Only text elements and PDF files can be sent. Text elements are elements of the types S, M, J, P, D, X and types derived from these provided they contain no block-oriented records. An element containing block-oriented records is sent only if its content is in PDF format.

**TO = \*USER(...)**

Specifies the receiver of the email.

**USER-IDENTIFICATION = \*OWN / <name 1..8>**

User ID whose entry in the user catalog contains the receiver's email address.

---

The default value is \*OWN, i.e. the logon user ID of the calling task. If the user entry contains a list with more than one email address, a receiver address may be selected in accordance with the job name (see [section "Return codes"](#)).

**SUBJECT = \*STD / <c-string 1..256 with-low>**

Specifies the subject of the email.

\*STD specifies that the email should have a standardized subject text which, in addition to the information "from BS2000", also contains the sender ID and the file name.

**DELETE-FILE = \*NO / \*YES / \*DESTROY**

Specifies whether the file or the PLAM library element should be automatically deleted after it has been sent successfully: If the system file SYSLST is to be sent and SYSLST has the primary allocation, DELETE-FILE=\*YES applies.

If the system file SYSLST or SYSOUT is to be sent and the system file is assigned to a file or file generation, it is not deleted automatically.

**DELETE-FILE = \*NO**

The file or the PLAM library element is not deleted. The file or the PLAM library element is available again immediately after MAIL-FILE is called.

**DELETE-FILE = \*YES**

The file or the PLAM library element is automatically deleted after it has been sent successfully. The file or the PLAM library element is regarded as having been sent successfully even if it cannot be delivered (e.g. because the email address is unknown).

**DELETE-FILE = \*DESTROY**

This specification has the same effect as DELETE-FILE=\*YES. In addition, the file or element content is overwritten with binary zeros when it is deleted.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
		CMD0001	Command executed
	1	CMD0202	Syntactical or semantic error in command
	32	DMS05C7	Unexpected internal error in DMS
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0535	Specified file not shareable
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0681	DMS error during execution
	64	DMS0684	File does not exist
	64	DMS068A	Mail sender reported error
	64	DMS068B	ILAM reported error
	64	DMS0694	Not permissible to send file
	64	DMS0695	Email address missing
	64	DMS0696	Email address of TSOS user ID missing
	130	DMS0524	System address space full
	130	DMS0582	File is currently locked or in use and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system
	130	DMS0594	Not enough virtual memory available

---

## Selecting email addresses by means of the job name

MAIL-FILE ascertains the email addresses of the receiver and the sender by means of the user entry of each of the user IDs concerned (see the SHOW-USER-ATTRIBUTES command, EMAIL-ADDRESS output field). The entry can also contain an address list, i.e. multiple email addresses separated by a comma. To execute the command at least the user ID of the receiver must contain at least one email address.

When the receiver's user entry contains an address list, MAIL-FILE makes a distinction between whether the caller's user ID (\*OWN) or a "foreign" user ID was specified as the receiver. If a foreign user ID is specified, MAIL-FILE sends the email to all addresses. Only if the home user ID is specified does select the addresses by means of the job name of the calling task.

When the sender's user entry contains an address list, MAIL-FILE selects the sender address by means of the job name of the calling task.

In the address list MAIL-FILE searches for an address in which a partial name of the local address part (ahead of the @) begins with the job name (not case-sensitive). Partial names are separated from one another by a period (e.g. first-name.last-name).

For example, the following addresses are selected from the address list `Anna.Huber@xy, Anja.Bauer@xy, Anton.Baumann@xy`:

- `Anna.Huber@xy` with the job names: ANN, HU, HUBER
- `Anja.Bauer@xy` with the job names: ANJ, ANJA, BAUE, BAUER
- `Anton.Baumann@xy` with the job names: ANT, BAUM, BAUMAN

Optionally you can also prefix the addresses in the user entry with "address names" in parentheses.

Example: `(ANH)Anna.Huber@xy, (ANB)Anja.Bauer@xy, (BMN)Anton.Baumann@xy`

The following addresses, for example, are then selected from this address list:

- `Anna.Huber@xy` with the job names: ANH and ANN, HU, HUBER
- `Anja.Bauer@xy` with the job names: ANB and ANJ, ANJA, BAUE, BAUER
- `Anton.Baumann@xy` with the job names: BMN and ANT, BAUM, BAUMAN

If the job name matches more than one address, the address is selected whose partial name which matches the job name is the shortest. For example, the following addresses are selected from the address list

`Beate.Pauli@xy, Pauline.Beck@xy, Paul.Becker@xy`:

- `Beate.Pauli@xy` with the job names: PAULI, BEA
- `Pauline.Beck@xy` with the job names: PAULIN, BE, BECK
- `Paul.Becker@xy` with the job names: P, PAUL, BECKER

If the partial name which matches the job name is equally short in more than one address, the first of these addresses is selected.

If more than one partial name in an address matches the job name, only the first partial name is taken into account.

If the calling task does not have a job name or the job name does not match any address in the address list, the following procedure applies:

- When the receiver address is ascertained, the entire address list is used, i.e. the email is sent to all addresses.

- When the sender address is ascertained, only the first address in the address list is used.

## Example

`/show-job-status` \_\_\_\_\_ (1)

```
%TSN:      3ZX9      TYPE:      3 DIALOG   NOW:      2012-04-15.150812
%JOBNAME:  VOG       PRI:      0 210
%USERID:   COGNIBS3  JCLASS:   JCDSTD    LOGON:    2012-04-15.1428
%ACCNB:    89001    CPU-MAX:  9999     CPU-USED: 000001.0700
%STATION:  $$$06581  PROC:     FIREBALL
%TID:      00090119  UNP/Q#:   00/000
%CMD:      SHOW-JOB-STATUS
%MONJV:    *NONE
```

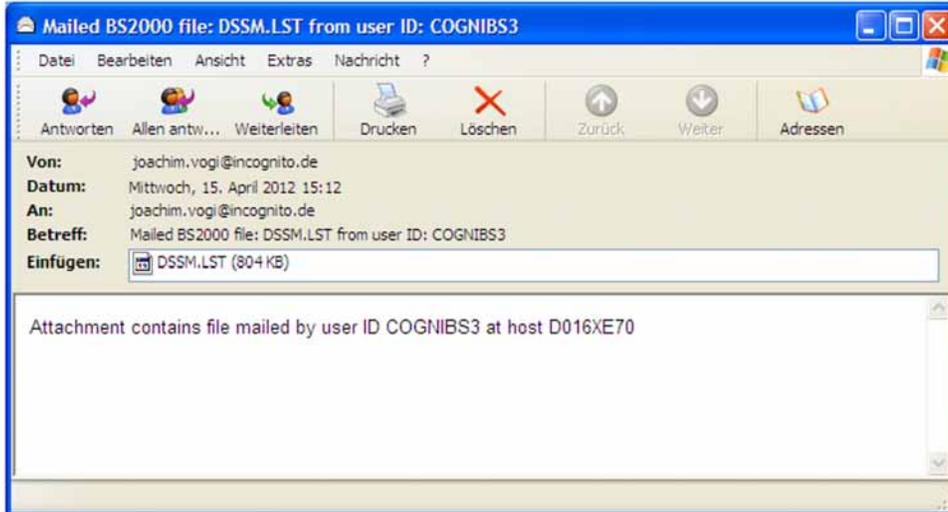

`/show-user-attr`

```
%SHOW-USER-ATTRIBUTES --- PUBSET TK82 - USER COGNIBS3      2012-04-15 15:09:05
.
.
%EMAIL-ADDRESS alfred.holli@incognito.de,
%              joachim.vogi@incognito.de, _____ (2)
%              johannes.kuli@incognito.de,
%              mathias.reh@incognito.de
.
.
%-----
%SHOW-USER-ATTRIBUTES          END OF DISPLAY FOR USER COGNIBS3 ON PUBSET TK82
```

`/mail-file dssm.lst` \_\_\_\_\_ (3)

- (1) The user has logged in under the user ID *COGNIBS3* with the job name *VOG*.
- (2) 4 email addresses are entered in the user entry (output abbreviated).
- (3) With MAIL-FILE the *DSSM.LST* file is sent to the home user ID. As the job name *VOG* can be assigned unambiguously to the address *joachim.vogi@incognito.de* from the address list of the user entry, MAIL-FILE uses this address as the sender and recipient (see opened email).

After the email arrives, it is opened on the PC:

---

## 4.2 MESSAGE

Send message to specific user task

**Component:** BS2000 OSD/BC

**Functional area:** not allocated

**Domain:** not allocated

**Privileges:** OPERATING

**Routing code:** E

**i** The MESSAGE command is being replaced by the INFORM-JOB command. MESSAGE continues to be supported to ensure backwards compatibility, but INFORM-JOB should be used for new applications. All that follows is a brief overview of the command's function, syntax and return codes.

### Function

The MESSAGE command enables the operator to send a message to a specific batch or interactive job. The system adds the date and time of day to the operator message. The message is written to SYSOUT.

If the job has already terminated, or has not yet been started, the MESSAGE command will not be executed and the operator will be informed.

#### *Restrictions*

The command is available in ISP format only; in other words, there are no SDF functions (such as syntax analysis or help).

The format has been subdivided into two subformats:

- Format 1: Send message to terminal
- Format 2: Send message to batch or interactive task

#### *Note*

The precise output format of the message is controlled by the NBMESLG system parameter (applies to both syntax formats).

### Format 1

<b>MESSAGE</b>	Alias: <b>MSG</b>
<b>TERM</b> = (<processor 1..8>,<station 1..8>)	
,<text 1..151>	

## Format 2

<b>MESSAGE</b>	Alias: <b>MSG</b>
TSN = <alphanum-name 1..4> ,<text 1..151>	

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	EXC0064	Warning. Specified task has temporarily suppressed message function
1	1	EXC0240	Syntax error
2	64	EXC0080	Specified task does not exist
3	64	EXC0062	Specified task cannot receive message
4	64	EXC0081	Invalid task type
5	64	EXC0109	Semantic error; command ignored
	130	EXC0061	Insufficient class 4 memory; command aborted

## Example

Operator input:

```
/MES TSN=0FC3, PLEASE CALL OPERATOR
```

Output on terminal of interactive task 0FC3:

```
%MESS PLEASE CALL OPERATOR :16:23:38 :12-01-26026
```

---

## 4.3 MODIFY-ACCOUNTING-PARAMETERS

Modify accounting system parameters

**Component:** BS2000 OSD/BC  
**Functional area:** Accounting system control  
**Domain:** ACCOUNTING  
**Privileges:** TSOS

### Function

This command allows system administration to modify the following accounting system parameters set with the START-ACCOUNTING command:

- accounting records and record extensions to be included in the accounting file
- the list of continuation files in the case of file switching
- the job classes to be monitored
- the monitoring cycle

Neither in the definition of the accounting records and their extensions nor in the definition of the job classes is a logical check of the ACCOUNT function for consistency of the specifications performed. The default value \* UNCHANGED in the corresponding operands means that the previously valid definition still applies.

### Format

#### MODIFY-ACCOUNTING-PARAMETERS

```
SET-RECORD-TYPE = *UNCHANGED / *ALL / list-poss(64): <name 1..6>  
,ADD-RECORD-TYPE = *NONE / list-poss(64): <name 1..6>  
,REMOVE-RECORD-TYPE = *NONE / list-poss(64): <name 1..6>  
,ALTERNATE-FILES = *UNCHANGED / *NONE / list-poss(5): <filename 1..54> / <partial-filename 2..53>  
,ACCOUNTING-PERIOD = *UNCHANGED / <integer 10..1440 minutes> / *STD  
,JOB-CLASS = *UNCHANGED / *NONE / *ALL / list-poss(16): <name 1..8>
```

### Operands

**SET-RECORD-TYPE = \*UNCHANGED / \*ALL / list-poss(64): <name 1..6>**

Defines the accounting records and record extensions to be written to the accounting file.

**SET-RECORD-TYPE = \*ALL**

All accounting records and implicitly active record extensions are written to the accounting file.

**SET-RECORD-TYPE = list-poss(64): <name 1..6>**

Identifiers of the accounting records or record extensions to be written. Up to 64 accounting records or extensions can be specified (see notes).

---

**ADD-RECORD-TYPE = \*NONE / list-poss(64): <name 1..6>**

Defines whether the specified accounting records and record extensions, and which ones (maximum 64), are also to be added to the list of accounting records/record extensions to be written (see the notes).

**REMOVE-RECORD-TYPE = \*NONE / list-poss(64): <name 1..6>**

Defines whether the specified accounting records and record extensions (maximum 64) are no longer to be written to the accounting file (see notes).

**ALTERNATE-FILES = \*UNCHANGED / \*NONE / <filename 1..54> / <partial-filename 2..53>**

Replaces the list of accounting file names defined by means of the START-ACCOUNTING command.

Specification of a list of continuation files is meaningful only if the name of the current accounting file was not automatically generated.

**ALTERNATE-FILES = \*NONE**

Deletes the list of continuation file names.

**ALTERNATE-FILES = list-poss(5): <filename 1..54> / <partial-file-name 2..53>**

Names of the continuation files to replace the file names in the list of continuation files. Up to 5 file names may be specified (see the notes).

**ACCOUNTING-PERIOD = \*UNCHANGED / \*STD / <integer 10..1440 minutes>**

Modifies the cycle of the periodic accounting interval.

Specific records of the accounting system and job classes are periodically monitored to derive average values.

To avoid overloading, the frequency of this periodic monitoring should be oriented towards the lower threshold of the value range only in exceptional cases.

The maximum value corresponds to one day.

**ACCOUNTING-PERIOD = \*STD**

The default value of 20 minutes applies.

**ACCOUNTING-PERIOD = <integer 10..1440 minutes>**

Value in minutes defining the frequency of the periodic monitoring of accounting records and job classes.

**JOB-CLASS = \*UNCHANGED / \*NONE / \*ALL / list-poss(16): <name 1..8>**

List of job classes to be subject to periodic monitoring of the accounting system.

**JOB-CLASS = \*NONE**

No job classes are to be monitored any longer.

**JOB-CLASS = \*ALL**

All job classes are to be monitored.

**JOB-CLASS = list-poss(16): <name 1..8>**

Specification of up to 16 job classes to be monitored within the specified period.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NAM3001	Requested action has been carried out, but accompanied by a warning
	1	CMD0202	Syntax error
	32	CMD0221	Internal system error
	64	NAM0012	No authorization for this command
	64	NAM3003	Semantic error
	128	CMD2280	Temporarily unable to execute the command

## Notes

- The accounting records are addressed via the record label (field 1 in the record definition). Activation of the accounting record implies that all record extensions are activated. If only specific record extensions are to be activated or suppressed, these must be addressed explicitly. The record extension is identified by adding the extension label to the record label. The deactivation of one or more record extensions means that the accounting record is written with the remaining record extensions.  
For example, the operand `ADD-RECORD-TYPE=(DALC,TASKCA,TASKTI)` causes memory allocation record DALC and two record extensions of the task accounting record (TASKCA and TASKTI) to be activated as well.
- The name of the continuation file or the last name in the list of continuation files may be a partially qualified file name. This causes automatic file name generation to be activated following a switch of accounting files.

## Example

```
/show-acc-sta inf=*files
```

```
ACCOUNTING STATUS INFORMATION
=====

## 4.4 MODIFY-ACS-OPTIONS

Modify ACS option settings

<b>Component:</b>	ACS
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING ACS-ADMINISTRATION SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The MODIFY-ACS-OPTIONS command allows the user to modify the following globally set AC options for the current task:

- output of messages when loading the alias catalog
- logging of alias substitutions and prefix insertions
- permission to use the catalog ID and user ID in aliases (fully qualified) This ACS option may be restricted by the ACS administrator!
- permission to use user IDs in aliases  
This ACS option may be restricted by the ACS administrator!
- range of the substitution (for files or for files and job variables)

The currently applicable settings can be determined by the user from the output of the SHOW-ACS-OPTIONS command.

#### *Privileged functions*

The ACS administrator uses SCOPE=\*SYSTEM to set AC options for the whole system and can specify that users are not allowed to modify the AC options relating to the use of catalog and user IDs in alias names.

The ACS administrator also globally defines the pubset on which temporary spool files may be created.

The changes to the global options remain in effect until the next MODIFY-ACS-OPTIONS or until shutdown, or until the ACS subsystem is unloaded.

Following the loading of the ACS subsystem, the following preset values apply:

```
SUCCESS-MSG=PAR (USER-FILES=*YES , SYSTEM-FILES=*YES )
LOGGING=*PAR (ALIAS-SUBSTITUTION=*STD , PREFIX-INSERTION=*NO )
COMPLETE-ALIAS-NAMES=*NOT-ALLOWED (USER-MODIFICATION=*NOT-ALLOWED )
ALIAS-USERID=*NOT-ALLOWED (USER-MODIFICATION=*NOT-ALLOWED )
SPOOL-FILE-PUBSET=*STD
STANDARD-RANGE=*BOTH
```

## Format

### MODIFY-ACS-OPTIONS

