardware, each with two PCIe expansion slots that are populated with Intel P3608 cards. Although not displayed as part of the <code>grep</code> output above, the column headers are as follows:

Node Slot Trained Width	Name Tar	get Gen Tra:	ined Gen Tai	rget Width
smw# xtcheckhssnocolordetail=fpci grep SSD				
c0-0c0s4n1 2 Fusion-io ioMemory3 Atomic Series SSD	Gen2	Gen2	x8	x8

3 Initial DataWarp Service (DWS) Installation

Prerequisites

This DataWarp installation procedure assumes the following:

- A Cray XC series system running CLE 6.0.UP04 with one or more nodes with SSD hardware
- This is an initial installation of CLE and not an update
- Identification (cname) of the nodes with SSD hardware (see Identify Nodes with SSD Hardware on page 16)

Additional Requirements

The following requirements can be implemented before or after the installation of DataWarp.

- A parallel file system (PFS) must be mounted in the same location on all compute nodes as well as all service nodes included in managed_nodes_groups within this procedure. In other words, the mount points must look the same on compute and SSD-endowed service nodes. More than one PFS is allowed.
- SanDisk/Fusion ioMemory3/SX300 SSD cards require firmware version 8.9.5. See *Update Fusion ioMemory Firmware* on page 68.

Other Important Things to Know

The DataWarp installation procedure includes running cfgset update to modify the attributes or content of a config set. Keep the following in mind while installing DataWarp.

CAUTION: Boot failure possible if using cfgset under certain conditions. The cfgset create and cfgset update commands always call pre- and post-configuration scripts. Some of these scripts require HSS daemons and other CLE services to be running. This can cause cfgset to fail if xtbounce is in progress or if the SMW is not connected to XC hardware. If xtdiscover is running, cfgset may hang or produce incorrect data that leads to system boot failure. In these situations, use cfgset create or cfgset update with the --no-scripts option to prevent running the scripts. When those situations are no longer in effect, run cfgset update without the --no-scripts option to ensure that all pre- and post-configuration scripts are run. Use the following command to see which HSS daemons are running:

smw# /etc/init.d/rsms status

Installation Overview

DataWarp is one of many services that store service configuration content in CLE configuration sets (*config sets*) on Cray systems. DataWarp can be configured when config sets are created during a fresh install or major upgrade, or it can be configured/reconfigured later by updating existing config sets during normal system operation (bearing in mind that some of the DataWarp module parameters are best set during initial system configuration). These procedures guide site administrators and staff in entering appropriate values for DataWarp

configuration settings using the configurator. Whether sites enter values in an interactive configurator session or enter values in a configuration worksheet for bulk import, the configurator takes the supplied values and ensures that they become part of the config set being created or updated.

The initial installation process described in XC[™] Series DataWarp[™] Installation and Administration Guide modifies configuration worksheets and consists of the following tasks:

- 1. (Systems with Fusion IO SSD cards only) Integrate the driver software into the service node image; *Create a New Service Node Image for Fusion IO SSDs* on page 18.
- 2. Update cray node groups; Update cray_node_groups for DataWarp on page 19.
- **3.** Verify that required services are enabled; *Ensure that cray_ipforward, cray_lnet, cray_munge, and cray_dw_wlm are Enabled* on page 22.
- 4. Update cray persistent storage; Set Up DataWarp Persistent Storage on page 27.
- 5. Configure cray dws and validate the config set; Configure the cray_dws Worksheet on page 28.
- 6. System reboot.
- 7. (Optional) Enable and configure DataWarp accounting within the cray_rur service; *Enable and Configure Accounting* on page 32.
- **8.** Post-boot configuration tasks; *Post-boot Configuration Overview* on page 65.

3.1 Create a New Service Node Image for Fusion IO SSDs

Prerequisites

- A Cray XC series system with one or more Fusion IO (Sandisk) SSD cards installed
- Identification (cname) of nodes with SSD hardware (see Identify Nodes with SSD Hardware on page 16)

About this task

Sites with Fusion IO (Sandisk) SSD cards must integrate the driver software into the service node image.

For more information about installation third-party software with a custom image, see XC^{TM} Series System Administration Guide (S-2393).

Procedure

1. Create a new image recipe for FIO service nodes and add a subrecipe of a service node image to it.

Note that the font size is decreased in some examples below, because some line lengths are too wide for a PDF page. Unfortunately, some lines are so incredibly long that they still need to be continued on another line.

TIP: Use recipe list to display current recipe names.

```
Smw# recipe create fio-service_cle_6.0up04_sles_12_x86-64_ari
smw# recipe update --add-recipe service_cle_6.0up04_sles_12_x86-64_ari fio-service_cle_6.0up04_sles_12_x86-64_ari
smw# recipe update --add-coll datawarp-xtra_cle_6.0up04_sles_12 fio-service_cle_6.0up04_sles_12_x86-64_ari
smw# recipe update --add-repo \
passthrough-common_cle_6.0up04_sles_12_x86-64_fio-service_cle_6.0up04_sles_12_x86-64_ari
smw# recipe update --add-repo \
passthrough-common_cle_6.0up04_sles_12_x86-64_updates fio-service_cle_6.0up04_sles_12_x86-64_ari
```

```
Smw# recipe update --add-repo common_cle_6.0up04_sles_12_x86-64_ari fio-service_cle_6.0up04_sles_12_x86-64_ari
smw# recipe update --add-repo common cle_6.0up04_sles_12_x86-64_ari_updates \
fio-service_cle_6.0up04_sles_12_x86-64_ari
smw# recipe update --add-repo sle-server_12sp2_x86-64 fio-service_cle_6.0up04_sles_12_x86-64_ari
smw# recipe update --add-repo sle-server_12sp2_x86-64_updates fio-service_cle_6.0up04_sles_12_x86-64_ari
```

2. Edit the cray_image_groups.yaml file to add the image recipe and destination to the end of the default group.

smw# vi /var/opt/cray/imps/config/sets/global/config/cray image groups.yaml

Add:

```
- recipe: "fio-service_cle_6.0up04 sles_12_x86-64 ari"
    dest: "fio-service{note}_cle_{cle_release}-build{cle_build}{patch}_sles_12-created{date}.cpio"
    nims_group: "fio-service"
fio-service:
- recipe: "fio-service_cle_6.0up04_sles_12_x86-64_ari"
    dest: "fio-service{note}_cle_{cle_release}-build{cle_build}{patch}_sles_12-created{date}.cpio"
    nims_group: "fio-service"
```

For example:

```
cray_image_groups:
    default:
        - recipe: "compute_cle_6.0up04_sles_12_x86-64_ari"
            dest: "{compute{note}_cle_{cle_release}_-build{cle_build}_{patch}_sles_12_-created{date}_.cpio"

            dest: "fio-service_note_6.0up04_sles_12_x86-64_ari"
            dest: "fio-service_note_6.0up04_sles_12_x86-64_ari"
            dest: "fio-serv
```

3. Create the new group, and add the nodes to the group.

```
smw# cnode update -G service -g fio-service cname1 cname2 ...
```

4. Build the updated image and update the node mappings.

```
smw# imgbuilder -g fio-service --map
```

5. Verify that the image is correctly assigned to the DataWarp nodes.

```
smw# cnode list cname1 cname2 ...
```

If the image is correctly assigned, continue with the DataWarp installation; otherwise, execute the following command to instruct NIMS to use the new image.

```
smw# cnode update -p p0 --filter group=fio-service -i image_file
```

Where *image* file is the full path to the image, including the cpio file extension.

Next, configure the node groups required by DataWarp; *Update cray_node_groups for DataWarp* on page 19.

3.2 Update cray_node_groups for DataWarp

About this task

DataWarp requires:

- At least one node group containing only DataWarp service nodes
- At least one node group containing only DataWarp API gateway nodes (for most systems, login_nodes, the
 node group that contains all internal login nodes is acceptable)

These node groups are defined in cray node groups and referenced within the cray dws service.

Procedure

1. Copy the cray node groups worksheet from the current config set to the CLE worksheet workarea.

This ensures that the worksheet being edited reflects current configuration values.

```
smw# cd /var/adm/cray/release/p0_worksheet_workarea
smw# cp -a /var/opt/cray/imps/config/sets/p0/worksheets/\
cray_node_groups_worksheet.yaml .
```

2. Determine if the datawarp nodes node group is already defined within the cray node groups service.

```
smw# cfgset search -s cray_node_groups -t datawarp p0
```

The node group does not exist:

```
# No matches found in the configuration data for the given search terms.

INFO - Matches may be hidden by level/state/service filtering.

INFO - See 'cfgset search -h' for filtering options.
```

The node group exists:

3. Display the login nodes node group defined in the cray node groups service.

If the nodes listed in steps 2 on page 20 and 3 on page 20 accurately reflect the system configuration, exit this procedure and continue with the DataWarp installation process.

4. Edit cray node groups worksheet.yaml.

```
smw# vi cray_node_groups_worksheet.yaml
```

- **5.** Proceed based on the results of the previous steps.
 - Go to step 6 on page 21 to add a datawarp nodes node group.
 - Go to step 7 on page 21 to update an existing datawarp_nodes node group.
 - Go to step 7 if no changes are needed for the datawarp nodes node group.
- 6. Add the datawarp nodes node group if it does not already exist.
 - a. Copy the three commented lines under

```
** EXAMPLE 'groups' VALUE (with current defaults) **
```

and paste them in this location:

```
# NOTE: Place additional 'group' setting entries here, if desired.
#cray_node_groups.settings.groups.data.group_name.sample_key_a: null <--setting a multival key
#cray_node_groups.settings.groups.data.sample_key_a.description: ''
#cray_node_groups.settings.groups.data.sample_key_a.members: []</pre>
```

- b. Uncomment the lines, and replace sample key a with datawarp nodes in all lines.
- c. Remove the <-- setting a multival key text at the end of the first line (note that the null value is required; do not remove or change it).
- d. Set the description value to DataWarp server nodes.
- e. Add DataWarp node names to the members list field. Add each cnode name on a separate line prefixed by a hyphen and space (-). For example:

- f. Proceed to step 8 on page 21.
- 7. Update pre-existing datawarp nodes.members if not defined correctly.

Each cnode name must be on a separate line prefixed by a hyphen and space (-). For example:

```
cray_node_groups.settings.groups.data.datawarp_nodes.members:
- c1-0c2s7n2
- c1-0c2s7n1
- c1-0c2s0n2
```

- **8.** Add an API gateway node group if not using the <code>login_nodes</code> node group. For most systems, the <code>login_nodes</code> node group is used.
 - a. Copy the three commented lines under

```
** EXAMPLE 'groups' VALUE (with current defaults) **
```

and paste them in this location:

```
# NOTE: Place additional 'group' setting entries here, if desired.
#cray_node_groups.settings.groups.data.group_name.sample_key_a: null <--setting a multival key
#cray_node_groups.settings.groups.data.sample_key_a.description: ''
#cray_node_groups.settings.groups.data.sample_key_a.members: []</pre>
```

- b. Uncomment the lines, and replace sample key a with dw gateway nodes in all lines.
- c. Remove the <-- setting a multival key text at the end of the first line (note that the null value is required; do not remove or change it).
- d. Set the description field as DataWarp API gateway nodes.
- e. Add DataWarp node names to the members list field. Add each cnode name on a separate line prefixed by a hyphen and space (-). For example:

9. Save the changes, and upload the modified worksheet into the CLE config set.

```
smw# cfgset update --worksheet-path cray_node_groups_worksheet.yaml p0
INFO - Running pre-configuration scripts
INFO - Checking directory access
...
INFO - ConfigSet 'p0' has been updated.
INFO - Run 'cfgset search --level basic p0' to review the current settings.
```

Next: ensure that the cray ipforward, cray lnet, cray munge, and cray dw wlm services are enabled.

3.3 Ensure that cray_ipforward, cray_lnet, cray_munge, and cray_dw_wlm are Enabled

About this task

The following configuration services must be enabled for DataWarp to function in a CLE 6.0 / SMW 8.0 system.

- cray_Inet
- cray_munge
- cray dw wlm
- cray_ipforward

This procedure provides two different methods to ensure that they are enabled. Use whichever method seems easiest.

- **Method 1** Use the configurator in interactive mode to check the status of these configuration services and enable them if needed.
- **Method 2** Use the configurator search function to check their status and use worksheets to enable them if needed.

Procedure

```
----- METHOD 1: CONFIGURATOR IN INTERACTIVE MODE -----

If using Method 2, skip this section and go to step 4 on page 24.
```

1. Invoke the configurator in interactive mode with level = advanced and state = all to view the list of services in the CLE config set p0.

This example configurator screen shows the list of CLE services in config set p0. The necessary services are in bold and have a variety of statuses. The number of a service in the list can vary (the services are not always listed alphabetically), so if using the example commands that follow, substitute the correct number for the service being enabled.

smw# cfgset update -m interactive -1 advanced -S all p0

```
Service Configuration List Menu (Config Set: p0, type: cle)

Selected # Service Status (level=advanced, state=all)

1) cray_alps [ OK ]
2) cray_auth [ OK ]
...

9) cray_dw_wlm valid, disabled, 6/7 unconfigured settings
...

17) cray_ipforward inheriting from global config
...

20) cray_lnet [ OK ]
...

27) cray_munge unconfigured service, 7/7 unconfigured settings
...

Service List Menu [default: save & exit - Q] $
```

2. Ensure that cray dw wlm, cray ipforward, cray lnet, and cray munge are enabled.

Find each of the necessary services in the list of services.

- If the status is [OK], it is enabled. No change is needed.
- If the status is disabled, enter the number of the service in the list to select it, then enter E to toggle it to enabled.

```
Service List Menu [default: save & exit - Q] $ 9
Service List Menu [default: configure - C] $ E
```

 If the status is unconfigured, select it and toggle it to disabled, then select it and toggle it again to enabled.

```
Service List Menu [default: save & exit - Q] $ 27
Service List Menu [default: configure - C] $ E
Service List Menu [default: save & exit - Q] $ 27
Service List Menu [default: configure - C] $ E
```

• If the status of cray_ipforward is inheriting from global config, it must be checked in the global config set. Exit the configurator and continue to the next step to ensure that it is enabled.

When done checking all four necessary services, save any changes and exit the configurator. If there are no changes, enter \mathbf{x} instead of \mathbf{Q} .

```
Service List Menu [default: save & exit - Q] $ Q
```

- 3. (If cray_ipforward inherits from global) Ensure that cray_ipforward is enabled in the global config set.
 - a. Invoke the configurator in interactive mode with state = all to view the list of services in the global config set.

```
smw# cfgset update -m interactive -S all global
```

b. Ensure that cray ipforward is enabled.

Find cray ipforward in the list of global services.

- If the status is [OK], it is enabled.
- If the status is disabled, select it (#4 in list in this example) and toggle it to enabled.

```
Service List Menu [default: save & exit - Q] $ 4
Service List Menu [default: configure - C] $ E
```

If the status is unconfigured, select and toggle it twice to enable it.

```
Service List Menu [default: save & exit - Q] $ 4
Service List Menu [default: configure - C] $ E
Service List Menu [default: save & exit - Q] $ 4
Service List Menu [default: configure - C] $ E
```

c. Save any changes and exit the configurator. If there are no changes, enter x instead of Q.

```
Service List Menu [default: save & exit - Q] $ Q
```

If Method 1 used, the procedure is complete. Skip the steps for Method 2.

```
----- METHOD 2: SEARCH + WORKSHEETS -----
```

4. Determine whether the cray linet, cray munge, and cray dw wilm services are enabled.

Use cfgset search to determine the status of these config services. Note that -1 advanced must be added to the command to search for the status of cray_dw_wlm, because all settings in that service are level advanced.

```
smw# cfgset search -s cray_lnet --service-status p0 \
| grep lnet.enabled
cray_lnet.enabled: True

smw# cfgset search -s cray_munge --service-status p0 \
| grep munge.enabled
```

```
cray_munge.enabled: True
smw# cfgset search -s cray_dw_wlm --service-status -1 advanced p0 \
| grep dw_wlm.enabled
cray_dw_wlm.enabled: True
```

In the example, these services are enabled. If any of these services is disabled (set to false), it can be enabled in a later step of this procedure.

5. Determine which config set to check for status of the cray ipforward service.

Because the cray_ipforward service has both a global and CLE template, the CLE template can be configured to inherit settings from the global template. Therefore, to check the status of cray_ipforward, it is first necessary to determine which template governs the configuration of that service: global or CLE.

Search the cray_ipforward worksheet in the CLE config set (p0 in example) to find the inherit setting.

```
smw# grep inherit: /var/opt/cray/imps/config/sets/p0/worksheets/\
cray_ipforward_worksheet.yaml
```

- If the output of this command is <code>cray_ipforward.inherit</code>: False, then cray_ipforward does not inherit from global, so the CLE config set worksheet is the correct one to check to find the status of the service.
- If the output of this command is <code>cray_ipforward.inherit</code>: <code>True</code>, then <code>cray_ipforward</code> inherits from global, so the global config set worksheet is the correct one to check to find the status of the service.
- **6.** Determine whether the cray ipforward service is enabled.
 - a. (If cray_ipforward.inherit set to false) Determine whether cray_ipforward is enabled in the CLE config set (p0 in example).

```
smw# cfgset search -s cray_ipforward --service-status p0 \
| grep ipforward.enabled
cray_ipforward.enabled: true
```

In the example, cray_ipforward is enabled.

b. (If cray ipforward.inherit set to true) Determine whether cray ipforward is enabled in the global config set.

```
smw# cfgset search --service-status global | grep ipforward.enabled
cray_ipforward.enabled: true
```

In the example, cray ipforward is enabled.

7. If any of the necessary services are disabled, copy current worksheets to the workareas for editing.

Copy CLE worksheets.

```
smw# cp -a /var/opt/cray/imps/config/sets/p0/worksheets/* \
/var/adm/cray/release/p0_worksheet_workarea/*
```

Copy global worksheets.

```
smw# cp -a /var/opt/cray/imps/config/sets/global/worksheets/* \
/var/adm/cray/release/global_worksheet_workarea/*
```

8. If cray Inet is disabled, enable it.

a. Edit the worksheet.

```
smw# cd /var/adm/cray/release/p0_worksheet_workarea
smw# vi cray_lnet_worksheet.yaml
```

b. Enable cray_Inet.

If cray lnet.enabled is commented out, uncomment it and ensure that it is set to true.

c. Import the updated worksheet to the config set.

```
smw# cfgset update --worksheet-path cray_lnet_worksheet.yaml p0
```

- **9.** If cray_munge is disabled, enable it.
 - a. Edit the worksheet.

```
smw# cd /var/adm/cray/release/p0_worksheet_workarea
smw# vi cray_munge_worksheet.yaml
```

b. Enable cray_munge.

If cray munge.enabled is commented out, uncomment it and ensure that it is set to true.

c. Import the updated worksheet to the config set.

```
smw# cfgset update --worksheet-path cray_munge_worksheet.yaml p0
```

- 10. If cray dw wlm is disabled, enable it.
 - a. Edit the worksheet.

```
smw# cd /var/adm/cray/release/p0_worksheet_workarea
smw# vi cray_dw_wlm_worksheet.yaml
```

b. Enable cray_dw_wlm.

If cray dw wlm.enabled is commented out, uncomment it and ensure that it is set to true.

c. Import the updated worksheet to the config set.

```
smw# cfgset update --worksheet-path cray_dw_wlm_worksheet.yaml p0
```

- 11. (If cray_ipforward.inherit set to false) If cray_ipforward is disabled, enable it in the CLE config set.
 - a. Edit the worksheet.

```
smw# cd /var/adm/cray/release/p0_worksheet_workarea
smw# vi cray_ipforward_worksheet.yaml
```

b. Enable cray ipforward.

If cray ipforward.enabled is commented out, uncomment it and ensure that it is set to true.

c. Import the updated worksheet to the config set.

```
smw# cfgset update --worksheet-path cray ipforward worksheet.yaml p0
```

- **12.** (If cray_ipforward.inherit set to true) If cray_ipforward is disabled, enable it in the global config set.
 - a. Edit the worksheet.

```
smw# cd /var/adm/cray/release/global_worksheet_workarea
smw# vi cray_ipforward_worksheet.yaml
```

b. Enable cray ipforward.

If cray ipforward.enabled is commented out, uncomment it and ensure that it is set to true.

c. Import the updated worksheet to the config set.

```
smw# cfgset update --worksheet-path cray ipforward worksheet.yaml global
```

3.4 Set Up DataWarp Persistent Storage

Procedure

1. Copy the cray_persistent_data worksheet from the current config set to the CLE worksheet workarea.

This ensures that the worksheet being edited reflects current configuration values.

```
smw# cd /var/adm/cray/release/p0_worksheet_workarea
smw# cp -a /var/opt/cray/imps/config/sets/p0/worksheets/\
cray_persistent_data_worksheet.yaml .
```

2. Edit cray persistent data worksheet.yaml.

```
smw# vi cray persistent data worksheet.yaml
```

3. Ensure that cray_persistent_data is enabled.

If cray persistent data.enabled is commented out, uncomment it and ensure that it is set to true.

4. Configure persistent storage for DataWarp.

In the worksheet, copy the five lines below

```
# ** EXAMPLE 'mounts' VALUE (with current defaults) **
```

and paste them below

NOTE: Place additional 'mounts' setting entries here, if desired.

```
# ** EXAMPLE 'mounts' VALUE (with current defaults) **
# cray_persistent_data.settings.mounts.data.mount_point.sample_key_a: null <-- setting a multival key
# cray_persistent_data.settings.mounts.data.sample_key_a.alt_storage_path: ''
# cray_persistent_data.settings.mounts.data.sample_key_a.options: ''
# cray_persistent_data.settings.mounts.data.sample_key_a.ancestor_def_perms: '0771'
# cray_persistent_data.settings.mounts.data.sample_key_a.client_groups: []</pre>
```

Uncomment the lines, replace <code>sample_key_a</code> with <code>/var/opt/cray/dws</code> in all lines, and remove the <code><--setting a multival key</code> text at the end of the first line (note that the <code>null value</code> is required; do not remove or change it). Change setting values as indicated in the example below.

```
# NOTE: Place additional 'mounts' setting entries here, if desired.
cray_persistent_data.settings.mounts.data.mount_point./var/opt/cray/dws: null
cray persistent data.settings.mounts.data./var/opt/cray/dws.alt storage path: ''
```

5. Save the changes, and upload the modified worksheet into the CLE config set.

```
smw# cfgset update --worksheet-path cray_persistent_data_worksheet.yaml p0
INFO - Running pre-configuration scripts
INFO - Checking directory access
...
INFO - ConfigSet 'p0' has been updated.
INFO - Run 'cfgset search --level basic p0' to review the current settings.
```

Next, configure the DataWarp service; Configure the cray_dws Worksheet on page 28.

3.5 Configure the cray_dws Worksheet

About this task

Several configuration parameters are required prior to booting and accessing the DataWarp nodes. The following steps correspond to the configuration settings available in the <code>cray_dws</code> worksheet, and step numbering reflects the order in which those settings appear there, unless noted otherwise.

CAUTION:

Configure DataWarp and all services only through the configurator or by placing/editing configuration files in the Simple Sync directory structure within the config set. Do not configure DataWarp by manually adding lines in any /etc files. In general, changes to those files are not persistent, and rebooting could result in loss of data.

Procedure

1. Copy the cray dws worksheet from the current config set to the CLE worksheet workarea.

This ensures that the worksheet being edited reflects current configuration values.

```
smw# cd /var/adm/cray/release/p0_worksheet_workarea
smw# cp -a /var/opt/cray/imps/config/sets/p0/worksheets/\
cray_dws_worksheet.yaml .
```

2. Edit cray dws worksheet.yaml.

```
smw# vi cray_dws_worksheet.yaml
```

3. Uncomment cray dws.enabled and ensure that it is set to true.

```
cray_dws.enabled: true
```

4. Set the managed nodes variable.

Uncomment #cray_dws.settings.service.data.managed_nodes_groups and set it to a list of node groups that contain DataWarp nodes and have been defined in the cray_node_groups configuration.

This example uses the datawarp-nodes node group defined in *Update cray_node_groups for DataWarp* on page 19.

```
cray_dws.settings.service.data.managed_nodes_groups:
    datawarp_nodes
```

5. Set the API gateway variable.

Uncomment <code>cray_dws.settings.service.data.api_gateway_nodes_groups</code> and set it to a list of node groups that contain the DataWarp gateway nodes that have been defined in the <code>cray_node_groups</code> configuration. Typically this is the set of login nodes, but sites can define a subset of login nodes as gateway nodes. This example assumes that all nodes in the predefined <code>login_nodes</code> node group are gateway nodes.

```
cray_dws.settings.service.data.api_gateway_nodes_groups:
    login_nodes
```

6. (Optional) Set the external API gateway variable.

Uncomment #cray_dws.settings.service.data.external_api_gateway_hostnames and set it to a list of the fully qualified domain names (FQDN), also known as DNS Authoritative name records, of nodes specified in api_gateway_nodes_groups. This is the first step in providing native access to DataWarp commands from eLogin nodes.

```
cray_dws.settings.service.data.external_api_gateway_hostnames:
    syslog1.us.cray.com
    syslog2.us.cray.com
```

The next two steps for settings <code>dwrest_cacheroot_whitelist</code> and <code>dwrest_cachemount_whitelist</code> are switched. Although <code>dwrest_cacheroot_whitelist</code> is sequentially next in the worksheet, it introduces a potential security issue that does not exist if using <code>dwrest_cachemount_whitelist</code>. Therefore, Cray recommends using <code>dwrest_cachemount_whitelist</code>.