```
SUCCESS-MSG = *UNCHANGED / *YES / *NO / [*PARAMETERS](...)  
    [*PARAMETERS](...  
        | SYSTEM-FILE-MSG = *UNCHANGED / *YES / *NO  
        | ,USER-FILE-MSG = *UNCHANGED / *YES / *NO  
,LOGGING = *UNCHANGED / *YES / *STD / [*PARAMETERS](...)  
    [*PARAMETERS](...  
        | ALIAS-SUBSTITUTION = *UNCHANGED / *STD / *YES  
        | ,PREFIX-INSERTION = *UNCHANGED / *YES / *NO  
,COMPLETE-ALIAS-NAMES = *UNCHANGED / *ALLOWED / *NOT-ALLOWED(...)  
    *NOT-ALLOWED(...  
        | USER-MODIFICATION = *UNCHANGED / *ALLOWED / *NOT-ALLOWED  
,ALIAS-USERID = *UNCHANGED / *ALLOWED / *NOT-ALLOWED(...)  
    *NOT-ALLOWED(...  
        | USER-MODIFICATION = *UNCHANGED / *ALLOWED / *NOT-ALLOWED  
,SPOOL-FILE-PUBSET = *UNCHANGED / *STD / <alphanum-name 1..4>  
,SCOPE = *TASK / *SYSTEM  
,STANDARD-RANGE = *UNCHANGED / *FILE / *BOTH
```

## Operands

### **SUCCESS-MSG** = \*UNCHANGED / \*YES / \*NO / \*PARAMETERS(...)

Affects the default setting for the output of message ACS0001 when loading an alias catalog. The specification made here applies as the default value \*STD in the SUCCESS-MSG operand of the LOAD-ALIAS-CATALOG command.

### **SUCCESS-MSG** = \*UNCHANGED

The default setting is not changed.

### **SUCCESS-MSG** = \*YES

The output of message ACS0001 is set as the task-specific default.

### **SUCCESS-MSG** = \*NO

Suppression of message ACS0001 is set as the task-specific default.

---

**SUCCESS-MSG = \*PARAMETERS(...)**

Enables the output of message ACS0001 to be set independently for AC system files and AC files.

**SYSTEM-FILE-MSG = \*UNCHANGED / \*YES / \*NO**

Defines the default setting for AC system files.

**USER-FILE-MSG = \*UNCHANGED / \*YES / \*NO**

Defines the default setting for AC files.

**LOGGING = \*UNCHANGED / \*YES / \*STD / \*PARAMETERS(...)**

Specifies whether a message is to be output for each alias substitution and prefix insertion. Note that alias substitutions and prefix insertions are performed whenever the system internally accesses the actual file or job variable name, so a correspondingly large number of messages will be generated.

**LOGGING = \*UNCHANGED**

The default setting is not changed.

**LOGGING = \*YES**

The messages must always be output.

**LOGGING = \*STD**

Messages for alias substitutions are output only if the corresponding AC entry has the LOGGING attribute; no messages are output for the insertion of prefixes.

\*STD is equivalent to LOGGING=\*PARAMETERS(ALIAS-SUBSTITUTION=\*STD, PREFIX-INSERTION=\*NO).

**LOGGING = \*PARAMETERS(...)**

Enables the output of messages to be set independently for alias substitutions and the insertion of prefixes.

**ALIAS-SUBSTITUTION = \*UNCHANGED / \*STD / \*YES**

Specifies whether message ACS0000 or ACS0049 is to be output for each alias substitution, i.e. whenever the actual file or job variable name is substituted for the alias. \*YES causes the message to be output for every alias substitution; \*STD for aliases with the attribute LOGGING.

**PREFIX-INSERTION = \*UNCHANGED / \*YES / \*NO**

Specifies whether message ACS0000 or ACS0049 is to be output for each prefix insertion.

**COMPLETE-ALIAS-NAMES = \*UNCHANGED / \*ALLOWED / \*NOT-ALLOWED(...)**

Defines whether the catalog and user ID may be used in aliases. This modification of the global setting for the local task must be permitted by the ACS administrator.

The ALLOWED setting should only be used when really necessary. Not allowing the catalog ID and user ID in aliases prevents the possibility of duplicate substitutions in cases where the already substituted and completed actual file or job variable name is inadvertently specified instead of the alias. Preventing such file or job variable names from appearing as an alias in the catalog thus ensures that no unwanted file or job variable is referenced.

**COMPLETE-ALIAS-NAMES = \*NOT-ALLOWED(...)**

Catalog and user IDs are not allowed within alias names.

*For users with ACS-ADMINISTRATION privilege:*

Specifies (in conjunction with SCOPE=\*SYSTEM) that the ACS option of COMPLETE-ALIAS-NAMES is by default unavailable to the users. However, in the substructure which follows, a user can be given the right to use this option by explicitly requesting it.

Use of this operand together with SCOPE=\*TASK modifies the setting for the current administrator task; in this case, the substructure is ignored.

---

**USER-MODIFICATION =**

Makes a system-wide specification of whether a user may utilize the COMPLETE-ALIAS-NAME option of ACS.

**USER-MODIFICATION = \*UNCHANGED**

Preset value: the previous declaration continues to apply.

**USER-MODIFICATION = \*ALLOWED**

Every ACS user is to be allowed to use the COMPLETE-ALIAS-NAME option of ACS, and hence use fully qualified file or job variable names, with catalog ID and user ID, in alias catalogs.

**USER-MODIFICATION = \*NOT-ALLOWED**

The COMPLETE-ALIAS-NAME option of ACS may not be used by nonprivileged users. A corresponding request in the user command, with COMPLETE-ALIAS-NAMES = \*ALLOWED, will be rejected with an error message.

**This is the preset value which applies following loading of the subsystem.**

**ALIAS-USERID = \*UNCHANGED / \*ALLOWED / \*NOT-ALLOWED(...)**

Defines whether user IDs are permitted within aliases. The right to modify the global setting NOT-ALLOWED for the local task must have been granted by the ACS administrator.

**ALIAS-USERID = \*ALLOWED**

Allows the use of user IDs in aliases. The user ID TSOS and all user IDs beginning with the string *SYS* are not permitted.

**ALIAS-USERID = \*NOT-ALLOWED(...)**

No foreign user IDs other than the system default ID may be used in an alias.

*For users with ACS-ADMINISTRATION privilege:*

Specifies in conjunction with SCOPE=\*SYSTEM that the ACS option of ALIAS-USERID is by default unavailable to the users. However, in the substructure which follows, a user can be given the right to use this option by explicitly requesting it.

**USER-MODIFICATION =**

Makes a system-wide specification of whether a user may utilize the ALIAS-USERID option of ACS.

**USER-MODIFICATION = \*UNCHANGED**

Preset value: the previous declaration continues to apply.

**USER-MODIFICATION = \*ALLOWED**

Every ACS user is to be allowed to use the ALIAS-USERID option of ACS, and hence use alias names containing any required user IDs (exception: \$SYS\* and \$TSOS.).

**USER-MODIFICATION = \*NOT-ALLOWED**

The ALIAS-USERID option of ACS must not be amended by nonprivileged users.

A corresponding request in the user command, with ALIAS-USERID = \*ALLOWED/ \*NOT-ALLOWED will be rejected with an error message.

**This is the preset value which applies following loading of the subsystem.**

**SPOOL-FILE-PUBSET =**

*Only for users with ACS-ADMINISTRATION privilege:*

Specifies the pubset on which temporary spool files (S.OUT., S.LST. files) should be created.

The operand will only be evaluated when the command is called if SCOPE=SYSTEM is also set, i.e. the ACS administration cannot exercise control specifically over its own spool files.

---

**SPOOL-FILE-PUBSET = \*UNCHANGED**

Preset value: the previous declaration continues to apply.

**SPOOL-FILE-PUBSET = \*STD**

For setting up temporary SPOOL files, use should be made of the default pubset for the task which is creating the file.

**This is the preset value which applies following loading of the subsystem.**

**SPOOL-FILE-PUBSET = <cat-id 1..4>**

Catalog ID of the pubset on which all temporary SPOOL files should be created.

If a SPOOL pubset is defined, the system administration must make sure that all the users of the system are entered in the user catalog for this pubset.

**SCOPE =**

*Only for users with ACS-ADMINISTRATION privilege:*

Defines the scope of validity of the specified options.

**SCOPE = \*TASK**

Preset value:

The specified options are only to apply task-locally, i.e. to the user's current task.

**SCOPE = \*SYSTEM**

Specifies that the options are to have system-global validity.

**STANDARD-RANGE =**

Defines the standard range for substituting aliases and inserting a prefix. The range determines whether alias substitution and insertion of a prefix should apply both for files and for job variables.

In the case of alias substitution, this range applies for all AC entries which were set up with RANGE=\*STD. A range deviating from this can be specified explicitly for each AC entry (see the ADD- and MODIFY-ALIAS-CATALOG-ENTRY commands).

For a prefix specification, this range applies with RANGE=\*STD (see the SET-FILE-NAME-PREFIX command).

**STANDARD-RANGE = \*UNCHANGED**

Preset value: the previous declaration continues to apply.

**STANDARD-RANGE = \*FILE**

Alias substitution and the prefix specification are effective only for files.

**STANDARD-RANGE = \*BOTH**

Alias substitution and the prefix specification are effective for both files and job variables.

**This is the preset value which applies following loading of the subsystem.**

---

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed normally Guaranteed message: ACS0032 if SPOOL-FILE-PUBSET is modified
	64	ACS0029	Command not permitted
	64	ACS0038	Pubset could not be reserved
	128	ACS0018	ACS is not available

## Examples

For examples, see the ADD-ALIAS-CATALOG-ENTRY and SET-FILE-NAME-PREFIX commands.

---

## 4.5 MODIFY-ACS-SYSTEM-FILE

Modify assignment or attributes of ACS system files

**Component:** ACS  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** ACS-ADMINISTRATION

### Function

The command MODIFY-ACS-SYSTEM-FILE permits the ACS administration to modify AC system file definitions which were specified by an ADD-ACS-SYSTEM-FILE command. An AC system file is addressed not by its file name, but instead by its symbolic name, which is its identifier. Using this command, it is possible to redefine both the assignment to a real file name and also the attributes of an AC system file.

Among the changes that are possible by modifying the attributes, the ACS system administration can specify that an identifier which has already been declared is to be used as the default AC system file for all subsequent calls. In this case, the entries from this file will be read whenever the user specifies the identifier "STD" (in the LOAD-ALIAS-CATALOG command).

If there is no AC system file with the specified identifier, the command will be rejected with an error message.

### Format

#### MODIFY-ACS-SYSTEM-FILE

**ALIAS-CATALOG-ID** = <composed-name 1..20>

,**FILE-NAME** = \*UNCHANGED / <filename 1..54>

,**ATTRIBUTES** = \*UNCHANGED / \*STD / list-poss(4): \*SYSTEM-DEFAULT / \*INVISIBLE /

\*SECRET-FILE-NAME / \*PRIVILEGED

### Operands

**ALIAS-CATALOG-ID** = <composed-name 1...20>

The symbolic name under which the AC system file can be addressed by a LOAD-ALIAS-CATALOG command. The user can request a display of the list of all the available AC system files by a SHOW-ACS-SYSTEM-FILES command.

**FILE-NAME** = \*UNCHANGED / <filename 1..54>

The assignment to the fully qualified, real file name of an AC system file, in which the entries are stored, is either to be kept unchanged or modified.

Before the file is inserted into the list of AC system files, the operand FILE-NAME will be supplemented, where appropriate, by the user ID of the calling task and its default pubset.

**ATTRIBUTES** =

Specifies the attributes which the AC system file is to be given.

---

**ATTRIBUTES = \*UNCHANGED**

The declarations made by the ADD-ACS-SYSTEM-FILES command are to remain valid.

**ATTRIBUTES = \*STD**

The AC system file is not to be given any of the attributes which follow, although the attribute SYSTEM-DEFAULT cannot be reset by this.

**ATTRIBUTES = \*SYSTEM-DEFAULT**

This AC system file is to act as the default AC system file. The entries in this file will then automatically be loaded into the alias catalog of any user who specifies the value \*STD for the ALIAS-CAT-ID operand in a LOAD-ALIAS-CATALOG command.

If the attribute SYSTEM-DEFAULT is given to more than one AC system file, the last assignment which was made will always apply. If there is no AC system file which has been explicitly given this attribute, it is implicitly given to the first of the system files which was declared.

**ATTRIBUTES = \*INVISIBLE**

When the AC system files which are available to the nonprivileged user are being output (SHOW-ACS-SYSTEM-FILES command) the entry for this file will not be shown. The identifier of such an AC system file can only be used by users who have previously been informed of it, or who invoke specially provided procedures.

When the command SHOW-ACS-OPTIONS is used to output details of AC files which are loaded, the character '\*' will appear for such files instead of their IDs, unless the caller is the ACS administrator.

**ATTRIBUTES = \*SECRET-FILE-NAME**

When the AC files which are available to the user are being output (SHOW-ACS-SYSTEM-FILES and SHOW-ACS-OPTIONS commands), then instead of the file name for such a file, the string '\*SYSTEM' will appear, unless the caller is the ACS administration. The nonprivileged user thus has no way of discovering the real file name.

**ATTRIBUTES = \*PRIVILEGED**

When this AC system file is used in the LOAD-ALIAS-CATALOG command, its entries should be copied into the task's virtual alias catalog as **system entries**.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command correctly executed
	32	CMD0221	Internal system error
	64	ACS0012	Error: ACSF not found
	130	ACS0036	Resource bottleneck

---

## 4.6 MODIFY-ALIAS-CATALOG-ENTRY

Modify entry in alias catalog

<b>Component:</b>	ACS
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING ACS-ADMINISTRATION SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The MODIFY-ALIAS-CATALOG-ENTRY command is used to change an existing entry in the current alias catalog. The following attributes can be redefined by the user for the existing entry:

- actual file or job variable name to be substituted for the alias
- whether the alias substitution is to be logged
- whether the entry is displayed in the output of the SHOW-ALIAS-CATALOG-ENTRY command
- whether the entry is protected against changes or deletion by the MODIFY-ALIAS-CATALOG-ENTRY or REMOVE-ALIAS-CATALOG-ENTRY command
- range of the substitution: the entry applies only for files, only for job variables, or for both (RANGE operand)

The command is rejected if there is no existing entry for the specified alias or if an existing entry is protected against changes by the PROTECTED attribute.

Modified entries are only temporarily present in the task-local alias catalog, which means they are discarded when the alias catalog is deleted (explicitly with the PURGE-ALIAS-CATALOG command or implicitly when the task is terminated). If desired, however, the current entries can be saved in a file by using the STORE-ALIAS-CATALOG command.

#### *Privileged functions*

When an individual catalog entry is modified, the ACS administration can convert the entry to a system entry. In this case, the alias name is subjected to a less rigorous check; it is then always permissible to specify a catalog ID and a user ID (other than \$SYS\*. or \$TSOS.).

---

## Format

### MODIFY-ALIAS-CATALOG-ENTRY

```
ALIAS-FILE-NAME = <filename 1..54>
,FILE-NAME = *UNCHANGED / <filename 1..54> / *SAME
,ATTRIBUTES = *UNCHANGED / *STD / *PARAMETERS(...)
    *PARAMETERS(...)
        | LOGGING = *UNCHANGED / *YES / *NO
        | ,VISIBILITY = *UNCHANGED / *YES / *NO
        | ,PROTECTION = *UNCHANGED / *YES / *NO
,TYPE = *UNCHANGED / *USER / *SYSTEM
,RANGE = *UNCHANGED / *FILE / *JV / *BOTH
```

## Operands

### ALIAS-FILE-NAME = <filename 1..54>

Alias for which the actual file or job variable name is to be substituted by ACS.

### FILE-NAME = \*UNCHANGED

The associated actual file or job variable name is not changed.

### FILE-NAME = <filename 1..54>

Actual file or job variable name to be substituted by ACS for the alias. The name of a temporary file or job variable is not allowed.

If the actual name is identical to the alias, the entry is treated as a normal alias definition (in contrast to \*SAME).

The substitution of the file name is logged as ACS0000. The substitution of the job variable name is logged with ACS0049.

### FILE-NAME = \*SAME

*The original specification can only be changed if the entry does not have the PROTECTED attribute.*

The actual file or job variable name is the same as the alias, so no substitution and logging take place in this case; however, the entry prevents the insertion of the defined prefix.

### ATTRIBUTES = \*UNCHANGED / \*STD / \*PARAMETERS(...)

Changes the attributes of the existing entry created in the alias catalog. Several attributes may be specified together in a list.

### ATTRIBUTES = \*UNCHANGED

No attributes are changed.

### ATTRIBUTES = \*STD

The entry in the alias catalog is to have none of the attributes below.

### ATTRIBUTES = \*PARAMETERS(...)

The new entry is to have the following attributes:

---

**LOGGING = \*UNCHANGED / \*YES / \*NO**

Substitution of the alias is to be logged. This attribute is independent of the corresponding ACS setting which applies to the task.

**VISIBILITY = \*UNCHANGED / \*YES / \*NO**

Prevents the entry in the alias catalog from appearing in the output of the SHOW-ALIAS-CATALOG-ENTRY command.

**PROTECTION = \*UNCHANGED / \*YES / \*NO**

Protects the entry in the alias catalog against modification and deletion with the MODIFY-ALIAS-CATALOG-ENTRY and REMOVE-ALIAS-CATALOG-ENTRY commands respectively.

**TYPE = \*UNCHANGED / \*USER / \*SYSTEM**

*Only for users with ACS-ADMINISTRATION privilege:*

Specifies whether the type of the entry which is being modified is to be USER or SYSTEM.

**TYPE = \*UNCHANGED**

Preset value: the previous declaration continues to apply.

**TYPE = \*USER**

The catalog entry in the alias catalog is to be held as a user entry. Such entries are included when the virtual catalog is saved into a file.

**TYPE = \*SYSTEM**

The catalog entry in the alias catalog is to be held as a system entry. When the virtual catalog is saved into the AC file of a nonprivileged user, such entries are not included.

**RANGE = \*UNCHANGED / \*FILE / \*JV / \*BOTH**

Determines the range of the entry. Alias substitution can be defined for files and/or job variables.

**RANGE = \*UNCHANGED**

Preset value: the previous declaration continues to apply.

**RANGE = \*FILE**

Alias substitution is only effective for files.

**RANGE = \*JV**

Alias substitution is only effective for job variables.

**RANGE = \*BOTH**

Alias substitution is effective for both files and job variables.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed normally
	32	CMD0221	Internal error
	64	ACS0006	Error: ACE entry not found
	64	ACS0017	Error: alias catalog not available
	64	ACS0024	Invalid alias catalog entry
	64	ACS0029	Command not permitted
	128	ACS0018	ACS is not available

## Examples

For examples, see the ADD-ALIAS-CATALOG-ENTRY, LOAD-ALIAS-CATALOG, and SET-FILE-NAME-PREFIX commands.

---

## 4.7 MODIFY-ASE-PARAMETERS

Modify global ASE settings

<b>Component:</b>	ASE
<b>Functional area:</b>	Error logging
<b>Domain:</b>	ERROR-LOGGING
<b>Privileges:</b>	TSOS

### Function

The MODIFY-ASE-PARAMETERS command modifies global ASE settings. The size of the internal logging buffer in which SERSLOG events are logged is concerned here (ACTION=\*INTERNAL-LOGGING). When the ASE subsystem is started, the buffer is created with a size of 4 KB. If the buffer is not large enough, new log records overwrite the oldest entries ("wrap-around"). If this is not desired, the buffer can be enlarged. The SHOW-ASE-STATUS command can be used to determine whether wrap-around is being used.

ASE V1.0 enables up to 127 log records to be saved per 4-KB block.

The SHOW-ASE-PARAMETERS command displays the current buffer size.

### Format

<b>MODIFY-ASE-PARAMETERS</b>
------------------------------

<b>BUFFER-SIZE</b> = * <u>UNCHANGED</u> / <integer 1..16 <i>4Kbyte</i> >
--

### Operands

**BUFFER-SIZE** = \*UNCHANGED / <integer 1..16 *4Kbyte*>

Specifies the new size of the internal logging buffer in 4-KB blocks. When the subsystem starts, ASE creates the internal logging buffer with a size of 4 KB (corresponds to BUFFER-SIZE=1).

### Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
	1	ASE0010	Syntax error
	32	CMD0221	System error
	64	ASE0011	Semantic error

---

## 4.8 MODIFY-CHANGE-DATE

Modify changeover time

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** TSOS

### Function

The MODIFY-CHANGE-DATE command changes a future changeover time from standard daylight time to daylight saving time (or vice versa).

The modified changeover time must satisfy the following conditions:

- It must be between the neighboring changeover times like the previous changeover time
- It may not be within the next hour
- It must be 4 to 8 months away from its neighboring changeover times

**i** The MODIFY-CHANGE-DATE command modifies a changeover time for the current session. If required, also modify the changeover time in the GTIME parameter set of the startup parameter file so that it is valid for future sessions.

### Format

#### MODIFY-CHANGE-DATE

```
DATE = <date>  
,NEW-DATE = *UNCHANGED / <date>  
,NEW-TIME = *UNCHANGED / <time>
```

### Operands

**DATE = <date>**

Selects the changeover time to be modified.

**NEW-DATE = \*UNCHANGED / <date>**

Date of the new changeover time.

**NEW-TIME = \*UNCHANGED / <time>**

Time of day of the new changeover time in the format hh:mm.

No seconds may be specified.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CHD0010	Syntax error in the command
	32	CMD0221	System error
	64	CHD0011	Semantic error in the command

---

## 4.9 MODIFY-CONSOLE-OPTIONS

Set operator terminal output control options

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** not allocated  
**Privileges:** OPERATING  
**Routing code:** @

### Function

The MODIFY-CONSOLE-OPTIONS command can be used to set the following operator terminal (console) output control options:

- screen updating on operator terminals (SCREEN-UPDATE operand)
- maximum number of undisplayed (queued) messages (QUEUE-WARNING operand)

#### *Restrictions when using the “Operator LOGON” function*

If the “Operator LOGON” function is used (incompatible mode; system parameter NBCONOPI=Y), the command can refer only to the physical operator terminal at which it is issued. That means that:

- with this command the main operator terminal ceases to have a privileged status in relation to the other operator terminals;
- entering the command from authorized user programs is no longer permissible; and
- the only value accepted for the CONSOLE-UNIT operand is the default setting \*OWN, so this operand can be left unspecified.

### Format

#### MODIFY-CONSOLE-OPTIONS

```
CONSOLE-UNIT = *OWN / <alphanum-name 2..2>  
,SCREEN-UPDATE = *UNCHANGED / *SCROLL / *PERIOD(...)  
    *PERIOD(...)  
        | UPDATE-INTERVAL = *UNCHANGED / <integer 0..60 seconds>  
,QUEUE-WARNING = *UNCHANGED / <integer 10..500>
```

---

## Operands

### **CONSOLE-UNIT =**

Specifies the operator terminal whose parameters are to be modified.

### **CONSOLE-UNIT = \*OWN**

The parameters of the operator terminal from which the command was issued are to be modified (default value).

### **CONSOLE-UNIT = <alphanum-name 2..2>**

*Not allowed in conjunction with the Operator Logon function.*

Specifies the mnemonic device name of the operator terminal whose parameters are to be modified. A different operator terminal may be specified at the main operator terminal or by an authorized user program only in compatible mode (NBCONOP1=N).

### **SCREEN-UPDATE =**

Defines the time intervals at which the screen is to be updated and how many lines are to be affected. There are two screen update modes: roll-up mode and interval mode.

### **SCREEN-UPDATE = \*UNCHANGED**

The values set for UPDATE-INTERVAL and MESSAGE-REPLACE-RATE remain unchanged.

### **SCREEN-UPDATE = \*SCROLL**

Sets roll-up mode. Screen update takes place at intervals of 255 ms, with one message per output.

### **SCREEN-UPDATE = \*PERIOD(...)**

Specifies values for the screen update and replacement of messages.

#### **UPDATE-INTERVAL = \*UNCHANGED**

The preset value is to remain unchanged.

#### **UPDATE-INTERVAL = <integer 0..60 seconds>**

Specifies the minimum time (in seconds) that may elapse between two screen updates. You can specify values in the range of 0 to 60; the default value is 0 (i.e. 255ms).

### **QUEUE-WARNING =**

Specifies the number of queued messages which may accrue at a given operator terminal.

### **QUEUE-WARNING = \*UNCHANGED**

The preset value is to remain unchanged.

### **QUEUE-WARNING = <integer 10..500>**

Specifies the number of queued messages which may accrue at a given operator terminal. If the number of such outstanding messages exceeds the specified value, control passes to interval mode with UPDATE-INTERVAL=0 (i.e. 255 ms).

Possible values: 10 <= int <= 500

The preset value is 50.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NBR0927	Command partially executed
	1	CMD0202	Syntax error
1	32	NBR0926	Internal error in command server
	64	CMD0216	Privilege violation
2	64	NBR0898	Input from user task illegal
1	64	NBR0922	Semantic error: command may be issued only from main console or by application
2	64	NBR0923	Semantic error: incorrect MN
3	64	NBR0924	Command not permitted on this console type
4	64	NBR0925	Semantic error; operand not allowed
	64	NBR1043	Authorized user program not allowed to perform this function in incompatible mode (NBCONOPI=Y)
	130	NBR0921	Out of memory

## 4.10 MODIFY-DBL-DEFAULTS

Set defaults for DBL calls

**Component:** BLSSERV  
**Functional area:** Program control  
**Domain:** PROGRAM  
**Privileges:** STD-PROCESSING

### Function

The MODIFY-DBL-DEFAULTS command sets defaults on a task-local basis for subsequent calls to the DBL using the START- and LOAD-EXECUTABLE-PROGRAM (or START-/LOAD-PROGRAM) commands and the BIND macro. Apart from setting specific values, it can configure their scope and priority.

The SHOW-DBL-DEFAULTS command lists the current settings. The RESET-DBL-DEFAULTS command can be used to return all settings to the original defaults.

### Format

#### MODIFY-DBL-DEFAULTS

```

## Operands

A value of \*UNCHANGED for an operand means that the previous setting of the associated DBL parameter is left unchanged. If nothing has yet been specified for the operand in a MODIFY-DBL-DEFAULTS command, the value that follows \*UNCHANGED in the syntax description applies.

The only operands described below are those which do not appear in LOAD-/START-EXECUTABLE-PROGRAM (or LOAD-/START-PROGRAM). The operands of the DBL macros are listed in [table "Assignment to corresponding operands of DBL macro calls"](#).

### PRIORITY =

Defines the priority of DBL parameter settings.

---

### **PRIORITY = \*STD**

The DBL parameters specified in LOAD-/START-EXECUTABLE-PROGRAM (or LOAD-/START-PROGRAM) or in the BIND macro have top priority. Thus, the hierarchy is as follows:

1. values specified in LOAD-EXECUTABLE-PROGRAM (or LOAD-/START-PROGRAM) or in a BIND macro call
2. values specified in the MODIFY-DBL-DEFAULTS command
3. default values defined on initialization of an internal DBL parameter table. In the syntax chart, these are the values following \*UNCHANGED, unless some other value is underscored

### **PRIORITY = \*FORCED**

The DBL parameters defined in MODIFY-DBL-DEFAULTS have top priority. The DBL parameters specified in EXECUTABLE-PROGRAM (or LOAD-/START-PROGRAM) or in a BIND macro are ignored by the DBL.

**i** PRIORITY = \*FORCED must not be specified together with LIBRARY, PROGRAM-VERSION, CONTEXT-NAME or CONTEXT-STAT.

### **SCOPE =**

Defines the scope of the settings.

### **SCOPE = \*ALL(...)**

The default settings apply both to DBL commands ((START-/LOAD-EXECUTABLE-PROGRAM or START-/LOAD-PROGRAM) and to DBL macros (BIND, ASHARE)).

### **SCOPE = \*CMD-CALLS(...)**

The default settings apply to DBL commands only (START-/LOAD-EXECUTABLE-PROGRAM or START-/LOAD-PROGRAM).

### **LOADING = \*PARAMETERS(...)**

#### **PROGRAM-MODE = \*UNCHANGED / \*STD / 24 / \*ANY**

Defines the part of the address space (above or below 16 MB) in which the load unit modules are to be loaded.

\*STD is set by default at task start.

#### **PROGRAM-MODE = \*STD**

The DBL default depends on the command call:

- In the case of LOAD-/START-EXECUTABLE-PROGRAM with FROM-FILE=\*LIBRARY-ELEMENT(...), PROGRAM-MODE=\*ANY is assumed as the DBL default value.
- In the case of LOAD-/START-PROGRAM with FROM-FILE=\*MODULE(...), PROGRAM-MODE=24 is assumed as the DBL default value.

### **CISC-COMPILATION = \*UNCHANGED / \*YES(...) / \*NO**

Specifies whether CISC-FW compilation is permitted. CISC-FW is a firmware component on SU x86 for mapping nonprivileged /390 code to X86-64 code. It supplements X86-64 mode and enables existing /390 code to be executed object-compatibly on SU x86. CISC-FW contains a Just-In-Time /390 code compiler which converts /390 code to X86-64 code at runtime.

A code block is compiled only when it is executed and is stored in a local task CISC-FW memory. When the code block is executed again, the code, which has already been compiled and optimized, is executed directly from the CISC-FW memory. Further optimization is achieved by making the CISC-FW memory resident.

---

CISCFW compilation is enabled by default.

In systems possessing only a small memory extension, programs that require high performance should be executed with CISCFW compilation. In the case of very large programs, a correspondingly larger main memory should be chosen (WORKSPACE operand).

**CISC-COMPILATION = \*YES(...)**

CISCFW compilation is allowed.

**WORKSPACE = \*STD / <integer 1..2048 Mbyte>**

Defines the size of the work area in MBytes available for the CISCFW memory. The default setting is \*STD, i.e. the size of the work storage area for CISCFW compilation is defined by the compiler.

**SHOW-MEMORY-USAGE = \*UNCHANGED / \*NO / \*YES**

Specifies whether the main memory that is to be used for the CISCFW memory is defined by the current value of the system parameter JTSTDMEM.

**CISC-COMPILATION = \*NO**

CISCFW compilation is not to be used. /390 code is emulated by the /390 firmware.

**SCOPE = \*PROGRAM-CALLS(...)**

The default settings apply to DBL macros only (BIND, ASHARE, see [table "Assignment to corresponding operands of DBL macro calls"](#)).

**LOADING = \*PARAMETERS(...)**

**CLOSE-LIBRARIES = \*UNCHANGED / \*ALL / \*NONE / \*ALTERNATE-LIBRARIES**

Specifies whether the libraries used by DBL are to be closed after processing.

**CLOSE-LIBRARIES = \*ALL**

All libraries used by DBL are closed.

**CLOSE-LIBRARIES = \*NONE**

None of the libraries used by DBL are closed.

**CLOSE-LIBRARIES = \*ALTERNATE-LIBRARIES**

Only the alternate libraries are closed.

**REP-SCOPE = \*UNCHANGED / \*CONTEXT / \*UNIT**

Specifies whether REP processing is to be performed for all modules in the context or only the modules of the current load unit.

**REP-SCOPE = \*CONTEXT**

REP processing is carried out for all modules in the context.

**REP-SCOPE = \*UNIT**

REP processing is restricted to the modules of the current load unit. All other modules in the context are skipped.

**CONTEXT-NAME = \*UNCHANGED / <filename 1..32>**

Names a context in which the load units are to be loaded. The name must begin with a letter. If no name is specified, the context LOCAL#DEFAULT is used.

**CONTEXT-STATE = \*UNCHANGED / \*ANY / \*NEW / \*OLD**

Determines whether the context specified with CONTEXT-NAME must or can exist.

---

**CONTEXT-STATE = \*ANY**

If a user context with the specified name (CONTEXT-NAME) exists, this context is used; otherwise, a new context is created.

**CONTEXT-STATE = \*NEW**

A new context with the specified name (CONTEXT-NAME) is created. This context must not be already present.

**CONTEXT-STATE = \*OLD**

The context with the specified name (CONTEXT-NAME) is used. This context must be one that exists.

**RESOLUTION = \*PARAMETERS(...)****RESOL-TYPE = \*UNCHANGED / \*STD / \*USER(...)**

Specifies the search strategy for resolving external references.

**RESOL-TYPE = \*STD**

The search sequence predefined by DBL applies:

1. link context
2. shared code of the user
3. shared code of the system
4. reference context(s)

**RESOL-TYPE = \*USER(...)**

The search sequence is defined by the user.

**ORDER = \*UNCHANGED / list-poss(4): \*LINK-CONTEXT / \*USER-SHARED-CODE / \*SYSTEM-SHARED-CODE / \*REFERENCE-CONTEXTS**

The user-defined search sequence is specified in the form of a list of the following keywords. The order in which the contexts are searched is defined by the sequence of the keywords in the list:

*LINK-CONTEXT	for link context
*USER-SHARED-CODE	for shared code of the user
*SYSTEM-SHARED-CODE	for shared code of the system
*REFERENCE-CONTEXT	for reference context

Each keyword can appear in the list only once. Keywords that are not specified in the list are appended to the end of the list internally by DBL in accordance with the predefined sequence (see \*STD).

*Example*

The specification `ORDER= ( *SYSTEM-SHARED-CODE , *USER-SHARED-CODE )` is extended to `ORDER= ( *SYSTEM-SHARED-CODE , *USER-SHARED-CODE , *LINK-CONTEXT , *REFERENCE-CONTEXT )`. When external references are resolved, the search is performed in the following order:

1. in the system's shared code

2. in the user's shared code
3. in the link context
4. and, finally, in the reference context

**PUBLIC-RESOL-TYPE = \*UNCHANGED / \*STD / \*USER(...)**

Specifies the search strategy for the resolution of external references in PUBLIC parts of LLMs.

**PUBLIC-RESOL-TYPE = \*STD**

The search sequence predefined by the DBL applies:

1. shared code of the user
2. shared code of the system
3. link context

**PUBLIC-RESOL-TYPE = \*USER(...)**

The search sequence is specified by the user.

**ORDER = \*UNCHANGED / list-poss(3): \*USER-SHARED-CODE / \*SYSTEM-SHARED-CODE / \*LINK-CONTEXT**

Specifies the user-defined search sequence in the form of a list of the following keywords. The order in which the contexts are to be searched is defined by the sequence of the keywords in the list:

*USER-SHARED-CODE	for shared user code of the user
*SYSTEM-SHARED-CODE	for shared user code of the system
*LINK-CONTEXT	for link context

Each keyword can appear in the list only once. Keywords that are not specified in the list are appended to the end of the list internally by DBL in accordance with the predefined sequence (see \*STD).

*Example*

The specification ORDER=\*SYSTEM-SHARED-CODE is extended to ORDER=( \*SYSTEM-SHARED-CODE , \*USER-SHARED-CODE , \*LINK-CONTEXT ). When external references are resolved in PUBLIC parts, the following search order is used:

1. in the system's shared code
2. in the user's shared code
3. and, finally, in the link context

**ERROR-PROCESSING = \*PARAMETERS(...)**

**UNRESOLVED-EXTRNS = \*UNCHANGED / \*STD / \*DELAY / \*DELAY-WARN / \*ABORT**

With the exception of the operand value \*DELAY-WARN, the operand occurs in LOAD-/START-EXECUTABLE-PROGRAM (or LOAD-/START-PROGRAM).

**UNRESOLVED-EXTRNS = \*DELAY-WARN**

The specification mainly corresponds to the operand value \*DELAY. However, when unresolved external symbols are found in the context, a return code is provided as a warning.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	BLS0150	The command was executed and a warning was issued
1	1	BLS0170	PRIORITY=*FORCED not allowed with specified operands
1	1	BLS0171	Invalid context name
1	32	BLS0002	Internal DBL error
1	32	BLS0152	System error
	64	CMD0216	User is not authorized to issue the command

## Notes

- For compatibility reasons, the priorities indicated above do not apply to the BIND macro parameters NACOL, UNRES, LDINFO, TSTOPT, MSG, and AMODCHK. The default settings are always taken from the LOAD-/START-EXECUTABLE-PROGRAM or LOAD-/START-PROGRAM command.
- The command MODIFY-DBL-DEFAULTS PRIORITY=\*FORCED is rejected if used with the specification of a library (file name or file link name), context, or program version.
- The default settings are not relevant for the LINK macro described in the appendix.
- The search order specified in the RESOL-TYPE and PUBLIC-RESOL-TYPE operands (ORDER suboperand) has no influence on **which** contexts are searched. **Whether** shared code is searched must be specified with the SHARE-SCOPE operand.

## Operands of the command and corresponding macro operands

## 4.11 MODIFY-DEFAULT-ACCOUNT

Modify default account numbers

**Component:** SRPMNUC

**Functional area:** Job processing  
User management  
POSIX administration and application

**Domain:** USER-ADMINISTRATION

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
OPERATING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

With the MODIFY-DEFAULT-ACCOUNT command the user modifies the default account numbers which are entered in the user catalog of the home pubset for BS2000 timesharing mode and POSIX access. The particular default account number entered is used in the following cases:

- The default account number for BS2000 timesharing mode is used for interactive or batch access if no account number is specified in the SET-LOGON-PARAMETERS, ENTER-JOB or ENTER-PROCEDURE command (ACCOUNT=\*NONE is the default).
- The default account number for POSIX access is always used for POSIX Rlogin and remote access as POSIX access itself does not provide an account number.

### Format

<b>MODIFY-DEFAULT-ACCOUNT</b>
<b>LOGON-DEFAULT</b> = <u>*UNCHANGED</u> / *NONE / <alphanum-name 1..8>
<b>,POSIX-DEFAULT</b> = <u>*UNCHANGED</u> / *NONE / *SAME / <alphanum-name 1..8>

### Operands

**LOGON-DEFAULT = \*UNCHANGED / \*NONE / <alphanum-name 1..8>**

Specifies which account number is to be used as the default for interactive and batch access in BS2000 timesharing mode.

**LOGON-DEFAULT = \*UNCHANGED**

The definition applicable so far remains unchanged.

**LOGON-DEFAULT = \*NONE**

No default account number is to be used.

**LOGON-DEFAULT = <alphanum-name 1..8>**

The account number specified becomes the default account number.

---

**POSIX-DEFAULT = \*UNCHANGED / \*NONE / \*SAME / <alphanum-name 1..8>**

Specifies which account number is to be used as the default for POSIX Rlogin and remote access.

**POSIX-DEFAULT = \*UNCHANGED**

The definition applicable so far remains unchanged.

**POSIX-DEFAULT = \*NONE**

No default account number is to be used.

**POSIX-DEFAULT = \*SAME**

The same default account number is to be used as for BS2000 access.

**POSIX-DEFAULT = <alphanum-name 1..8>**

The account number specified becomes the default account number.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
2	0	SRM6001	Command executed with warning
	32	SRM6020	Command rejected owing to system error
	64	SRM6040	Command rejected with error message
	130	SRM6030	Command rejected owing to lack of resources

---

## 4.12 MODIFY-FILE-ATTRIBUTES

Modify attributes of file

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION TSOS
<b>Routing code:</b>	\$ (bei NBCONOPI=N) bzw. E (bei NBCONOPI=Y)

### Function

The MODIFY-FILE-ATTRIBUTES command changes the attributes for existing catalog entries (see [section "Overview of functions"](#)). Only the owner, any co-owners (see "Privileged functions") and systems support personnel are allowed to modify all the file's attributes. Other users, who have write permission for the the file, are only allowed to allocate extra space or tapes and modify the CODED-CHARACTER-SET and NET-CODED-CHAR-SET entries.

If a file is write-protected by a password, the password must have been added to the password table for the job (see the ADD-PASSWORD command).

File renaming (NEW-NAME operand) and the operand settings AVAILABILITY=\*HIGH (even specified implicitly by the allocation of a storage class) and MIGRATE=\*FORBIDDEN are rejected if applied to a file which has been migrated from the processing level (S0) to a background level (S1 or S2) using HSMS.

For each of the operands, a value of \*UNCHANGED means that the value previously specified will continue to apply. If a permanent file is recataloged as a temporary file (or vice versa), file attributes may change even if \*UNCHANGED is specified (see [section "Temporary files"](#)).

#### *Privileged functions*

The following functions are available to nonprivileged users only if the physical allocation of public space is allowed (see "Privileged functions" in the function description of the CREATE-FILE command):

- explicit specification (values other than the default, \*STD) of a volume or volume set in the VOLUME or VOLUME-SET operand in the structure SUPPORT=\*PUBLIC-DISK (STORAGE-CLASS=\*NONE(...)) when the files are contained on the pubset's disks
- absolute space reservation using SPACE=\*ABSOLUTE(...) in the structure SUPPORT=\*PUBLIC-DISK(...)
- intensified migration locking using MIGRATE=\*FORBIDDEN
- locking against migration to another volume set in the SM pubset, using S0-MIGRATION=\*FORBIDDEN

Exception: Privileged functions are not available for work files if no authorization for physical allocation is given.

Systems support personnel can supplement the user information in the file catalog with one to eight bytes of information about the file (ADM-INFORMATION operand).