7. Set dwrest cachemount whitelist, if desired.

dwrest_cachemount_whitelist is a list of PFS directories that users are allowed to use as mounted cache file systems. The PFS paths must be set up on all DataWarp service nodes for cache configurations to function.

Only the directories listed for <code>dwrest_cachemount_whitelist</code> are allowed for cache mount file systems whereas, <code>dwrest_cacheroot_whitelist</code> contains paths on which users are allowed to mount cache file systems. <code>dwrest_cachemount_whitelist</code> is more restrictive than <code>dwrest_cacheroot_whitelist</code>.

dwrest_cachemount_whitelist is not a required setting and can be defined with 0 entries. These two settings can be used either jointly or separately, but at least one must be defined for DataWarp caching to work.

If dwrest_cacheroot_whitelist and dwrest_cachemount_whitelist are both defined, the process used for determining if a user-specified cache directory is valid is as follows:

- 1. Is it an acceptable path given the value for <code>dwrest_cacheroot_whitelist</code>? If yes, the request succeeds: else.
- 2. Is it an acceptable path given the value for <code>dwrest_cachemount_whitelist</code>? If yes, the request succeeds; else,
- **3.** The request fails.
- a. Uncomment #cray_dws.settings.service.data.dwrest_cachemount_whitelist and set it to a list of PFS directories that users are allowed to use as mounted cache file systems.

```
cray_dws.settings.service.data.dwrest_cacheroot_whitelist:
    /pfs/path/user1
    /pfs/path/user2
```

8. Set dwrest cacheroot whitelist, if desired.

WARNING: Use of dwrest_cacheroot_whitelist introduces a potential security issue that depends on the permissions of the parent directories used for DataWarp cache. This issue and workarounds are described here.

dwrest_cacheroot_whitelist is a list of PFS path prefixes on which users are allowed to mount cache file systems. For example, if dwrest_cacheroot_whitelist is set as /lus/users, a user can mount the cache file system /lus/users/seymour. The PFS paths specified must be set up on all DataWarp service nodes for cache configurations to function. Each file system path specified and any subdirectories are considered valid.

dwrest_cacheroot_whitelist is not a required setting and can be defined with 0 entries. For a more restrictive setting, sites can specify a list of specific directories as cache file systems by defining dwrest_cachemount_whitelist in the next step. These two settings can be used either jointly or separately, but at least one must be defined for DataWarp caching to work.

If dwrest_cacheroot_whitelist and dwrest_cachemount_whitelist are both defined, the process used for determining if a user-specified cache directory is valid is as follows:

- 1. Is it an acceptable path given the value for <code>dwrest_cacheroot_whitelist</code>? If yes, the request succeeds; else,
- 2. Is it an acceptable path given the value for <code>dwrest_cachemount_whitelist</code>? If yes, the request succeeds; else,
- **3.** The request fails.

With the DataWarp caching file system, dwcfs, users can specify which PFS directory to cache. For example, a user may wish to cache /lus/users/seymour/data rather than all of /lus/users. When dwcfs is mounted and made available to compute nodes via DVS, users can only interact with the files in /lus/users/seymour/data or lower.

The security issue is possible when interacting with the cached version of /lus/users/seymour/data, because dwcfs only honors the file system permissions at /lus/users/seymour/data and lower, and not the permissions of the parent directories of the path being cached. Suppose a user does not have execute

access to /lus/users/seymour, but the directory /lus/users/seymour/data is world readable, writeable, and executable. If interacting directly with the PFS, the user cannot access /lus/users/seymour/data or any of its files because of the file permissions set on the parent directory. But, if the same user requests type=cache access to /lus/users/seymour/data, the user can now access and modify files at this level or lower.

The following conditions are necessary for a user to exploit this issue:

- The user has access to DataWarp
- The user knows of the existence of /lus/users/seymour/data
- the dwrest_cacheroot_whitelist setting includes any of the following:
 - o /lus/
 - o /lus/users/
 - o /lus/users/seymour/
 - o /lus/users/seymour/data

To avoid this issue, use dwrest cachemount whitelist to define specific cache mount points.

a. Uncomment #cray_dws.settings.service.data.dwrest_cacheroot_whitelist and set it to a list of PFS paths on which users are allowed to mount cache file systems.

```
cray_dws.settings.service.data.dwrest_cacheroot_whitelist:
    /pfs/path/free
    /pfs/path/scratch
    /pfs/path/notbackedup
```

9. Set allow dws cli from computes, if desired.

allow_dws_cli_from_computes determines whether commands such as dwstat and dwcli are executable on compute nodes. This is a required setting and is false by default, because scaling problems can occur if large numbers of compute nodes access the dwrest gateway simultaneously.

```
cray_dws.settings.service.data.allow_dws_cli_from_computes: false
```

10. Exit the editor, then import the complete DataWarp worksheet by updating the config set and specifying the worksheet path.

```
smw# cfgset update --worksheet-path \
'/some/edit/location/cray_dws_worksheet.yaml' p0
```

When the config set is updated using the configurator, all of the pre-and post-configuration scripts are run.

11. Validate the global and CLE config sets. Correct any discrepancies before proceeding.

```
smw# cfgset validate global
...
INFO - ConfigSet 'global' is valid.
smw# cfgset validate p0
...
INFO - ConfigSet 'p0' is valid.
```

12. Reboot the system following the typical procedure in order to activate all DataWarp requirements.

DWS is now enabled as part of CLE.

Next, post boot configuration procedures are necessary to define a functional DWS state.

3.6 Enable and Configure Accounting

DataWarp accounting is enabled and configured through Cray's Resource Utilization Reporting service (cray_rur). RUR supports a plugin architecture, allowing many types of usage data to be collected while using the same software infrastructure. Cray provides data plugins (dws, dws_job_server, dws_server) for collecting DataWarp usage statistics. These plugins can be added to cray_rur at any time and does not require a system reboot. For the complete procedure, see XCTM Series System Administration Guide.

4 DataWarp Update Following CLE Update

Prerequisities

The DataWarp update procedures assume the following:

- System is currently running CLE 6.0.UP01, CLE 6.0.UP02, or CLE 6.0UP03
- SanDisk/Fusion ioMemory3/SX300 SSD cards require firmware version 8.9.5. See *Update Fusion ioMemory Firmware* on page 68.

The CLE software update brings in all new configuration templates. During the update process, the configurator runs in auto mode to merge the new content with CLE and global config sets already on the system. All config sets are updated and validated. Everything is in place for <code>cray_dws</code> to function properly in an updated environment, there are no additional software update procedures for DataWarp. That said, Cray recommends reviewing all DataWarp settings to verify that they are as expected. Use the following procedures to ensure that DataWarp is configured as desired.

Other Important Things to Know

The DataWarp installation procedure includes running cfgset update to modify the attributes or content of a config set. Keep the following in mind while installing DataWarp.

CAUTION: Boot failure possible if using cfgset under certain conditions. The cfgset create and cfgset update commands always call pre- and post-configuration scripts. Some of these scripts require HSS daemons and other CLE services to be running. This can cause cfgset to fail if xtbounce is in progress or if the SMW is not connected to XC hardware. If xtdiscover is running, cfgset may hang or produce incorrect data that leads to system boot failure. In these situations, use cfgset create or cfgset update with the --no-scripts option to prevent running the scripts. When those situations are no longer in effect, run cfgset update without the --no-scripts option to ensure that all pre- and post-configuration scripts are run. Use the following command to see which HSS daemons are running:

smw# /etc/init.d/rsms status

IMPORTANT:

For sites updating DataWarp from CLE 6.0.UP01 to CLE6.0.UP02 or above. Cray Field Notice (FN) #6121a describes a performance issue caused by the incorrect over-provisioning of Intel P3608 SSDs. Sites with P3608 SSDs that followed the over-provisioning procedure described in a DataWarp installation guide published prior to the dates listed below **must** complete the recommended fix described within the FN if this has not yet been done.

Corrected versions of the following DataWarp installation guides were available from the Cray release team and on the Cray Publications Portal at http://pubs.cray.com on October 17, 2016:

- XC™ Series DataWarp™ Installation and Administration Guide (CLE 6.0.UP01) S-2564 Rev C
- DataWarp™ Installation and Configuration Guide S-2547-5204c

4.1 Remove Existing Cache Configurations Before Initiating Updated DWS

Prerequisites

This procedure assumes the system is being updated from CLE 6.0.UP01. Skip this procedure for systems updating from CLE 6.0.UP02 or later.

About this task

DataWarp cache configurations created in CLE 6.0.UP01 are not usable in CLE 6.0.UP02 or later and must be removed. If a CLE 6.0.UP01 cache configuration is detected by a CLE 6.0.UP02 or later DataWarp manager daemon (dwmd), the configuration's fuse is blown and messages similar to the following are written to dwmd.log:

```
2017-05-13 16:06:01 (3519): <77> [testsys]: (cid:1,sid:1,stoken:xxyzz)
dws_realm_member_ERROR:realm_member_create2 1 failed: Found old cache_dir setup
in /var/opt/cray/dws/mounts/fragments/1
...
2017-05-13 16:06:01 (3519): <77> [testsys]: RuntimeError: Found old cache_dir
setup in /var/opt/cray/dws/mounts/fragments/1
...
```

Procedure

1. Check for existing cache configurations.

```
hostname# module load dws
hostname# dwstat --cache configurations
conf state inst type amode activs backing_path
19 CA--- 753 cache stripe 1 /usr/local
```

Exit this procedure if there are no existing cache configurations.

2. Find the session corresponding to the instance for this configuration.

```
hostname# dwstat instances
inst state sess bytes nodes created expiration intact label public confs
753 CA--- 832 128GiB 1 2017-05-08T16:20:36 never true I832-0 private 1
```

3. Remove the session.

The command to remove a session is:

```
dwcli rm session --id sid
hostname# dwcli rm session --id 832
```

4.2 Verify DataWarp Service Update

Prerequisites

This procedure assumes:

- An XC series system with one or more nodes with SSD hardware
- CLE has been updated by following the instructions in XC[™] Series Software Installation and Configuration Guide

About this task

During the CLE update procedure, the cray_dws service template was updated and a new template for cray dw wlm was added. This procedure verifies that all settings are as expected.

Procedure

1. Display and verify the cray_dws settings.

```
smw# cfgset search -1 advanced -s cray dws p0
```

The configurator displays the basic settings, any advanced settings that have been modified, and some advanced settings that are currently set to their default values.

```
smw# cfgset search -1 advanced -s cray dws p0
INFO - Checking services for valid YAML syntax
INFO - Checking services for schema compliance
# 11 matches for '.' from cray dws config.yaml
cray dws.settings.service.data.managed nodes groups: datawarp nodes
cray dws.settings.service.data.api gateway nodes groups: login nodes
cray dws.settings.service.data.external api gateway hostnames: [ ] # (empty)
cray dws.settings.service.data.dwrest cacheroot whitelist: /lus/scratch
cray dws.settings.service.data.dwrest cachemount whitelist: [ ] # (empty)
cray dws.settings.service.data.allow dws cli from computes: false
cray dws.settings.service.data.lvm issue discards: 0
cray dws.settings.dwmd.data.dwmd conf: iscsi initiator cred path: /etc/opt/cray/
dws/iscsi target secret, iscsi target cred path: /etc/opt/cray/dws/
iscsi initiator secret, capmc os cacert: /etc/pki/trust/anchors/
certificate authority.pem
cray dws.settings.dwsd.data.dwsd conf: log mask: 0x7,
instance optimization default: bandwidth, scratch limit action: 0x3
cray dws.settings.dwrest.data.dwrest conf: port: 2015
cray dws.settings.dwrestgun.data.dwrestgun conf: max requests=1024
```

- 2. Verify that cray dws configuration is as expected, and correct any discrepencies before proceeding.
 - a. Verify that managed_nodes_groups is defined as one or more node groups that contain the cnames of the DataWarp service nodes to be managed by DWS.

- b. Verify that api_gateway_nodes_groups is defined either as login_nodes, the group of internal login nodes defined within cray node groups, or as a node group consisting of a subset of login nodes.
- c. Verify that <code>external_api_gateway_hostnames</code> is a list of fully-qualified domain names (FQDN) of internal login nodes with external connectivity selected to run the <code>dwrest</code> service.
- d. Verify that dwrest cacheroot whitelist is defined as expected.
- e. Verify dwrest cachemount whitelist is defined as expected.
- f. Verify allow_dws_cli_from_computes is defined as expected.
- 3. Verify cray_dws advanced settings if any have been modified, and correct any discrepencies before proceeding.

Some sites choose to modify certain DWS advanced settings in response to their workload specifics. Those settings are displayed and Cray recommends verifying them.

TIP:

The configurator displays a handful of advanced settings, whether or not they have been modified, when invoked with -1 advanced. For convenience, these settings and their default values are listed here for comparison.

All other displayed advanced settings have been modified by the site.

```
iscsi_initiator_cred_path: /etc/opt/cray/dws/iscsi_target_secret
iscsi_target_cred_path: /etc/opt/cray/dws/iscsi_initiator_secret
capmc_os_cacert: /etc/pki/trust/anchors/certificate_authority.pem
log_mask: 0x7
instance_optimization_default: bandwidth
scratch_limit_action: 0x3
port: 2015
max_requests=1024
```

Next, verify that other necessary services are enabled.

4.3 Verify Settings of Required Services

Prerequisites

This procedure assumes:

- An XC series system with one or more nodes with SSD hardware
- CLE has been updated by following the instructions in XC™ Series Software Installation and Configuration Guide

About this task

During the update of CLE, all service templates were updated. This procedure verifies that the services required by DWS are enabled and configured correctly, if applicable.

Procedure

- **1.** Verify that cray_ipforward, cray_lnet, cray_munge, and cray_dw_wlm are enabled; *Ensure that cray_ipforward, cray_lnet, cray_munge, and cray_dw_wlm are Enabled* on page 22.
- 2. Verify that a persistent directory entry for DataWarp exists in the mounts setting of cray persistent data.

```
smw# cfgset search -s cray_persistent_data -l advanced p0 | grep dws
cray_persistent_data.settings.mounts.data./var/opt/cray/dws.alt_storage_path: # (empty)
cray_persistent_data.settings.mounts.data./var/opt/cray/dws.options: # (empty)
cray_persistent_data.settings.mounts.data./var/opt/cray/dws.ancestor_def_perms: 0771
cray persistent_data.settings.mounts.data./var/opt/cray/dws.client_groups: service_nodes
```

If a persistent directory entry for DataWarp doesn't exist, it's likely that it was not configured in the previous version of CLE running on the system. Because of this, all storage pool information is lost. It is necessary to add /var/opt/cray/dws (or site-specific persistent directory) to the mounts setting, as described in Set Up DataWarp Persistent Storage on page 27.

3. Validate the global and CLE config sets. Correct any discrepancies before proceeding.

```
smw# cfgset validate global
...
INFO - ConfigSet 'global' is valid.
smw# cfgset validate p0
...
INFO - ConfigSet 'p0' is valid.
```

4. Reboot the system following the typical procedure in order to activate any changes to cray_dws, cray_ipforward, cray_munge, cray_persistent_data, **or** cray_dw_wlm.

Reboot is only necessary if changes were made to the DWS service or any of the required services.

DataWarp is now enabled as part of CLE. Cray recommends verifying that the site's pool configurations are as expected.

5 DataWarp Concepts

For basic definitions, refer to *Terminology* on page 125.

Instances

DataWarp storage is assigned dynamically when requested, and that storage is referred to as an <code>instance</code>. The space is allocated on one or more DataWarp server nodes and is dedicated to the instance for the lifetime of the instance. A DataWarp instance has a lifetime and accessibility managed by whatever creates it. A job instance is relevant to all previously described use cases except the shared data use case.

- Job instance: The lifetime of a job instance, as it sounds, is the lifetime of the job that created it, and is
 accessible only by the job that created it.
- Persistent instance: The lifetime of a persistent instance is not tied to the lifetime of any single job and is terminated by command. Access can be requested by any job, but file access is authenticated and authorized based on the POSIX file permissions of the individual files. Jobs request access to an existing persistent instance using a persistent instance name. A persistent instance is relevant only to the shared data use case.

IMPORTANT: New DataWarp software releases may require the re-creation of persistent instances.

When either type of instance is destroyed, DataWarp ensures that data needing to be written to the parallel file system (PFS) is written before releasing the space for reuse. In the case of a job instance, this can delay the completion of the job.

Application I/O

The DataWarp service (DWS) dynamically configures access to a DataWarp instance for all compute nodes assigned to a job using the instance. Application I/O is forwarded from compute nodes to the instance's DataWarp server nodes using the Cray Data Virtualization Service (DVS), which provides POSIX based file system access to the DataWarp storage.

A DataWarp instance is configured as scratch, cache, or swap. For scratch instances, all data staging between the instance and the PFS is explicitly requested using the DataWarp job script staging commands or the application C library API (libdatawarp). For cache instances, all data staging between the cache instance and the PFS occurs implicitly. For swap instances, each compute node has access to a unique swap instance that is distributed across all server nodes.

Scratch Configuration I/O

A scratch configuration is accessed in one or more of the following ways:

Striped: In striped access mode individual files are striped across multiple DataWarp server nodes
(aggregating both capacity and bandwidth per file) and are accessible by all compute nodes using the
instance.

- Private: In private access mode individual files are also striped across multiple DataWarp server nodes (also
 aggregating both capacity and bandwidth per file), but the files are accessible only to the compute node that
 created them (e.g., /tmp). Private access is not supported for persistent instances, because a persistent
 instance is usable by multiple jobs with different numbers of compute nodes.
- Load balanced: (deferred implementation) In load balanced access mode individual files are replicated (read only) on multiple DataWarp server nodes (aggregating bandwidth but not capacity per instance) and compute nodes choose one of the replicas to use. Load balanced mode is useful when the files are not large enough to stripe across a sufficient number of nodes.

There is a separate file namespace for every scratch instance (job and persistent) and access mode (striped, private, loadbalanced) except persistent/private is not supported. The file path prefix for each is provided to the job via environment variables; see the XC^{TM} Series DataWarp User Guide.

The following diagram shows a scratch private and scratch stripe mount point on each of three compute (client) nodes in a DataWarp installation configured with default settings for CLE 6.0.UP01; where tree represents which node manages metadata for the namespace, and data represents where file data may be stored. For scratch private, each compute node reads and writes to its own namespace that spans all allocated DataWarp server nodes, giving any one private namespace access to all space in an instance. For scratch stripe, each compute node reads and writes to a common namespace, and that namespace spans all three DataWarp nodes.

client node client node client node data data tree namespace data tree data namespace data data data namespace data data data namespace data tree data DataWarp Server DataWarp Server DataWarp Server

Figure 6. Scratch Configuration Access Modes (with Default Settings)

The following diagram shows a scratch private and scratch stripe mount point on each of three compute (client) nodes in a DataWarp installation where the scratch private access type is configured to not behave in a striped manner (scratch_private_stripe=no in the dwsd.yaml configuration file). That is, every client node that activates a scratch private configuration has its own unique namespace on only one server, which is restricted to one fragment's worth of space. This is the default for CLE 5.2.UP04 and CLE 6.0.UP00 DataWarp. For scratch stripe, each compute node reads and writes to a common namespace, and that namespace spans all three DataWarp nodes. As in the previous diagram, tree represents which node manages metadata for the namespace, and data represents where file data may be stored.

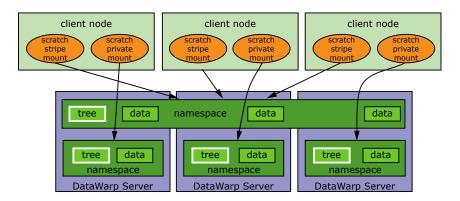

Figure 7. Scratch Configuration Access Modes (with scratch private stripe=no)

Cache Configuration I/O

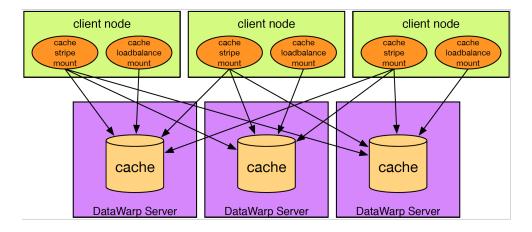

A cache configuration is accessed in one or more of the following ways:

- **Striped**: in striped access mode all read/write activity performed by all compute nodes is striped over all DataWarp server nodes.
- Load balanced (read only): in load balanced access mode, individual files are replicated on multiple
 DataWarp server nodes (aggregating bandwidth but not capacity per instance), and compute nodes choose
 one of the replicas to use. Load balanced mode is useful when the files are not large enough to stripe across
 a sufficient number of nodes or when data is only read, not written.

There is only one namespace within a cache configuration; that namespace is essentially the user-provided PFS path. Private access it is not supported for cached instances because all files are visible in the PFS.

The following diagram shows a cache stripe and cache loadbalance mount point on each of three compute (client) nodes.

Figure 8. Cache Configuration Access Modes

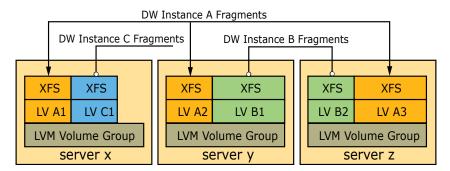

5.1 Instances and Fragments - a Detailed Look

The DataWarp Service (DWS) provides user access to subsets of storage space that exist between an arbitrary file system path (typically that of a parallel file system (PFS)) and a client (typically a compute node in a batch job). Storage space typically exists on multiple server nodes. On each server node, LVM combines block devices and presents them to the DWS as a Logical Volume Manager (LVM) volume group. All of the LVM volume groups on all of the server nodes compose the aggregate storage space. A specific subset of the storage space is called a DataWarp *instance*, and typically spans multiple server nodes. Each piece of a DataWarp instance (as it exists on each server node) is called a DataWarp instance fragment. A DataWarp instance fragment is implemented as an LVM logical volume.

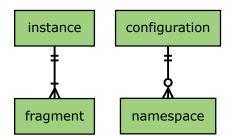

The following figure is an example of three DataWarp instances. DataWarp instance A consists of fragments that map to LVM logical volumes A1, A2, and A3 on servers x, y, z, respectively. DataWarp Instance B consists of fragments that map to LVM logical volumes y and z, respectively. DataWarp Instance C consists of a single fragment that maps to LVM logical volume C1 on server x.

Figure 9. Instances-Fragments LVM Mapping

The following diagram uses Crow's foot notation to illustrate the relationship between an instance-fragment and a configuration-namespace. One instance has one or more fragments; a fragment can belong to only one instance. A configuration has 0 or more namespaces; a namespace can belong to only one configuration.

Figure 10. Instance-Fragment and Configuration-Namespace Relationships

5.2 Storage Pools

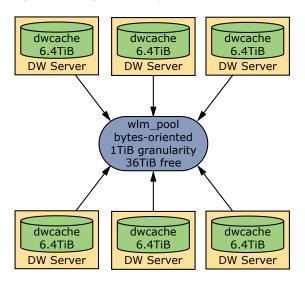

A storage pool groups nodes with storage together such that requests for space made against the pool are fulfilled from the nodes associated with the pool with a common allocation granularity. Pools have either byte or node allocation granularity ($pool_AG$). This release of DataWarp only supports byte allocation granularity. There are tradeoffs in picking allocation granularities too small or too large.

All pools must meet the following requirements:

- The byte-oriented allocation granularity for a pool must be at least 16MiB.
- Each node's volume group (dwcache, configured during SSD initialization) has a Physical Extent size (PE_size) and Physical Volume count (PV_count). The default PE_size is 4MiB, and PV_count is equal to the number of Physical Volumes specified during volume group creation. The DataWarp service (DWS) places the following restriction on nodes associated with a pool:
 - A node can only be associated with a storage pool if the node's granularity (PE_size * PV_count) is a
 factor of the pool's allocation granularity (pool_AG). The dwstat nodes command lists the node's
 granularity in the gran column.

The following diagram shows six different DataWarp nodes belonging to a storage pool wlm_pool with a 1TiB allocation granularity. Each DataWarp node has 6.4TiB of space, which means that 0.4TiB are wasted per node because only 6 allocation granularities fit on any one node.

Figure 11. Storage Pool Example

For an in depth look at pools, see *Create a Storage Pool* on page 73.

5.3 Registrations

A configuration represents a way to use the DataWarp space. Configurations are used in one of two ways:

- configurations are activated
- data is staged into or out of configurations

When either of these actions are performed, the action must supply a DataWarp session identifier in addition to other action-specific data such as a mount point. The session identifier is required because the DataWarp Service (DWS) keeps track of whether a configuration is used and which sessions used it. Then, when requested to remove either the configuration or session, the DWS cleans things up correctly.

The first time a configuration is used by a session, the DWS automatically creates a *registration* entry that binds together the session and configuration. The registration is automatically requested to be removed when either the linked configuration or session is requested to be removed. The actions performed at registration removal time depend on the type of configuration linked with the registration. By default, --wait is set, resulting in the execution of some configuration-specific actions prior to the complete removal of the registration.

DWS carries out the following operations for a registration based on the type of configuration with which it is linked:

scratch

- 1. Files marked for stage out by a user application (using libdatawarp) in a batch job with the DW STAGE AT JOB END stage type are transitioned to being immediately staged out.
- 2. All existing stage out activity, including the stage out from the previous step, is allowed to fully complete.

cache:

- **1.** All existing dirty data in the configuration is written out to the PFS.
- **swap**: no additional operations are carried out at registration removal time.

If the above processes are interrupted, e.g., a DataWarp server node crashes, the DWS attempts to restore everything associated with the node and restart the process after the node reboots. This includes restoring any logical volumes or mount points that are associated with the configuration.

There are times when the previous behavior is not desired. Consider either of the following:

- A DWS or underlying software bug exists that prevents the restoration of the DataWarp state on a crashed server node
- Hardware fails such that data on the SSD is permanently lost

In situations like this, set $--no-wait \mid --haste$ for the registration in order to tell the DWS to abort the normal cleanup process. For example, the following registration is in the process of being destroyed but cannot finish because a linked SSD has failed:

```
user@login> dwstat registrations
reg state sess conf wait
2 D---- 5 11 wait
```

Instruct the DWS to abort the normal registration removal tasks by setting --haste with the following dwcli command:

```
user@login> dwcli update registration --id 2 --haste
update request for registrations entity with id = 2 accepted, "dwstat
registrations" for status
```

WARNING: Use of --haste can lead to data loss because some data may not have been staged out to the PFS.

Workload Manager (WLM) Interaction with Registrations

Registration removal blocks batch job removal because the registration belongs to a session, which in turn belongs to a batch job. Each WLM provides its own way to force the removal of a batch job. Although the DataWarp-integrated WLMs are exepected to automatically set --haste for registrations when the WLM-specific job removal force option is used, not all have implemented this feature. Therefore, it is necessary to manually set --haste using dwcli for registrations without a corresponding WLM batch job to force remove, and may also be necessary for some WLMs. For example:

```
login# dwcli update registration --id 1 --haste
update request for registrations entity with id = 1 accepted, "dwstat
registrations" for status
```

5.4 DataWarp Accounting

The CLE Resource Utilization Reporting (RUR) administration tool includes three plugins (dws, dws_server, dws_job_server) that collect DataWarp accounting data. These plugins must be enabled within the RUR framework in order to collect data. The data is written in JSON format to /var/opt/cray/log/partition-current/messages-date on the SMW.

Usage data is collected separately from compute and storage nodes, and is then combined during post processing. For systems using ALPS, RUR is the primary collection mechanism for DataWarp accounting data. Systems with SLURM must use a plugin defined by SchedMD. RUR is called from both job prologue and epilogue scripts, and by ALPS apsys. This provides both job and application scope accounting records, with more complete records for job scope. Job scope records do not include compute node data, only server data.

5.4.1 The dws Data Plugin

The dws plugin collects the following DataWarp utilization statistics from compute nodes, if present. This usage data is available within the scope of an application, not the scope of a job. The data is written in JSON dictionary format. Additional DataWarp usage data is available through the dws server and dws job server plugins.

bytes_read Number of bytes read
bytes_written Number of bytes written
files_created Number of files created

max_read_offset Maximum byte offset read
max_write_offset Maximum byte offset written

RUR dws output

This example shows dws data as written

to /var/opt/cray/log/partition-current/messages-date on the SMW:

```
2017-02-03T13:27:32.662733-05:00 c0-1c0s8n0 RUR 16521 p0-20161006t064726 [RUR@34] uid: 12345, apid: 1140449, jobid: 1127.sdb, cmdname: /bin/hostname, plugin:dws {"token": "1127.sdb", "mountpoint": "/var/opt/cray/dws/mounts/batch/1127.sdb/ss", "inodes_created": 407, "files_created": 405, "bytes_read": 11207405004, "bytes_written": 6712208222, "max_read_offset": 4096024126, "max_write_offset": 21772241122}
```

5.4.2 The dws_job_server Data Plugin

The <code>dws_job_server</code> plugin collects utilization statistics from DataWarp servers, if present. This usage information is within the scope of a job, not the scope of an application. The data is written in JSON dictionary format. DataWarp server usage information within the scope of an application is available through the <code>dws_server</code> plugin. Compute node usage of DataWarp is available through the <code>dws</code> plugin.

Type scratch File Systems

The following data is collected for type=scratch file systems.

Per realm:

dwtype Type of DataWarp file system (scratch)

namespace_count Number of namespaces within the realm

realm_id Realm ID

server count Number of servers in the realm

server_hostname Server hostname

Per

fragment:

bytes_read Number of bytes read from this fragment

bytes_written Number of bytes written to this fragment

capacity used Amount of file system capacity used

capacity_max Maximum capacity of fragment

files_created Number of files created in this realm

fs capacity Capacity of file system to which this fragment belongs

max window write Maximum amount of data written during a write window period of time

write_high_water The largest amount of data written

write limit Maximum bytes allowed to be written per fragment

write moving avg The average amount of data written during a write window period of time

Per

namespace:

namespace_id

Namespace ID

bytes_read Number of bytes read from this namespace
bytes_written Number of bytes written to this namespace

files_create_threshold Maximum number of files allowed to be created within this

namespace

file size limit Maximum size (bytes) of one file

files_created Number of files created within this namespace

max_offset_read Maximum byte offset read

max_offset_written Maximum byte offset written

stripe_size Size of each stripe (bytes)

stripe width Number of stripes in this namespace

substripe size Size of each substripe (bytes)

substripe width

Number of substripes in per stripe

```
RUR dws server/dws job server output for type=scratch file systems
This example shows data as written
to /var/opt/cray/log/partition-current/messages-date on the SMW:
uid: 12345, apid: 416746, jobid: 21268, cmdname: xio_p,
plugin:dws_server {{"realm": {"server_count": 1, "fragments": [{
 {"capacity used": 128648781824, "fs capacity": 3296920076288,

```

Type cache File Systems

The following data is collected for type=cache file systems.

Per realm:	dwtype	Type of DataWarp file system (cache)
	pfs_path	Backing path
	realm_id	Realm ID
	server_count	Number of servers in the realm
Per fragment:	capacity_highwater	Maximum number of bytes used in underlying file system
	fs_capacity	Capacity of file system to which this fragment belongs
	max_offset_read	Maximum byte offset read
	max_offset_threshold	Maximum byte offset allowed to be read/written
	max_offset_written	Maximum byte offset written
	pfs_read	Number of bytes read from the PFS
	pfs_written	Number of bytes written to the PFS
	window_write_bytes	Number of bytes written during a write window period of time
	window_write_seconds	Number of seconds in a write window period of time
	cache_read	Number of DataWarp storage bytes read
	cache_written	Number of DataWarp storage bytes written

RUR dws server / dws job server output for type=cache file systems This example shows data as written to /var/opt/cray/log/partition-current/messages-date on the SMW: uid: 12345, apid: 416742, jobid: 21266, cmdname: fdfa1, {plugin:dws server "realm": {"fragments": [{ "server hostname": "c0-0c1s1n2", "window write bytes": 82165273, "fs capacity": 0, "capacity highwater": 0, "window write seconds": 21600000, "cache written": 82165273, "max offset read": 183609, "max offset written": 8388608, "pfs read": 82165273, "max offset threshold": 0, "pfs written": 0, "cache read": 6741137 }, { "server_hostname": "c0-0c1s1n1", "window write bytes": 101616737, "fs capacity": 3856795508736, "capacity highwater": 2657973817344, "window write seconds": 21600000, "cache written": 101616737, "max offset read": 95786, "max offset written": 8388608, "pfs read": 101616737, "max_offset_threshold": 0, "pfs_written": 0, "cache_read": 6586671 }], "server_count": 2, "realm_id": 1902, "pfs path": "/lus/peel" }}}

5.4.3 The dws_server Data Plugin

The dws_server plugin collects utilization statistics from DataWarp servers, if present. This usage information is within the scope of an application, not the scope of a job. The data is written in JSON dictionary format. DataWarp server usage information within the scope of a job is available through the dws_job_server plugin. Compute node usage of DataWarp is available through the dws plugin.

Type scratch File Systems

The following data is collected for type=scratch file systems.

Per realm:	dwtype namespace_count	Type of DataWarp file system (scratch) Number of namespaces within the realm
	realm_id	Realm ID
	server_count	Number of servers in the realm
	server_hostname	Server hostname
D		
Per fragment:	bytes_read	Number of bytes read from this fragment
g	bytes_written	Number of bytes written to this fragment
	capacity_used	Amount of file system capacity used
	capacity_max	Maximum capacity of fragment
	files_created	Number of files created in this realm
	fs_capacity	Capacity of file system to which this fragment belongs

S2564 47

max window write Maximum amount of data written during a write window period of time

write_high_water The largest amount of data written
write_limit Maximum bytes allowed to be written per fragment
write moving avg The average amount of data written during a write window period of time

Per namespace:

namespace id Namespace ID Number of bytes read from this namespace bytes read bytes_written Number of bytes written to this namespace files_create_threshold Maximum number of files allowed to be created within this namespace file size limit Maximum size (bytes) of one file files created Number of files created within this namespace max offset read Maximum byte offset read max offset written Maximum byte offset written num_data_created Total number of data files created on all DataWarp servers stage bytes read Number of staged bytes read stage bytes written Number of staged bytes written stripe size Size of each stripe (bytes) stripe width Number of stripes in this namespace

Size of each substripe (bytes)

Number of substripes in per stripe

RUR dws server / dws job server output for type=scratch file systems

This example shows data as written

substripe_size

substripe width

to /var/opt/cray/log/partition-current/messages-date on the SMW:

Type cache File Systems

The following data is collected for type=cache file systems.

Per realm: Type of DataWarp file system (cache)

pfs_path Backing path
realm_id Realm ID

server_count Number of servers in the realm

Per fragment:

capacity_highwater Maximum number of bytes used in underlying file system

fs_capacity Capacity of file system to which this fragment belongs

max_offset_read Maximum byte offset read

max offset threshold Maximum byte offset allowed to be read/written

pfs_read Number of bytes read from the PFS
pfs_written Number of bytes written to the PFS

cache_read Number of DataWarp storage bytes read

cache written Number of DataWarp storage bytes written

RUR dws server / dws job server output for type=cache file systems

This example shows data as written

to /var/opt/cray/log/partition-current/messages-date on the SMW:

```
uid: 12345, apid: 416742, jobid: 21266, cmdname: fdfa1,
{plugin:dws_server "realm": {"fragments": [{ "server_hostname":
    "c0-0c1s1n2", "window_write_bytes": 82165273, "fs_capacity": 0,
    "capacity_highwater": 0, "window_write_seconds": 21600000,
    "cache_written": 82165273, "max_offset_read": 183609,
    "max_offset_written": 8388608, "pfs_read": 82165273,
    "max_offset_threshold": 0, "pfs_written": 0, "cache_read":
6741137 }, { "server_hostname": "c0-0c1s1n1", "window_write_bytes":
101616737, "fs_capacity": 3856795508736, "capacity_highwater":
2657973817344, "window_write_seconds": 21600000, "cache_written":
101616737, "max_offset_read": 95786, "max_offset_written": 8388608,
    "pfs_read": 101616737, "max_offset_threshold": 0, "pfs_written": 0,
    "cache_read": 6586671 }], "server_count": 2, "realm_id": 1902,
    "pfs_path": "/lus/peel" }}
```

6 Advanced DataWarp Concepts

6.1 DVS Client-side Caching can Improve DataWarp Performance

With the advent of DataWarp and faster backing storage, the overhead of network operations has become an increasingly large portion of overall file system operation latency. DVS provides the ability to cache both read and write data on a client node while preserving close-to-open coherency and without contributing to out-of-memory issues on compute nodes. Instead of using network communication for all read/write operations, DVS can aggregate those operations and reuse data already read by or written from a client. This can provide a substantial performance benefit for these I/O patterns, which typically bear the additional cost of network latency:

- small reads and writes
- reads following writes
- multiple reads of the same data

Client-side Write-back Caching may not be Suitable for all Applications

CAUTION: Possible data corruption or performance penalty!

Using the page cache may not provide a benefit for all applications. Applications that require very large reads or writes may find that introducing the overhead of managing the page cache slows down I/O handling. Benefit can also depend on write access patterns: small, random writes may not perform as well as sequential writes. This is due to pages being aggregated for write-back. If random writes do not access sequential pages, then less-than-optimal-sized write-backs may have to be issued when a break in contiguous cache pages is encountered.

More important, successful use of write-back caching on client nodes requires a clear understanding and acceptance of the limitations of close-to-open coherency. It is important for site system administrators to ensure that users at their site understand how client-side write-back caching works before enabling it. Without that understanding, users could experience data corruption issues.

For detailed information about DVS client-side caching, see XC™ Series DVS Administration Guide (S-0005).

6.1.1 Client-side Caching Options

Although many workloads can benefit from client-side caching because it can reduce the frequency and necessity of network operations, others will be negatively affected due to the coherency characteristics of the implementation. Therefore, DWS includes both administrator-controlled default configuration settings and DataWarp job script command line options that enable users to opt in or opt out of client-side caching on a peractivation basis.

System Configuration Options

Two dwsd system-level configuration options (considered advanced settings) control the default values for the client-side caching attribute. They are:

activation cache default

Specifies the default for client-side caching on activation objects for activations that support the feature. This includes scratch and cache but excludes swap. For now, this only applies to stripe access modes. With client-side caching enabled, application performance can be greatly improved but applications must take special care to avoid having application processes on separate client nodes write to the same page.

Default: off.

activation private cache default

Specifies the default for client-side caching on activation objects of private access mode configurations. With stripe access mode, multiple processes on separate nodes can write to the same page, which can lead to what appears to be data corruption. With private access mode, this is not possible since only one client node can ever access a particular file. Consequently the default for client-side caching for private access mode is separately configurable.

Default: on.

CAUTION:

Advanced DataWarp settings must be modified with extreme care. The default values as released are acceptable for most installations. Sites that modify advanced settings are at risk of degrading DataWarp performance, decreasing SSD lifetime, and possibly other unknown outcomes. It is the administrator's responsibility to understand the purpose of any advanced settings changed, the formatting required, and the impact these changes may have.

Options incorrectly spelled or formatted are added but ignored, and the current value is not modified.

For further details on how to change these default settings, see *Modify DWS Advanced Settings* on page 94.

Client-side caching defaults are enumerated by activation type and access mode in the following table:

Table 2. Default Client-side Caching Configuration Settings

Activation Type	Access Mode	Default
scratch	stripe	activation_cache_default
scratch	private	activation_private_cache_default
cache	stripe	activation_cache_default
cache	Idbalance	always on

Note that read-only activations always have the client-side caching attribute enabled.

User-defined Options

Users opt in or out of client-side caching on a per-access mode basis via the #DW jobdw and #DW persistentdw job script commands. For example, the following command requests a scratch striped instance with client-side caching enabled and no more than 1000 files able to be created:

```
#DW jobdw type=scratch access_mode=striped(MFC=1000,client_cache=yes)
```

For further details, see *XC*[™] *Series DataWarp*[™] *User Guide* (S-2558).

6.2 DataWarp Configuration Files and Advanced Settings

There are four DataWarp configuration files:

- 1. The scheduler daemon (dwsd) configuration file: sdb:/etc/opt/cray/dws/dwsd.yaml
- 2. The manager daemon (dwmd) configuration file: sdb:/etc/opt/cray/dws/dwmd.yaml
- 3. The DataWarp RESTful service (dwrest) configuration file: api-qw:/etc/opt/cray/dws/dwrest.yaml
- **4.** The dwrest Gunicorn instance configuration file: api-gw:/etc/opt/cray/dws/dwrestgun.conf

Each file contains options that define limits, determine actions for different situations, and specify how to handle various requests. These options are considered *advanced* settings, and are set with default values that are acceptable for most initial DataWarp configurations. Cray recommends not modifying the default values until there is a good understanding of the site's configuration and workload.

CAUTION:

Advanced DataWarp settings must be modified with extreme care. The default values as released are acceptable for most installations. Sites that modify advanced settings are at risk of degrading DataWarp performance, decreasing SSD lifetime, and possibly other unknown outcomes. It is the administrator's responsibility to understand the purpose of any advanced settings changed, the formatting required, and the impact these changes may have.

Options incorrectly spelled or formatted are added but ignored, and the current value is not modified.

At some point, an administrator very familiar with the site's configuration and usage history may want to modify one or more options to achieve a particular goal. For example, to allow the scheduler (dwsd) to grab more space than requested when processing instance create requests, the equalize_fragments option can be enabled using the system configurator. Before modifying any advanced setting, it is extremely important to understand the purpose of the setting, the format used to assign its value, and the impact of changing its value.

The configuration files contain descriptions for each setting. For example, the <code>equalize_fragments</code> setting is defined in <code>dwsd.yaml</code> as:

Specifies whether the scheduler will attempt to create instances that are
comprised of equal size fragments. By default the scheduler will only pick
as much space (roundup to pool granularity) as was requested at instance
creation request time. With this option, the scheduler will allot more space
to instances in attempt to make all fragments within the instance be of equal
size. This can cause problems for workload managers but can provide for
significantly improved performance to applications using DataWarp.
equalize_fragments: no

In addition to the descriptions provided within the configuration files, certain topics within XC^{TM} Series $DataWarp^{TM}$ Installation and Administration Guide contain more information about some advanced settings, and Cray support personnel are also an available resource.

Configuration File Formats

Within the YAML configuration files, options are set using the format: option: *value*. For example, the expire grace option in dwsd.yaml is as follows:

```
# The length of time to allow an expired resource to linger before the scheduler
# automatically requests its destruction.
#
# expire_grace: 3600
```

Within the dwrestgun.conf file, options are set using the format: option=value. For example, loglevel accepts a quotation mark delimited text value, and timeout requires an integer value:

```
# the default logging level
loglevel = "info"
# Default timeout for a request, 10 minutes by default
timeout=600
```

6.3 The dwsd Configuration File

The DataWarp scheduler daemon (dwsd) runs on the SDB node and reads the configuration file /etc/opt/cray/dws/dwsd.yaml at startup and when it receives the SIGHUP signal. Keep in mind that the majority of the configuration options are considered advanced settings; see *Modify DWS Advanced Settings* on page 94.

IMPORTANT: Do not directly modify any DataWarp configuration files (dwsd.yaml, dwmd.yaml, dwrest.yaml, dwrestgun.conf) as changes do not persist over a reboot. Modify the settings within these files using the configurator only; this ensures that the changes become part of the system config set.

CONFIGURATION OPTIONS

The configuration file /etc/opt/cray/dws/dwsd.yaml contains the following modifiable options:

```
activation cache default
```

Specifies the default for client-side caching on activation objects for activations that support the feature. This includes scratch and cache but excludes swap. For now, this only applies to stripe access types. With client-side caching enabled, application performance can be greatly improved but applications must take special care to avoid having application processes on separate client nodes write to the same page.

```
activation_cache_default: no
```

activation_private_cache_default

Specifies the default for client-side caching on activation objects of private access type configurations. With stripe access type, multiple processes on separate nodes can write to

the same page, which can lead to what appears to be data corruption. With private access type, this is not possible since only one client node can ever access a particular file. Consequently the default for client-side caching for private access type is separately configurable.

```
activation private cache default: yes
```

cache_limit_action

What action to take when one of the cache limits are exceeded. This action applies to all limits.

0x1: log only

0x2: error on filesystem operations

0x3: log and error

cache limit action: 0x3

cache_max_file_size_default

Specifies the maximum size (bytes) of any one file that may ever exist in a cache configuration. In other words, the maximum byte offset for a file that may be read from or written to. When the threshold is exceeded, a message will be emitted to the system console and an error will be reported back to the filesystem operation that triggered the limit.

A value of 0 means no limit. User requests may override this value.

```
cache max file size default: 0
```

cache_max_file_size_max

The maximum value a user may request when overriding cache_max_file_size_default. The value of 0 means there is no max. cache max file size max: 0

cache_modified_threshold_default

For cache configurations, the maximum number of dirty bytes (per file) before the file system begins writeback of the dirty bytes to the backing store/PFS.

```
cache_modified_threshold_default: 268435456
```

cache_read_ahead_size_default

For cache configurations, the number of bytes to be read ahead when read-ahead is enabled.

```
cache_read_ahead_size_default: 8388608
```

cache_read_ahead_threshold_default

For cache configurations, the number of bytes that must be read sequentially before a readahead starts.

```
cache read ahead threshold default: 25165824
```

cache_stripe_size

The stripe size for cache configurations. This must be a power of 2 (enforced) as well as a multiple of the PFS stripe size (unenforced). Most PFS configuration stripe sizes are a factor of the default value given here; therefore, it is unlikely this needs to change.

```
cache stripe size: 8388608
```

cache_substripe_width

The number of substripes for each cache stripe. Substriping improves performance when multiple client nodes try to interact with the same stripe on a server.

```
cache substripe width: 12
```

cache_sync_on_close_default

For cache configurations, this controls the behavior of POSIX close (). If yes, a file close will not return until all modified data has been flushed to the backing store/PFS.

```
cache sync on close default: no
```

cache_sync_to_backing_store_default

For cache configurations, this controls the behavior of POSIX fsync() and fdatasync(). If yes, these operations will not close until all data has been flushed to the backing store/ PFS.

```
cache sync to backing store default: no
```

device health interval

The minimum number of seconds before dwsd asks for a system-wide update on the health of all block devices being used in the DWS. A value of 0 means this action is disabled.

```
device health interval: 3600
```

dwmd_heartbeat_watchdog

The number of seconds a <code>dwmd</code> may neglect to heartbeat back to <code>dwsd</code> before <code>dwsd</code> considers the <code>dwmd</code> node to be offline. Although <code>dwsd</code> normally detects that a <code>dwmd</code> is down due to node failure or connect failures to the node, there are cases where a <code>dwmd</code> may hang or crash that are only detectable by a lack of heartbeats. A value of <code>0</code> disables the check.

```
dwmd_heartbeat_watchdog: 1800
```

dwsd host

The hostname to which dwmd should connect when responding to tasks distributed by dwsd. On multi-interface hosts running dwsd, the primary hostname may not be appropriate for the remote dwmd to use. This option serves as an override to the primary hostname returned by gethostname().

```
dwsd host: result of gethostname ()
```

equalize fragments

Specifies whether the scheduler will attempt to create instances that are comprised of equal size fragments. By default the scheduler will only pick as much space (roundup to pool granularity) as was requested at instance creation request time. With this option, the scheduler will allot more space to instances in attempt to make all fragments within the

instance be of equal size. This can cause problems for workload managers but can provide for significantly improved performance to applications using DataWarp.

```
equalize fragments: no
```

equalize fragments guarantee

This option tweaks both equalize_fragments behavior and how pool "free" space is calculated for pools. This option is only valid when equalize_fragments is set to yes. When equalize_fragments and this option are set to yes, this option prevents the scheduler from creating an instance that is not comprised of fragments of equal size. Additionally, the amount of free capacity reported in pool information may be adjusted downward so as to reflect the maximum size a request may be while respecting the modified equalize fragments behavior.

```
equalize fragments guarantee: yes
```

expire_grace

The length of time in seconds to allow an expired resource to linger before dwsd automatically requests its destruction.

```
expire grace: 3600
```

instance_optimization_default

When processing an instance-create request, dwsd decides how to select space across all of the servers that are under the control of the DWS. It first restricts selection to server nodes that belong to the pool specified in the instance create request itself and are up and responding. It then carves out space from each server according to some policy. When the instance create request does not specify a policy, the

instance optimization default option is used as the default.

Valid options:

- 1. bandwidth pick as many server nodes as possible
- 2. interference pick as few server nodes as possible, and pick nodes that are unused when possible
- **3.** wear pick nodes based on the health of the underlying block devices. Note that the other options only take device health into account to break ties.

instance optimization default: bandwidth

instance_write_window_length_default

The default number of seconds used when calculating the simple moving average of writes to an instance. Note that the configurations using the instance must provide support for this (e.g., does not apply to swap). A value of $\, \circ \,$ means the write window limit is not used.

```
instance_write_window_length_default: 86400
```

instance write window length max

The maximum value a user may request when overriding

instance write window length min

The minimum value a user may request when overriding

instance_write_window_length_default. A value of 0 means there is no minimum.

```
instance write window length min: 0
```

instance write window multiplier default

The default multiplier to use against an instance size to determine the maximum number of bytes written portion of the moving average calculation for purposes of detecting anomalous write behavior. The multiplier must be an integer of 0 or more. A value of 0 means the write window limit is not used. For example, if the multiplier is 10, the instance size is 2 TiB, and the write window is 86400, then 20 TiB may be written to the instance in any 24 hour sliding window.

```
instance write window multiplier default: 10
```

instance_write_window_multiplier_max

The maximum value a user may request when overriding

instance_write_window_multiplier_default. A value of 0 means there is no maximum.

```
instance write window multiplier max: 0
```

log_mask

A mask for the various types of messages logged by dwsd. Bits beyond warning (0x4) are subject to change.