---

Systems support personnel (TSOS privilege) can have accesses to the file monitored (AUDIT operand). To configure the AUDIT function, nonprivileged users need appropriate authorization in the user entry of the pubset in which the file is to be created (see the *AUDIT* output field of the SHOW-USER-ATTRIBUTES) command.

By default, systems support (TSOS privilege) is a co-owner of all the files (and can, therefore, modify files under any user ID). When SECOS is used, this co-ownership can be restricted for permanent files.

### *Temporary files*

Temporary files can be accessed only by the task which creates them and by systems support personnel. It is impossible to specify any file protection measures for them, i.e. no passwords can be defined for them, and only the standard protection attributes ACCESS= \*WRITE, USER-ACCESS=\*OWNER-ONLY, BASIC-ACL=\*NONE, GUARDS=\*NONE, and FREE-FOR-DELETION=\*NONE can be assigned. The EXPIRATION-DATE operand may only be specified as \*UNCHANGED (the default value in the catalog entry of a file already created with OPEN /CLOSE is <= current date, otherwise NONE). If a permanent file is recataloged (renamed) as a temporary file or vice versa, the default protection attributes are set automatically, even if the associated operand is specified as \*UNCHANGED.

The attribute NUM-OF-BACKUP-VERS can be given only two values: \*UNCHANGED or 0.

If a permanent file is recataloged as a temporary file, the attribute NUM-OF-BACKUP-VERS switches from \*UNCHANGED to 0. If the value is specified explicitly, only \*UNCHANGED or 0 are accepted.

If a temporary file is recataloged as a permanent file, the attribute NUM-OF-BACKUP-VERS switches from \*UNCHANGED to the value specified in the system parameter NUMBACK.

The BACKUP-CLASS and DISK-WRITE attributes may likewise change when a permanent file is recataloged (renamed) as a temporary file or vice versa if the associated operand is assigned the default value \*UNCHANGED (see operand description).

A nonprivileged user can only generate temporary files on the default pubset of his user ID.

### *Verifying command execution*

The DIALOG-CONTROL operand governs whether a verification dialog is to be conducted with the user. The OUTPUT operand lets the user specify whether each file name that is processed is to be logged in a guaranteed message to SYSOUT. In conjunction with the chargeable SDF-P subsystem, the processed file names can be viewed in the S variable stream for guaranteed messages (SYSMSG; see also the ASSIGN-STREAM and EXECUTE-CMD commands in the "SDF-P" manual [34]).

### *Physical allocation in SM pubsets*

A user who is allowed to perform physical allocation of public storage space (see "Privileged functions" in the CREATE-FILE command function description) can directly specify a volume or volume set (VOLUME or VOLUME-SET operand) in the structure STORAGE-CLASS= \*NONE(...) in order to select a specific volume set of an SM pubset as the storage location for a file.

The WORK-FILE attribute is specified implicitly. In addition, a lock on migration to another volume set of the SM pubset is placed on the file (S0-MIGRATION=\*FORBIDDEN; see also the identically named operand in the command description).

When S0-MIGRATION=\*FORBIDDEN is set (explicitly with the identically named operand or implicitly through the physical allocation of storage space), the file's PERFORMANCE and AVAILABILITY attributes are matched to the identically named attributes of the volume set.

These attributes correspond to the levels of PERFORMANCE (STD, HIGH, VERY-HIGH) and AVAILABILITY (STD, HIGH) which are hierarchically arranged in the user catalog. To ensure that there are adequate levels of performance and availability, files with the S0-MIGRATION=\*FORBIDDEN attribute are always assigned at least

---

the PERFORMANCE and AVAILABILITY levels defined for the volume set (you can list the attributes of the volume set with the SHOW-PUBSET-DEFINITION-FILE command (and also with SHOW-PUBSET-CONFIGURATION)). Any explicit specification of the PERFORMANCE and AVAILABILITY operands which selects a lower level in the hierarchy is ignored. The minimum value is recorded in the file's catalog entry, and the level in the user catalog is set accordingly. Note that a file's PERFORMANCE attribute may be higher than the maximum permissible value as set in the user entry (*DMS-TUNING-RESOURCES* output field). Then, regardless of the level that has been set, the file will at best be processed using the value which is in the user entry at the time of OPEN processing. The level settings and the value of the DMS-TUNING-RESOURCES attribute can be viewed in the output of the SHOW-USER-ATTRIBUTES command, INFORMATION=\*PUBSET-ATTRIBUTES operand.

### *Example*

Together with the operand setting S0-MIGRATION=\*FORBIDDEN or in conjunction with physical allocation, the user specifies PERFORMANCE=\*HIGH or \*STD (or this applies implicitly, since it is the default), but the attribute of the chosen volume set is PERFORMANCE=\*VERY-HIGH. The file will then automatically be assigned the attribute PERFORMANCE=\*VERY-HIGH. If the user entry includes DMS-TUNING-RESOURCES=\*NONE, the file will actually only be processed with a setting of PERFORMANCE=\*STD.

### *Work files*

A file which is in an SM pubset and does not yet occupy any storage space can be defined as a work file by the user in one of the following ways:

- explicitly by setting the operand value WORK-FILE=\*YES.
- implicitly by physical allocation in a volume set for work files (VOLUME-SET operand)
- implicitly by assignment to a storage class with the attribute WORK-FILE=\*YES

Work files are created as permanent files in a volume set defined for that purpose. Systems support personnel can delete work files again at times which it defines.

By default, work files are not backed up.

The WORK-FILE attribute cannot be changed for files which already occupy storage space, i.e. that a "normal" file cannot be recataloged as a work file and vice versa.

Only a storage class with the attribute WORK-FILE=\*YES can be assigned to a work file. The only possible setting for the AVAILABILITY attribute for work files is \*STD, i.e. AVAILABILITY=\*HIGH will be rejected.

### *Files in SM pubsets*

The storage location for a file on an SM pubset can be selected on the basis of a storage class. This simplifies the automatic management of storage space on an SM pubset (for details see the "Introduction to System Administration" [14] or the "System-Managed Storage" manual [45]).

Systems support personnel allocates to a storage class certain file attributes which are implicitly set for all files assigned to that storage class. If a storage class is specified, there is no need to explicitly specify values for the WORK-FILE, VOLUME-SET, VOLUME, DEVICE-TYPE, IO-ATTRIBUTES, DISK-WRITE, FILE-PREFORMAT, and AVAILABILITY operands.

The SHOW-STORAGE-CLASS command allows users to find out which storage classes of the SM pubset are available to them and which file attributes are set.

If the requirements for the file's storage location are changed (explicitly or implicitly by way of the storage class), the storage location may change automatically, with the result that the file is moved to a different volume set.

The change of storage location is a synchronous process involving copying of the file. The file is not accessible to other tasks while copying is in progress.

---

An automatic change of storage location and the recataloging of a permanent file as a temporary file (or vice versa) cannot be performed at the same time.

*Files on tapes and tape cartridges*

When the catalog entries for tape files are being accessed or created, the special features associated with this storage medium must be taken into account.

For files with standard labels, the specifications for shareability (USER-ACCESS), access type (ACCESS) and passwords will be transferred from the catalog entry into the file labels at the time the file is created.

Since the file labels on a tape cannot be amended without corrupting the file (hardware restriction), and the contents of the catalog entry for each file must agree with the contents of its file labels, it will not be possible to amend the access rights and expiration date using a MODIFY-FILE-ATTRIBUTES command after the file has once been correctly opened and closed again. This means that the file protection attributes can only be changed before the file is opened for the first time. These attributes will then be transferred unchecked into the labels when the file is created. This allows attributes, e.g. write protection (MODIFY-FILE-ATTRIBUTES...ACCESS=\*READ) to be defined for a file which has yet to be created. The file can then be opened as an output file, and created; the write protection will take effect after this.

If password protection is specified for a tape file, then when the file is created, the label processing routines will transfer the passwords from the catalog entry to the HDR3 labels, without checking them (conversely, the passwords will be transferred from the HDR3 label to the catalog entry if the file is imported).

For file processing in batch mode, if ADD-FILE-LINK...PROTECTION-LEVEL=\*LOW is specified, the file owner can bypass the checking of the passwords if his user entry includes TAPE-ACCESS=\*PRIVILEGED

If systems support specified password encryption using the system parameter ENCRYPT, then the encryption indicator in the HDR3 label will be set to "1".

## Overview of functions

Function / Meaning	Level 1 operands	Level 2/3 operands
Name of the catalog entry which is to be changed	FILE-NAME =	
New name of the file	NEW-NAME =

## Operands

### **FILE-NAME = <filename 1..54 without-gen with-wild(80)>**

Name of an existing permanent or temporary file. If the file name includes wildcards, or if the specification is partially qualified, the command is executed for the associated set of files. Processing can be controlled and verified with the aid of the DIALOG-CONTROL and OUTPUT operands. Only systems support is allowed to use wildcards within the user ID. In processing a file set, no distinction is made between files and file generation groups. Changes to group entries are rejected if operands not available for file generation groups are specified in the command. The MODIFY-FILE-GROUP-ATTRIBUTES command should be used to modify group entries.

### **NEW-NAME = \*SAME / <filename 1..54 with-wild-constr(80)>**

Specifies whether the file is to be renamed.

### **NEW-NAME = \*SAME**

The default value is \*SAME, i.e. the current name is retained.

### **NEW-NAME = <filename 1..54 with-wild-constr(80)>**

The file is to be renamed. Either a new file name or the name of a new file generation is specified. The command is rejected if a file or file generation with the specified name already exists. Files which are on HSMS storage level S1 or S2 cannot be renamed (see the STORAGE-LEVEL operand in the SHOW-FILE-ATTRIBUTES command). If a set of files has been specified in the FILE-NAME operand, a constructor can be used to specify how the names of the target files are to be formed. The constructor string should be designed to ensure that the names of the target files are unique. Renaming is rejected for file names which already exist. If, for example, a fully qualified file name is specified as the new name for a set of files, only the first file can be given this name. For the following files, the name will already exist, so renaming will be rejected.

If a permanent file is recataloged as a temporary file (or vice versa), the values in the catalog entry may change even if the default value \*UNCHANGED has been specified for the operand in question. A nonprivileged user can only generate temporary files on the default pubset of his user ID.

With tape files, NEW-NAME must differ from FILE-NAME by the addition of, or by a change to, the version identifier.

If a file generation is specified (relatively or absolutely), the absolute number of the new generation must either be LAST-GEN + 1 or, with LAST-GEN=9999, must be equal to 1 (see *BASE-NUM* and *LAST-GEN* output fields, SHOW-FILE-ATTRIBUTES command).

*Renaming a file as a file generation:* The CODED-CHARACTER-SET specified for the file must be the same as that defined in the file generation's group entry. In an SM pubset, the WORK-FILE attributes of the file and the file generation group must also match. Any further file attribute specifications must be made in the SUPPORT operand. The other file attributes of the original file (such as its protection attributes) are automatically set to the values defined in the group entry.

### **SUPPORT = \*UNCHANGED / \*PUBLIC-DISK(...) / \*PRIVATE-DISK(...) / \*ANY-DISK(...) / \*TAPE(...)**

Type of volume on which the file is located. This entry must not contradict the specification that was made when the catalog entry was created (CREATE-FILE).

### **SUPPORT = \*PUBLIC-DISK(...)**

The file is located on a public disk or Net-Storage.

### **STORAGE-TYPE = \*UNCHANGED / \*STD / \*PUBLIC-SPACE / \*NET-STORAGE**

Determines the storage type for the file's storage location.

Files which have already been allocated cannot be moved from public disks to Net-Storage volumes and vice versa.

---

**STORAGE-TYPE = \*STD**

The file is created on the default storage type for storing files on this pubset.

**STORAGE-TYPE = \*PUBLIC-SPACE**

The file is created on the disks of the pubset.

In addition to the entry in the file catalog, the file is also created physically with the smallest possible amount of storage space (see the [SPACE](#) operand).

**STORAGE-TYPE = \*NET-STORAGE(...)**

The file is created on a Net-Storage volume.

The authorization NET-STORAGE-USAGE=\*ALLOWED (default) must be entered in the user entry. Catalog entries are generated both on the local pubset and in the relevant file system of the Net-Server. However, the file is not created physically. If no volume is specified, the file is created on the default Net-Storage volume.

**i** Files with a PAM key, file generation groups, work files and temporary files cannot be stored on Net-Storage.

**FILE-TYPE = \*UNCHANGED / \*STD / \*BS2000 / \*NODE-FILE**

Determines the file type in which the file is created. The file type can no longer be changed for files which have already been allocated.

**FILE-TYPE = \*STD**

The file is created as a BS2000 file on a Net-Storage volume. When the volume of a private disk is specified under STORAGE-CLASS=\*NONE(...), the file is created on the private disk.

**FILE-TYPE = \*BS2000**

The file is created as a BS2000 file on a Net-Storage volume. When under STORAGE-CLASS=\*NONE (...) specifications regarding the volume or device type are provided which do not permit this, the command is aborted with an error.

**FILE-TYPE = \*NODE-FILE**

The file is created as a node file on a Net-Storage volume. When under STORAGE-CLASS=\*NONE(...) specifications regarding the volume or device type are provided which do not permit this, the command is aborted with an error.

**STORAGE-CLASS = \*UNCHANGED / \*STD / \*UPDATE/ <composed-name 1..8> / \*NONE(...)**

Governs the properties of the file's storage location. A storage class is a container set up by systems support to hold a defined combination of file attributes specific to an SM pubset. On the basis of the assigned volume set lists it maps these attributes onto the existing range of pubset services. This mapping may be more detailed than can be described by explicitly specifying the WORK-FILE, IO-ATTRIBUTES, DISK-WRITE, AVAILABILITY, FILE-PREFORMAT, VOLUME-SET, VOLUME, DEVICE-TYPE and S0-MIGRATION operands in the structure STORAGE-CLASS=\*NONE.

At the time when the assignment is made, the storage class that is specified (even implicitly using \*STD) must exist, and the user must be authorized to use it. The SHOW-STORAGE-CLASS command allows users to find out which storage classes of an SM pubset are available to them and which file attributes are set.

Assigning a storage class simplifies the automatic management of storage space in an SM pubset (for details see the "Introduction to System Administration" [14] or the "System-Managed Storage" manual [45]).

The WORK-FILE attribute of the storage class must be the same as that of the file.

---

Defining a different storage class (STORAGE-CLASS unequal to \*NONE) can result in the file being relocated (reallocated) from its current volume set to another volume set which is better suited to this storage class. The following cases can occur here:

- If the storage class contains AVAILABILITY=\*HIGH and the existing volume set has AVAILABILITY=\*STD, the file must be reallocated to a volume set with the attribute AVAILABILITY=\*HIGH. If reallocation is not possible, the command is rejected.
- If the storage class contains a volume set list and the file is not located on a volume set of this volume set list, the file is, if possible, reallocated to a volume set from this list. If reallocation is not possible, the command is executed without it.

During reallocation, the file is open. Accesses from other tasks are rejected.

#### **STORAGE-CLASS = \*STD**

A file in an SM pubset is assigned the default storage class from the user entry for that pubset. If there is no default storage class defined, or if the file is stored in an SF pubset, the file is given the same attributes as with STORAGE-CLASS=\*NONE with default values.

#### **STORAGE-CLASS = \*UPDATE**

*The operand is evaluated only for files on SM pubsets to which a storage class has already been assigned.*  
The attributes are once more read from the storage class catalog and assigned to the file.

#### **STORAGE-CLASS = <composed-name 1..8>**

A file in an SM pubset is assigned the specified storage class. This specification is ignored for a file in an SF pubset; the file is then given the same attributes as with STORAGE-CLASS=\*NONE with default values.

#### **STORAGE-CLASS = \*NONE(...)**

The value has the same effect as \*UNCHANGED if all the following conditions are fulfilled:

- The file was or is being created on a volume set for permanent data storage.
- A default storage class is assigned to the user ID at the SM pubset in question.
- Physical allocation is not permitted.

Only in this case are the WORK-FILE, PERFORMANCE, USAGE, DISK-WRITE and AVAILABILITY operands and the S0-MIGRATION=\*ALLOWED specification ignored.

In all other cases, the properties of the file's storage location are determined on the basis of the following operands and no storage class is assigned to the file or a storage class which is already assigned is withdrawn.

#### **WORK-FILE = \*UNCHANGED / \*NO / \*YES**

*The operand is evaluated only for files in SM pubsets.* Specifies whether the file is a work file which systems support is allowed to delete at a time which it defines. If the file already occupies storage space, the only value allowed is \*UNCHANGED.

#### **WORK-FILE = \*NO**

The file is not to be a work file.

#### **WORK-FILE = \*YES**

The file is to be a work file.

#### **IO-ATTRIBUTES = \*UNCHANGED / \*PARAMETERS(...)**

Specifies the performance requirements demanded by the user for input/output operations. Whether such requirements are satisfied and the extent to which they are fulfilled depends on the cache medium that is

---

defined for the associated pubset (see the output of the SHOW-MASTER-CATALOG-ENTRY command). Read and write access is performed through a fast cache. The number of disk accesses and the access times are reduced. Performance attributes for processing can also be defined in the TFT (see the ADD-FILE-LINK command).

**IO-ATTRIBUTES = \*PARAMETERS(...)**

Performance attributes are determined by the values of the PERFORMANCE and USAGE operands.

**PERFORMANCE = \*UNCHANGED / \*STD / \*HIGH / \*VERY-HIGH / \*USER-MAXIMUM**

Specifies the file's performance attribute. It indicates the priority required for the I/O operations selected in the USAGE operand. The highest performance attribute allowed is defined in the user entry (see also the *DMS-TUNING-RESOURCES* output field in the output of the SHOW-USER-ATTRIBUTES command).

**PERFORMANCE = \*STD**

The file has no special performance attribute and is therefore not processed via a cache. The USAGE operand does not affect the processing of the file in this case.

**PERFORMANCE = \*HIGH**

The file is to be processed through a cache (high performance priority). This specification is only possible for users who have the DMS tuning privilege CONCURRENT-USE or EXCLUSIVE-USE for the pubset (see the output field *DMS-TUNING-RESOURCES* in the output of the SHOW-USER-ATTRIBUTES command).

**PERFORMANCE = \*VERY-HIGH**

The file is to be processed through a cache. The referenced data in the file is to be kept permanently in the cache (highest performance priority). The cache data is only evicted from the cache when the file is closed. Specification is only possible for users who have the DMS tuning privilege EXCLUSIVE-USE for the pubset (see the output for the SHOW-USER-ATTRIBUTES command, output field *DMS-TUNING-RESOURCES*).

*Note*

All cache segments used for this file are locked until the file is closed. If there are many files open with this attribute at the same time, the cache memory available for normally cached files may as a result be so greatly restricted that data accesses to such files can no longer be implemented with an adequate level of performance.

**PERFORMANCE = \*USER-MAXIMUM**

The file is assigned the highest performance attribute contained in the user catalog for the user.

**USAGE = \*UNCHANGED / \*READ-WRITE / \*WRITE / \*READ**

Specifies the I/O operations for which enhanced performance (caching) is required. The default setting is \*READ-WRITE, i.e. the requirements apply to read and write operations. If the file does not have a particular performance attribute (PERFORMANCE= \*STD) and if the cache area for the pubset is not defined in such a way that all existing files are served (see the operand CACHED-FILES=\*ALL for the MODIFY-PUBSET-CACHING-ATTRIBUTES command), then the USAGE operand has no effect on processing.

**USAGE = \*READ-WRITE**

The performance requirements apply both to read and to write operations.

---

**USAGE = \*WRITE**

The performance requirements apply to write operations only.

**USAGE = \*READ**

The performance requirements apply to read operations only.

*Note*

With USAGE=\*READ-WRITE or \*WRITE, write caching is performed only if the conditions for the DISK-WRITE file attributes are met (see CREATE-FILE or MODIFY-FILE-ATTRIBUTES). In the case of DISK-WRITE= \*IMMEDIATE, the cache medium used for write caching has to be failsafe (see the output for the command SHOW-MASTER-CATALOG-ENTRY INFORMATION=\*USER, output field *CACHE-MEDIUM*).

**DISK-WRITE = \*UNCHANGED / \*IMMEDIATE / \*BY-CLOSE**

Specifies the time at which the data must be on a nonvolatile medium (disk or fail-safe cache medium) after a write operation. If a volatile cache medium is used as the write cache, data in the file will not be in a consistent state until CLOSE processing has been completed because the write data is written out to disk during CLOSE processing. System errors during the processing phase may lead to inconsistencies. Write caching for files containing data which cannot easily be restored should be performed using only fail-safe cache media, i.e. data consistency after each write operation should be requested with DISK-WRITE=\*IMMEDIATE.

**DISK-WRITE = \*UNCHANGED**

When a temporary file is recataloged to a permanent file, DISK-WRITE=IMMEDIATE is set. DISK-WRITE=BY-CLOSE is set for the reverse case.

**DISK-WRITE = \*IMMEDIATE**

Data contained in the file must be on a nonvolatile medium immediately after a write operation. Write caching is performed for files marked in this way only if a nonvolatile cache area is active for the pubset (see the *CACHE-MEDIUM=NONVOLATILE* output field of the SHOW-MASTER-CATALOG-ENTRY command with INFORMATION= \*USER). If a volatile cache area is active for the pubset (*CACHE-MEDIUM=VOLATILE* output field), only read accesses are buffered for the file; write accesses are performed directly on the disks.

**DISK-WRITE = \*BY-CLOSE**

Data contained in the file needs to be on a nonvolatile medium only after CLOSE processing. Write caching for files marked in this way is performed regardless of whether the cache medium is fail-safe, i.e. even on volatile cache media. Unsaved cached data is written out during CLOSE processing. The data in the file will not be on a nonvolatile medium (disk storage) until that point. This attribute is suitable only for files containing data that can easily be restored (list files generated during compilation, for example), as a system error may cause inconsistencies in the files.

**AVAILABILITY = \*UNCHANGED / \*STD / \*HIGH**

Specifies availability requirements for the file. Files for which high availability is required must always be created by the system on suitable volumes (such as a disk with DRV mirroring). If no appropriate volume is available, the command is rejected.

**AVAILABILITY = \*STD**

The file is not subject to special availability requirements.

---

**AVAILABILITY = \*HIGH**

The file is to have high availability. A file for which high availability was not originally required is automatically relocated to a suitable volume. The file cannot be accessed while relocation is in progress. If the volume is not capable of meeting the requirement, or if no suitable volume set is available within the SM pubset, the command is rejected. This specification is not allowed for temporary files or when renaming a permanent file as a temporary file. Furthermore, the file must not have been migrated to one of the HSMS background storage levels, S1 and S2 (see the STORAGE-LEVEL operand in the SHOW-FILE-ATTRIBUTES command).

**FILE-PREFORMAT = \*STD / \*K / \*NK2 / \*NK4**

*The operand is evaluated only for files which do not yet occupy any storage space and for which storage space on an SM pubset is requested.* Governs the preferred file format, which is taken into account in the choice of volume set. As long as the file has not yet been opened (no CREATION-DATE in the catalog entry), the chosen storage location is provisional and may still change in the course of OPEN processing.

**FILE-PREFORMAT = \*STD**

The preferred file format which applies is the format that systems support has defined as the pubset-specific default for the SM pubset using the MODIFY-PUBSET-SPACE-DEFAULTS command. The value set can be determined with the SHOW-PUBSET-SPACE-DEFAULTS command (and also with SHOW-PUBSET-CONFIGURATION).

**FILE-PREFORMAT = \*K**

The file is to be created as a K file (BLOCK-CONTROL-INFO=\*PAMKEY).

**FILE-PREFORMAT = \*NK2**

The file is to be created as an NK file in 2K format (BLOCK-CONTROL-INFO= \*WITHIN-DATA-2K-BLOCK or \*WITHIN-DATA-BLOCK for a SAM file).

**FILE-PREFORMAT = \*NK4**

The file is to be created as an NK file in 4K format (BLOCK-CONTROL-INFO= \*WITHIN-DATA-4K-BLOCK or \*WITHIN-DATA-BLOCK for a SAM file).

**VOLUME-SET = \*STD / \*CONTROL-VOLUME-SET / <cat-id 1..4>**

*The operand is evaluated only for files which do not yet occupy any storage space and for which storage space on an SM pubset is requested.* Determines the volume set on which the file is to be stored.

Systems support can use \*CONTROL-VOLUME-SET or <cat-id 1..4> to specify a volume set explicitly. Nonprivileged users cannot specify a volume set explicitly unless they have authorization to perform physical allocation of public storage space (see "Privileged functions" under "Function" in the CREATE-FILE command).

**VOLUME-SET = \*STD**

The file is stored in a suitable volume set of the SM pubset.

**VOLUME-SET = \*CONTROL-VOLUME-SET**

*Subject to restrictions (see general operand description).* The file is stored in a control volume set of the SM pubset. S0-MIGRATION= \*FORBIDDEN is set implicitly. If the volume set does not match the requested file attributes, the command is rejected.

**VOLUME-SET = <cat-id 1..4>**

*Subject to restrictions (see general operand description).* The file is stored in the specified volume set of the SM pubset. S0-MIGRATION= \*FORBIDDEN is set implicitly. If the volume set does not match the requested file attributes, the command is rejected.

---

**VOLUME = \*UNCHANGED / list-poss(255): <vsn 1..6>**

Volume serial numbers of additional public disks or of a Net-Storage volume which may be used for storage space extension.

**VOLUME = list-poss(255): <vsn 1..6>**

Systems support can specify volume serial numbers explicitly.

Nonprivileged users can specify a VSN for a Net-Storage volume explicitly. Nonprivileged users can specify VSNs explicitly for a public disk only if they have authorization to perform physical allocation of public storage space (see [section "Privileged functions"](#)). VSNs can only be specified for public disks of the pubset whose pubset ID matches the catalog ID of the file name. If the specified disk is part of the volume set of an SM pubset, S0-MIGRATION and MIGRATE=\*FORBIDDEN are set implicitly.

In the case of files on Net-Storage the specified Net-Storage volume must be assigned to the catalog ID of the file name.

If the file is only cataloged and stored on a specific Net-Storage volume without a default name, the VSN must be specified. Otherwise, the file is stored in the default Net-Storage volume or, if this does not exist, the system selects a Net-Storage volume.

**DEVICE-TYPE = \*UNCHANGED / <device>**

Type of device to which the required public disks or Net-Storage volumes are assigned. Only device types known within the system are accepted. In interactive mode, the possible device types are displayed with DEVICE-TYPE=?.

The volume type NETSTOR must be specified for Net-Storage volumes.

If at least one volume ID is specified with VOLUME, each specification of a disk device type which is known to the system is handled like the STDDISK specification.

Systems support can specify device types explicitly.

When files are created on public volumes, nonprivileged users cannot specify a device type explicitly unless they have authorization to perform physical allocation (see [section "Privileged functions"](#)).

**S0-MIGRATION = \*UNCHANGED / \*ALLOWED / \*FORBIDDEN**

*The specification is relevant only for a file on an SM pubset.* Governs whether the file may be relocated to a different volume set within the SM pubset (storage level S0). Migration can be initiated either explicitly using the HSMS subsystem or implicitly by the system.

**S0-MIGRATION = \*UNCHANGED**

The previous value is left unchanged if the file already occupies storage space. With physical space allocation (explicit specification of a volume set or volume or absolute allocation), S0-MIGRATION=\*FORBIDDEN is set for a file not yet occupying storage space. Without physical allocation, S0-MIGRATION= \*ALLOWED is set.

**S0-MIGRATION = \*ALLOWED**

Migration of the file within the SM pubset is allowed.

**S0-MIGRATION = \*FORBIDDEN**

Nonprivileged users cannot select this value unless they are authorized to perform physical allocation of public space (see "Privileged functions" under "Function" in the CREATE-FILE command). Migration of the file within the SM pubset is not allowed. The S0 migration lock affects the allocation of PERFORMANCE and AVAILABILITY attributes to files (see [section "Physical allocation in SM pubsets"](#)).

**SPACE = \*UNCHANGED / \*RELATIVE(...) / \*ABSOLUTE(...) / \*RELEASE(...)**

Influences the storage space allocation for the file.

**SPACE = \*RELATIVE(...)**

Here, the user can request additional storage space for the file (as a relative allocation). Note that the storage

space ceiling defined for the user in the user entry may be exceeded only if the user is authorized to do so (PUBLIC-SPACE-EXCESS=\*YES, see the SHOW-USER-ATTRIBUTES command).

**PRIMARY-ALLOCATION = 0 / <integer 0..2147483647>**

The number of PAM pages by which the file should immediately be increased.

The user should note that, in procedures, etc. every call of the MODIFY-FILE-ATTRIBUTES command which has a positive value for the primary allocation will reserve storage space for the file. If the primary allocation is large, this will quickly exhaust the storage space assigned to the user. Since the disk selection mechanism is executed each time, a suitable primary allocation can be used to cause a disk swap when creating large files and only a few segments are free on individual disk. This then avoids excessive fragmentation of the file.

When storage space is actually allocated, the specified number of PAM pages is rounded up to a multiple of **k** if required. At this **k** is the number of PAM pages in the smallest allocation unit in each case.

Pubset/volume set format	Smallest allocation unit in Kbytes	Rounding factor k
K pubset/volume set	6	3
NK2(6K) pubset/volume set	6	3
NK2(8K) pubset/volume set	8	4
NK2(64K) pubset/volume set	64	32
NK4(8K) pubset/volume set	8	4
NK4(64K) pubset/volume set	64	32

Table 55: Smallest allocation unit based on pubset/volume set format

The pubset/volume set format and the smallest allocation unit can also be determined by the user from the output of the SHOW-MASTER-CATALOG-ENTRY command.

**SECONDARY-ALLOCATION = \*UNCHANGED / <integer 0..32767>**

The number of PAM pages for later file extensions.

The number of PAM pages specified here is not immediately reserved. Only if the number of pages initially reserved (primary allocation) is no longer sufficient will the system automatically increase the storage space allocated to the file by the number of PAM pages specified in SECONDARY-ALLOCATION (output field *S-ALLOC* of the SHOW-FILE-ATTRIBUTES command). The value for secondary allocation is doubled after each successful extension. It is no longer doubled when the maximum value set in the system has been reached. When storage space is actually allocated, the specified number of PAM pages is rounded up to a multiple of **k** if required. The rounding factor **k** is dependent on the pubset/volume set format, i.e. on the formatting of the associated disks (see the PRIMARY-ALLOCATION operand).

Specifying SECONDARY-ALLOCATION=0 will prevent dynamic extension of the file.

**SPACE = \*ABSOLUTE(...)**

Systems support staff can allocate storage space explicitly. Absolute allocation is allowed only if a disk is specified in the VOLUME operand.

Nonprivileged users are allowed to use an absolute allocation only if they have authorization to perform physical allocation of public storage space (see "Privileged functions" under "Function" in the CREATE-FILE command).

When requesting additional storage space (as an absolute allocation), please note: An absolute allocation will only be made if it is possible to reserve the whole of the specified number of PAM pages (SIZE) on **one** disk. If

---

this is not the case, the command is rejected. If more than one disk was specified in the VOLUME operand, then only the first of the named disks will be used. If no secondary allocation has been defined for the file, the *SECONDARY-ALLOCATION* field in the catalog entry will have the value zero, i.e. if the number of PAM pages specified in SIZE proves insufficient at a later point, there will be no automatic extension of the storage space.

**FIRST-PAGE = <integer 1..2147483647>**

Number of the first physical block of the file on the first specified disk. The value specified here must be a multiple of the smallest allocation unit **k** plus 1 (see SPACE=\*RELATIVE).

**SIZE = <integer 1..2147483647>**

Number of PAM pages required. This value must be a multiple of the smallest allocation unit **k** (see SPACE=\*RELATIVE).

**SPACE = \*RELEASE(...)**

Here, the user can release storage space which has been reserved but not used. The request to release memory space is ignored if SPACE-RELEASE-LOCK=\*YES has been defined for the file.

**NUMBER-OF-PAGES = <integer 1..2147483647> / \*ALL-RELEASABLE**

The maximum number of PAM pages which are to be released. \*ALL-RELEASABLE means that the maximum possible number of PAM pages will be released.

The release of storage space will start at the end of the file and work toward its beginning, in units of **k** PAM pages, going no further than the PAM page which follows the last occupied one. If DESTROY=YES is recorded in the catalog for the file, then up to the specified number of PAM pages (but not more than the number of unused PAM pages) will be overwritten with binary zeros.

**KEEP-MIN-ALLOCATION = \*NO / \*YES**

Specifies whether at least one allocation unit is to be retained for the file when storage space is released.

**MANAGEMENT-CLASS = \*UNCHANGED / \*NONE / <composed-name 1..8>**

Specifies whether the HSMS backup, archiving and long-term archiving functions are controlled by a management class defined using HSMS. See "HSMS, Volume 1" manual [18] for further details. Management class allocations are rejected for files in SF pubsets.

**MANAGEMENT-CLASS = \*NONE**

The file attributes set with the SAVE and MIGRATE operands are evaluated for file backup and migration.

**MANAGEMENT-CLASS = <composed-name 1..8>**

*This specification is permitted only for files on SM pubsets.* Name of the management class defined using HSMS. The specified management class must exist, and the file owner must have access authorization.

**USER-INFORMATION = \*UNCHANGED / \*NONE / <c-string 1..8 with-low>**

Specifies whether user information is to be added to the catalog entry. This information is not evaluated by the system. Its content and meaning are defined solely by the user. This specification is ignored for files on private disks. If \*NONE is specified, any existing user information is deleted.

**ADM-INFORMATION = \*UNCHANGED / \*NONE / <c-string 1..8 with-low>**

*This operand is available only to privileged users (TSOS privilege).* Specifies whether a text is to be added to the catalog entry as information for systems support. This information is not evaluated by the system. Its content and meaning are defined solely by systems support. This specification is ignored for files on private disks. If \*NONE is specified, any existing user information is deleted.

**SUPPORT = \*PRIVATE-DISK(...)**

The file is held on private disk.

---

**VOLUME = \*UNCHANGED / \*ANY(...) / list-poss(255): <alphanum-name 1..6>**

The VSNs of the required disks (additional disks can be requested here; the operand is only effective if additional storage space is requested).

**VOLUME = \*ANY(...)**

Any private disks may be mounted (no particular VSNs are required).

**NUMBER-OF-DEVICES = 1 / <integer 1..9>**

Number of disks required.

**DEVICE-TYPE = \*UNCHANGED / <device>**

The device type to which the required private disks are assigned. Only device types known within the system are accepted. In interactive mode, the possible device types are displayed with DEVICE-TYPE=?. The permissible specifications for DEVICE-TYPE can also be found in the device table in [section "Device type table"](#) (device type column). The devices available on the system can be listed with the SHOW-DEVICE-CONFIGURATION command.

If at least one volume ID is specified with VOLUME, each specification of a disk device type which is known to the system is handled like the STDDISK specification.

**SPACE = \*UNCHANGED / \*RELATIVE(...) / \*ABSOLUTE(...) / \*RELEASE(...)**

Type of storage space allocation.

**SPACE = \*UNCHANGED**

The previous specification for this operand will continue to apply.

**SPACE = \*RELATIVE(...)**

Here, the user can request additional storage space for the file (as a relative allocation).

**PRIMARY-ALLOCATION = 0 / <integer 0..2147483647>**

The number of PAM pages by which the file is to be immediately extended (if additional disks are requested, the allocation is made at that point).

The user should note that, in procedures etc., every call of the MODIFY-FILE-ATTRIBUTES command which has a positive value for the primary allocation will reserve storage space for the file. If the primary allocation is large, this will quickly exhaust the storage space assigned to the user. Since the disk selection mechanism is executed each time, a suitable primary allocation can be used to cause a disk swap when creating large files and only a few segments are free on individual disk. This then avoids excessive fragmentation of the file.

**SECONDARY-ALLOCATION = \*UNCHANGED / <integer 0..32767>**

The number of PAM pages for later file extensions.

The number of PAM pages specified here is not immediately reserved. Only if the number of pages initially reserved (primary allocation) is no longer sufficient will the system automatically increase the storage space allocated to the file by the number of PAM pages specified in SECONDARY-ALLOCATION (*S-ALLOC* output field of the SHOW-FILE-ATTRIBUTES command). The value for secondary allocation is doubled after each successful extension. It is no longer doubled when the maximum value set in the system has been reached. If required, the defined number of PAM pages is rounded up to a multiple of 3 when allocating space.

Specifying SECONDARY-ALLOCATION=0 will prevent dynamic extension of the file.

**SPACE = \*ABSOLUTE(...)**

Here, the user can request additional storage space (as an absolute allocation). When doing so, the following

---

should be noted: An absolute allocation will only be made if it is possible to reserve the whole of the specified number of PAM pages (SIZE) on **one** single disk. If more than one disk was specified in the VOLUME operand, then only the first of the named disks will be used.

**FIRST-PAGE = <integer 1..2147483647>**

The number of the first physical block of the file on the first specified disk (the specified number must be 1 more than a multiple of 3, i.e. 1 / 4 / 7 / 10, etc.).

**SIZE = <integer 1..2147483647>**

The number of PAM pages required (this must be a multiple of 3).

**SPACE = \*RELEASE(...)**

Here, the user can release storage space which has been reserved but not used. If this operand is specified, any VOLUME operand value will be ignored.

**NUMBER-OF-PAGES = <integer 1..2147483647> / \*ALL-RELEASABLE**

The maximum number of PAM pages which are to be released. \*ALL-RELEASABLE means that the maximum possible number of PAM pages will be released.

The release of storage space will start at the end of the file and work towards its beginning, in units of three PAM pages, going no further than the PAM page which follows the last occupied one. If DESTROY=\*YES is recorded in the catalog for the file, then up to the specified number of PAM pages (but not more than the number of unused PAM pages) will be overwritten with binary zeros. All the private disks which hold any part of the file must be mounted.

**VOLUME-ALLOCATION = \*IMMEDIATE / \*DELAYED**

Specifies when the required private disk is to be mounted.

**VOLUME-ALLOCATION = \*IMMEDIATE**

The required private disk is to be mounted immediately.

**VOLUME-ALLOCATION = \*DELAYED**

The required private disk is to be mounted when the file is opened.

**DATA-SUPPORT = \*UNCHANGED / \*PARAMETERS(...)**

*Only allowed for ISAM files:* where the data section is stored.

This operand is only meaningful if it is required to change the storage location for the data section of an ISAM file whose data and index blocks are held on separate disks. For such files, the details specified in the VOLUME and SPACE operands refer only to the index section.

**DATA-SUPPORT = \*PARAMETERS(...)**

**DATA-DEVICE-TYPE = \*UNCHANGED / <device>**

The type of device to which the required disks are allocated. Only device types known within the system are accepted.