0x0000001: Info 0x0000002: Error 0x0000004: Warning

0x0000080: General-purpose debugging

0x0000100: JSON RPCs

0x0000200: Encrypted messages

0x0000400: JSON notification messages

0x0000800: RCA debugging messages (noisy)

log mask: 0x7

max failures

The maximum number of times dwsd attempts to transition a resource to its non-destroyed state before the scheduler requires an API client interaction to try again through PATCH on fuse_blown attributes (dwcli update resources --idid--replace-fuse).

```
max_failures: 2
```

resource_failure_cooldown

Periodically, performing an action on a resource may fail (e.g., creating an LVM logical volume as part of fragment creation). When this occurs, it can be useful to wait a small period of time to retry the operation, rather than aggressively retrying in a tight loop. This parameter sets the minimum number of seconds before <code>dwsd</code> retries an operation.

```
resource failure cooldown: 60
```

resource rm scan interval

Typically all nodes are up and responding and resources can be created and destroyed without error. If a node becomes unresponsive, the resource is created or destroyed once it comes back online. Occasionally, a node becomes unresponsive for an extended period of time (e.g., it crashes and is not rebooted for some time) and it is desirable to "forget" about the resource on the node. This parameter specifies the minimum number of seconds between scans where <code>dwsd</code> finds all down nodes (using an external data source) and deletes from them any resources that are intended to be destroyed.

```
resource rm scan interval: 180
```

scratch data subdirs

The underlying XFS file system has points of serialization that can be overcome by distributing data into multiple subdirectories. This variable influences the number of subdirectories used for scratch file systems.

```
scratch data subdirs: 256
```

scratch limit action

What action to take when one of the scratch limits are exceeded; this action applies to all limits.

0x1: log only

0x2: error on file system operations

0x3: log and error

scratch_limit_action: 0x3

scratch_metadata_subdirs

The underlying XFS file system has points of serialization that can be overcome by distributing metadata into multiple subdirectories. This variable influences the number of subdirectories used for scratch file systems.

```
scratch metadata subdirs: 32
```

scratch_namespace_max_file_size_default

The maximum size (bytes) of any one file that may exist in a scratch configuration namespace. When the threshold is exceeded, a message is emitted to the system console and an error is reported back to the file system operation that triggered the limit. A value of 0 means no limit. User requests may override this value.

```
scratch namespace max file size default: 0
```

scratch namespace max file size max

The maximum value a user may request when overriding

```
\label{lem:scratch_namespace_max_file_size_default. A value of 0 means there is no max. \\ scratch namespace max file size max: 0
```

scratch namespace max files default

The maximum number of files that may be created in a scratch configuration namespace. When the threshold is exceeded, a message is displayed on the system console and no new files can be created in the namespace. A value of 0 means no limit. User requests may override this value.

```
scratch namespace max files default: 0
```

scratch_namespace_max_files_max

The maximum value a user may request when overriding scratch_namespace_max_files_default. A value of 0 means no limit. scratch_namespace max files max: 0

scratch private striped

Specifies whether the scratch private access type should behave in a striped manner. That is, every client node that activates the scratch private configuration will still have its own unique namespace, but each namespace will stripe across all servers in a dwfs realm. This gives any one private namespace access to all space in an instance, rather than being restricted to one fragment's worth of space.

```
scratch private striped: yes
```

scratch_private_substripe_width

The number of substripes to use for each scratch stripe (private access type). Substriping a stripe improves performance when multiple client nodes try to interact with the same stripe on a server. Because only one client node is intended to interact with a stripe at any one time with private access type, substripes are not generally useful with scratch private.

```
scratch private substripe width: 1
```

scratch stripe size

The stripe size for scratch configurations; this must be a power of 2 (enforced) as well as a multiple of the PFS stripe size (unenforced). Most PFS configuration stripe sizes are a factor of the default value here, so it is unlikely this needs to be changed.

```
scratch stripe size: 8388608
```

scratch substripe size

The substripe size to use for scratch configurations; this must be a power of 2 (enforced). If the value is less than <code>scratch_stripe_size</code>, then each complete read/write of a stripe is mapped to two or more substripe files, using round robin across the substripe files as necessary. If the value is equal to <code>scratch_stripe_size</code>, then each complete read/write of a stripe is mapped to exactly one substripe file. If the value is greater than <code>scratch_stripe_size</code>, then each complete read/write of a stripe is mapped to a subset of one substripe file.

scratch_substripe size: 8388608

scratch substripe width

The number of substripes for each scratch stripe (stripe access type). Substriping a stripe improves performance when multiple client nodes try to interact with the same stripe on a server.

```
scratch substripe width: 12
```

trusted uids

The dwsd only trusts messages from the listed numeric uids. This should be the UIDs of dwmd (root) and the API gateway (non-root).

```
trusted uids: [0, nginx uid]
```

6.4 The dwmd Configuration File

The DataWarp management daemon (dwmd) master process reads the configuration file /etc/opt/cray/dws/dwmd.yaml at startup and when it receives the SIGHUP signal. Keep in mind that the majority of the configuration options are considered advanced settings; see *Modify DWS Advanced Settings* on page 94.

IMPORTANT: Do not directly modify any DataWarp configuration files (dwsd.yaml, dwmd.yaml, dwrest.yaml, dwrestgun.conf) as changes do not persist over a reboot. Modify the settings within these files using the configurator only; this ensures that the changes become part of the system configurator set.

CONFIGURATION OPTIONS

There are four ways to specify dwmd configuration settings. They are, in order of precedence:

- environment variables
- 2. dwmd command line options
- 3. configuration file changes via the configurator
- 4. default dwmd settings

Not all configuration settings are meant to be modified by a site. The following subset of configuration options found in dwmd.yaml represent those options that an experienced DataWarp administrator might modify. To implement changes to the configuration file, send a SIGHUP to dwmd.

allow_scc

If specified, dwcfs allows the $dwc_set_stripe_configuration$ API to be used and will query the PFS for persistent attributes when a file is first opened. If not specified (default), dwcfs does not attempt to use PFS extended attributes, which avoids the associated overhead in those cases where the PFS does not support or is not configured to allow the use of extended attributes. Only available for dwcfs; value must be [0] 1.

```
allow_scc:0
```

dvs_mnt_opt

An optional DVS mount option string added to the option string for mount -t dwfs [-o option[,option]...]. This option string must be a comma-separated list of valid DVS options.

```
dvs mnt opt: ""
```

dwfs mnt opt

An optional DWfs mount option string added to the option string for mount -t dwfs [-o option[,option]...]. This option string must be a comma-separated list of valid DWfs options.

```
dwfs mnt opt: ""
```

hb_aggr_delay

The minimum initial delay interval (in seconds) before dwmd goes into aggressive heartbeat mode after the first occurrence of detecting a task failure.

```
hb aggr delay: 10
```

hb val

The heartbeat to dwsd interval in seconds.

```
hb val: 600
```

hb_num_aggr

The number of aggressive heartbeats to repeat.

```
hb num aggr: 5
```

hb_val_aggr

The aggressive heartbeat interval used when task failures are detected.

For example, when a task fails, dwmd changes the heartbeat delay from hb_val to hb_val_aggr for hb_num_aggr times. If hb_val_aggr=5, hb_val=600, and hb_val_aggr=30, dwmd sends a heartbeat every 30 seconds for five times before returning to the normal heartbeat (600 seconds), unless another failure occurs and resets the aggressive heartbeat counter.

```
hb val aggr: 30
```

max utilization

The percentage (1 to 100) of the capacity of the underlying file system that dwcfs will use for application file data. XFS can fail catastrophically if the file system fills up under a heavy load, and this avoids filling the file system with application data. Only available for dwcfs; value is a percentage.

```
max utilization: 98
```

substripe type

Namespace substripe type; value must be [DEFERRED | NONDEFERRED].

```
substripe type: DEFERRED
```

trusted uids

A comma-separated list of trusted numeric UIDs; DataWarp only trusts messages from UIDs within this list. This list must include the UIDs of dwsd (root) and the API gateway.

Note that the CLE installer sets this option, therefore, it does not need to be changed.

```
trusted uids: [0, nginx uid]
```

vgck_panic

Flag for panic node when volume group test fails; value must be [yes | no].

```
vgck panic: yes
```

xfs mkfs opt:

An optional mkfs.xfs command option string added to command. This option string must be a space-separated list of valid mkfs.xfs options. Note that -f is always added by default.

```
xfs mkfs opt: ""
```

xfs mnt opt:

An optional XFS mount option string added to the option string for the mount [-o option[,option]...] command to mount fragments. This option string must be a comma-separated list of valid XFS mount options.

```
xfs mnt opt: "nodiscard"
```

6.5 The dwrest Configuration File

The DataWarp RESTful gateway daemon (dwrest) reads the configuration

file /etc/opt/cray/dws/dwrest.yaml at startup and when it receives the SIGHUP signal. Keep in mind that the majority of the configuration options are considered advanced settings; see *Modify DWS Advanced Settings* on page 94.

IMPORTANT: Do not directly modify any DataWarp configuration files (dwsd.yaml, dwmd.yaml, dwrest.yaml, dwrestgun.conf) as changes do not persist over a reboot. Modify the settings within these files using the configurator only; this ensures that the changes become part of the system configurator set.

CONFIGURATION OPTIONS

The configuration file /etc/opt/cray/dws/dwrest.yaml contains the following modifiable options: admin mountroot blacklist

A comma-separated list of mount paths on which an administrator cannot create activations. This list is to prevent mistakes by an administrator accidentally mounting over / tmp as an example.

While an admin may choose to mount to subdirectories within this blacklist, e.g., /, depending upon the mount point it may or may not be advisable to do so.

One may choose to change this to allow these directories to be overlaid, however doing so may put DWS or the system into an unknown state.

```
admin_mountroot_blacklist:/sys/fs/cgroup,/var/tmp,/dev/shm,
/usr/sbin,/usr/bin,/sbin,/bin,/.snapshots,/root,/boot,/usr,/etc,/tmp,
/proc,/sys,/dev,/run,/
```

admins

A comma-separated list of UIDs of MUNGE administration. MUNGE is used to provide user authentication/identification in environments where uids are consistent across machines.

```
admins: []
```

user mountroot whitelist

List of allowed mount paths on which a user can create activations. Note, all paths are required to be fully rooted or <code>dwrest</code> will not start. The default of an empty list means that users cannot create activations as there is no valid mount path on which to create them.

Additionally, users cannot mount to the whitelist mount itself. That is, if /one/two is in the whitelist and a user tries to mount to /one/two, it fails. An activation must be a subdirectory of a mount path in the whitelist. For example /one/two/three.

```
user mountroot whitelist: []
```

6.6 The dwrestgun Configuration File

The dwrestgun.conf file, found on login nodes, contains the configuration options for interfacing with Gunicorn. Gunicorn (Green Unicorn) is a Python WSGI HTTP Server for UNIX. For dwrest, nginx communicates with Gunicorn, which handles the running of multiple instances of dwrest in a number of Unix processes. Keep in mind that the majority of the configuration options are considered advanced settings; see *Modify DWS Advanced Settings* on page 94.

IMPORTANT: Do not directly modify any DataWarp configuration files (dwsd.yaml, dwmd.yaml, dwrest.yaml, dwrestgun.conf) as changes do not persist over a reboot. Modify the settings within these files using the configurator only; this ensures that the changes become part of the system configurator set.

CONFIGURATION OPTIONS

The configuration file /etc/opt/cray/dws/dwrestgun.conf contains the following modifiable options: backlog

Maximum number of pending connections – this refers to the number of clients that can be waiting to be served. Exceeding this number results in the client getting an error when attempting to connect. It should only affect servers under significant load.

```
backlog=128
```

graceful timeout

Timeout for graceful workers restart – after receiving a restart signal, workers have this much time to finish serving requests. Workers still alive after the timeout (starting from the receipt of the restart signal) are force killed.

```
graceful timeout=30
```

max_requests

Maximum number of requests a worker will process before restarting – any value greater than zero will limit the number of requests a worker will process before automatically

restarting. This is a simple method to help limit the damage of memory leaks. If this is set to zero (the default), the automatic worker restarts are disabled.

```
max requests=1024
```

max_requests_jitter

Maximum jitter to add to the $max_requests$ setting – the jitter causes the restart per worker to be randomized by $randint(0, max_requests_jitter)$. This is intended to stagger worker restarts to avoid all workers restarting at the same time.

timeout

Workers silent for more than this many seconds are killed and restarted.

timeout=600

Some dwrestgun.conf options are not listed here because they are not meant to be modified. Additionally, there are Gunicorn settings that, if added to dwrestgun.conf, would be valid, but their use is discouraged by Cray. For further details on all Gunicorn configuration options, see http://docs.gunicorn.org/en/19.3/settings.html#config-file.

7 Post-boot Configuration Overview

About this task

After the system boots, DataWarp requires further manual configuration. The steps required are:

Procedure

- 1. Over-provision all Intel P3608 cards; Over-provision an Intel P3608 SSD on page 65.
- 2. Flash the firmware for all Fusion IO cards; *Update Fusion ioMemory Firmware* on page 68.
- Initialize all DataWarp-designated SSDs for use with the DataWarp service (DWS); Initialize an SSD on page 70.
- **4.** Create storage pools; *Create a Storage Pool* on page 73.
- 5. Assign desired nodes with space to a storage pool; Assign Nodes to a Storage Pool on page 77.
- **6.** Verify the configuration; *Verify the DataWarp Configuration* on page 78.

7.1 Over-provision an Intel P3608 SSD

Prerequisites

- A Cray XC series system with one or more Intel P3608 SSD cards installed
- Ability to log in as root

About this task

This procedure is only valid for Intel P3608 SSDs. The examples provided are based on the 4TB drives, but this procedure also works for the 1.6TB drives.

WARNING: This procedure destroys any existing data on the SSDs.

Over-provisioning determines the size of the device available to the Logical Volume Manager (LVM) commands and needs to occur prior to executing any LVM commands. Typically, over-provisioning is done when the SSD cards are first installed.

TIP: Throughout these procedures, units of bytes are described using the binary prefixes defined by the International Electrotechnical Commission (IEC). For further information, see *Prefixes for Binary and Decimal Multiples* on page 126.

Procedure

1. Log on to an Intel P3608 SSD-endowed node as root, then determine the SSD model number.

```
ssd# module load linux-nvme-ctl
ssd# nvme id-ctrl /dev/nvme0 |grep mn
mn : INTEL SSDPECME040T4Y
```

2. Shut down the DataWarp manager daemon (dwmd).

```
ssd# systemctl stop dwmd
```

3. Remove any existing configuration.

TIP: Numerous methods exist for creating configurations on an SSD; these instructions may not capture all possible cleanup techniques.

a. Unmount file systems (if any).

b. Remove logical volumes (if any).

```
nid00350# lvdisplay
 --- Logical volume ---
 LV Path
                      /dev/dwcache/s98i94f104o0
 LV Name
                      s98i94f104o0
 VG Name
                      dwcache
 LV UUID
                      910tio-RJXq-puYV-s3UL-yDM1-RoQl-HugeTM

 Block device
                       253:0
nid00350# lvremove /dev/dwcache
```

c. Remove volume groups (if any).

```
nid00350# vgs

VG  #PV #LV #SN Attr  VSize VFree

dwcache  4  0  0 wz--n- 7.28t 7.28t

nid00350# vgremove dwcache

Volume group "dwcache" successfully removed
```

d. Remove physical volumes (if any).

```
nid00350# pvs
PV
                      Fmt Attr PSize PFree
             VG
                      lvm2 a-- 1.82t 1.82t lvm2 a-- 1.82t 1.82t
/dev/nvme0n1
/dev/nvme1n1
/dev/nvme2n1
                      lvm2 a-- 1.82t 1.82t
/dev/nvme3n1
                      lvm2 a-- 1.82t 1.82t
nid00350# pvremove /dev/nvme0n1 /dev/nvme1n1 /dev/nvme2n1 /dev/nvme3n1
  Labels on physical volume "/dev/nvme0n1" successfully wiped
  Labels on physical volume "/dev/nvme1n1" successfully wiped
 Labels on physical volume "/dev/nvme2n1" successfully wiped
 Labels on physical volume "/dev/nvme3n1" successfully wiped
```

e. Clear partitions for each device removed in the previous step (if any).

WARNING: This operation destroys any existing data on an SSD. Back up any existing data before proceeding.

```
nid00350# dd if=/dev/zero of=phys_vol bs=512 count=1

nid00350# dd if=/dev/zero of=/dev/nvme0n1 bs=512 count=1

nid00350# dd if=/dev/zero of=/dev/nvme1n1 bs=512 count=1

nid00350# dd if=/dev/zero of=/dev/nvme2n1 bs=512 count=1

nid00350# dd if=/dev/zero of=/dev/nvme3n1 bs=512 count=1
```

4. Reconfigure the device based on the model number determined in step **1** on page 66 and the corresponding over-provision value from the following table.

Table 3. Over-provision values for supported Intel P3608 models

Model Number	Size (TB)	Over-provision Value (bytes)	HEX
SSDPECME016T4Y	1.6	1250259487	0x4a85721f
SSDPECME040T4	4.0	3125623327	0xba4d3a1f
SSDPECME040T4Y	4.0	3125623327	0xba4d3a1f

```
nid00350# nvme set-feature device -n 1 -f 0XC1 -v op_value set-feature:193(Unknown), value:00000000
```

TIP: For the remainder of this procedure, the examples assume 4TB SSDs; values will be different for 1.6TB SSDs.

```
nid00350# nvme set-feature /dev/nvme0 -n 1 -f 0XC1 -v 3125623327
set-feature:193(Unknown), value:00000000
nid00350# nvme set-feature /dev/nvme1 -n 1 -f 0XC1 -v 3125623327
set-feature:193(Unknown), value:00000000
nid00350# nvme set-feature /dev/nvme2 -n 1 -f 0XC1 -v 3125623327
set-feature:193(Unknown), value:00000000
nid00350# nvme set-feature /dev/nvme3 -n 1 -f 0XC1 -v 3125623327
set-feature:193(Unknown), value:00000000
```

5. Confirm the change based on the SSD model number and values in *Over-provision values for supported Intel P3608 models* on page 67. Note that 0xba4d3a1f = 3125623327.

```
nid00350# nvme get-feature device -n 1 -f 0XC1 --sel=0
get-feature:193(Unknown), value:0xba4d3a1f

nid00350# nvme get-feature /dev/nvme0 -n 1 -f 0XC1 --sel=0
get-feature:193(Unknown), value:0xba4d3a1f
nid00350# nvme get-feature /dev/nvme1 -n 1 -f 0XC1 --sel=0
get-feature:193(Unknown), value:0xba4d3a1f
nid00350# nvme get-feature /dev/nvme2 -n 1 -f 0XC1 --sel=0
get-feature:193(Unknown), value:0xba4d3a1f
nid00350# nvme get-feature /dev/nvme3 -n 1 -f 0XC1 --sel=0
get-feature:193(Unknown), value:0xba4d3a1f
```

6. Return to the SMW, and warm boot the DataWarp node.

```
crayadm@smw> xtnmi cname
crayadm@smw> sleep 60
crayadm@smw> xtbootsys --reboot -r "warmboot for Intel SSD node" cname
```

7. Log in to the Intel P3608 SSD-endowed node as root, and confirm that SIZE = 1600319143936 bytes for all volumes.

```
nid00350# lsblk -b
NAME
       MAJ:MIN RM
                           SIZE RO TYPE MOUNTPOINT
              0
loop0
         7:0
                         196608 0 loop /var/opt/cray/imps-distribution/squash/
                          65536 0
loop1
         7:1
                0
                                  loop /var/opt/cray/imps-distribution/squash/
nvmeUni 259:1
nvme0n1 259:0
                0 1600319143936 0
                                  disk
                0 1600319143936 0
nvme2n1 259:2
                0 1600319143936 0 disk
              0 1600319143936 0 disk
nvme3n1 259:3
```

Contact Cray service personnel if SIZE is incorrect.

7.2 Update Fusion ioMemory Firmware

Prerequisites

- A Cray XC series system with one or more nodes with Fusion IO SSD hardware
- Identification of the nodes with Fusion IO SSD hardware

About this task

After the Fusion ioMemory VSL software is integrated in the FIO service node image (during the initial DataWarp installation), it is necessary to ensure that the Fusion ioMemory device firmware is up-to-date. For ioMemory3/SX300 cards, CLE 6.0.UP02 and beyond requires the use of the SLES12 version of SanDisk/Fusion driver – VSL 4.2.5. This driver requires firmware version 8.9.5.

WARNING:

- It is extremely important that the power not be turned off during a firmware upgrade, as this could cause device failure.
- Do not use this utility to downgrade the Fusion ioMemory device to an earlier version of the firmware. Doing so may result in data loss and void your warranty.

• After reflashing, the firmware level cannot be reverted to a previous level, and therefore, the drives are no longer usable with pre-CLE6.0.UP02 releases.

For further details, see *Fusion ioMemory*™ *VSL*® *4.2.x User Guide for Linux*.

Procedure

1. Log in to a node with Fusion IO SSD hardware installed and determine the firmware status.

If the firmware needs to be updated, running the "fio-status -a" command displays the following message, "The firmware on this device is not compatible with the currently installed version of the driver," and the device will not attach.

```
nid00078# fio-status -a
Found 1 VSL driver package:
    4.2.x build 1137 Driver: loaded

Found 1 ioMemory device in this system
...

The firmware on this device is not compatible with the currently installed version of the driver
...

There are active errors or warnings on this device! Read below for details.
...

This means the firmware needs to be updated.
```

- **2.** Skip the remainder of this procedure if the firmware is compatible with the driver.
- 3. Determine the location of the fio-firmware-fusion file.

```
nid00078# rpm -q --list fio-firmware-fusion
/usr/share/doc/fio-firmware/copyright
/usr/share/fio/firmware/fusion_4.2.x-date.fff
```

4. Update the firmware.

```
nid00078# fio-update-iodrive firmware-path
```

For example:

```
nid00078# fio-update-iodrive /usr/share/fio/firmware/fusion_4.2.x-date.fff
WARNING: DO NOT TURN OFF POWER OR RUN ANY IODRIVE UTILITIES WHILE THE FIRMWARE
UPDATE IS IN PROGRESS
Please wait...this could take a while

Updating: [==============] (100%)
fct0 - successfully updated the following:
Updated the firmware from old_level to new_level
    Updated CONTROLLER from old_level to new_level
    Updated SMPCTRL from old_level to new_level
    Updated NCE from old_level to new_level

Reboot this machine to activate new firmware.
```

- **5.** Repeat the previous steps for all nodes with Fusion IO SSD hardware.
- **6.** Warm boot the node(s).

```
crayadm@smw> xtnmi cname
crayadm@smw> sleep 60
crayadm@smw> xtbootsys --reboot -r "warmboot for Fusion IO SSD node" cname
```

7. Log in to the node(s) and verify that the firmware update is recognized.

```
nid00078# fio-status -a
```

If no error messages are displayed, the node is ready for initialization. Otherwise, contact Cray service personnel.

7.3 Initialize an SSD

Prerequisites

- root privileges
- Intel P3608 SSDs must be over-provisioned
- Up-to-date firmware on Fusion IO SSDs

About this task

During the DataWarp installation process, the system administrator defines SSD-endowed nodes whose space the DataWarp service (DWS) will manage. This step ensures that the DataWarp manager daemon, dwmd, is started at boot time on these nodes. It **does not** prepare the SSDs for use with the DWS; this is performed manually using the following instructions.

After CLE boots, the following one-time manual device configuration must be performed for each node specified in the managed nodes setting for the cray dws service.

The diagram below shows how the Logical Volume Manager (LVM) volume group <code>dwcache</code> is constructed on each DW node. In this diagram, four SSD block devices have been converted to LVM physical devices with the <code>pvcreate</code> command. These four LVM physical volumes were combined into the LVM volume group <code>dwcache</code> with the <code>vqcreate</code> command.

Figure 12. LVM Volume Group

LVM Volume Group (dwcache)					
LVM PV	LVM PV	LVM PV	LVM PV		
SSD Block Device	SSD Block Device	SSD Block Device	SSD Block Device		
DW Server					

TIP: Throughout these procedures, units of bytes are described using the binary prefixes defined by the International Electrotechnical Commission (IEC). For further information, see *Prefixes for Binary and Decimal Multiples* on page 126.

Procedure

1. Log in to an SSD-endowed node as root.

This example uses nid00350.

2. Stop the dwmd service.

```
nid00350# systemctl stop dwmd
```

3. Identify the SSD block devices.

NVMe SSDs:

```
nid00350# lsblk
NAME MAJ:MIN RM SIZE RO MOUNTPOINT
loop0 7:0 0 196608 0 loop /var/opt/cray/imps-distribution/squash/
loop1 7:1 0 65536 0 loop /var/opt/cray/imps-distribution/squash/
nvme0n1 259:0 0 1600319143936 0 disk
nvme1n1 259:1 0 1600319143936 0 disk
nvme2n1 259:2 0 1600319143936 0 disk
nvme3n1 259:3 0 1600319143936 0 disk
```

Fusion IO SSDs:

```
nid00350# lsblk

NAME MAJ:MIN RM SIZE RO TYPE MOUNTPOINT

fioa 254:0 0 2.9T 0 disk

fiob 254:1 0 2.9T 0 disk

loop0 7:0 0 196608 0 /var/opt/cray/impsdistribution/squash/
loop1 7:1 0 65536 0 /var/opt/cray/impsdistribution/squash/
```

- **4.** (Intel P3608 SSDs only) Proceed to step 6 on page 72 as the following step was completed during the over-provisioning procedure.
- **5.** (All non-Intel P3608 SSDs) Remove any existing configuration.

TIP: Numerous methods exist for creating configurations on an SSD; these instructions may not capture all possible cleanup techniques.

a. Unmount file systems (if any).

Remove logical volumes (if any).

```
nid00350# lvdisplay
--- Logical volume ---

                        253:0
nid00350# lvremove /dev/dwcache
```

c. Remove volume groups (if any).

```
nid00350# vgs

VG  #PV #LV #SN Attr  VSize VFree
dwcache  2  0  0 wz--n- 2.92t 2.92t
nid00350# vgremove dwcache
Volume group "dwcache" successfully removed
```

d. Remove physical volumes (if any).

```
nid00350# pvs

PV VG Fmt Attr PSize PFree

/dev/fioa lvm2 a-- 1.46t 1.46t

/dev/fiob lvm2 a-- 1.46t 1.46t

nid00350# pvremove /dev/fioa /dev/fiob

Labels on physical volume "/dev/fioa" successfully wiped

Labels on physical volume "/dev/fiob" successfully wiped
```

e. Remove partitions for each device removed in the previous step (if any).

Physical volume "/dev/nvme1n1" successfully created

WARNING: This operation destroys any existing data on an SSD. Back up any existing data before proceeding.

```
nid00350# dd if=/dev/zero of=phys_vol bs=512 count=1
nid00350# dd if=/dev/zero of=/dev/fioa bs=512 count=1
nid00350# dd if=/dev/zero of=/dev/fiob bs=512 count=1
```

6. Initialize each physical device for later use by LVM. Note that Cray currently sells systems with 1, 2, 4, or 6 physical devices on a node.

WARNING: This operation destroys any existing data on an SSD. Back up any existing data before proceeding.

```
nid00350# pvcreate phys_vol [phys_vol...]

NVMe SSDs:

nid00350# pvcreate /dev/nvme0n1 /dev/nvme1n1 /dev/nvme2n1 /dev/nvme3n1 /dev/nvme4n1 /dev/nvme5n1

Physical volume "/dev/nvme0n1" successfully created
```

```
Physical volume "/dev/nvme2n1" successfully created
Physical volume "/dev/nvme3n1" successfully created
```

FIQ SSDs:

```
nid00350# pvcreate /dev/fioa /dev/fiob
Physical volume "/dev/fioa" successfully created
Physical volume "/dev/fiob" successfully created
```

7. Create an LVM volume group called dwcache that uses these physical devices.

Requirements for the LVM physical volumes specified are:

- Any number of physical devices may be specified.
- Each physical volume specified must be the exact same size.
 - To verify physical volume size, execute the command: pvs --units b and examine the PSize column of the output.

TIP: If sizes differ between physical volumes, it is likely that either an over-provisioning step was forgotten or there is mixed hardware on the node. Address this issue before proceeding.

```
nid00350# vgcreate dwcache phys_vol [phys_vol...]
```

NVMe SSDs:

```
nid00350# vgcreate dwcache /dev/nvme0n1 /dev/nvme1n1 /dev/nvme2n1 /dev/nvme3n1 Volume group "dwcache" successfully created
```

FIO SSDs:

```
nid00350# vgcreate dwcache /dev/fioa /dev/fiob
Volume group "dwcache" successfully created
```

8. Start the dwmd service.

```
nid00350# systemctl start dwmd
```

9. Verify that DWS recognizes the node with storage.

NVMe SSDs:

```
nid00350# module load dws
nid00350# dwstat nodes
node pool online drain gran capacity insts activs
nid00350 - online fill 8MiB 3.64TiB 0 0
```

FIO SSDs:

```
nid00350# module load dws
nid00350# dwstat nodes
node pool online drain gran capacity insts activs
nid00350 - online fill 4MiB 2.92TiB 0 0
```

7.4 Create a Storage Pool

A storage pool groups nodes with storage together such that requests for space made against the pool are fulfilled from the nodes associated with the pool with a common allocation granularity. Pools have either byte or node allocation granularity ($pool_AG$). This release of DataWarp only supports byte allocation granularity. There are tradeoffs in picking allocation granularities too small or too large.

Choosing a pool allocation granularity equal to the capacity of each node prevents sharing of nodes across usages of DataWarp. However, application performance is more deterministic as bandwidth is dedicated and unrelated usages of DataWarp are less likely to perturb each other. Further, requests for a small amount of capacity will be placed on only one server node.

Picking a small pool allocation granularity allows for higher utilization of DataWarp resources and potentially greatly increased performance, but at the cost of less deterministic and potentially worse performance. With a small pool allocation granularity, each usage of DataWarp capacity is more likely to be spread out over more or all DataWarp servers. If only one application is actively performing I/O to DataWarp, then it gets all of the bandwidth provided by all of the servers. Multiple applications performing I/O concurrently to the same DataWarp servers will share the available bandwidth. Finally, even requests for a small amount of capacity are more likely to be placed on multiple server nodes.

Considerations When Determining Pool Allocation Granularity

Determining an optimal pool allocation granularity for a system is a function of several factors, including the number of SSD nodes, the number of SSD cards per node, the size of the SSDs, as well as software requirements, limitations, and bugs. Therefore, the best value is site specific and may change over time.

All pools must meet the following requirements:

- The byte-oriented allocation granularity for a pool must be at least 16MiB.
- Each node's volume group (dwcache, configured during SSD initialization) has a Physical Extent size (PE_size) and Physical Volume count (PV_count). The default PE_size is 4MiB, and PV_count is equal to the number of Physical Volumes specified during volume group creation. The DataWarp service (DWS) places the following restriction on nodes associated with a pool:
 - A node can only be associated with a storage pool if the node's granularity (PE_size * PV_count) is a
 factor of the pool's allocation granularity (pool_AG). The dwstat nodes command lists the node's
 granularity in the gran column.

Ideally, a pool's allocation granularity is defined as a factor of the aggregate space of each node within the pool; otherwise, some space is not usable and, therefore, is wasted. For example, if a node contributes 6.4TiB of capacity, but the pool allocation granularity is 1TiB, then 0.4TiB of capacity is wasted per node.

With this release of DataWarp, valid pool granularities are those that meet the above requirements. For most installations, this means that the pool allocation granularity must be a multiple of 16MiB. Choosing such a pool allocation granularity will result in a functioning, but perhaps non-optimal, DataWarp environment.

How DataWarp Interacts with Pool Allocation Granularity

The default behavior of DataWarp leads to space allocation imbalances that can lead to poor performance. A request for space through DataWarp is called an instance. When DataWarp processes an instance create request, the request is fulfilled by carving out some capacity from one or more nodes. Each piece of the instance is called a fragment. If even one fragment of an instance is sized differently from other fragments in the instance, the result can be greatly reduced performance. By default, DataWarp creates fragments such that only as much space as was requested, rounded up to the nearest multiple of the pool allocation granularity, is taken to satisfy

the request. This frequently leads to at least one instance fragment being sized differently from all other fragments.

Optionally, the <code>equalize_fragments</code> configuration setting in <code>dwsd.yaml</code> directs the scheduler to avoid this situation by attempting to only create instances of equal-sized fragments. With <code>equalize_fragments</code> the scheduler is given the freedom to grab more space than requested when processing instance create requests. The option is off by default, because not every Workload Manager functions correctly with it on.

Additionally, the equalize_fragments_guarantee setting prevents the scheduler from ever creating an instance that is not comprised of fragments of equal size. By default, it is set to yes, but is only applicable when equalize_fragments is also set to yes. Because equalize_fragments_guarantee has implications for how free space is calculated, the amount of free capacity reported in pool information may be adjusted downward so as to reflect the maximum size a request may be while respecting the modified equalize_fragments behavior. See *Modify DWS Advanced Settings* on page 94 for more information.

When equalize_fragments is not enabled, certain usages of DataWarp have limitations where having too small of a pool allocation granularity can lead to situations where not all capacity requested is accessible by that usage. For scratch usages of DataWarp, any instance consisting of more than 4096 allocation granularities is not guaranteed to have all of its space usable by the scratch usage. The scratch usage is still functional, but not as much data may be able to be written to it as expected. Requesting more space than is strictly necessary helps to alleviate the problem. If having the guarantee is important, the <code>dwpoolhelp</code> command can suggest pool allocation granularity values for a particular system that provide the guarantee.

The dwpoolhelp command

Note that future releases of DataWarp will enable equalize_fragments by default; therefore, dwpoolhelp is deprecated.

TIP: The dwpoolhelp command is only needed for DataWarp configurations of type scratch when the administrator wants to guarantee that all of the requested space is usable for scratch usages. If equalize fragments is enabled, there is no need to use dwpoolhelp.

dwpoolhelp calculates and displays pool allocation granularity values for a range of node granularity units along with waste per node and waste per pool values in bytes.

```
== Optimal pool granularities per granules per node ==
Gran / node
             Pool granularity Waste per node
                                                      Waste per pool
                  1599992758272
                                        4194304
                                                             8388608
         2
                                       20971520
                   799987990528
                                                            41943040
         3
                   533330919424
                                        4194304
                                                             8388608
                   399985606656
                                       54525952
                                                           109051904
         5
                   319991840768
                                       37748736
                                                            75497472
```

As mentioned earlier, the best pool allocation granularity value is site specific; therefore, when using dwpoolhelp, there are no set guidelines for choosing the best value. In general, the goal is to pick a pool allocation granularity value that minimizes the Waste per pool value, although this might not be the case if smaller pool granularity is important. Example 2: Create a storage pool using dwpoolhelp to first determine allocation granularity on page 76 shows the dwpoolhelp output sorted by amount of waste per node. See the dwpoolhelp(8) man page for further details.

Recommendations

Taken together, Cray recommends the following:

- For performance reasons, create pools that only contain nodes with homogeneous SSD hardware.
- If possible, turn on the equalize_fragments option in dwsd.yaml. See *Modify DWS Advanced Settings* on page 94.
- Keep the equalize fragments guarantee option set to its default value, yes.
- Use the smallest possible pool allocation granularity, which is typically 16MiB.
- If having the guarantee of being able to access all requested space for scratch usages of DataWarp is important and equalize_fragments is set to no, use the dwpoolhelp command to pick an alternative pool allocation granularity. Note that dwpoolhelp assumes a homogeneous system and is not likely to calculate pool allocation granularity values that will provide optimal performance for systems with more than one type of SSD installed.
 - Do not use dwpoolhelp for pools with only one node. Single node pools should always use a pool
 granularity value of 16MiB or the node granularity (gran column in dwstat nodes -b), whichever is
 greater.

Example 1: Create a storage pool with allocation granularity = 16MiB.

As a DataWarp administrator logged on to a CLE service node:

```
crayadm@login> module load dws
crayadm@login> dwcli create pool --name wlm_pool --granularity 16MiB
create request for pools entity with name = wlm-pool accepted, "dwstat pools" for
status
```

Verify the pool was created.

```
crayadm@login> dwstat pools
   pool unit quantity free gran
wlm_pool bytes 0 0 16MiB
```

Example 2: Create a storage pool using dwpoolhelp to first determine allocation granularity

IMPORTANT: Note that this is for example purposes only; optimal pool allocation granularity is site specific.

As a DataWarp administrator logged on to a CLE service node:

1. Determine node capacity and allocation granularity.

```
crayadm@login> dwstat -b nodes
   node pool online drain
                               gran
                                         capacity insts activs
nid00028
              - online fill 8388608 4000795590656
                                                     Ω
                                                           0
                                                           0
nid00029
              - online fill 8388608 4000795590656
                                                     0
                                                     0
                                                           0
              - online fill 8388608 4000795590656
nid00089
nid00090 - online fill 8388608 4000795590656
```

2. Use the above information with the dwpoolhelp command.

```
crayadm@login> dwpoolhelp -n 4 -g 8388608 -c 4000795590656
== Starting Values ==
Number of nodes: 4
Node capacity: 4000795590656
Allocation granularity on nodes: 8388608
```

```
Using 16777216 bytes for actual allocation granularity on nodes to satisfy XFS
requirements
== Calculating maximum granules per node ==
Max number of granules in an instance while still being able to access all capacity is
floor(max_stripes / nodes) -> floor(4096 / 4) = 1024
Reducing granules per node to 1023 to account for interaction with node granularity
Maximum granules per node: 409
== Optimal pool granularities per granules per node ==
Gran / node Pool granularity Waste per node
                                                      Waste per pool
         1
                  4000795590656
                                              0
                                                                    0
          2
                  2000397795328
                                               0
                                                                    0
                  1333587345408
                                        33554432
                                                           134217728
                  1000190509056
                                        33554432
                                                           134217728
          5
                   800155762688
                                        16777216
                                                             67108864
```

3. Sort on 'Waste per pool,' as there is too much output to weed through.

```
crayadm@login> dwpoolhelp -n 4 -g 8388608 -c 4000795590656 | egrep '^ |Gran' | sort -bg
--key=3
Gran / node
                Pool granularity Waste per node
                                                       Waste per pool
         1
                  4000795590656
                                                                     0
          2
                   2000397795328
                                                                     0
        185
                    21625831424
                                        16777216
                                                             67108864
         37
                    108129157120
                                        16777216
                                                             67108864
          5
                   800155762688
                                        16777216
                                                             67108864
        108
                     37044092928
                                        33554432
                                                            134217728
```

4. Create a pool with 185 granularities per node.

```
crayadm@login> dwcli create pool --name wlm_pool2 --granularity 21625831424
create request for pools entity with name = wlm-pool2 accepted, "dwstat pools"
for status
```

5. Verify the pool was created.

7.5 Assign Nodes to a Storage Pool

Prerequisites

- At least one storage pool exists
- At least one SSD is initialized for use with the DataWarp service (DWS)
- DataWarp administrator privileges

About this task

Follow this procedure to associate SSD-endowed nodes with an existing storage pool.

Procedure

- 1. Log in to a booted CLE service node as a DWS administrator.
- 2. Load the DataWarp Service module.

```
crayadm@login> module load dws
```

3. Associate SSD-endowed nodes with a storage pool.

```
crayadm@login> dwcli update node --name hostname --pool pool name
```

Note that the update action has an extended parsing capability that allows multiple inputs for --name. The syntax allows for whitespace-delimited inputs, comma-separated inputs, pdsh-style range inputs, or any combination of these. See the dwcli(8) man page for complete details.

For example, to associate nodes nid00001, nid00002, nid00421, nid00422, nid00423, nid00424, and nid00425 with a storage pool called wlm pool:

```
crayadm@login> dwcli update node --name nid00001,nid0002 nid00[421-425] --pool wlm_pool update request for nodes entity with name = nid00001 accepted, "dwstat nodes" for status update request for nodes entity with name = nid00002 accepted, "dwstat nodes" for status update request for nodes entity with name = nid00421 accepted, "dwstat nodes" for status ...

update request for nodes entity with name = nid00425 accepted, "dwstat nodes" for status
```

The association may fail. If it does, ensure that the pool exists (dwstat pools) and that the nodes' granularity (dwstat nodes -b) is a factor of the pool's granularity (dwstat pools -b).

4. Verify the nodes are associated with the pool.

```
crayadm@login> dwstat pools nodes
   pool units quantity
                          free
                                  gran
wlm pool bytes 25.48TiB 25.48TiB 910GiB
            pool online drain gran capacity insts activs
nid00001 wlm pool online fill 8MiB 3.64TiB
                                                       0
nid00002 wlm pool online fill 8MiB 3.64TiB
                                                0
                                                       0
nid00421 wlm pool online fill 8MiB 3.64TiB
                                                       0
nid00422 wlm_pool online fill 8MiB 3.64TiB
                                                       0
nid00423 wlm pool online fill 8MiB 3.64TiB
                                                0
                                                       0
nid00424 wlm pool online fill 8MiB 3.64TiB
                                                0
                                                       0
nid00425 wlm pool online fill 8MiB 3.64TiB
```

7.6 Verify the DataWarp Configuration

Prerequisites

- At least one SSD node is assigned to a storage pool
- DataWarp administrator privileges

About this task

There are a few ways to verify that the DataWarp configuration is as desired.

Procedure

1. Log in to a booted service node as crayadm, then load the DataWarp Service (DWS) module.

```
crayadm@login> module load dws
```

2. Request status information about DataWarp resources.

```
crayadm@login> dwstat pools nodes
      pool units quantity
                                           free
                                                         gran
                           4.0TiB 3.38TiB 128GiB
wlm pool bytes
                   pool online drain gran capacity insts activs
nid00065 wlm_pool online fill 16MiB 1TiB
nid00066 wlm_pool online fill 16MiB 1TiB
nid00069 wlm_pool online fill 16MiB 1TiB
nid00070 wlm_pool online fill 16MiB 1TiB
nid00004 - online fill 16MiB 3.64TiB
                                                                                  0
                                                                                             0
                                                                                             0
                                                                                  0
                                                                                  0
                                                                                             0
                                                                                  0
                                                                                             0
                          - online fill 16MiB 3.64TiB
nid00005
                                                                                  0
                                                                                             0
```

- **3.** Check the following combinations for each row.
 - If pool is and capacity ≠ 0: This is a server node that has not yet been associated with a storage pool.
 See Assign Nodes to a Storage Pool on page 77.
 - If **pool** is and **capacity** is 0: This is a non-server node (e.g., client/compute) and does not need to be associated with a storage pool.
 - If **pool** is *something* and **capacity** ≠ 0: This is a server node that belongs to the pool called <something>.
 - If **pool** is *something* and **capacity** is 0: This is a non-server node that belongs to a pool. Since the non-server node contributes no space to the pool, this association is not necessary but harmless.

This completes the process to configure DataWarp with DWS. Refer to the site-specific workload manager (WLM) documentation for further configuration steps to integrate the WLM with Cray DataWarp.

8 DataWarp Administrator Tasks

8.1 Check the Status of DataWarp Resources

Prerequisites

The dws module must be loaded:

```
> module load dws
```

The dwstat command

To check the status of various DataWarp resources, invoke the dwstat command, which has the following format:

```
dwstat [-h] [unit_options] [RESOURCE [RESOURCE]...]
```

Where:

unit options

Includes a number of options that determine the SI or IEC units with which output is displayed. See the dwstat(1) man page for details.

RESOURCE

May be: activations, all, configurations, fragments, instances, most, namespaces, nodes, pools, registrations, Or sessions.

By default, dwstat displays the status of pools:

```
> dwstat
   pool units quantity free gran
wlm_pool bytes 0 0 1GiB
scratch bytes 7.12TiB 2.88TiB 128GiB
mypool bytes 0 0 1 6MiB
```

In contrast, dwstat all reports on all resources for which it finds data:

```
inst state sess bytes nodes
                                         created expiration intact label public confs
    4 CA--- 4 128GiB 1 2017-05-19T21:16:12 never intact I4-0 private 7 CA--- 7 128GiB 1 2017-05-19T23:53:17 never intact I7-0 private
                                                                                     1
  1
  139 CA--- 139 128GiB

                                                       0
nid00350 wlm pool online fill 16MiB 7.28TiB
did not find any cache configurations, swap configurations, activations
```

For further information, see the dwstat(1) man page.

8.2 Check SSD Health and Remaining Life

The xtcheckssd command queries the health of one or more SSDs (both FusionIO and NVMe), including remaining life expectancy. The command is located in /opt/cray/ssd/bin, and must be run as root on an SSD service node or from a login node. xtcheckssd runs as a daemon or as a one-time command. It reports output to:

- the console (when not run as a daemon)
- the SMW, via the /dev/console log
- the CLE system log (syslog) via the RCA event ec_rca_diag

Examples

1. Report on all SSDs for a node:

```
nid00065# /opt/cray/ssd/bin/xtcheckssd
PhysLoc:IBB:Slot2, Name:INTEL SSDPECME040T4Y, SN:CVF86242003T4P0DGN-1, Size:
2000GB, Remaining life:100%, Temperature:31(c)
```

```
PhysLoc:IBB:Slot2, Name:INTEL SSDPECME040T4Y, SN:CVF86242003T4P0DGN-2, Size: 2000GB, Remaining life:100%, Temperature:31(c)
PhysLoc:IBB:Slot3, Name:INTEL SSDPECME040T4Y, SN:CVF86242005T4P0DGN-1, Size: 2000GB, Remaining life:100%, Temperature:29(c)
PhysLoc:IBB:Slot3, Name:INTEL SSDPECME040T4Y, SN:CVF86242005T4P0DGN-2, Size: 2000GB, Remaining life:100%, Temperature:29(c) xtcheckssd-terminate. exit code: 0 Normal program termination
```

2. Run xtcheckssd as a deamon generating a report every 24 hours.

```
nid00433# /opt/cray/ssd/bin/xtcheckssd -d
```

3. Run xtcheckssd for multiple nodes, originating from a login node.

```
login# module load pdsh
login# pdsh -w nid00073,nid00421 /opt/cray/ssd/bin/xtcheckssd
nid00073: PhysLoc:IBB:Slot2, Name:INTEL
SSDPECME040T4, SN:CVF85156006N4P0DGN-1, Size:2000GB, Remaining life:
100%, Temperature: 25(c)
nid00073: PhysLoc:IBB:Slot2,Name:INTEL
SSDPECME040T4, SN: CVF85156006N4P0DGN-2, Size: 2000GB, Remaining life:
100%, Temperature: 26(c)
nid00073: PhysLoc:IBB:Slot3, Name:INTEL
SSDPECME040T4, SN: CVF85153001J4P0DGN-1, Size: 2000GB, Remaining life:
100%, Temperature: 24(c)
nid00073: PhysLoc:IBB:Slot3, Name:INTEL
SSDPECME040T4, SN:CVF85153001J4P0DGN-2, Size:2000GB, Remaining life:
100%, Temperature: 25(c)
nid00421: PhysLoc:IODC0:J9500, Name:ioMemory PX600-2600, SN:1410G0497, Size:
2600GB, Remaining life:96%, Temperature:29(c)
nid00421: PhysLoc:IODC0:J9500, Name:ioMemory PX600-2600, SN:1410G0369, Size:
2600GB, Remaining life:100%, Temperature:31(c)
nid00421: xtcheckssd-terminate. exit code: 0 Normal program termination
```

See the pdsh(1) and xtcheckssd(8) man pages for further details.

8.3 Remove Nodes From a Storage Pool

Prerequisites

DataWarp administrator privileges

About this task

Nodes that no longer exists or are no longer DataWarp server nodes should be removed from the pool to which they are assigned.

Procedure

1. Log in to a CLE service node as a DataWarp administrator and load the dws module.

```
crayadm@login> module load dws
```

2. Verify node names.

```
crayadm@login> dwstat pools nodes
   pool units quantity free
                               gran
wlm pool bytes 6.0TiB 6.0TiB 128GiB
           pool online drain gran capacity insts activs
nid00065 wlm pool online fill 16MiB 1TiB 0
nid00066 wlm pool online fill 16MiB
nid00067 wlm pool online fill 16MiB
                                   1TiB
nid00068 wlm pool online fill 16MiB
                                   1TiB
nid00069 wlm pool online fill 16MiB
nid00070 wlm_pool online fill 16MiB 1TiB
nid00004
           - online fill 16MiB 3.64TiB
                                            0
                                                   0
nid00005
             - online fill 16MiB 3.64TiB
```

3. Remove the desired nodes from its pool.

```
crayadm@login> dwcli update node --name hostname --rm-pool
```

Note that the update action has an extended parsing capability that allows multiple inputs for --name. The syntax allows for whitespace-delimited inputs, comma-separated inputs, pdsh-style range inputs, or any combination of these. See the dwcli(8) man page for complete details.

For example, remove nodes nid00068, nid00069, and nid00070.

```
crayadm@login> dwcli update node --name nid000[68-70] --rm-pool
update request for nodes entity with name = nid00068 accepted, "dwstat nodes"
for status
update request for nodes entity with name = nid00069 accepted, "dwstat nodes"
for status
update request for nodes entity with name = nid00070 accepted, "dwstat nodes"
for status
```

The nodes are no longer assigned to the pool: wlm pool, decreasing the pool's storage capacity.

4. Verify the change.

```
crayadm@login> dwstat pools nodes
   pool units quantity free
              3.0TiB 3.0TiB 128GiB
wlm pool bytes
            pool online drain gran capacity insts activs
nid00065 wlm pool online fill 16MiB
                                      1TiB
                                            0
                                                      0
nid00066 wlm pool online fill 16MiB
                                       1TiB
                                               0
                                                      0
nid00067 wlm pool online fill 16MiB
                                      1TiB
                                               0
                                                      0
        - online fill 16MiB 3.64TiB
nid00004
                                               0
                                                      0
              - online fill 16MiB 3.64TiB
nid00005
                                               0
```

8.4 Change a Node's Pool

Prerequisites

DataWarp administrator privileges

About this task

Changing a node's pool involves reassigning it to a different pool; there is no need to remove it from its original pool.

Procedure

1. Log in to a CLE service node as a DataWarp administrator and load the dws module.

```
crayadm@login> module load dws
```

2. Verify pool and node names.

```
crayadm@login> dwstat pools nodes
    pool units quantity
                            free
pvt_pool bytes 3.64TiB 3.64TiB
                                    16GiB
                4.0TiB 4.0TiB 128GiB
wlm pool bytes
             pool online drain gran capacity insts activs
nid00004 pvt pool online fill 16MiB 3.64TiB
                                                      0
                                                             0
nid00065 wlm pool online fill 16MiB
                                            1TiB
                                                      0
                                                              0
nid00066 wlm_pool online fill 16MiB nid00069 wlm_pool online fill 16MiB
                                            1TiB
                                                      0
                                                             0
                                            1TiB
                                                      0
                                                             0
nid00070 wlm pool online fill 16MiB
                                            1TiB
                                                      0
                                                             0
                 - online fill 16MiB 3.64TiB
nid00005
                                                      0
```

3. Reassign the desired node(s) to the desired pool.

```
crayadm@login> dwcli update node --name hostname --pool pool name
```

Note that the update action has an extended parsing capability that allows multiple inputs for --name. The syntax allows for whitespace-delimited inputs, comma-separated inputs, pdsh-style range inputs, or any combination of these. See the dwcli(8) man page for complete details.