In interactive mode, DATA-DEVICE-TYPE=? calls up a list of the available device types. The permissible specifications for DEVICE-TYPE can also be found in the device table in [section "Device type table"](#) (device type column). If at least one volume ID is specified with DATA- VOLUME, each specification of a disk device type which is known to the system is handled like the STDDISK specification.

**DATA-VOLUME = \*UNCHANGED / list-poss(255): <alphanum-name 1..6>**

The VSNs of the required disks (additional disks can be requested here; the operand is only effective if additional storage space is requested).

**DATA-SPACE = \*RELATIVE(...)/ \*ABSOLUTE(...)**

Type of storage space allocation.

---

**DATA-SPACE = \*RELATIVE(...)**

Here, the user can request additional storage space for the data section of the ISAM file (as a relative allocation).

**PRIMARY-ALLOCATION =  $\underline{0}$  / <integer 0..2147483647>**

The number of PAM pages by which the file is to be immediately extended. If additional disks are requested, the allocation is made at that point.

**SECONDARY-ALLOCATION = \*UNCHANGED / <integer 0..32767>**

The number of PAM pages for later file extensions. The number of PAM pages specified here is not immediately reserved. Only if the number of pages initially reserved (primary allocation) is no longer sufficient will the system automatically increase the storage space allocated to the data section of the ISAM file by the number of PAM pages specified in the *S-ALLOC* (output field). This allocation is made dynamically, i.e. each time that additional storage space is required. If it is not already a multiple of 3, the extra space requested will be rounded to one.

**DATA-SPACE = \*ABSOLUTE(...)**

Here, the user can request additional storage space (as an absolute allocation). When doing so, the following should be noted: An absolute allocation will only be made if it is possible to reserve the whole of the specified number of PAM pages (SIZE) on **one** single disk. If more than one disk was specified in the DATA-VOLUME operand, then only the first of the named disks will be used.

**FIRST-PAGE = <integer 1..2147483647>**

The number of the first physical block of the file on the first specified disk (the specified number must be 1 more than a multiple of 3, i.e. 1 / 4 / 7 / 10, etc.).

**SIZE = <integer 1..2147483647>**

The number of PAM pages required (this must be a multiple of 3).

**SUPPORT = \*ANY-DISK(...)**

The file may be held on public or private disks. A detailed description can be found with the corresponding operands under SUPPORT=PUBLIC-DISK(...) or SUPPORT=PRIVATE-DISK(...).

**VOLUME = \*UNCHANGED / list-poss(255): <vsn 1..6>**

VSNs of additional disks to be used for storage space extension.

**DEVICE-TYPE = \*UNCHANGED / <device>**

Type of device to which the specified disks are assigned. Only device types known within the system are accepted. In interactive mode, the possible device types are displayed with DEVICE-TYPE=?. If at least one volume ID is specified with VOLUME, each specification of a disk device type which is known to the system is handled like the STDDISK specification.

**SPACE = \*UNCHANGED / \*RELATIVE(...) / \*ABSOLUTE(...) / \*RELEASE(...)**

Type of storage space allocation.

**SPACE = \*RELATIVE(...)**

Reserves additional storage space for the file (a relative allocation).

**PRIMARY-ALLOCATION =  $\underline{0}$  / <integer 0..2147483647>**

The number of PAM pages by which the file is to be immediately extended.

**SECONDARY-ALLOCATION = \*UNCHANGED / <integer 0..32767>**

The number of PAM pages for later file extensions.

---

**SPACE = \*ABSOLUTE(...)**

Here, the user can request additional storage space (as an absolute allocation).

**FIRST-PAGE = <integer 1..2147483647>**

Number of the first physical block of the file on the first specified disk.

**SIZE = <integer 1..2147483647>**

Number of PAM pages required.

**SPACE = \*RELEASE(...)**

Here, the user can release storage space which has been reserved but not used.

**NUMBER-OF-PAGES = <integer 1..2147483647> / \*ALL-RELEASABLE**

The maximum number of PAM pages which are to be released. \*ALL-RELEASABLE means that the maximum possible number of PAM pages will be released.

The release of storage space will start at the end of the file and work towards its beginning, in units of **three** PAM pages, going no further than the PAM page which follows the last occupied one. With files on private volumes, at least one allocation unit will be reserved for the file. If DESTROY=\*YES is recorded in the catalog for the file, then up to the specified number of PAM pages (but not more than the number of unused PAM pages) will be overwritten with binary zeros. If the file is held on private disks, they must be mounted.

**SUPPORT = \*TAPE(...)**

The file is stored on tape. This operand can only be meaningfully specified if additional tapes are to be requested.

**VOLUME = \*NO / \*ANY(...) / \*REMOVE-UNUSED / list-poss(255): <alphanum-name 1..6>**

The VSNs of the required tapes (additional tapes can be requested at this point). The volume list in the VOLUME operand represents an extension to the volume list in the catalog entry; the former must therefore not contain any VSNs which are already recorded in the catalog entry.

**VOLUME = \*NO**

No extra tapes are to be added to the volume list in the catalog entry.

**VOLUME = \*ANY(...)**

Any tapes may be provided and added to the volume list in the catalog entry (no particular VSN required).

**NUMBER-OF-DEVICES = 1 / <integer 1..9>**

The number of tapes which is required.

**VOLUME = \*REMOVE-UNUSED**

Any tapes on which none of the file's data is located are to be removed from the volume list in the catalog entry.

**DEVICE-TYPE = \*UNCHANGED / <device>**

Device type for the required tapes. Only device types or volume types known within the system are accepted. In interactive mode, the possible device and volume types are displayed with DEVICE-TYPE=?.

**PREMOUNT-LIST = \*NONE / list-poss(255): <integer 0..255>**

Tape sequence number of the required tape.

Issues a MOUNT message on the console (operator) requesting the mounting of tapes or suppresses the request.

**PREMOUNT-LIST = \*NONE**

The first volume containing the file will be requested.

---

**PREMOUNT-LIST = list-poss(255): <integer 0..255>**

Issues a MOUNT message on the console (operator) requesting the mounting of tapes or suppresses the request. The tape sequence numbers specified here refer to the VSNs recorded in the catalog entry, followed by those listed in the VOLUME operand. Specifying PREMOUNT-LIST=0 has the effect that no tapes will be requested. Otherwise, PREMOUNT-LIST=(n[,n+1][,n+2]...) applies with n=1

**PROTECTION = \*UNCHANGED / \*PARAMETERS(...)**

The protection attributes for the file.

The default value \*UNCHANGED means in each case that the previous specification continues to apply.

With regard to temporary files, see also "[Temporary files](#)" section.

**PROTECTION = \*PARAMETERS(...)**

The file is to be given the specified protection attributes. When the file is accessed, the highest activated protection level applies. The following table shows the method used for access control, the protection attributes, and the job variable protection hierarchy (protection levels):

Access control	Protection attribute	Prot. level
Standard access control	ACCESS and USER-ACCESS	0
Basic access control list	BASIC-ACL	1
Access control via guards	PASSWORD	2

Table 56: Hierarchy of access control methods

All other protection attributes of the file (e.g. passwords) are evaluated independently, without regard to the implemented protection level.

If the file's date of release for deletion has been reached (see the FREE-FOR-DELETION operand), the file owner can delete the file regardless of its access protection.

With temporary files, the only attributes that can be given values other than the default protection attributes specified in the table "[Effects of PROTECTION-ATTR on the protection attributes](#)" are AUDIT, SPACE-RELEASE-LOCK, and DESTROY-BY-DELETE.

**PROTECTION-ATTR = \*UNCHANGED / \*BY-DEF-PROT-OR-STD / \*STD / \*FROM-FILE(...)**

Specifies whether the protection attributes with the values \*BY-PROTECTION-ATTR or \*BY-PROT-ATTR-OR-UNCH are to be copied.

Protection attribute	PROTECTION-ATTR=				
	*UNCH	*FROM-FILE	*STD <sup>1)</sup>	*BY-DEF-PROT-OR-STD	
				Default protection not active <sup>1)</sup>	Default protection active
ACCESS	UNCHANGED	value from reference file	WRITE	WRITE	values from default protection
USER-ACCESS	UNCHANGED		OWNER-ONLY	OWNER-ONLY	
BASIC-ACL	UNCHANGED		NONE	NONE	
DESTROY-BY-DELETE	UNCHANGED		NO	NO	
GUARDS	UNCHANGED		NONE	NONE	
SPACE-RELEASE-LOCK	UNCHANGED		NO	NO	
EXPIRATION-DATE <sup>2)</sup>	UNCHANGED		TODAY	TODAY	
READ-PASSWORD	UNCHANGED	UNCHANGED	UNCHANGED	NONE	
WRITE-PASSWORD	UNCHANGED	UNCHANGED	UNCHANGED	NONE	
EXEC-PASSWORD	UNCHANGED	UNCHANGED	UNCHANGED	NONE	
FREE-FOR-DELETION	UNCHANGED	UNCHANGED	UNCHANGED	NONE	
AUDIT	UNCHANGED	UNCHANGED	UNCHANGED	UNCHANGED	UNCHANGED

1) The system default values are entered.

2) The protection terms is only entered for permanent files with a creation date or for file generation groups. If the reference file does not have a protected period, then \*TODAY is entered.

Table 57: Effects of PROTECTION-ATTR on the protection attributes of the MODIFY commands

If a value other than \*UNCHANGED is entered for this operand in the guided dialog of the EDIT-FILE-ATTRIBUTES command, only the protection attributes will be copied for which the default values was replaced with \*BY-PROTECTION-ATTR or \*BY-PROT-ATTR-OR-UNCH.

---

**PROTECTION-ATTR = \*UNCHANGED**

The values of protection attributes with \*BY-PROTECTION-ATTR or \*BY-PROT-ATTR-OR-UNCH remain unchanged.

**PROTECTION-ATTR = \*BY-DEF-PROT-OR-STD**

Operands with \*BY-PROTECTION-ATTR or \*BY-PROT-ATTR-OR-UNCH are supplied with the default protection values. If default protection has not been activated, the system standard values apply.

*Note*

A modification made with the SPACE, VOLUME or DEVICE-TYPE operand is executed immediately after the protection attributes are entered. Exception: When renaming at the same time, a modification made with SPACE, VOLUME or DEVICE-TYPE is performed before the protection attributes are entered.

**PROTECTION-ATTR = \*STD**

Operands for which the default value \*BY-PROTECTION-ATTR is specified (either explicitly or implicitly) are assigned default protection attributes.

Operands with the value \*BY-PROT-ATTR-OR-UNCH remain unchanged.

**PROTECTION-ATTR = \*FROM-FILE(...)**

Operands for which \*BY-PROTECTION-ATTR is specified are assigned the operand value which they are assigned in the reference file named next. If the reference file has no EXPIRATION-DATE, but the original file has a creation date, then EXPIRATION-DATE=\*TODAY is entered. Operands with the value \*BY-PROT-ATTR-OR-UNCH remain unchanged.

If the protection attributes are to be copied for a temporary file, either the operands ACCESS=\*WRITE, USER-ACCESS=\*OWNER-ONLY, BASIC-ACL=\*NONE and GUARDS=\*NONE must be specified explicitly or the specified file must have been cataloged with these attributes. ACCESS and USER-ACCESS can have any value in the case of temporary tape files.

**FILE-NAME = <filename 1..54 without-gen>**

The name of the reference file.

*Note*

A modification made with the SPACE, VOLUME or DEVICE-TYPE operands is only executed after the protection status requested with \*FROM-FILE has been established. The modification may be rejected by the new protection status. In this case the command is only partially executed or canceled (with a return code).

**ACCESS = \*BY-PROTECTION-ATTR / \*UNCHANGED / \*WRITE / \*READ**

The ACCESS operand enables a file to be protected against overwriting; it specifies whether write access to the file is permitted (implicitly allowing read access) or only read access. This protection attribute is used by the standard access control procedure, and will only be evaluated if no higher-level access protection is active (see [table "Hierarchy of access control methods"](#)).

*Tape files:* When the file is first opened, DMS copies the ACCESS type identifier into the HDR3 label. During subsequent accesses to the file, the file owner can bypass the checks on access type by using the command ADD-FILE-LINK... PROTECTION-LEVEL=\*LOW.

---

**ACCESS = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used. If PROTECTION-ATTR is set to \*UNCHANGED, the value set previously is retained. If PROTECTION-ATTR is set to \*STD, ACCESS defaults to \*WRITE.

**ACCESS = \*UNCHANGED**

The ACCESS value recorded in the catalog entry is not to be changed.

**ACCESS = \*WRITE**

All types of access to the file are permitted.

*Tape files:* HDR3 label: access type indicator = 0

**ACCESS = \*READ**

The file may only be accessed to read it.

*Temporary files:* Write access cannot be prevented, ACCESS=\*READ will be rejected.

*Tape files:* HDR3 label: access type indicator = 1

**USER-ACCESS = \*BY-PROTECTION-ATTR / \*UNCHANGED / \*OWNER-ONLY / \*ALL-USERS / \*SPECIAL**

Specifies whether the file may be processed under user IDs other than the file owner's ID. The type of access permitted in this case is defined by the other protection attributes (see the operands ACCESS, WRITE-PASSWORD, etc.).

This protection attribute is part of the standard access control mechanism. It is evaluated for users without HARDWARE-MAINTENANCE privileges only if no higher access protection is defined for the file (see [table "Hierarchy of access control methods"](#)).

*Tape files:* When the file is first opened, DMS copies the USER-ACCESS indicator into the HDR1 label (access type indicator = 1).

The file may be accessed by any user ID, i.e. the file is shareable.

**USER-ACCESS = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used. If PROTECTION-ATTR is set to \*UNCHANGED, the value set previously is retained.

**USER-ACCESS = \*OWNER-ONLY**

The file is not shareable. It may only be accessed under its owner's ID, but this may be under any catalog identifier under which a user with the same name is recorded (i.e. not only under the catalog ID under which the file was created).

**USER-ACCESS = \*ALL-USERS**

The file may be accessed under IDs other than the user's. The file may be accessed by any user ID, i.e. such files are shareable.

*Temporary files:* USER-ACCESS=ALL-USERS is not permitted.

*Tape files:* HDR1 label: access indicator = (X'40') 'BLANK'

**USER-ACCESS = \*SPECIAL**

File access is allowed for maintenance IDs (i.e. user IDs with HARDWARE-MAINTENANCE privileges). USER-ACCESS= \*ALL-USERS applies implicitly.

**BASIC-ACL = \*BY-PROTECTION-ATTR / \*UNCHANGED / \*NONE / \*PREVIOUS / \*STD / \*PARAMETERS(...) / \*OWNER-RX / \*OWNER-WRX / \*OWNER-ONLY / \*GROUP-X / \*GROUP-RX /**

**\*GROUP-WRX / \*EXCEPT-OTHERS / \*OTHERS-X / \*OTHERS-RX / \*OTHERS-WRX / \*ALL-X / \*ALL-RX / \*ALL-WRX**

Specifies whether a BASIC-ACL entry is to be created, changed, or deleted for the file. A BASIC-ACL entry will only be evaluated if no higher protection level has been activated for the file (see also [table "Hierarchy of access control methods"](#)). Temporary files and tape files cannot be protected with BASIC-ACL. The following operand values correspond to common BASIC-ACL settings:

Operand value	BASIC-ACL protection								
	OWNER			GROUP			OTHERS		
	R	W	X	R	W	X	R	W	X
*STD	Y	Y	Y	N	N	N	N	N	N
*OWNER-RX	Y	N	Y	U	N	U	U	N	U
*OWNER-WRX	Y	Y	Y	U	U	U	U	U	U
*OWNER-ONLY	U	U	U	N	N	N	N	N	N
*GROUP-X	U	U	Y	N	N	Y	N	N	U
*GROUP-RX	Y	U	Y	Y	U	Y	U	N	U
*GROUP-WRX	Y	Y	Y	Y	Y	Y	U	U	U
*EXCEPT-OTHERS	U	U	U	U	U	U	N	N	N
*OTHERS-X	U	U	Y	N	N	Y	N	N	Y
*OTHERS-RX	Y	U	Y	Y	N	Y	Y	N	Y
*OTHERS-WRX	Y	Y	Y	Y	Y	Y	Y	Y	Y
*ALL-X	U	U	Y	N	N	Y	N	N	Y
*ALL-RX	Y	U	Y	Y	N	Y	Y	N	Y
*ALL-WRX	Y	Y	Y	Y	Y	Y	Y	Y	Y

Table 58: Operand values for common BASIC-ACL settings

Y: access granted

N: access denied

U: access unchanged

**i** On initial activation of BASIC-ACL, U is treated as if it were N! That is why it is usually best to activate it with BASIC-ACL=\*PREVIOUS.

**BASIC-ACL = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used. If PROTECTION-ATTR is set to \*UNCHANGED, the value set previously is retained. If PROTECTION-ATTR is set to \*STD, BASIC-ACL defaults to \*NONE.

### **BASIC-ACL = \*UNCHANGED**

The previous setting is to remain unchanged.

### **BASIC-ACL = \*NONE**

Any existing BASIC-ACL entry for the file will be deleted. Access control will then be in accordance with the values of USER-ACCESS and ACCESS (standard access control), provided no higher protection level has been activated.

### **BASIC-ACL = \*PREVIOUS**

A BASIC-ACL entry will be created for the file if there is not already one. In doing this, the values for USER-ACCESS and ACCESS will be converted to a BASIC-ACL according to the following table:

Standard access control		BASIC-ACL protection								
USER-ACCESS	ACCESS	OWNER			GROUP			OTHERS		
		R	W	X		W	X	R	W	X
OWNER-ONLY	WRITE	Y	Y	Y	N	N	N	N	N	N
OWNER-ONLY	READ	Y	N	Y	N	N	N	N	N	N
ALL-USERS	WRITE	Y	Y	Y	Y	Y	Y	Y	Y	Y
ALL-USERS	READ	Y	N	Y	Y	N	Y	Y	N	Y
SPECIAL	WRITE	Y	Y	Y	Y	Y	Y	Y	Y	Y
SPECIAL	READ	Y	N	Y	Y	N	Y	Y	N	Y

Table 59: Standard access control/BASIC-ACL

If a BASIC-ACL entry already exists, all the values it contains will be unchanged.

### **BASIC-ACL = \*PARAMETERS(...)**

A BASIC-ACL entry will not be generated for a file which was previously not protected by BASIC-ACL unless a value other than \*UNCHANGED is specified for at least one of the OWNER, GROUP and OTHERS operands. Authorization to make read, write and execute accesses must be explicitly granted or denied for each user ID which has any rights. Those with access rights are:

- OWNER, i.e. the user ID of the file owner, any co-owners and systems support.
- GROUP, i.e. all user IDs which are in the same group as the file owner (i.e. not the owner and not systems support). Definition of user groups is possible only when the software product SECOS is used. To allow for possible later installation of the software product SECOS, GROUP should be given the same access rights as for OTHERS.
- OTHERS, i.e. all user IDs which belong to a different group from the file owner (i.e. not the owner and not systems support).

If the value \*UNCHANGED is specified for any of the operands OWNER, GROUP, OTHERS, READ, WRITE and EXEC when a BASIC-ACL entry is created, the associated access permissions will be set to “no access” (equivalent to \*NO-ACCESS or \*NO). An ungranted access permission is indicated by “-”.

### **OWNER = \*UNCHANGED / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights are to be set for the owner. When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO-ACCESS.