To reassign node nid00069 and nid00070 to pool pvt pool:

```
crayadm@login> dwcli update node --name nid000[69-70] --pool pvt_pool
update request for nodes entity with name = nid00069 accepted, "dwstat nodes"
for status
update request for nodes entity with name = nid00070 accepted, "dwstat nodes"
for status
```

Node nid00069 and nid00070 are assigned to the pool: pvt_pool , resulting in increased storage capacity for pvt_pool and decreased capacity for wlm_pool .

4. Verify the change.

```
crayadm@login> dwstat pools nodes
   pool units quantity
                          free
                                  gran
pvt pool bytes 5.64TiB 5.64TiB
wlm pool bytes
                2.0TiB 2.0TiB 128GiB
            pool online drain gran capacity insts activs
nid00004 pvt pool online fill 16MiB 3.64TiB
                                                         0
nid00069 pvt pool online fill 16MiB
                                                         0
                                        1TiB
                                                  0
nid00070 pvt pool online fill 16MiB
                                                  0
                                                         0
                                        1TiB
nid00065 wlm pool online fill 16MiB
                                                  0
                                                         0
                                        1TiB
```

```
nid00066 wlm_pool online fill 16MiB 1TiB 0 0 nid00005 - online fill 16MiB 3.64TiB 0 0
```

8.5 Replace a Blown Fuse

After a workload manager sends DataWarp requests to the DataWarp service (DWS), the DWS begins preparing the SSDs and compute nodes for the corresponding batch job. When things are working well, this process is quick and does not require admin intervention. The dwstat command reports CA--- or CA-- in the state column for all objects associated with the batch job.

If the DWS encounters difficulty creating or destroying an object, it retries a configurable number of times but eventually stops trying. To convey that the retry threshold has been exceeded, the DWS borrows terminology from another domain and reports that the object's *fuse* is blown. The dwstat command reports this as an F in the 3rd hyphen position of the state column. For example, C-F-- as in the following dwstat activations output:

```
crayadm@sdb> module load dws
crayadm@sdb> dwstat activations
activ state sess conf nodes
    2 C-F-- 5 11 1
```

When dwstat reports that an object's fuse is blown, it likely indicates a serious error that needs investigating. Clues as to what broke and why may be found in the Lightweight Log Manager (LLM) log file for dwmd, found at smw:/var/opt/cray/log/p#-current/dws/dwmd-date. In this log file, each session/instance/configuration/registration/activation is abbreviated as sid/iid/cid/rid/aid; therefore, information for the resource with the blown fuse is searchable by ID. For example, if a fuse is blown on configuration 16, grep the log for cid:16:

```
crayadm@smw> cd /var/opt/cray/log/p3-current/dws
crayadm@smw> grep -A 4 cid:16 dwmd-20160520
2017-05-20 12:39:41 (11964): <76> [os-172-30-196-191]: (cid:16,sid:32,stoken:987333) dws_realm_member
ERROR:Invalid host found nid12345 in [u'nid12345']
2017-05-20 12:39:41 (11964): <76> [os-172-30-196-191]: (cid:16,sid:32,stoken:987333) dws_realm_member
ERROR:realm_member_create2 2 failed: gen_host_list_file failed for dwfs2_id=2 realm_id=2
2017-05-20 12:39:41 (11964): <76> [os-172-30-196-191]: Traceback (most recent call last):
2017-05-20 12:39:41 (11964): <76> [os-172-30-196-191]: File "/opt/cray/dws/1.3-1.0000.67025.34.35.tcp/
lib/dws_realm_member.py", line 223, in realm_member_create2
2017-05-20 12:39:41 (11964): <76> [os-172-30-196-191]: % (dwfs_id, realm_id))

dwfs2_id=2 realm_id=2
...
```

When the issue is understood and resolved, use the dwcli command to replace the blown fuse associated with the object, and thereby inform DWS to retry the operations associated with the failed object. For example, continuing with the above failed activation:

```
crayadm@sdb> dwcli update activation --id 2 --replace-fuse
```

Use dwstat to find the status of the object again. Fuses are replaceable as many times as necessary.

For further information, see the dwstat(1) and dwcli(8) man pages.

8.6 Drain Storage Nodes

About this task

After an administrator assigns a node to a pool, any capacity on the node may be used when satisfying instance requests. There are times when a site does not want to allow new instances to be placed on a node and also does not want to disassociate the node from a pool. The drain attribute on a node controls this behavior. If a node is in a drain state, the DataWarp service (DWS) will not place new instances on the node and will also remove that node's free capacity contribution to a pool. The dwstat nodes pools command displays this information.

Procedure

1. Check the node and pool information.

```
crayadm@login> module load dws
crayadm@login> dwstat nodes pools
             pool online drain gran capacity insts activs
    node
nid00022 wlm_pool online fill 8MiB 3.64TiB nid00023 wlm_pool online fill 8MiB 3.64TiB
                                                        0
                                                                 0
                                                                 \Omega
nid00024 wlm_pool online fill 8MiB 3.64TiB
                                                        0
                                                                 \Omega
nid00025 wlm pool online fill 8MiB 3.64TiB
                                                                 Ω
    pool units quantity
                                 free
                                         gran
wlm_pool bytes 14.56TiB 14.56TiB 128GiB
```

2. Drain one or more storage nodes.

```
crayadm@login> dwcli update node --name hostname --drain
```

Note that the update action has an extended parsing capability that allows multiple inputs for --name. The syntax allows for whitespace-delimited inputs, comma-separated inputs, pdsh-style range inputs, or any combination of these. See the dwcli(8) man page for complete details.

For example, to drain nodes nid00024 and nid00025:

```
crayadm@login> dwcli update node --name nid00024, nid00025 --drain
update request for nodes entity with name = nid00024 accepted, "dwstat nodes"
for status
update request for nodes entity with name = nid00025 accepted, "dwstat nodes"
for status
crayadm@login> dwstat nodes pools
            pool online drain gran capacity insts activs
    node
nid00022 wlm pool online fill 8MiB 3.64TiB
                                                        0
nid00023 wlm pool online fill 8MiB 3.64TiB
                                                 0
                                                        0
nid00024 wlm pool online drain 8MiB 3.64TiB
                                                 0
                                                        0
nid00025 wlm pool online drain 8MiB 3.64TiB
```

```
pool units quantity free gran wlm_pool bytes 7.28TiB 7.28TiB 128GiB
```

3. (Optional) If shutting down a node after draining it, wait for existing instances to be removed from the node. The dwstat nodes command displays the number of instances present in the inst column; 0 indicates no instances are present. In a healthy system, instances are removed over time as batch jobs complete. If it takes longer than expected, or to clean up the node more quickly, identify the fragments (pieces of instances) on the node by consulting the node column output of the dwstat fragments command and then finding the corresponding instance by looking at the inst column output:

```
crayadm@login> dwstat fragments
frag state inst capacity node
102 CA-- 47 745.19GiB nid00024
```

4. (Optional) Remove that instance.

```
crayadm@login> dwcli rm instance --id 47
rm request for instance entity with id = 47 accepted, "dwstat instances" for status
```

Persistent DataWarp instances, which have a lifetime that may span multiple batch jobs, must also be removed, either through a WLM-specific command or with dwcli.

5. When the node is fit for being used by the DWS again, unset the drain, thereby allowing the DWS to place new instances on the node.

For example, unset the drain for nid00024 only.

```
crayadm@login> dwcli update node --name nid00024 --fill
update request for nodes entity with name = nid00024 accepted, "dwstat nodes"
for status
crayadm@login> dwstat nodes pools
     node pool online drain gran capacity insts activs
nid00022 wlm pool online fill 8MiB
                                    3.64TiB
                                                        0
nid00023 wlm pool online fill 8MiB
                                     3.64TiB
                                                 0
                                                        0
nid00024 wlm pool online fill 8MiB
                                     3.64TiB
                                                 0
                                                        0
nid00025 wlm pool online drain 8MiB
                                    3.64TiB
                                                        0
    pool units quantity
                            free
wlm pool bytes 10.92TiB 10.92TiB 128GiB
```

8.7 Do Not Quiesce a DataWarp Node

WARNING: DVS, which provides software infrastructure for DataWarp storage, includes a quiesce capability that enables administrators to temporarily suspend traffic to a DVS-projected file system, allowing them to safely repair a file system or take a DVS server node out of service. This capability must never be used on DataWarp service nodes because of the risk for data corruption.

Use the *Drain Storage Nodes* on page 86 procedure to prevent new instance activity on a node.

8.8 Examples Using dwcli

The dwcli command provides a command line interface to act upon DataWarp resources. This is primarily an administration command, although a user can initiate some actions using it. With full WLM support, a user does not have a need for this command. For complete details, see the dwcli (8) man page.

The dws module must be loaded to execute DataWarp commands.

```
> module load dws
```

EXAMPLE: Create a pool

Only an administrator can execute this command.

```
# dwcli create pool --name wlm-pool --granularity 16MiB
create request for pools entity with name = wlm-pool accepted, "dwstat pools" for
status
```

EXAMPLE: Assign nodes to the pool

Only an administrator can execute this command.

```
login# dwcli update node --name nid000[30-32] --pool wlm-pool
update request for nodes entity with name = nid00030 accepted, "dwstat nodes" for
status
update request for nodes entity with name = nid00031 accepted, "dwstat nodes" for
status
update request for nodes entity with name = nid00032 accepted, "dwstat nodes" for
status
```

EXAMPLE: Create a scratch session, instance, configuration, and activation

Only an administrator can create a session or instance.

```
login# dwcli create session --expiration 1462815522 --creator crayadm --token \
ok-scratch --owner 12345 --hosts $(dwcli ls nodes)

125
login# dwcli create instance --expiration 1462815522 --public --session 125 \
--pool wlm_pool --capacity 1099511627776 --label my-scratch

324
login# dwcli create configuration --type scratch --access-mode stripe \
--root-permissions 0755 --instance 324 --group 513

112
login# dwcli create activation --mount /mnt/dw/my_mount --caching \
--configuration 112 --session 125
```

EXAMPLE: Create a swap session, instance, configuration, and activation

Only an administrator can create a session or instance.

```
login# dwcli create session --expiration 1462815522 --creator crayadm --token \
ok-swap --owner 12345 --hosts nid00030
126
```

```
login# dwcli create instance --expiration 1462815522 --public --session 126 \
--pool wlm_pool --capacity 1099511627776 --label my-swap
325
login# dwcli create configuration --type swap --swap-size 4GiB --instance 325 \
--group 513
113
login# dwcli create activation --configuration 113 --session 126
232
```

EXAMPLE: Create a cache session, instance, configuration, and activation

Only a DataWarp administrator can create a session or instance.

```
login# dwcli create session --expiration 1462815522 --creator crayadm --token \
ok-cache --owner 12345 --hosts nid00030

127
login# dwcli create instance --expiration 1462815522 --public --session 127 \
--pool wlm_pool --capacity 1099511627776 --label my-cache
326
login# dwcli create configuration --type cache --access-mode stripe \
--backing-path /lus/scratch --instance 326

114
login# dwcli create activation --mount /mnt/dw/my_mount2 --configuration 114 \
--session 127
323
```

EXAMPLE: View results from above create commands

```
login# dwstat most
$dwstat most
   pool units quantity f ree

```

EXAMPLE: Set multiple registrations to --haste

Directs DWS to not wait for associated configurations to finish asynchronous activities such as waiting for all staged out data to finish staging out to the PFS.

```
login# dwcli update registration --id 1,4-6 --haste
update request for registrations entity with id = 1 accepted, "dwstat
registrations" for status
update request for registrations entity with id = 4 accepted, "dwstat
registrations" for status
update request for registrations entity with id = 5 accepted, "dwstat
registrations" for status
update request for registrations entity with id = 6 accepted, "dwstat
registrations" for status
```

EXAMPLE: Remove a pool

Only an administrator can execute this command.

```
login# dwstat pools
  pool units quantity   free gran
canary bytes  3.98GiB 3.97GiB 16MiB
# dwcli rm pool --name canary
# dwstat pools
no pools
```

EXAMPLE: Remove multiple sessions

Only an administrator or the session owner can execute this command.

```
login# dwstat sessions
sess state token creator owner
                                                  created expiration nodes
               ok test 12345 2017-05-18T16:31:24 expired
   2 D----
                ok
                       test 12345 2017-05-18T16:31:24
                                                               expired
                                                                             1
                     test 12345 2017-05-18T16:31:24
            ok
   3 D----
                                                               expired
$ dwcli rm session --id 1-3
rm request for sessions entity with id = 1 accepted, "dwstat sessions" for status rm request for sessions entity with id = 2 accepted, "dwstat sessions" for status
rm request for sessions entity with id = 3 accepted, "dwstat sessions" for status
```

EXAMPLE: Fuse replacement

Only an administrator or the session owner can execute this command.

EXAMPLE: Stage in a directory, query immediately, then stage list

```
user@login> dwcli stage in --session $session --configuration $configuration --dir=/tld/. \
--backing-path=/tmp/demo/
path backing-path nss ->c ->q ->f <-c <-q <-f <-m
/tld/. - 1 3 1 - - - -

user@login> dwcli stage query --session $session --configuration $configuration
path backing-path nss ->c ->q ->f <-c <-q <-f <-m
/. - 1 4 - - - - - -
/tld/ - 1 4 - - - - - -

user@login> dwcli stage list --session $session --configuration $configuration
path backing-path nss ->c ->q ->f <-c <-q <-f <-m
/tld/filea /tmp/demo/filea 1 1 - - - - - -</pre>
```

```
/tld/fileb /tmp/demo/fileb 1 1 - - - - - - /
/tld/subdir/subdirfile /tmp/demo/subdir/subdirfile 1 1 - - - - - - /
/tld/subdir/subfile /tmp/demo/subdir/subfile 1 1 - - - - - - - - /
```

EXAMPLE: Stage a file in afterwards, stage list, then query

Note the difference in the stage query output.

```
user@login> dwcli stage in --session $session --configuration $configuration --file /dwfsfile \
--backing-path /tmp/demo/filea
       backing-path nss ->c ->q ->f <-c <-q <-f <-m
/dwfsfile /tmp/demo/filea 1 1 -
user@login> dwcli stage list --session $session --configuration $configuration
         path
           /tmp/demo/filea
/tmp/demo/filea
/tmp/demo/fileb
                                             1 1 - - -
1 1 - - -
1 1 - - -
/dwfsfile
/tld/filea
/tld/fileb
/tld/illeb /tmp/demo/subdir/subdirfile 1 1 - /tld/subdir/subfile /tmp/demo/subdir/subfile 1 1 -
/tld/subdir/subfile /tmp/demo/subdir/subfile
user@login> dwcli stage query --session $session --configuration $configuration
path backing-path nss ->c ->q ->f <-c <-q <-f <-m
/dwfsfile /tmp/demo/filea 1
```

EXAMPLE: Terminate stage operations

To terminate a directory stage:

```
user@login> dwcli stage terminate -c 4 -s 4 -d /testdir/.
path backing-path nss ->c ->q ->f <-c <-q <-f <-m
/testdir/. - 1 - - - - - - -

user@login> dwcli stage terminate -c 4 -s 4 -d /.
path backing-path nss ->c ->q ->f <-c <-q <-f <-m
/. - 1 - - - - - - - - - - - - -</pre>
```

And similarly to terminate a file stage:

```
user@login> dwcli stage terminate -c 5 -s 5 -f /testdir/file
request accepted
user@login> dwcli stage terminate -c 5 -s 5 -f /testdir/file
Unexpected error codes -22 found in dwmd reply: {u'-22': [4]}
```

Where the "unexpected error" message indicates the file no longer exists.

EXAMPLE: Back up and restore the DataWarp configuration

Only a DataWarp administrator can execute these dwcli commands. For this example, the following configuration is assumed:

```
login# dwstat nodes pools
node pool online drain gran capacity insts activs
datawarp12-s5 backup online fill 8MiB 3.99GiB 0 0

pool units quantity free gran
backup bytes 3.98GiB 3.98GiB 16MiB
demo bytes 0 0 16MiB
```

1. Backup the configuration.

```
login# dwcli config backup > backup.json
```

2. Remove the demo pool.

```
login# dwcli rm pool --name demo
```

3. Restore the configuration as captured by the backup.

```
login# dwcli config restore < backup.json
note: recreating pool(s) 'demo'
note: creating pool demo with granularity=16MiB and units=bytes
pool add progress [========] 1/1 100% done
pool chk progress [========] 1/1 100% done
node chk progress [========] 1/1 100% done</pre>
```

4. Verify the configuration.

```
login# dwstat nodes pools
node pool online drain gran capacity insts activs
datawarp12-s5 backup online fill 8MiB 3.99GiB 0 0

pool units quantity free gran
backup bytes 3.98GiB 3.98GiB 16MiB
demo bytes 0 0 16MiB
```

8.9 Manage Access to DataWarp Nodes

Each workload manager (WLM) has its own commands for managing DataWarp, and it is beyond the scope of this administration guide to document all cases. Therefore, WLM examples are provided with the caveat that they may be out of sync with changes made by the WLM vendors, although it is Cray's intent to keep them up-to-date. For detailed information, refer to the documentation for the site-specific WLM.

Access to DataWarp SSD nodes is managed through the various WLMs. In Slurm, for example, access to DataWarp nodes is controlled by either the AllowUsers or DenyUsers option within the burst buffer configuration file /opt/slurm/default/etc/burst_buffer.conf. These options are mutually exclusive. By default, all users have access to the DataWarp nodes.

```
boot# xtopview default/:/# vi /opt/slurm/default/etc/burst_buffer.conf
```

The format of either option is a colon-delimited list of usernames or UIDs. For example:

```
DenyUsers=username1:username2...
```

8.10 Flash the Intel P3608 Firmware

Prerequisites

- A Cray XC series system with one or more Intel P3608 SSD cards installed
- Ability to log in as root

Access to an Intel P3608 image flash file (location provided by Cray)

About this task

This procedure, typically only done at Cray's recommendation, ensures that the firmware of any Intel P3608 SSD cards is up-to-date with an image flash file. The xtiossdflash command compares the current flash version to the image flash file and flashes the device (up or down) only if the two are different.

For further information, see the xtiossdflash(8) man page.

boot# man -1 /opt/cray/ssd-flash/man/man8/xtiossdflash.8

Procedure

1. Log on to the boot node as root and load the pdsh module.

```
smw:# ssh root@boot
boot:# module load pdsh
```

2. Copy the firmware image to the target nodes.

```
boot:# scp P3608_fw_image_file target:/location
```

For example:

```
boot:# scp /P3608 FW/FW1B0 BL133 c0-1c0s9n2:/tmp
```

3. Flash the firmware.

```
boot:# /opt/cray/ssd-flash/bin/xtiossdflash -f -i /location/P3608_fw_image_file target
```

Where:

```
/location/P3608 fw image file
```

Specifies the path to the Intel P3608 flash image

target

Specifies a single node with SSDs, a comma-separated list of nodes (with SSDs), or the keyword all service

For example:

```
boot:# /opt/cray/ssd-flash/bin/xtiossdflash -f -i /tmp/FW1B0_BL133 c0-1c0s9n2
```

If the firmware updates successfully, one of the following messages is displayed.

- Firmware application requires conventional reset.
- Firmware application requires NVM subsystem reset.

If the firmware does not update successfully, one of the following messages is displayed.

- No devices available No /dev/nvmeX devices were found.
- The file /root/8DV101B0_8B1B0133_signed.bin does not exist. Skipping. The firmware image flash file could not be found.
- Could not find image file compatible with /dev/nvmeX. Skipping The device exists, but no firmware image was found that matches the device.

• /dev/nvmeX already flashed to firmware version <version>. Skipping - The device is already flashed to the firmware selected.

If applicable, rectify the problem and try again.

4. Reboot the *target* node(s) to load the new firmware.

```
boot# xtbootsys --reboot c0-1c0s9n2
```

5. Verify the flash version.

The firmware version displayed below is for example purposes only and should not be expected.

```
boot# /opt/cray/ssd-flash/bin/xtiossdflash -v c0-1c0s9n2
c0-1c0s9n2: <nvme_flash>: /dev/nvme3: Model = INTEL SSDPECME040T4Y , FW Version = 8DV101B0
c0-1c0s9n2: <nvme_flash>: /dev/nvme2: Model = INTEL SSDPECME040T4Y , FW Version = 8DV101B0
c0-1c0s9n2: <nvme_flash>: /dev/nvme1: Model = INTEL SSDPECME040T4Y , FW Version = 8DV101B0
c0-1c0s9n2: <nvme_flash>: /dev/nvme0: Model = INTEL SSDPECME040T4Y , FW Version = 8DV101B0
```

8.11 Modify DWS Advanced Settings

Prerequisites

Ability to log in to the SMW as root

About this task

This procedure describes how to modify DataWarp advanced settings using the system configurator. Cray recommends that DataWarp administrators have a thorough understanding of these settings before modifying them. DataWarp Configuration Files and Advanced Settings on page 52 provides an overview of the advanced settings and the configuration files in which they are defined. The configuration files include a description of each setting, and various topics within the XC^{TM} Series DataWarp Installation and Administration Guide provide additional information for certain advanced settings.

CAUTION:

Advanced DataWarp settings must be modified with extreme care. The default values as released are acceptable for most installations. Sites that modify advanced settings are at risk of degrading DataWarp performance, decreasing SSD lifetime, and possibly other unknown outcomes. It is the administrator's responsibility to understand the purpose of any advanced settings changed, the formatting required, and the impact these changes may have.

Options incorrectly spelled or formatted are added but ignored, and the current value is not modified.

Procedure

1. Invoke the configurator to access the advanced DataWarp settings.

The configurator displays the basic settings, as defined during the initial installation, as well as **some** of the advanced DataWarp settings. All advanced DataWarp settings are modifiable whether or not they are displayed by the configurator. Any advanced settings that have been modified through the configurator are displayed, and some settings that are currently set to their default values are also displayed.

- 2. Proceed based on the setting to be modified:
 - To modify a displayed setting, proceed to step 3 on page 95.
 - To modify a non-displayed setting, proceed to step 4 on page 95.
 - To reset a displayed setting to its default value, proceed to step 5 on page 96.
- Modify a displayed setting:

This example changes the value of instance optimization default within the dwsd settings.

a. Select dwsd.

TIP: The configurator uses index numbering to identify configuration items. This numbering may vary; the value used in the examples may not be correct for all systems. The user must search the listing displayed on the screen to determine the correct index number for the service/setting being configured.

b. Choose to change the entry for instance_optimization_default, enter the new value, and then set the entries

Use the format #* to indicate which entry to change, where # is the index number for instance optimization default.

The configurator displays all cray_dws basic and visible advanced settings (as in step 1), including the new value for instance optimization default.

- c. Continue to modify advanced settings if desired; otherwise, proceed to step 6 on page 97.
- 4. Modify a non-displayed setting:

This example enables the equalize fragments option that is defined in the dwsd settings.

a. Select dwsd conf.

```
1) log_mask: 0x7
2) instance_optimization_default: bandwidth
3) scratch_limit_action: 0x3
3) scratch_limit_action: 0x3
...
```

b. Choose to add entries.

```
cray_dws.settings.dwsd.data.dwsd_conf
[<cr>=set 3 entries, +=add an entry, ?=help, @=less] $ +
```

c. Enter the setting(s).

TIP: Use the format: <code>option: value</code> to set a value for <code>dwsd_conf</code>, <code>dwmd_conf</code>, and <code>dwsrest_conf</code> options. Use the format: <code>option=value</code> for <code>dwrestgun_conf</code> options, with text values delimited by quotation marks.

The configurator displays all cray_dws basic and visible advanced settings (as in step 1), including the new value for equalize fragments.

- d. Continue to modify advanced settings if desired; otherwise, proceed to step 6 on page 97.
- **5.** Reset a displayed setting to its default value:

This example resets equalize fragments to its default value.

a. Select dwsd conf.

b. Remove the equalize fragments setting.

Use the format #- to remove a setting, thereby resetting it to its default value.

```
Value/Status (level=advanced)
Selected
                       Settings
                        service
                           managed_nodes_groups
                                                                      ['datawarp_nodes']
                           api_gateway_nodes_groups
external_api_gateway_hostnames
dwrest_cacheroot_whitelist
dwrest_cachemount_whitelist
                2)
                                                                     ['login_nodes']
                                                                     (none)
                                                                     /lus/scratch
                5)
                                                                     (none)
                6)
                           allow_dws_cli_from_computes
                                                                     False
                7)
                           lvm_issue_discards
                8)
                           dwmd_conf
                                                                     iscsi_initiator_cred_path:
                                                                      /etc/opt/cray/dws/iscsi_target_secret,
                                                                     iscsi_target_cred_path:
/etc/opt/cray/dws/iscsi_initiator_secret,
                                                                     capmc_os_cacert:
                                                                     /etc/pki/trust/anchors/certificate authority.pem
                         dwsd
                9)
                           dwsd_conf
                                                                     log_mask: 0x7, instance_optimization_default:
                                                                     bandwidth, scratch_limit_action: 0x3
                        dwrest
                          dwrest_conf
               10)
                                                                     port: 2015
                        dwrestaun
               11)
                                                                     max_requests=2048
                           dwrestgun conf
```

- Continue to modify advanced settings if desired; otherwise, proceed to the next step.
- 6. Save and exit the configurator.

```
Cray dws Menu [default: save & exit - Q] $ Q
```

- 7. Activate the changes on all appropriate nodes. Proceed based on the configuration files modified.
 - dwsd conf: execute the following commands on the scheduler node.

```
sdb# /etc/init.d/cray-ansible start
sdb# systemctl reload dwsd
```

dwmd conf: execute the following commands on all DataWarp managed nodes.

```
nid# /etc/init.d/cray-ansible start
nid# systemctl reload dwmd
```

• dwrest conf or dwrestgun conf: execute the following commands on the API gateway node.

```
api-gw# /etc/init.d/cray-ansible start
api-gw# systemctl reload dwrest
api-gw# systemctl reload nginx
```

8.12 Configure SSD Protection Settings

Prerequisites

- Ability to log in as root
- Read Modify DWS Advanced Settings on page 94

About this task

The possibility exists for a user program to unintentionally cause excessive activity to SSDs, and thereby diminish the lifetime of the devices. To mitigate this issue, DataWarp includes both administrator-defined configuration options and user-specified job script command options that help the DataWarp service (DWS) detect when a program's behavior is anomalous and then react based on configuration settings.

This procedure describes how to modify the administrator-defined SSD protection settings using the system configurator. For user-defined settings, see the XC^{TM} Series DataWarp User Guide (S-2558).

IMPORTANT: Do not directly modify any DataWarp configuration files (dwsd.yaml, dwmd.yaml, dwrest.yaml, dwrestgun.conf) as changes do not persist over a reboot. Modify the settings within these files using the configurator only; this ensures that the changes become part of the system configurator.

Protection Settings within the dwsd Configuration File

The DataWarp scheduler daemon (dwsd) configuration file (sdb:/etc/opt/cray/dws/dwsd.yaml) contains options for the following DataWarp SSD protection features:

- Action upon error
- Write tracking
- File creation limits
- File size limits

The configurable SSD protection options are:

cache limit action

The action to take when one of the cache limits is exceeded; this action applies to all limits.

Default: 0x3

0x1: log only

0x2: error on file system operations

0x3: log and error

cache max file size default

The maximum size (bytes) of any one file that may exist in a cache configuration. In other words, the maximum byte offset for a file that may be read from or written to. When the threshold is exceeded, a message displays on the system console and an error is reported back to the file system operation that triggered the limit. A value of 0 means no limit. User requests may override this value. Default: 0

cache_max_file_size_max

The maximum value a user may request when overriding ${\tt cache_max_file_size_default}. \ \ {\tt The\ value\ of\ 0\ means\ there\ is\ no\ max}. \ \ {\tt Default:\ 0}$

instance write window length default

The default number of seconds used when calculating the simple moving average of writes to an instance. Note that the configurations using the instance must provide support for this (e.g., does not apply to swap). A value of 0 means the write window limit is not used. Default: 86400

instance_write_window_length_max

The maximum value a user may request when overriding

 $\verb|instance_write_window_length_default. A value of 0 means there is no maximum. \\ Default: 0$

instance_write_window_length_min

The minimum value a user may request when overriding

instance_write_window_length_default. A value of 0 means there is no minimum.
Default: 0

instance write window multiplier default

The default multiplier to use against an instance size to determine the maximum number of bytes written portion of the moving average calculation for purposes of detecting anomalous write behavior. The multiplier must be an integer of 0 or more. A value of 0 means the write window limit is not used. For example, if the multiplier is 10, the instance size is 2 TiB, and the write window is 86400, then 20 TiB may be written to the instance in any 24 hour sliding window. Default: 10

instance_write_window_multiplier_max

The maximum value a user may request when overriding

instance_write_window_multiplier_default. A value of 0 means there is no
maximum. Default: 0

scratch_limit_action

The action to take when one of the scratch limits is exceeded; this action applies to all limits.

Default: 0x3

0x1: log only

0x2: error on file system operations

0x3: log and error

scratch_namespace_max_files_default

The maximum number of files that may be created in a scratch configuration namespace. When the threshold is exceeded, a message displays on the system console and no new files can be created in the namespace. A value of 0 means no limit. User requests may override this value. Default: 0

scratch_namespace_max_files_max

The maximum value a user may request when overriding

 $\verb|scratch_namespace_max_files_default. A value of 0 means no limit. Default: 0|$

scratch_namespace_max_file_size_default

The maximum size (bytes) of any one file that may exist in a scratch configuration namespace. When the threshold is exceeded, a message displays on the system console and an error is reported back to the file system operation that triggered the limit. A value of 0 means no limit. User requests may override this value. Default: 0

scratch_namespace_max_file_size_max

The maximum value a user may request when overriding

scratch_namespace_max_file_size_default. The value of 0 means there is no maximum. Default: 0

The administrator selects default values, min/max user limits, and the action taken when a limit is exceeded. The options within /etc/opt/cray/dws/dwsd.yaml are considered advanced options and must be modified with extreme caution. This procedure describes how to modify these advanced settings using the system configurator.

CAUTION:

Advanced DataWarp settings must be modified with extreme care. The default values as released are acceptable for most installations. Sites that modify advanced settings are at risk of degrading DataWarp performance, decreasing SSD lifetime, and possibly other unknown outcomes. It is the administrator's responsibility to understand the purpose of any advanced settings changed, the formatting required, and the impact these changes may have.

Options incorrectly spelled or formatted are added but ignored, and the current value is not modified.

For further details, see Modify DWS Advanced Settings on page 94.

Procedure

- 1. Invoke a configurator session to modify cray dws advanced settings.
- 2. Select dwsd conf.

TIP: The configurator uses index numbering to identify configuration items. This numbering may vary; the value used in the examples may not be correct for all systems. The user must search the listing displayed on the screen to determine the correct index number for the service/setting being configured.

Only a sampling of the dwsd conf settings are displayed, although all settings are modifiable.

3. Modify one or more settings.

This example demonstrates how to modify the scratch_namespace_max_files_default and scratch_namespace_max_files_max settings.

```
Default:

1) log_mask: 0x7
2) instance_optimization_default: bandwidth
3) scratch_limit_action: 0x3
4) scratch_limit_action: 0x3
4) scratch_namespace_max_files_default: 10000
5) scratch_namespace_max_files_max: 30000

...
cray_dws.settings.dwsd.data.dwsd_conf
[<cr>=set 5 entries, +=add an entry, ?=help, @=less] $ <cr>
# Complete cray_dws displayed here with new settings included
...
Cray dws Menu [default: save & exit - Q] $ Q
INFO -
...
INFO - ConfigSet 'p0' has been updated.
INFO - Run 'cfgset search -s cray_dws --level advanced p0' to review the current settings.
```

4. Validate the config set.

```
smw# cfgset validate p0
...
INFO - ConfigSet 'p0' is valid.
```

Correct any discrepancies before proceeding.

5. Log in to the sdb node and activate the config set changes.

```
sdb# /etc/init.d/cray-ansible start
sdb# systemctl reload dwsd
```

8.13 Back Up and Restore DataWarp State Data

The DataWarp scheduler daemon, dwsd, relies on specific node and pool information for correct operation. This information is stored in a state database and should be backed up periodically to minimize any potential impact of events that may cause loss of this information (e.g., drive failure or backwards incompatible DWS upgrade). Cray recommends creating a DataWarp backup cron job or including it as part of a periodic maintenance checklist. Additionally, it is important to create a backup of the DataWarp configuration data at the following times:

- after initial installation and configuration of DataWarp
- after configuration changes
- prior to system upgrades

Note that the dws module must be loaded to use the backup and restore commands.

```
sdb# module load dws
```

Back Up

Two commands are available to back up the configuration data from the dwsd database, dwcli config backup and dwbackup. Any DataWarp administrator (e.g., root, crayadm) can run dwcli config backup when the dwrest service is running. This is slightly less restrictive and may be preferable to dwbackup, which must be run by root from the node on which dwsd runs (typically sdb).

The dwbackup command reads data from sdb:/var/opt/cray/dws/dwsd.db, whereas the dwcli config backup command reads data through the RESTful API (i.e., through dwrest). Both commands output the node and pool properties to stdout, and neither command backs up any user data.

The dwbackup command is normally used after an upgrade if the state database configuration information was not backed up using either command prior to the upgrade. This is because the upgrade may include a backwards incompatible change to the database. In this case, DataWarp fails to come up properly and dwrest fails to run, which prevents the use of dwcli config backup.

Example 1: Run dwbackup with default option settings

As root on to the sdb node:

Example 2: Use dwbackup to create a backup file

As root on the sdb node:

```
sdb# dwbackup > /persistent/storage/my dws backup.json
```

Example 3: Use dwcli config backup to create a backup file

As a DataWarp administrator on a login node:

```
crayadm@login> dwcli config backup > /persistent/storage/my dws backup.json
```

Restore

Any DataWarp administrator can run dwcli config restore to restore a DataWarp configuration as captured in a backup created by either backup command.

Example 4: Restore a saved configuration

```
crayadm@sdb> dwcli config restore < /persistent/storage/my_dws_backup.json</pre>
```

For further information, see the dwcli(8) and dwbackup(8) man pages.

8.14 Recover After a Backwards-incompatible Upgrade

Prerequisites

DataWarp administrator privileges (e.g., root, crayadm)

About this task

The DataWarp scheduler daemon, dwsd, relies on specific node and pool information, stored in state files, for correct operation. Occasionally, a DataWarp software upgrade may modify these state files such that the DataWarp service (DWS) is not backwards compatible with any state created by a previous DataWarp release. If this occurs, DataWarp does not come up correctly, and:

- The dwcli and dwstat commands fail and report a connection error to the dwsd daemon
- Messages similar to the following appear in both:

```
o sdb:/var/opt/cray/dws/log/dwsd.log
```

o smw:/var/opt/cray/log/p#-timestamp/dws/dwsd-timestamp

```
2017-05-13 15:51:07 State file is at v0.0
2017-05-13 15:51:07 ADMIN ALERT -> This version of dwsd expects state file v1.0, you have v0.0.
2017-05-13 15:51:07 ADMIN ALERT -> This version of dwsd is incompatible with the existing state file located at /var/opt/cray/dws/dwsd.db. If you roll back to an older version of the DWS as well as underlying dependencies like DVS and kdwfs, you may be able to retrieve any existing data stored in your DataWarp instances.
Otherwise, to get DWS working again, you can back up some DWS state (like pools) with the dwbackup tool and then later restore that state with the dwcli config restore tool. See the DataWarp man pages and other documentation for further details.
2017-05-13 15:51:07 src/dwsd/context.c:dwsd_context_init():356 -> Unable to initialize sqlite 2017-05-13 15:51:07 Daemon ran for 2 seconds
2017-05-13 15:51:07 Src/dwsd/dwsd.c:main():66 -> Context initialization failed.
```

This procedure describes the steps to back up some DataWarp state (if not done prior to the software upgrade), remove the incompatible dwsd.db file, and restore the backed up state to an upgraded state file.

Procedure

1. Log in to the sdb node as root, and back up the DataWarp state if it was not backed up just prior to the software upgrade.

```
sdb# module load dws
sdb# dwbackup > /persistent/storage/my_dws_backup.json
```

2. Stop the dwsd service.

```
sdb# systemctl stop dwsd
```

3. Move the existing DataWarp state file.

```
sdb# mv /var/opt/cray/dws/dwsd.db /var/opt/cray/dws/dwsd.db.old-$(date "+%Y%m%d%H%M%S")
```

4. Start the dwsd service.

```
sdb# systemctl start dwsd
```

5. Wait 600 seconds, or restart dwmd on all SSD-endowed nodes.

```
sdb# module load pdsh
sdb# pdsh -w dwnode1,dwnode2,... 'kill -USR1 $(</var/opt/cray/dws/dwmd.pid)'
```

Where *dwnode#* is the hostname of any DataWarp server node.

6. Restore the backed up state to the upgraded state file.

```
sdb# dwcli config restore </persistent/storage/my-dw-backup.json
```

8.15 In the Event of DataWarp Database Corruption

Prerequisites

DataWarp administrator privileges

About this task

The DataWarp scheduler daemon, dwsd, relies on a state database for accurate node and pool information. Although a rare event, it is possible for this file to become corrupt. If this happens, administrator intervention is required.

Database Corruption Symptoms

A corrupt dwsd state database will generate varying error messages, dependent on the type of corruption, in sdb:/var/opt/cray/dws/log/dwsd.log. The most common is SQLite error: database disk image is malformed, as shown in this excerpt:

```
2017-05-24 08:50:20 Attempting to listen on port 2015
2017-05-24 08:50:20 src/dwsd/log.c:sqlite errorlog cb():168 -> SQLite error 11:
database corruption at line 52076 of [ea3317a480]
2017-05-24 08:50:20 src/dwsd/log.c:sqlite errorlog cb():168 -> SQLite error 11:
database corruption at line 52115 of [ea3317a480]
2017-05-24 08:50:20 src/dwsd/log.c:sqlite errorlog cb():168 -> SQLite error 11:

2017-05-24 08:50:20 src/dwsd/sqlite.c:sqlite init():131 -> SQLite error:
database disk image is malformed
2017-05-24 08:50:20 src/dwsd/context.c:dwsd context init():356 -> Unable to
initialize sqlite
2017-05-24 08:50:20 Daemon ran for 0 seconds
2017-05-24 08:50:20 src/dwsd/dwsd.c:main():66 -> Context initialization failed.
2017-05-24 08:50:20 Shutting down
```

Additionally, commands such as dwstat may fail:

```
sdb# module load dws
sdb dwstat
cannot communicate with dwsd daemon at sdb port 2015
[Errno 111] Connection refused
```

Corrective Steps

If a current backup of the dwsd state database exists, it is possible to recover some of the configuration data. Otherwise, with no backup, it is necessary to re-create pools and the node-pool associations. In either case, **no user data is recoverable**. Follow this procedure after determining that the DataWarp database is corrupt.

Cray recommends backing up the state file at regular intervals, see *Back Up and Restore DataWarp State Data* on page 101.

Procedure

1. Stop the dwsd service.

```
sdb# service dwsd stop
```

2. Remove the DataWarp database file.

```
sdb# rm /var/opt/cray/dws/dwsd.db
```

3. Start the dwsd service.

```
sdb# service dwsd start
```

4. Wait 600 seconds, or restart dwmd on all SSD-endowed nodes.

```
sdb# module load pdsh
sdb# pdsh -w dwnode1,dwnode2,... 'kill -USR1 $(</var/opt/cray/dws/dwmd.pid)'
```

Where <code>dwnode#</code> is the hostname of any DataWarp server node.

- **5.** Proceed based on the availability of a dwsd state file backup:
 - If a current backup exists, either via cron or done manually, restore the DataWarp state file from the backup:

```
sdb# dwcli config restore < path to backup file
```

If a current backup does not exist, recreate the pools and the node-pool associations.

```
sdb# dwcli create pool -n pool_name -g granularity
sdb# dwcli update node -n hostname -p pool_name
```

8.16 Enable the Node Health Checker DataWarp Plugin (if Necessary)

Prerequisites

Ability to log in as root

About this task

The Node Health Checker (NHC) DataWarp plugin is enabled by default at system installation but may become disabled. This procedure describes how to verify that the DataWarp plugin is enabled and, if not, walks through the steps to enable it.

When enabled, NHC is automatically invoked upon the termination of every application. It performs specified tests to determine if compute nodes allocated to the application are healthy enough to support running subsequent applications. The <code>DataWarp</code> plugin is a script to check that any reservation-affiliated DataWarp mount points have been removed; it can only detect a problem once the last reservation on a node completes. The behavior of NHC after a job has terminated is determined through settings in the configurator.

The configurator guides the user through the configuration process with explanations, options, and prompts. The majority of this dialog is not displayed in the steps below, only prompts and example responses are displayed.

TIP: The configurator uses index numbering to identify configuration items. This numbering may vary; the value used in the examples may not be correct for all systems. The user must search the listing displayed on the screen to determine the correct index number for the service/setting being configured.

For further information about NHC, see the intro_NHC (8) man page and XC™ Series System Administration Guide.

Procedure

1. Determine if Plugin DataWarp is enabled in the cray node health service of the CLE config set.

```
smw# cfgset search -s cray node health -l advanced -t DataWarp p0
```

a. Exit this procedure if the DataWarp plugin is enabled.

b. Continue with this procedure if the DataWarp plugin is not enabled.

```
# No matches found in the configuration data for the given search terms.

INFO - Matches may be hidden by level/state/service filtering.

INFO - See 'cfgset search -h' for filtering options.
```

2. Invoke the configurator for the cray node health service.

```
smw# cfgset update -m interactive -l advanced -s cray_node_health p0
Service Configuration Menu (Config Set: p0, type: cle)
    cray_node_health [ status: enabled ] [ validation: valid ]
```

Select	ed 	#	Settings	Value/Status (level=advanced)
	2	27)	memory_plugins desc: Default Memory	[OK]

3. Select the **plugins** setting using the index numbering.

TIP: The configurator uses index numbering to identify configuration items. This numbering may vary; the value used in the examples may not be correct for all systems. The user must search the listing displayed on the screen to determine the correct index number for the service/setting being configured.

```
Node Health Service Menu [default: save & exit - Q] $ 28
```

4. Configure **plugins**.

```
Node Health Service Menu [default: configure - C] $ C
```

- 5. Add an entry.
 - a. Enter +.

```
cray_node_health.settings.plugins
[<cr>=set 12 entries, +=add an entry, ?=help, @=less] $ +
```

b. Set desc to Plugin DataWarp.

```
cray_node_health.settings.plugins.data.desc
[<cr>=set '', <new value>, ?=help, @=less] $ Plugin DataWarp
```

c. Set name to Plugin.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.name
[<cr>=set 'Plugin', <new value>, ?=help, @=less] $ <cr>
```

d. Set enabled to true.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.enabled
[<cr>=set 'false', <new value>, ?=help, @=less] $ true
```

e. Set command to datawarp.sh -v.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.command
[<cr>=set '', <new value>, ?=help, @=less] $ datawarp.sh -v
```

f. Set action to Admindown.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.command
[<cr>=set '', <new value>, ?=help, @=less] $ Admindown
```

g. Set warntime to 30.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.warntime
[<cr>=set '0', <new value>, ?=help, @=less] $ 30
```

h. Set timeout to 360.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.timeout
[<cr>=set '0', <new value>, ?=help, @=less] $ 360
```

i. Set restartdelay to 65.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.restartdelay
[<cr>=set '0', <new value>, ?=help, @=less] $ 65
```

j. Set **uid** to 0.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.uid
[<cr>=set '0', <new value>, ?=help, @=less] $ 0
```

k. Set gid to 0.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.gid
[<cr>=set '0', <new value>, ?=help, @=less] $ 0
```

I. Set sets to Reservation.

```
cray_node_health.settings.plugins.data.Plugin DataWarp.sets
[<cr>=set 'Application', <new value>, ?=help, @=less] $ Reservation
```

m. Accept the settings.

```
cray node health.settings.plugins
[<cr>=set 13 entries, +=add an entry, ?=help, @=less] $ <cr>

```

6. Verify the settings.

Correct any discrepancies before proceeding.

7. Reboot the system.

8.17 Deconfigure DataWarp

Prerequisites

- root privileges
- The system is not running

About this task

Follow this procedure to remove the DataWarp configuration from a system.

Procedure

1. Invoke the configurator in interactive mode to update the CLE config set.

```
smw# cfgset update -m interactive -s cray_dws p0
```

2. Disable the service by entering E.

```
Cray dws Menu [default: save & exit - Q] $ E
```

3. Save and exit the configurator.

```
Cray dws Menu [default: save & exit - Q] $ Q
```

- **4.** Reboot the system.
- **5.** Log in to an SSD-endowed node as root.

This example uses nid00349.

- 6. Remove the data.
 - a. Remove the Logical Volume Manager (LVM) volume group.

```
nid00349# vgremove dwcache
```

A confirmation prompt may appear:

```
Do you really want to remove volume group "dwcache" containing 1 logical volumes? [y/n]:
```

- b. Answer yes.
- c. Identify the SSD block devices.

```
nid00349# pvs

PV VG Fmt Attr PSize PFree
/dev/nvme0n1 dwcache lvm2 a-- 1.46t 1.46t
/dev/nvme1n1 dwcache lvm2 a-- 1.46t 1.46t
/dev/nvme2n1 dwcache lvm2 a-- 1.46t 1.46t
/dev/nvme3n1 dwcache lvm2 a-- 1.46t 1.46t
```

d. Remove LVM ownership of devices. Specify all SSD block devices on the node.

```
nid00349:# pvremove /dev/nvme0n1 /dev/nvme1n1 /dev/nvme2n1 /dev/nvme3n1
Labels on physical volume "/dev/nvme0n1" successfully wiped
Labels on physical volume "/dev/nvme1n1" successfully wiped
Labels on physical volume "/dev/nvme2n1" successfully wiped
Labels on physical volume "/dev/nvme3n1" successfully wiped
```

7. Repeat steps 5 on page 110 through 6 on page 110 for all SSD nodes listed within the node group(s) defined as managed nodes groups.

DataWarp is deconfigured.

8.18 Prepare to Replace a DataWarp SSD

Prerequisites

- DataWarp administrator privileges
- Knowledge of the configuration of the blade on which the failing SSD is located

About this task

SSDs may require replacement due to hardware failure or low remaining endurance. Before replacing an SSD, the DataWarp service (DWS) is instructed to temporarily stop using it for future usages, and any existing usages are cleaned up. After the SSD is replaced, it is initialized and DWS is informed that the new hardware is available for use.

IMPORTANT: SSD replacement involves powering down a blade and physically removing it from a cabinet. Because a blade consists of more than one node, SSD replacement likely impacts more than just the SSD-endowed node. If the other nodes on the blade are used by DataWarp, which is the typical configuration, then DataWarp is told to stop using them as well. If the other nodes on the blade are not used by DataWarp, they are shut down gracefully in accordance with their respective software.

This procedure covers three node types:

- 1. Failing DWS-managed SSD nodes
- 2. Healthy DWS-managed nodes on the same blade as a failing SSD
- 3. Nodes not managed by DWS on the same blade as a failing SSD

Procedure

1. Log in to the sdb node and load the dws module.

```
crayadm@sdb> module load dws
```

2. Drain the failing SSD node. This prevents the creation of new instances on the node and also removes the node's free capacity contribution from the pool.

```
crayadm@sdb> dwcli update node --name hostname --drain
```

Throughout these examples, nid00350 is the failing SSD node and nid00349 is located on the same blade.

```
crayadm@sdb> dwcli update node --name nid00350 --drain
update request for nodes entity with name = nid00350 accepted, "dwstat nodes"
for status
```

3. WAIT for all existing instances to be removed from the node.

```
crayadm@sdb> watch -n 10 dwstat nodes
```

a. If no instances or activations remain, proceed to step 4 on page 112.

```
crayadm@sdb> watch -n 10 dwstat nodes

Every 10.0s: dwstat nodes

node    pool online drain gran capacity insts activs
nid00322 wlm_pool online fill 16MiB 7.28TiB 0 0
nid00349 wlm_pool online fill 16MiB 7.28TiB 0 0
nid00350 wlm_pool online fill 16MiB 7.28TiB 0 0
```

b. Determine the IDs of any persistent instances and remove them.

This example shows that the site needs to wait or take action for one instance on nid00350.

```
crayadm@sdb> watch -n 10 dwstat nodes
Every 10.0s: dwstat nodes
           pool online drain gran capacity insts activs
nid00322 wlm pool online fill 16MiB 7.28TiB
                                                 0
                                                        0
nid00349 wlm pool online fill 16MiB 7.28TiB
                                                        0
nid00350 wlm pool online fill 16MiB 7.28TiB
                                                 1
crayadm@sdb> dwstat fragments | grep nid00350
frag state inst capacity
88071 CA-- 2227 596.16GiB nid00350
88072 CA-- 2227 596.16GiB nid00350
88073 CA-- 2227 596.16GiB nid00350
88074 CA-- 2227 596.16GiB nid00350
crayadm@sdb> dwcli rm instance --id 2227
rm request for instances entity with id = 2227 accepted, "dwstat instances"
for status
```

WAIT for the instance to be removed. An instance that cannot be removed is likely blocked by a reservation trying to copy data back out to the parallel file system (PFS). In which case, the reservation may need to be set to --haste. For further information, see *Registrations* on page 42.

4. Log in to the failing SSD node as root.

This example uses nid00350.

5. Display and remove the logical volume(s).

TIP: Use -f to force removal.

```
nid00350# lvdisplay
  --- Logical volume ---
                         /dev/dwcache/s98i94f104o0

/dev/nvme3n1 lvm2 a-- 1.46t 1.26t

nid00350# pvremove /dev/nvme0n1 /dev/nvme1n1 /dev/nvme2n1 /dev/nvme3n1

Labels on physical volume "/dev/nvme0n1" successfully wiped

Labels on physical volume "/dev/nvme1n1" successfully wiped

Labels on physical volume "/dev/nvme2n1" successfully wiped

Labels on physical volume "/dev/nvme2n1" successfully wiped

Labels on physical volume "/dev/nvme3n1" successfully wiped
```

The failing SSD is disabled and ready for replacement; however, the other node(s) on the blade must first be quiesced. Repeat the previous steps if there are multiple failing nodes.

- 8. Quiesce the non-failing nodes that share the blade with the failing SSD. Proceed based on node type:
 - DWS-managed SSD nodes: drain the nodes and remove all instances. **Do not** remove logical volumes, volume groups, physical volumes or labels.