---

**OWNER = \*PARAMETERS(...)**

The owner's access rights are entered as specified:

**READ = \*UNCHANGED / \*NO / \*YES**

Specifies whether read authorization is set.

When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO.

**WRITE = \*UNCHANGED / \*NO / \*YES**

Specifies whether write authorization is specified.

Write permission does not imply read permission.

When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO.

**EXEC = \*UNCHANGED / \*NO / \*YES**

Indicates whether read access is permitted or not.

When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO.

**GROUP = \*UNCHANGED / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights are to be set for all user IDs from the group of the owner. When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO-ACCESS.

**GROUP = \*PARAMETERS(...)**

The access rights are to be set for the group as specified:

**READ = \*UNCHANGED / \*NO / \*YES**

Specifies whether read authorization is set.

When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO.

**WRITE = \*UNCHANGED / \*NO / \*YES**

Specifies whether write authorization is specified.

When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO.

**EXEC = \*UNCHANGED / \*NO / \*YES**

Indicates whether read access is permitted or not.

When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO.

**OTHERS = \*UNCHANGED / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies what access rights are to be given to all other user IDs. To allow for possible later installation of the software product SECOS, GROUP should be given the same access rights as for OTHERS. When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO-ACCESS.

**OTHERS = \*PARAMETERS(...)**

The access rights for other users will be set as specified:

**READ = \*UNCHANGED / \*NO / \*YES**

Specifies whether read authorization is set.

When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO.

**WRITE = \*UNCHANGED / \*NO / \*YES**

Specifies whether write authorization is specified.

When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO.

**EXEC = \*UNCHANGED / \*NO / \*YES**

Indicates whether read access is permitted or not.

When BASIC-ACL is first activated, \*UNCHANGED is treated like \*NO.

---

**GUARDS = \*BY-PROTECTION-ATTR / \*UNCHANGED / \*NONE / \*PARAMETERS(...)**

Specifies whether access control using GUARDS is to be activated or modified. Temporary files and files on private volume (tape and disk) cannot be protected with GUARDS.

**GUARDS = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used. If PROTECTION-ATTR is set to \*UNCHANGED, the value set previously is retained. If PROTECTION-ATTR is set to \*STD, GUARDS defaults to \*NONE.

**GUARDS = \*NONE**

Access to the JV is not (is no longer) to be controlled via GUARDS.

**GUARDS = \*PARAMETERS(...)**

Any existing access control via GUARDS for the JV is to be modified as specified. If the file in question was not protected by GUARDS, access control with GUARDS will be activated for it, provided at least one of the operands READ, WRITE or EXEC has an operand value other than \*UNCHANGED.

Access to the file is controlled via a guard, i.e. a specific object identifying all the conditions subject to which access will be granted: such as date, time and user ID. The GUARDS function unit of the chargeable software product SECOS (see the "SECOS" manual [35]) must be installed in order to create and maintain a guard. Each guard is uniquely identified by its name. The guard name resembles a file name: it can contain a user ID and consists of a name part which is up to 8 characters in length. If no user ID is specified explicitly, the user's own ID is added implicitly. Each access mode can be controlled by a separate guard. If no guard is assigned for an access mode (\*NONE), access control will refuse any corresponding access (e.g. WRITE=\*NONE prevents all write access). Specifying GUARDS=\*PARAMETERS defines access control using GUARDS, with the default value \*NONE for all access modes, which means that the file cannot be read, updated or executed.

The GUARDS subsystem is not required in order to define access control via GUARDS. The appropriate checks by GUARDS are not performed until the time file access takes place: If a guard has been defined but is not available, all access of the type controlled by that guard is prohibited. No access at all is possible if the GUARDS subsystem is not available at the time of access.

**READ = \*UNCHANGED / \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard controlling read access (up to 8 characters if no user ID is specified). The default setting is \*NONE, i.e. no read access is allowed.

**WRITE = \*UNCHANGED / \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard controlling write access (up to 8 characters if no user ID is specified). The default setting is \*NONE, i.e. no write access is allowed.

**EXEC = \*UNCHANGED / \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard for execute protection (up to 8 characters when no user ID is specified). The default setting is \*NONE, i.e. the file cannot be executed.

**WRITE-PASSWORD = \*BY-PROT-ATTR-OR-UNCH / \*UNCHANGED / \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

Write or read password for the JV to be modified. The defined password must be specified in the ADD-PASSWORD command in order to enable write access to the file or to modify or delete a defined password.

The WRITE-PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

---

*Temporary files:* cannot be password-protected

*Tape files:* the password protection is noted in the HDR3 label

**WRITE-PASSWORD = \*BY-PROT-ATTR-OR-UNCH**

The write password is defined through the value of the PROTECTION-ATTR operand. If PROTECTION-ATTR=\*BY-DEF-PROT-OR-STD is set, the values supplied by default protection or - if default protection is not activated - \*NONE is entered. Otherwise, the write password remains unchanged.

**WRITE-PASSWORD = \*NONE**

Any existing write protection password will be deleted.

**WRITE-PASSWORD = <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>**

Defines a password that is required for write accesses.

**READ-PASSWORD = \*BY-PROT-ATTR-OR-UNCH / \*UNCHANGED / \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

*For encrypted files all values specified are handled like \*UNCHANGED.*

Password for protection against unauthorized reading. The defined password must be specified in the ADD-PASSWORD command in order to enable read access to the file or to modify or delete a defined password.

The READ-PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

*Temporary files:* cannot be password-protected

*Tape files:* the password protection is noted in the HDR3 label

**READ-PASSWORD = \*BY-PROT-ATTR-OR-UNCH**

The read password is defined through the value of the ROTECTION-ATTR operand. If PROTECTION-ATTR=\*BY-DEF-PROT-OR-STD is set, the values supplied by default protection or - if default protection is not activated - \*NONE is entered. Otherwise, the read password remains unchanged.

**READ-PASSWORD = \*NONE**

Any existing read protection password will be deleted.

**READ-PASSWORD = <c-string 1..4> / x-string 1..8> / <integer -2147483648..2147483647>**

Defines a password which protects against unauthorized read accesses to the file. This protection against unauthorized read accesses also provides protection against unauthorized write accesses; however, it does not protect against the unauthorized execution of an object or load module stored in the file, or a command sequence. In the case of an object or load module, both the file itself and the phase held in main memory are protected against unauthorized read accesses (the LOAD-PROGRAM command and the AID commands %DISPLAY and %IN will be rejected if access is not authorized). A source program which is protected by a read password cannot be compiled.

**EXEC-PASSWORD = \*BY-PROT-ATTR-OR-UNCH / \*UNCHANGED / \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

*For encrypted files all values specified are handled like \*UNCHANGED.*

The password used to protect against unauthorized execution of the file. This type of password is specified for procedures and load modules. The specified password must be entered into the job-specific password table by using the ADD-PASSWORD command before the procedure or program can be run or a defined password can be

---

changed or deleted.

The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

*Temporary files:* cannot be password-protected

*Tape files:* the password protection is noted in the HDR3 label

#### **EXEC-PASSWORD = \*BY-PROT-ATTR-OR-UNCH**

The execution password is defined through the value of the PROTECTION-ATTR operand. If PROTECTION-ATTR=\*BY-DEF-PROT-OR-STD is set, the values supplied by default protection or - if default protection is not activated - \*NONE is entered. Otherwise, the execution password remains unchanged.

#### **EXEC-PASSWORD = \*NONE**

Any existing execute protection password will be deleted.

#### **EXEC-PASSWORD = <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>**

Defines a password which is required to call a program/procedure file.

#### **DESTROY-BY-DELETE = \*BY-PROTECTION-ATTR / \*UNCHANGED / \*NO / \*YES**

To increase the level of protection of data, the user can specify in the catalog entry that any data no longer required is overwritten by X'00' (binary zero). For disk files, the specification DESTROY-BY-DELETE takes effect when deletions are carried out or storage space is released; for tape files, any data remaining on the tape when EOF or EOY processing is carried out will be overwritten (see also the ADD-FILE-LINK command, DESTROY-OLD-CONTENTS operand).

#### **DESTROY-BY-DELETE = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used. If PROTECTION-ATTR is set to \*UNCHANGED, the value set previously is retained. If PROTECTION-ATTR is set to \*STD, DESTROY-BY-DELETE defaults to \*NO.

#### **DESTROY-BY-DELETE = \*UNCHANGED**

The value set previously will be retained.

#### **DESTROY-BY-DELETE = \*NO**

If this operand is set to NO, the action specified in the DELETE-FILE command (OPTION operand) will be carried out.

*Disk files:* the storage space released will be left unchanged if the operand OPTION=DESTROY-ALL is not specified in the DELETE-FILE command

*Tape files:* Any data which follows on the tape will not be overwritten if DESTROY-OLD-CONTENTS=\*YES is not specified in the ADD-FILE-LINK command for the current processing run.

#### **DESTROY-BY-DELETE = \*YES**

When the file is deleted, its storage space will be overwritten with binary zeros. When storage space is released, the specified number of reserved PAM pages will be overwritten with binary zeros, unless they are occupied by data.

*Disk files:* when the storage space is released or deleted, it will be automatically overwritten with binary zeros (X'00').

*Tape files:* the tape content after the end of the file will be overwritten with binary zeros; it is not necessary to explicitly set the ADD-FILE-LINK command to delete residual data for the current processing run (DESTROY-OLD-CONTENTS operand).

**i** Please also observe the notes in the section “Data protection by data destruction” in the “Introductory Guide to DMS” [13].

#### **AUDIT = \*UNCHANGED / \*NONE / \*SUCCESS / \*FAILURE / \*ALL**

This operand specifies whether accesses to the file are to be monitored. This monitoring may also be made dependent on the result of the access (see the operand values). Systems support staff (TSOS privilege) can use this function unrestrictedly. Nonprivileged users require the appropriate authorization in the user entry of the pubset in which the file is to be created (see the *FILE-AUDIT* output field of the SHOW-USER-ATTRIBUTES command). Without this authorization the command will be rejected if auditing is requested.

It is possible to monitor the following DMS actions:

- the creation, amendment (protection attributes), reading and deletion of a catalog entry
- the opening and closing of files
- the renaming, importing and exporting of files

The monitoring is performed by system exit routines or, if the software product SECOS is being used, by the SAT function unit.

In order to use system exit routines for monitoring, they must be activated (this is the responsibility of systems support, privilege TSOS). In order to use SAT for monitoring, SAT logging must have been started, and events for the FILE to be monitored must not be excluded from the logging procedure (this is the responsibility of the security officer, under the user ID SYSPRIV). The user cannot alter any explicit settings of SAT made by the security officer. The SAT log files can be analyzed by the SAT file administrator, under the user ID SYSAUDIT.

#### **AUDIT = \*NONE**

No monitoring.

#### **AUDIT = \*SUCCESS**

All successful DMS operations on the file will be monitored.

#### **AUDIT = \*FAILURE**

All erroneous/unsuccessful DMS operations on the file will be monitored.

#### **AUDIT = \*ALL**

All DMS operations on the file will be monitored.

#### **SPACE-RELEASE-LOCK = \*BY-PROTECTION-ATTR / \*UNCHANGED / \*NO / \*YES**

Specifies whether the specification to release unused memory space in the MODIFY-FILE-ATTRIBUTES command (SPACE=RELEASE operand) is to be ignored. The existence of a space release lock can be determined by the user from the output field *SP-REL-LOCK* of the SHOW-FILE-ATTRIBUTES command.

#### **SPACE-RELEASE-LOCK = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used. If PROTECTION-ATTR is set

---

to \*UNCHANGED, the value set previously is retained. If PROTECTION-ATTR is set to \*STD, SPACE-RELEASE-LOCK defaults to \*NO.

**SPACE-RELEASE-LOCK = \*NO**

Removes an existing lock to prevent the release of unused storage space.

**SPACE-RELEASE-LOCK = \*YES**

Sets an existing lock to prevent the release of unused storage space.

**EXPIRATION-DATE = \*BY-PROTECTION-ATTR / \*UNCHANGED / \*TODAY / \*TOMORROW / <date> / <integer 0..99999>**

Specifies a protected period, during which the file may be neither amended nor deleted; i.e. it can only be read ("read only").

The MODIFY-FILE-ATTRIBUTES command can be run again specifying EXPIRATION-DATE in order to cancel or change the expiration date. Once the specified date has arrived, write access is allowed again, but the file is not automatically deleted.

A protected period can only be assigned if the file has already been opened and consequently has a CREATION-DATE.

If the end of the protected period is before the current date, the current date is entered.

*Temporary files:* cannot be given an expiration date

*Tape files:* maximum possible EXPIRATION-DATE is 2155-12-31

**EXPIRATION-DATE = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used. If PROTECTION-ATTR is set to \*UNCHANGED, the value set previously is retained.

**EXPIRATION-DATE = \*UNCHANGED**

The expiration date will remain unchanged.

**EXPIRATION-DATE = \*TODAY**

The file can be updated or deleted immediately. Today's date is added to the catalog entry as the EXPIRATION-DATE.

**EXPIRATION-DATE = \*TOMORROW**

The file cannot be updated or deleted until the following day. The following day's date is added to the catalog entry as the EXPIRATION-DATE.

**EXPIRATION-DATE = <date with-compl>**

The file can be updated or deleted starting on the specified date. The specified date is added to the catalog entry as the EXPIRATION-DATE. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two-digit year specifications < 60, 19 to two-digit year specifications >= 60.

**EXPIRATION-DATE = <integer 0..99999 days >**

The file can be updated or deleted after the specified number of days. The value must be specified in the form +n (days). The date calculated internally is added to the catalog entry as the EXPIRATION-DATE.

A retention period can only be specified for an existing file, i.e. the *CRE-DATE* and *FILE-STRUC* output fields must indicate a value other than NONE.

---

**FREE-FOR-DELETION = \*BY-PROT-ATTR-OR-UNCH / \*UNCHANGED / \*NONE / <date> / <integer 0..99999>**

Specifies as of when the file can be deleted, regardless of its ACCESS, BASIC-ACL, GUARDS, EXPIRATION-DATE protection attributes and its password protection or when its storage space can be released (free-for-deletion date).

A free-for-deletion date cannot be assigned to temporary files or to files on private volumes.

**FREE-FOR-DELETION = \*BY-PROT-ATTR-OR-UNCH**

The free-for-deletion date is defined by means of the PROTECTION-ATTR operand value. If PROTECTION-ATTR=\*BY-DEF-PROT-OR-STD is set, the values supplied by default protection or - if default protection is not activated - \*NONE is entered. Otherwise, the free-for-deletion date remains unchanged.

**FREE-FOR-DELETION = \*NONE**

No free-for-deletion date is defined. The protection attributes are taken into account with regard to file deletion.

**FREE-FOR-DELETION = <date>**

Once the specified date is reached, the file can be deleted regardless of its protection attributes listed above. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two-digit year specifications < 60, 19 to two-digit year specifications >= 60.

**FREE-FOR-DELETION = <integer 0..99999>**

After the specified number of days, the file can be deleted regardless of the protection attributes listed above. The date must be specified in the form +n.

**SAVE = \*UNCHANGED**

*Only for files on disks and Net-Storage volume:* BACKUP-CLASS relates to the automatic file backup by the ARCHIVE backup system; it determines which runs of the ARCHIVE or HSMS system are to back up the files.

**SAVE = \*PARAMETERS(...)**

Parameters governing the type and frequency of backups.

**BACKUP-CLASS = \*UNCHANGED / \*A / \*B / \*C / \*D / \*E**

Backup frequency, where \*A represents the most frequent backup.

**BACKUP-CLASS = \*A**

The most frequent backup. Files with this setting will be backed up by every backup run.

**BACKUP-CLASS = \*B**

Files with this setting will be backed up every time a backup run is performed for files with BACKUP-CLASS=\*B or \*C or \*D.

**BACKUP-CLASS = \*C**

Files with this setting will be backed up every time a backup run is performed for files with BACKUP-CLASS=\*C or \*D.

**BACKUP-CLASS = \*D**

The least frequent backup.

Files with this setting will only be backed up when a backup run is performed for files with BACKUP-CLASS=\*D.

**BACKUP-CLASS = \*E**

Not backed up by ARCHIVE or HSMS (This is appropriate for work files, for example.).

---

**SAVED-PAGES = \*UNCHANGED / \*COMPLETE-FILE / \*MODIFIED-PAGES**

*Only for disk files.*

like BACKUP-CLASS, refers to the backup with ARCHIVE or HSMS and defines whether the entire file is to be backed up completely during automatic backup runs, or whether only those blocks that have changed since the last backup are to be saved.

**SAVED-PAGES = \*COMPLETE-FILE**

The complete file is backed up.

**SAVED-PAGES = \*MODIFIED-PAGES**

Incremental saving: only the modified blocks are saved. This specification is useful for extremely large files.

**NUM-OF-BACKUP-VERS = \*UNCHANGED / <integer 0..32>**

Maximum number of file versions in the version backup archive.

A value equal to 0 means the file will be ignored when version backups are performed.

Any values except 0 specified for temporary files or files on private disks are rejected.

A file on tape does not participate in the version backup, so the specified value is ignored and the value 0 is set.

**MIGRATE = \*UNCHANGED / \*ALLOWED / \*INHIBITED / \*FORBIDDEN**

*Only relevant for files on public disks - evaluated by the software product HSMS (Hierarchical Storage Management System).*

It allows a user to specify whether files that have not been accessed for a long time (by the user) may be migrated to a storage medium with slower access. The files will be migrated from the online processing level S0 to the background level S1, which is available online, or to background level S2 (e.g. tape storage) which is available offline (for further details see the "HSMS, Volume 1" manual [18]).

**MIGRATE = \*ALLOWED**

If HSMS is being used, the file may be migrated from the processing level to the background level (S1), or to the archive level (S2). This operand value may only be specified for permanent files.

**MIGRATE = \*INHIBITED**

The file may only be migrated for a brief period, e.g. for reorganization purposes (migration lock).

**MIGRATE = \*FORBIDDEN**

*This specification is allowed only in conjunction with authorization to perform physical allocation of public storage space (see "Privileged functions" under "Function" above).*

The file must not be migrated, typically because it is intended to stay in its current physical storage location (intensified migration lock). The command is rejected if the file has been migrated to a background storage level (S1 or S2) using HSMS (see the STORAGE-LEVEL operand in the SHOW-FILE-ATTRIBUTES command).

**CODED-CHARACTER-SET = \*UNCHANGED / \*USER-DEFAULT / \*NONE / <name 1..8>**

*This operand is ignored with regard to files on private disks.*

Determines the code of the file. This defines how the characters of a national character set are to be stored in binary form. The specified character set has an effect on the representation of characters on the screen, the collating sequence, etc. (see the "XHCS" manual [51]).

**CODED-CHARACTER-SET = \*USER-DEFAULT**

The code is taken over from the file owner's user ID if a code other than EDF03IRV is entered there, otherwise \*NONE applies.

**CODED-CHARACTER-SET = \*NONE**

No coded character set is specified for the file.

### **CODED-CHARACTER-SET = <name 1..8>**

Specifies the coded character set for the file.