```
dwcli update node --name nid00349 --drain
update request for nodes entity with name = nid00349 accepted, "dwstat
nodes" for status
```

- Nodes not managed by DWS: refer to the software-specific documentation
- **9.** Follow appropriate hardware procedures to power down the blade and replace the SSD node.

Further software configuration is required after the SSD node is physically replaced, see *Complete the Replacement of an SSD Node* on page 113.

8.19 Complete the Replacement of an SSD Node

Prerequisites

- DataWarp administrator privileges
- Completion of Prepare to Replace a DataWarp SSD on page 111

About this task

SSDs may require replacement due to hardware failure or low remaining endurance. After replacing an SSD, a one-time manual device configuration that defines the Logical Volume Manager (LVM) structure is done, and then the DataWarp service (DWS) is informed that the new hardware is available for use.

IMPORTANT: SSD replacement involves power cycling the blade on which the new SSD is located. Because a blade consists of more than one node, SSD replacement likely impacts more than just the SSD-endowed node. If the other nodes on the blade are used by DataWarp, which is the typical configuration, then DataWarp is told to enable them as well. If the other nodes on the blade are not used by DataWarp, they are enabled in accordance with their respective software.

This procedure covers three node types:

- 1. Newly-replaced SSD nodes for DataWarp
- 2. DWS-managed nodes on the same blade as a newly-replaced node
- 3. Nodes not managed by DWS on the same blade as a newly-replaced node

Procedure

- **1.** Power up the blade and boot the nodes according to standard procedure.
- 2. Over-provision the new SSD if it is an Intel P3608; see Over-provision an Intel P3608 SSD on page 65.
- 3. Verify that the new SSD has the proper PCIe generation and width:
 - Intel P3608:
 - On-board PLX switch trains as Gen3 and x8 width
 - Each card has two x4 SSD devices connected by the PLX switch
 - Samsung SM1725 trains as Gen3 and x8 width
 - SX300 (ioMemory3) trains as Gen2 and x4 width
 - Fusion ioScale2 cards are not supported with CLE 6.0/SMW 8.0 and beyond

smw# xtcheck Node S	hssnocolor -		-	Trained Gen	Target Width	Trained Width
			_	_		
c0-0c0s3n1	0 Intel_P3600		Gen3	Gen3	x4	x4
c0-0c0s3n1	0 Intel P3600	Series SSD	Gen3	Gen3	x4	x4
c0-0c0s3n1	0 -	PLX switch	Gen3	Gen3	8x	x8
c0-0c0s3n1	1 Intel P3600	Series SSD	Gen3	Gen3	x4	×4
c0-0c0s3n1	1 Intel P3600	Series SSD	Gen3	Gen3	x4	×4
c0-0c0s3n1	1	PLX_switch	Gen3	Gen3	x8	x8
		_				

- 4. Initialize the new SSD to define the LVM structure, see *Initialize an SSD* on page 70.
- **5.** Set --fill for the new SSD node.

```
crayadm@sdb> dwcli update node --name hostname --fill
```

In this example, nid00350 is the new SSD node and nid00349 is a DWS-managed node located on the same blade.

```
crayadm@sdb> dwcli update node --name nid00350 --fill
update request for nodes entity with name = nid00350 accepted, "dwstat nodes"
for status
crayadm@sdb> dwstat nodes
    node    pool online drain gran capacity insts activs
nid00322 wlm_pool online fill 16MiB 7.28TiB 0 0
nid00349 wlm_pool online fill 16MiB 7.28TiB 0 0
nid00350 wlm_pool online fill 16MiB 7.28TiB 0 0
```

The new SSD is enabled and its storage is added to the pool; however, the other nodes on the blade must also be enabled. Repeat the previous steps if there are multiple new DataWarp nodes.

- 6. Enable the nodes that share the blade with the new SSD. Proceed based on node type:
 - DWS-managed SSD nodes: set the nodes to not drain.

```
dwcli update node --name nid00349 --fill
update request for nodes entity with name = nid00349 accepted, "dwstat
nodes" for status
```

Nodes not managed by DWS: refer to the software-specific documentation.

This completes the process of replacing a DataWarp SSD node.

9 Troubleshooting

9.1 Where are the Log Files?

The DataWarp scheduler daemon (dwsd), manager daemon (dwmd), and RESTful service (dwrest) write to local log files, the console log, and to log files managed by the Lightweight Log Manager (LLM). logrotate manages the following local log files on the specified nodes:

- API gateway:/var/opt/cray/dws/log/dwmd.log, gunicorn.log
- API gateway:/var/log/nginx/access.log, error.log
- Scheduler node:/var/opt/cray/dws/log/dwsd.log
- Managed nodes:/var/opt/cray/dws/log/dwmd.log

By default, logrotate runs as a daily cron job. For further information, see the logrotate (8) and cron (8) man pages.

The following LLM-managed log files are located on the SMW at /var/opt/cray/log/p#-bootsession/dws:

- dwmd-date: multiple daemons (one for every managed node) log to this file
- dwsd-date: one daemon logs to this file
- dwrest-date: multiple daemons (one for every API gateway) can log to this file

For further information about LLM, see the intro LLM(8) man page.

9.2 What Does this Log Message Mean?

DataWarp daemons and the utilities they invoke write log messages for many different reasons, and not all are of interest or concern. Additionally, a message can occur during a transient condition and not be interesting, but become interesting during certain non-transient conditions. It is important to keep this in mind when browsing through a log file.

9.2.1 Low SSD Life Remaining

When a DataWarp SSD reaches 90% of its life expectancy, a message is written to the console log file.

```
Mon 03/17/2017 3:17 PM SEC: 15:17 sitename-systemname: Low SSD Life Remaining 8% c3-0c0s2n1 PCIe slot -1
```

9.2.2 SSD Protection Limits Exceeded

The possibility exists for a user program to unintentionally cause excessive activity to SSDs, and thereby diminish the lifetime of the devices. To mitigate this issue, DataWarp includes both administrator-defined configuration options and user-specified job script command options that help the DataWarp service (DWS) detect when a program's behavior is anomalous and then react based on configuration settings. See *Configure SSD Protection Settings* on page 97 for further details.

If the SSD protection settings are configured to log SSD overuse events (default setting), then a message is written to the console log file when an SSD protection threshold is exceeded. The message varies slightly depending on the configuration type (scratch or cache) as well as the type of violation, but always includes the following information:

sid Session ID

stoken Session token

When a WLM is controlling DataWarp, the session token is the batch job identifier.

Registration ID, or range of IDs (when same session/stoken registration gets converted into a single label)

Examples: SSD threshold messages written to the console log file

For a scratch configuration, when the bytes written threshold is exceeded:

```
[Thu Apr 20 22:13:13 2017] kdwfs: KDWFS protection limit(s) exceeded!
[Thu Apr 20 22:13:13 2017] kdwfs: Write threshold (16777216) exceeded. label=sid: 1;stoken:"WLM.111" rid:1;sid:1;stoken:"WLM.111"
```

For a scratch configuration, when the file size threshold is exceeded:

```
[Thu Apr 20 22:14:44 2017] kdwfs: KDWFS protection limit(s) exceeded!
[Thu Apr 20 22:14:44 2017] kdwfs: File size threshold (1) exceeded. label=sid: 4;stoken:"WLM.234" rid:7;sid:4;stoken:"WLM.234"
```

For a scratch configuration, when the file creation threshold is exceeded:

```
[Thu Apr 20 22:15:05 2017] kdwfs: KDWFS protection limit(s) exceeded!
[Thu Apr 20 22:15:05 2017] kdwfs: File creation threshold (1) exceeded.
label=sid:12;stoken:"WLM.432" rid:4;sid:12;stoken:"WLM.432"
```

For a persistent scratch instance created by one user and used by two others, when the bytes written threshold is exceeded:

```
[Thu Apr 20 22:17:57 2017] kdwfs: KDWFS protection limit(s) exceeded!
[Thu Apr 20 22:17:57 2017] kdwfs: Write threshold (34359738368) exceeded.
label=sid:28;stoken:"WLM.557" rid:100-110;sid:87:stoken:"WLM.732" rid:133;sid:92:stoken:"WLM.759"
```

For a cache configuration when the bytes written threshold is exceeded:

```
[Thu Apr 20 22:23:27 2017] kdwcfs: KDWCFS protection limit(s) exceeded!
[Thu Apr 20 22:23:17 2017] kdwcfs: Write threshold (16777216) exceeded. sid: 57;stoken: "WLM.18482" rid:22-31;sid:57;stoken: "WLM.18482"
```

For a cache configuration when the file size threshold is exceeded:

```
[Thu Apr 20 22:23:27 2017] kdwcfs: KDWCFS protection limit(s) exceeded!
[Thu Apr 20 22:23:17 2017] kdwcfs: File size (1) exceeded. sid:28;stoken:"WLM. 26636" rid:2-11;sid:28;stoken:"WLM.26636"
```

9.2.3 dwmd Daemon Triggers a Crash

The dwmd daemon triggers a server node panic and writes a message to the console log when it detects a faulty LVM logical volume, which indicates the likelihood of bad hardware.

```
2017-04-04T15:01:53.663992-06:00 c0-1c0s1n0 DataWarp dwmd daemon triggering a crash after detecting a failed LVM volume group. Check for failing hardware!
```

Fix: Be suspicious of the hardware on the mentioned node. If an SSD comes online with no issues after reboot, then it is possible that a problem was incorrectly detected. If it does not come online, then it must be re-seated and/or replaced. Continue to monitor the node for some time to see if a pattern emerges. Perhaps the device is faulty in specific situations, e.g., after a heavy load. Contact Cray support for further information.

9.2.4 MUNGE Authentication Error

Scenario: Execution of dwstat failed with the error: You must be authenticated to request this resource. At the same time, the MUNGE authentication service wrote the following message to a DataWarp log file:

```
MUNGE decrypt error: Rewound credential
```

DWS components depend on MUNGE authentication, which requires client/server clock times to be in sync (within a range). This message may indicate that the time discrepancy between the client and server node exceeded the threshold.

Fix: Sync client/server clock times. There is no need to restart any services.

9.3 SEC Notification when 90% of SSD Life Expectancy is Reached

When a DataWarp SSD reaches 90% of its life expectancy, a message is written to the console log file. If enabled, the Simple Event Correlator (SEC) monitors system log files for significant events such as this and sends a notification (either by email, IRC, writing to a file, or some user-configurable combination of all three) that this has happened. The notification for nearing the end of life of an SSD is as follows:

```
Mon 5/22/2017 3:17 PM
SEC: 15:17 sitename-systemname: Low SSD Life Remaining 8% c3-0c0s2n1 PCIe slot
-1
```

```
Please contact your Cray support personnel or sales representative for SSD card
replacements.
 12 hours -- skip repeats period, applies on a per SSD basis.
 System:
            sitename-systemname, sn9000
Event:
           Low ioMemory SSD Life Remaining (8%) c3-0c0s2n1 PCIe faceplate slot:
Unknown (only one slot is populated in this node)
           15:17:04 in logged string.
Mon May 22 15:17:05 2017 -- Time when SEC observed the logged string.
 Entire line in log file:
 /var/opt/cray/log/p0-20150817t070336/console-20150817
 2017-05-22T15:17:04.871808-05:00 c3-0c0s2n1 PCIe slot#:-1, Name:ioMemory
SX300-3200, SN:1416G0636, Size:3200GB, Remaining life: 8%, Temperature:41(c)
 SEC rule file:
 /opt/cray/sec/default/rules/aries/h ssd remaining life.sr
Note:
 The skip repeats period is a period during which any repeats of this event
type that occur will not be reported by SEC. It begins when the first message
that triggered this email was observed by SEC.
```

For detailed information about configuring SEC, see XC™ Series SEC Configuration Guide.

9.4 Why Do dwcli and dwstat Fail?

The dwcli and dwstat commands fail for a variety of reasons, some of which are described here.

1. Both commands fail if the DataWarp service is not configured or not up and running.

```
user@login> dwstat
Cannot determine gateway via libdws_thin
fatal: Cannot find a valid api host to connect to or no config file found.
```

Fix: Ensure that the DataWarp service is up and running.

2. Both commands fail if the dws module is not loaded.

```
user@login> dwstat

If 'dwstat' is not a typo you can use command-not-found to lookup the package that contains it, like this: cnf dwstat
```

Fix: load the module and try again.

3. Both commands fail if the DataWarp scheduler daemon goes offline.

```
user@login> dwstat
cannot communicate with dwsd daemon at sdb-hostname port 2015
[Errno 111] Connection refused
```

TIP:

One reason the scheduler daemon dwsd may go offline is if DataWarp state files are upgraded such that the DWS is not backwards compatible with any state file from the previous release. This should only be a concern immediately following an upgrade.

Fix: A backup of the most recent state file prior to upgrade must be restored to the upgraded format. For details, see *Back Up and Restore DataWarp State Data* on page 101.

Both commands fail when SSL certificate verification fails.

```
user@login> dwstat all
Connecting to https://c1-0c0s0n2:81 yielded fatal error:
[SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)
```

TIP: One reason SSL certification may fail is if SMW HA was recently installed on a system already running DataWarp. The installation creates a new certificate chain, thereby invalidating any client certificates that were generated by the prior non-HA installation. To remedy, the host certificates must be re-created. See XC^{TM} Series SMW HA Installation Guide (S-0044).

- **5.** Both commands fail if the DataWarp configuration option allow_dws_cli_from_computes is set to false and one of the following is true:
 - the command is executed from a batch script
 - the command is executed from a compute node

Both commands output an error message similar to the following:

```
Connecting to https://dwrest-nodename yielded fatal error: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)
```

Fix: to have this functionality, the system administrator must change the configuration setting and restart DataWarp.

6. Both commands fail when there is a MUNGE authentication issue.

```
user@login> dwstat
You must be authenticated to request this resource.
```

Fix: DWS components depend on MUNGE authentication, which requires client/server clock times to be in sync (within 120 seconds). This message may indicate that the time discrepancy between the client and server node exceeded the threshold. Check client/server clock times, and sync if necessary. There is no need to restart any services.

7. Depending on the options and actions invoked, dwcli can fail when dwmd is not functional.

```
user@login> dwcli stage in -c 1 -s 1 --backing-path /etc/lvm/ --dir /test cannot communicate with backend dwmd daemon at datawarp port 49214 [Errno 111] Connection refused
```

Fix: If the DataWarp service is up and running, attempt to start dwmd.

```
smw# systemctl start dwmd
```

9.5 Dispatch Requests

The DataWarp scheduler daemon, dwsd, is designed to dispatch requests to the dwmd processes as soon as there is work for the dwmd processes to perform. If the dwsd gets confused or has a bug, it may fail to dispatch a request at the appropriate time. If this is suspected, send SIGUSR1 to the dwsd process on the sdb node, forcing it to look for tasks to perform.

```
sdb# kill -USR1 $(</var/opt/cray/dws/dwsd.pid)
sdb# tail -6 /var/opt/cray/dws/log/dwsd.log
2017-05-17 15:24:05 ======== Event on fd 4
2017-05-17 15:24:05 Caught signal User defined signal 1
2017-05-17 15:24:05 Alerting the task manager to wake up
2017-05-17 15:24:05 ======== Event on fd 7
2017-05-17 15:24:05 Finding tasks to spawn
2017-05-17 15:24:05 Nothing can be done right now
```

More likely than not, the <code>dwsd</code> cannot yet perform the action in question. Check if any nodes are not online (<code>dwstat nodes</code>) and if all prerequisites to the action are met. For example, the <code>dwsd</code> will not dispatch a request to create a configuration until after the corresponding instance has been created.

9.6 Stage In or Out Fails When Transferring a Large Number of Files

The stage in and stage out operations associated with DataWarp scratch configurations have default timeout settings that are configured in both the NGINX webserver and the dwrest application runner, Gunicorn. If the staging of a large number of files fails, the default settings may need increasing. The following symptoms may indicate that timeouts have been hit:

- Stage in of a directory generates error 404 and job becomes JobHeldAdmin
- HTTP 500 errors appear in the NGINX logs (API gateway:/var/log/nginx/access.log, error.log)
- WLM user receives a stage in or out failure after dwrest is forcibly restarted

The default timeout settings (in seconds) are as follows:

- NGINX proxy read timeout: 645
- dwrestgun timeout: 600

The disparity between the timeouts is due to a 30 second grace period with a 15 second buffer when data is actively transferred back to clients.

TIP: Maintain at least a 30 second buffer for the NGINX timeout when modifying these default values.

These default values routinely allow for 3,000 to 10,000 files to stage in or out each minute with the transfer of 100,000 files typically not triggering the timeout. This is a general heuristic, and Cray recommends adjusting these timeouts based on both the worst-case anticipated load and stage in/out performance measurements from the system.

Modify the Default Settings

The following is an overview of the procedure to modify the NGINX and dwrest timeout settings.

1. Create a site-local Ansible play in smw:/var/opt/cray/imps/config/sets/configset/ansible to modify the default timeout setting for NGINX, a third-party package not directly affected by the Cray system configurator. Set numsecs as desired.

```
# Datawarp site local play.
 name: Datawarp site local
 hosts: localhost
 roles:
   run after:
    - early
    - dws

    name: fixup dwrest.conf

      lineinfile: >
        dest=/etc/nginx/conf.d/dwrest.conf
        regexp="^#?\s*proxy_read_timeout="
                              proxy read timeout=numsecs"
      when: not ansible_local.cray_system.in_init and
            ansible_local.cray_system.hostid in cray_dws.settings.service.data.api_gateway_nodes
     name: restart nginx
      service: name=nginx state=restarted
      when: not ansible_local.cray_system.in_init and
            ansible local.cray system.hostid in cray dws.settings.service.data.api gateway nodes
```

2. Follow the procedure in *Modify DWS Advanced Settings* on page 94 to modify the default dwrestgun setting: timeout and to activate the changes and run the Ansible play.

IMPORTANT: Use the format timeout=secs if defining it for the first time; that is, if it is a non-displayed setting (as explained in the procedure).

9.7 Staging Failure Might be Caused by Insufficient Space

A #DW stage_in or #DW stage_out job script request can fail if there is insufficient space to complete the request. If a user reports a hung job or that a stage in/out request has failed, it could be due to insufficient space to fulfill the request. If this occurs, the job goes into a hold state and an error message is written to the dwmd log file on the SMW.

DataWarp Stage Out Failure

At the end of a batch job, the DWS transitions any files that are marked for deferred stage out to actually staging out. If there is insufficient space in the PFS to accommodate the data, the #DW stage_out command fails.

Output from dwcli stage guery will be similar to the following:

```
> dwcli stage query -s $sid -c $cid -f /demo
path backing-path nss ->c ->q ->f <-c <-q <-f <-m
/demo /tmp/demo 1 - - - - 1 -</pre>
```

Additionally, a message similar to:

```
__udwfs_activate_deferred_stage failed: -28
```

will be written to smw:/var/opt/cray/log/\$PARTITION-current/dws/dwmd-\$DATE.

If the DataWarp session, configuration, and instance do not expire, then the job and all of its DataWarp resources will remain until the system fails or an administrator intervenes.

When sufficient space is available, the stage out request can be submitted manually. Monitor the PFS to validate that it has enough space to complete the request. Cray also recommends validating that enough inodes are available, although this is much less likely to occur.

```
> df /pfs mount; df -hi /pfs mount
```

When sufficient space is available, manually resubmit the staging request via dwcli stage out. For example:

```
> dwcli stage out --configuration $configuration --session $session \
--backing-path /pfs/path --dir /dwfs/dir
```

After the data is staged out, either the user or an administrator must remove the WLM job following the WLM-specific procedures.

DataWarp Stage In Failure

A #DW stage_in request will fail if the DataWarp instance requested is not large enough for the amount of data being transferred. If this happens output from dwcli stage query will be similar to the following:

```
> dwcli stage query -s $sid -c $cid -f /demo
path backing-path nss ->c ->q ->f <-c <-q <-f <-m
/demo /tmp/demo 1 - - 1 - - - -</pre>
```

and a message similar to:

```
__udwfs_activate_deferred_stage failed: -28
```

will be written to sdb:/var/opt/cray/dws/log/dwsd.log.

The user or an administrator must remove the WLM job following the WLM-specific procedures, after which the user can resubmit the job with a DataWarp allocation large enough to cover the requirements of files needing to be staged in.

9.8 Old Nodes in dwstat Output

The DataWarp Service (DWS) learns about node existence from two sources:

- 1. Heartbeat registrations between the dwsd process and the dwmd processes
- 2. Hostnames provided by workload managers as users are granted access to compute nodes as part of their batch jobs

The dwsd process on the sdb node stores the DWS state in its state file and controls the information displayed by dwstat nodes. On dwsd process restart, dwsd removes a node from its state file if the node meets the following criteria:

- 1. the node is not in a pool
- 2. there are no instances on the node
- **3.** there are no activations on the node
- 4. the node does not belong to a session

If a node lingers in the dwstat nodes output longer than expected, verify the above criterion are met, and then restart the dwsd process on the sdb node.

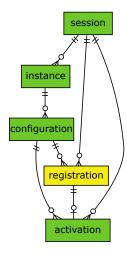

sdb# systemctl restart dwsd

10 Supplemental Information

10.1 Terminology

The following diagram shows the relationship between the majority of the DataWarp service terminology using Crow's foot notation. A session can have 0 or more instances, and an instance must belong to only one session. An instance can have 0 or more configurations, but a configuration must belong to only one instance. A registration belongs to only one configuration and only one session. Sessions and configurations can have 0 or more registrations. An activation must belong to only one configuration, registration and session. A configuration can have 0 or more activations. A registration is used by 0 or no activations. A session can have 0 or more activations.

Figure 13. DataWarp Component Relationships

Activation An object that represents making a DataWarp configuration available to one or more client

nodes, e.g., creating a mount point.

Client Node A compute node on which a configuration is activated; that is, where a DVS client mount

point is created. Client nodes have direct network connectivity to all DataWarp server nodes.

At least one parallel file system (PFS) is mounted on a client node.

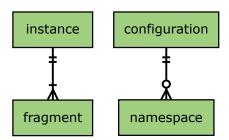

Configuration A configuration represents a way to use the DataWarp space.

Fragment A piece of an instance as it exists on a DataWarp service node.

The following diagram uses Crow's foot notation to illustrate the relationship between an instance-fragment and a configuration-namespace. One instance has one or more fragments; a fragment can belong to only one instance. A configuration has 0 or more

namespaces; a namespace can belong to only one configuration.

Figure 14. Instance/Fragment ↔ Configuration/Namespace Relationship

Instance A specific subset of the storage space comprised of DataWarp fragments, where no two

fragments exist on the same node. An instance is essentially raw space until there exists at least one DataWarp instance configuration that specifies how the space is to be used and

accessed.

DataWarp Service The DataWarp Service (DWS) manages access and configuration of DataWarp instances in

response to requests from a workload manager (WLM) or a user.

Fragment A piece of an instance as it exists on a DataWarp service node

Job Instance A DataWarp instance whose lifetime matches that of a batch job and is only accessible to

the batch job because the public attribute is not set.

Namespace A piece of a scratch configuration; think of it as a directory on a file system.

Node A DataWarp service node (with SSDs) or a compute node (without SSDs). Nodes with space

are server nodes; nodes without space are client nodes.

Persistent Instance A DataWarp instance whose lifetime matches that of possibly multiple batch jobs and may

be accessed by multiple user simultaneously because the public attribute is set.

Pool Groups server nodes together so that requests for capacity (instance requests) refer to a

pool rather than a bunch of nodes. Each pool has an overall quantity (maximum configured space), a granularity of allocation, and a unit type. The units are either bytes or nodes (currently only bytes are supported). Nodes that host storage capacity belong to at most one

pool.

Registration A known usage of a configuration by a session.

Server Node An IO service blade that contains two SSDs and has network connectivity to the PFS.

Session An intagible object (i.e., not visible to the application, job, or user) used to track interactions

with the DWS; typically maps to a batch job.

10.2 Prefixes for Binary and Decimal Multiples

The International System of Units (SI) prefixes and symbols (e.g., kilo-, Mega-, Giga-) are often used interchangeably (and incorrectly) for decimal and binary values. This misuse not only causes confusion and errors, but the errors compound as the numbers increase. In terms of storage, this can cause significant problems. For example, consider that a kilobyte (10³) of data is only 24 bytes less than 2¹0 bytes of data. Although this difference may be of little consequence, the table below demonstrates how the differences increase and become significant.

To alleviate the confusion, the International Electrotechnical Commission (IEC) adopted a standard of prefixes for binary multiples for use in information technology. The table below compares the SI and IEC prefixes, symbols, and values.

SI decimal vs IEC binary prefixes for multiples									
SI decimal standard			IEC binary standard						
Prefix (Symbol)	Power	Value	Value	Power	Prefix (Symbol)				
kilo- (kB)	10 ³	1000	1024	2 ¹⁰	kibi- (KiB)				
mega- (MB)	10 ⁶	1000000	1048576	2 ²⁰	mebi- (MiB)				
giga- (GB)	10 ⁹	100000000	1073741824	230	gibi- (GiB)				
tera- (TB)	10 ¹²	100000000000	1099511627776	240	tebi- (TiB)				
peta- (PB)	10 ¹⁵	1000000000000000	1125899906842624	2 ⁵⁰	pebi- (PiB)				
exa- (EB)	10 ¹⁸	100000000000000000	1152921504606846976	260	exbi- (EiB)				
zetta- (ZB)	10 ²¹	100000000000000000000000000000000000000	1180591620717411303424	₂ 70	zebi- (ZiB)				
yotta- (YB)	10 ²⁴	100000000000000000000000000000000000000	1208925819614629174706176	280	yobi- (YiB)				

For a detailed explanation, including a historical perspective, see http://physics.nist.gov/cuu/Units/binary.html.