### **NET-CODED-CHAR-SET = \*UNCHANGED / \*USER-DEFAULT / \*ISO / \*NO-CONVERSION / <name 1..8>**

*Only relevant for Net-Storage files of the type node file. This specification is ignored for other files.*

Defines which Net-Storage coded character set (NETCCS) is to be used for a node file on Net-Storage. The NETCCS is the character set used to store the data from SAM node files on Net-Storage. During copying, the data are converted from the CODED-CHARACTER-SET into the NET-CODED-CHARACTER-SET and vice versa. All SAM node files and PAM node files created with BS2000 V11.0 or later have a defined NETCCS. PAM node files created with an older version than V11.0 are treated as if they were created with \*NO-CONVERSION. Only data from SAM node files are converted. In the case of PAM node files, the NET-CODED-CHAR-SET is not evaluated while data are copied.

### **NET-CODED-CHAR-SET = \*USER-DEFAULT**

The setting is defined by the definition in the user entry. The resulting NETCCS of the file is determined based on the following table:

<b>User entry (SYSSRPM) or specification in the CREATE-FILE / MODIFY-FILE-ATTRIBUTES command</b>		<b>Resulting NETCCS in the catalog entry of the node files</b>
<b>CCS</b>	<b>NETCCS</b>	<b>NETCCS</b>
EDF03IRV/*NONE	*ISO	ISO88591; during code conversion, EDF041 is assumed for CCS
EDF03DRV	*ISO	ISO88591; during code conversion, EDF04DRV is assumed for CCS
EDF04DRV	*ISO	ISO88591
EDF04x	*ISO	ISO8859x with x=1,2,..F
ISO8859x	*ISO or *NO-CONV	ISOx
UTFx	*ISO or *NO-CONV	UTFx
<name_a 1..8>	<name_b 1..8>	<name_b 1..8>
<name_a 1..8>	*NO-CONV	<name_a 1..8>

### **NET-CODED-CHAR-SET = \*ISO**

For SAM node files, EBCDIC character sets are converted into character sets common in the open world. In the process, the NETCCS is mapped onto an ISO variant that corresponds to the CCS. Examples:

```
EDF03IRV => ISO88591
EDF04DRV => ISO88591
EDF04x   => ISO8859x
```

**i** The following applies here: If an ISO or UTF character set was specified for the CODED-CHARACTER-SET, no conversion takes place. In this case, \*ISO acts like \*NO-CONVERSION.

## NET-CODED-CHAR-SET = \*NO-CONVERSION

The character set of the file is not converted while the file is transferred to the Net-Storage. The value of the CODED-CHARACTER-SET is adopted for the NET-CODED-CHAR-SET. If the CODED-CHARACTER-SET is equivalent to \*NONE or EDV03IRV, the resulting NETCCS becomes EDF03IRV.

A node file is created on the Net-Storage in the EBCDIC character set specified in the CCS.

## NET-CODED-CHAR-SET = <name 1..8>

Name of the NETCCS with which a node is created on the Net-Storage.

**i** There is no check whether the name corresponds to a valid character set!

## DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*FILE-CHANGE / \*MORE-THAN-ONE-FILE / \*CATALOG-CHANGE / \*USER-ID-CHANGE

Specifies whether and under what conditions a verification dialog is to be conducted with the user during command execution. The verification dialog allows you to monitor the progress of the command and to take action if necessary. A control dialog is only possible in interactive mode but, in this mode, may also be used in procedures. In batch mode, all operand values have the same effect as \*NO.

If one of the events (apart from \*ERROR) specified in the DIALOG-CONTROL operand occurs, a verification dialog is initiated. Message DMS0810 is issued, asking you whether you want the command to be executed for the shown file or file set. The SDF abbreviation rules apply to the entered response. To display the possible responses, enter a question mark.

*Syntax of the response to message DMS0810 (verification dialog)*

*possible replies:* \*YES(...) / \*NO(...) / \*TERMINATE

\*YES(...)

```
| DIALOG-CONTROL = *UNCHANGED / *NO / *ERROR / *MORE-THAN-ONE-FILE /  
| *FILE-CHANGE / *CATALOG-CHANGE / *USER-ID-CHANGE  
| ,OUTPUT = *UNCHANGED / *NO / *SYSOUT
```

\*NO(...)

```
| DIALOG-CONTROL = *UNCHANGED / *NO / *ERROR / *MORE-THAN-ONE-FILE /  
| *FILE-CHANGE / *CATALOG-CHANGE / *USER-ID-CHANGE  
| ,OUTPUT = *UNCHANGED / *NO / *SYSOUT
```

*Meaning of the operands*

The meaning of the DIALOG-CONTROL and OUTPUT suboperands is the same as that of the corresponding main command operands. The operand value \*UNCHANGED leaves the previous setting unchanged.

### Reply \*YES(...)

The set of files listed in the message is processed. If you specify a new value in the DIALOG-CONTROL suboperand which calls for a reduction in the size of the set of files listed in the message (e.g. changing \*CATALOG-

CHANGE to \*FILE-CHANGE), the file set is first slimmed down to reflect the new value, and then a second verification dialog is conducted for the reduced set of files. The meaning of the DIALOG-CONTROL and OUTPUT suboperands is the same as that of the corresponding main command operands.

#### Reply \*NO(...)

The set of files listed in the message is not processed. If you change the DIALOG-CONTROL operand, the verification check is not repeated until the next time the associated event occurs. If there are other files to process before the event occurs, they will be processed without verification.

#### Reply \*TERMINATE

The set of files listed in the message is not processed and processing of the command terminates. In a non-S procedure, spin-off is initiated; in an S procedure, SDF-P error handling is initiated.

If an error occurs while one of the selected files is being processed and DIALOG-CONTROL has a setting other than \*NO, an error verification dialog is initiated. Guaranteed message DMS0811 or DMS0812 shows you the file name(s) and the DMS error code. You are then asked by message DMS0813 whether and if so how command execution is to continue. The SDF abbreviation rules apply to the entered response. To display the possible responses, enter a question mark.

*Syntax of replies to message DMS0813 (error verification dialog)*

*possible replies* : \*YES(...) / \*RETRY(...) / \*NO / \*SKIP-CATALOG(...) / \*SKIP-USER-ID(...)

\*YES(...)

| DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /  
| \*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE  
| ,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT

\*RETRY(...)

| DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /  
| \*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE  
| ,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT

\*SKIP-CATALOG(...)

| DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /  
| \*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE  
| ,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT

\*SKIP-USER-ID(...)

| DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /  
| \*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE  
| ,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT

---

### *Meaning of the operands*

The meaning of the DIALOG-CONTROL and OUTPUT suboperands is the same as that of the corresponding main command operands. The operand value \*UNCHANGED leaves the previous setting unchanged.

#### **Reply \*YES(...)**

Processing is to continue with the next file name.

#### **Reply \*RETRY(...)**

Processing is to be retried for the same file name.

#### **Reply \*SKIP-CATALOG(...)**

Processing is to continue with the file names from the next selected catalog. This selection only makes sense if wildcards were used in the catalog ID.

#### **Reply \*SKIP-USER-ID(...)**

Processing is to continue with the file names from the next selected user ID or, if files of a user ID which are on various subsets were selected, with the next catalog ID. This selection only makes sense if wildcards were used in the user or catalog ID.

#### **DIALOG-CONTROL = \*STD**

The default \*STD setting is equivalent to \*MORE-THAN-ONE-FILE in an interactive dialog (when SYSCMD is connected to the terminal) and to \*NO in procedures and in batch mode.

#### **DIALOG-CONTROL = \*NO**

All the selected files are processed without an opportunity for the user to intervene.

#### **DIALOG-CONTROL = \*MORE-THAN-ONE-FILE**

A verification dialog is initiated if more than one file has been selected. The verification query is issued for each of the selected files. If the catalog and/or user ID contains wildcards, the query is issued for each catalog and/or user ID. DIALOG-CONTROL=\*ERROR also applies implicitly.

#### **DIALOG-CONTROL = \*ERROR**

An error verification dialog is initiated if an error occurs while one of the selected file names is being processed.

#### **DIALOG-CONTROL = \*FILE-CHANGE**

A verification dialog is initiated for each selected file name. DIALOG-CONTROL=\*ERROR also applies implicitly.

#### **DIALOG-CONTROL = \*CATALOG-CHANGE**

The verification query is issued for all the selected file names in a catalog. DIALOG-CONTROL=\*ERROR also applies implicitly.

#### **DIALOG-CONTROL = \*USER-ID-CHANGE**

The verification query is issued for all the selected file names of a user ID within a catalog. DIALOG-CONTROL=\*ERROR also applies implicitly.

#### **OUTPUT = \*STD / \*NO / \*SYSOUT**

Specifies whether the names of processed files are to be logged on SYSOUT.

#### **OUTPUT = \*NO**

Only any errors that occur are logged on SYSOUT.

#### **OUTPUT = \*SYSOUT**

The names of processed files and any errors that occur are logged on SYSOUT (guaranteed message DMS0815 or DMS0816, or DMS0811 or DMS0812 in the event of an error).

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	DMS051E	Inconsistency in private disk pool or operand error detected
2	0	DMS0546	Catalog entry for specified file has reached maximum size
2	0	DMS054A	Insufficient disk space or access to disk not possible
2	0	DMS06A9	Some generations of this FGG are missing
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0102	Wildcard selection action: processing interrupted by *TERMINATE or by K2 key in verification dialog
	64	CMD0216	Privilege error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset Guaranteed messages: DMS051B, DMS0681
	64	DMS051C	User not authorized to access pubset Guaranteed messages: DMS051C, DMS0681
	64	DMS0535	Specified file not shareable
	64	DMS053E	File already cataloged on private volume
	64	DMS0557	Invalid volume specification
	64	DMS055C	Catalog entry not found on the assigned volume
	64	DMS0579	Invalid operand for temporary file or work file
	64	DMS057A	Invalid combination of file attributes and storage class
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS057F	Renaming of migrated file not permitted

64	DMS0585	Error detected when processing catalog or multiprocessor system.
64	DMS0586	It is not possible to access or reserve a volume at present
64	DMS0587	Use of the specified command has been restricted by the system administrator
64	DMS0588	The disk storage assignment could not be executed
64	DMS05A0	Attribute modification not possible - data still in write cache
64	DMS059F	Specified value for number of backup versions invalid
64	DMS05A5	Allocation change not allowed when renaming permanent file as temporary file (or vice versa)
64	DMS05AD	Renaming in conjunction with a change of storage location: the attributes have been modified, but renaming failed owing to a system malfunction
64	DMS05B5	Guard not available
64	DMS05BD	Invalid combination of file and volume set attributes
64	DMS05CC	File name already cataloged
64	DMS05FC	Specified user ID not in HOME pubset
64	DMS0609	No access to system file
64	DMS060D	Invalid file name for reference file (PROTECTION-ATTR)
64	DMS0610	Action with selection specification (wildcards): command execution failed for at least one of the selected files
64	DMS0613	Unknown management class
64	DMS0618	Unknown storage class
64	DMS061A	Storage class catalog could not be read
64	DMS0640	Access to Net-Storage is rejected by the ONETSTOR subsystem because of communication problems with the net client
64	DMS0643	Net client reports access error
64	DMS0644	Net client reports internal error
64	DMS0645	File does not exist on Net-Storage
64	DMS0646	FGG does not exist on Net-Storage
64	DMS0649	Net server reports POSIX-ACL error
64	DMS064A	Net client reports that access to files is forbidden on the Net-Storage volume
64	DMS064B	Access to node files not supported by the net client

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	64	DMS0684	File does not exist Guaranteed message: DMS0684
	64	DMS0685	File not yet allocated storage space
	64	DMS0689	Operands only allowed for files not yet occupying storage space have been specified
	64	DMS06B5	File already open or catalog entry not updated after system error
	64	DMS06B6	File attributes not compatible with file generation group
	64	DMS06FF	BCAM connection severed
	128	DMS0506	Function not executed due to change in master
	130	DMS0524	System address space exhausted
	130	DMS053C	No space in pubset catalog file
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system. Guaranteed message: DMS053C
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0588	The disk storage assignment could not be executed
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

## Examples

*Example 1: Changing file attributes (releasing storage space)*

```

```

- (1) The file *D.10* is protected by a read password.
- (2) Renames the permanent file *D.10* to the temporary file *#FILE.1* (the tempfile character is #).
- (3) The command was rejected, since the password is not contained in the password table of the task.
- (4) The read password *PAUL* is entered into the password table of the task.
- (5) A new attempt is made to rename the permanent file *D.10* to the temporary file *#FILE.1* (see also Point 2).
- (6) Shows the protection attributes of the temporary file *#FILE.1*. The tempfile character is replaced in the output by the internal name component for temporary files (here: *S.313.3ZAA.*). When a permanent file is renamed to a temporary file, some of the file attributes are changed. For example, temporary files cannot be protected by passwords. In this case, the read password was canceled (READ-PASS=\*NONE).

*Example 3: Assigning BASIC-ACL protection to a group of files*

```

- (1) All files with names beginning with *SYSSDF.GROUP.* are to have their access permissions modified. *SHOW-FILE-ATTRIBUTES* (alias = *SH*) is used to show the currently set permissions in abbreviated form (*INFORMATION=\*MINIMUM*). Only the default permissions are set (all users have read access).
- (2) Using *MODIFY-FILE-ATTRIBUTES* (alias = *MD*), *BASIC-ACL* protection is applied to the chosen files. *\*ALL-X* assigns execute permission to all users. Command execution is confirmed with "Y(*OUTPUT=\*SYSOUT*)". This causes the names of processed files to be displayed.
- (3) Read and execute permission is to be granted to all users. This is achieved with *BASIC-ACL=\*ALL-RX*.
- (4) *\*OWNER-WRX* grants the owner all access permissions.
- (5) *\*OWNER-RX* lets the owner protect the file against inadvertent overwriting.

---

## 4.13 MODIFY-FILE-GENERATION-SUPPORT

Modify device assignment and space allocation of file generations

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE-GENERATION-GROUP
<b>Privileges:</b>	STD-PROCESSING TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The MODIFY-FILE-GENERATION-SUPPORT command amends the device assignment and storage space allocation for an existing file generation. Only the owner, any co-owners (see “Privileged functions”) and systems support personnel are allowed to modify all of a file generation’s attributes. Other users, provided they have write permission for the file generation, are allowed only to allocate extra space or tapes.

The file protection and data backup attributes are defined once only for the entire file generation group using the CREATE-FILE-GROUP command and modified using the MODIFY-FILE-GROUP-ATTRIBUTES command. User and systems support information (see the USER-INFORMATION and ADM-INFORMATION operands) is not copied from the group entry but can be defined separately for each file generation.

The default value \*UNCHANGED in the corresponding operands means that the previously valid definition still applies.

#### *Privileged functions*

The following functions are available to nonprivileged users only if physical allocation of public space is allowed (see “Privileged functions” in the function description of the CREATE-FILE command):

- explicit specification (values other than the default, \*STD) of a volume or volume set in the VOLUME and VOLUME-SET operands in the structure SUPPORT=\*PUBLIC-DISK (STORAGE-CLASS=\*NONE(...))
- absolute space reservation using SPACE=\*ABSOLUTE(...) in the structure SUPPORT=\*PUBLIC-DISK(...)

Exception: Privileged functions are not available for work files if no authorization for physical allocation is given.

Systems support personnel can supplement the user information in the file catalog with one to eight bytes of information about the file generation (ADM-INFORMATION operand).

By default, systems support (TSOS privilege) is a co-owner of all the files and file generations (and can, therefore, modify their catalog entries). When SECOS is used, this co-ownership can be restricted for permanent files.

#### *Verifying command execution*

The DIALOG-CONTROL operand governs whether a verification dialog is to be conducted with the user. The OUTPUT operand lets the user specify whether each file name that is processed is to be logged in a guaranteed message to SYSOUT. In conjunction with the chargeable SDF-P subsystem, the processed file names can be viewed in the S variable stream for guaranteed messages (SYSMSG; see also the ASSIGN-STREAM and EXECUTE-CMD commands in the “SDF-P” manual [34]).

The storage location for a file generation on an SM pubset can be selected on the basis of a storage class. This simplifies the automatic management of storage space on an SM pubset (for details see the “Introduction to System Administration” [14] or the “System-Managed Storage” manual [45]). Systems support personnel allocates to a storage class certain file attributes which are implicitly set for all files assigned to that storage class. If a storage class is specified, there is no need to explicitly specify values for the WORK-FILE, VOLUME-SET, VOLUME, DEVICE-TYPE, IO-ATTRIBUTES, DISK-WRITE, FILE-PREFORMAT and AVAILABILITY operands. The SHOW-STORAGE-CLASS command allows users to find out which storage classes of the SM pubset are available to them and which file attributes are set.

If the requirements for the file generation’s storage location are changed (explicitly or implicitly by way of the storage class), the storage location may change automatically, with the result that the file is moved to a different volume set. The change of storage location is a synchronous process involving copying of the file generation. The file generation is not accessible to other tasks while copying is in progress.

## Overview of functions

```

## Operands

**GENERATION-NAME = <filename 1..54 without-vers with-wild(80)>**

Name of an existing file generation. If the generation name includes wildcards, or if the specification is partially qualified, the command is executed for the associated set of files. Processing can be controlled and verified with the aid of the DIALOG-CONTROL and OUTPUT operands. Only systems support personnel (TSOS privilege) is allowed to use wildcards within the user ID.

**SUPPORT = \*UNCHANGED / \*PUBLIC-DISK(...) / \*PRIVATE-DISK(...) / \*ANY-DISK(...) / \*TAPE(...)**

Type of volume on which the file generation is located. This entry must not contradict the specification that was made when the catalog entry was created (CREATE-FILE-GENERATION).

**SUPPORT = \*PUBLIC-DISK(...)**

The file generation is located on a public disk.

**STORAGE-CLASS = \*UNCHANGED / \*STD / \*UPDATE/ <composed-name 1..8> / \*NONE(...)**

Governs the properties of the file generation's storage location. A storage class is a container set up by systems support to hold a defined combination of file attributes specific to an SM pubset. On the basis of the assigned volume set lists it maps these attributes onto the existing range of pubset services. This mapping may be more detailed than can be described by explicitly specifying the IO-ATTRIBUTES, DISK-WRITE,

---

AVAILABILITY, FILE-PREFORMAT, VOLUME-SET, VOLUME, DEVICE-TYPE and S0-MIGRATION operands in the STORAGE-CLASS=\*NONE structure.

Assigning a storage class simplifies the automatic management of storage space in an SM pubset (for details see the “Introduction to System Administration” [14] or the “System-Managed Storage” manual [45]).

At the time when the assignment is made, the storage class that is specified (even implicitly using \*STD) must exist, and the user must be authorized to use it. The SHOW-STORAGE-CLASS command allows users to find out which storage classes of an SM pubset are available to them and which file attributes are set.

The WORK-FILE attribute of the storage class must be the same as that of the file generation group.

Defining a different storage class (STORAGE-CLASS not equal \*NONE) can result in the file generation being relocated (reallocated) from its current volume set to another volume set which is better suited to this storage class. The following cases can occur here:

- If the storage class contains AVAILABILITY=\*HIGH and the existing volume set has AVAILABILITY=\*STD, the file generation must be reallocated to a volume set with the attribute AVAILABILITY=\*HIGH. If reallocation is not possible, the command is rejected.
- If the storage class contains a volume set list and the file generation is not located on a volume set of this volume set list, the file generation is, if possible, reallocated to a volume set from this list. If reallocation is not possible, the command is executed without it.

During reallocation, the file generation is open. Accesses from other tasks are rejected.

#### **STORAGE-CLASS = \*STD**

If the file generation is stored in an SM pubset, it is assigned the default storage class from the group entry of the FGG. The default storage class is governed by the STOR-CLASS-DEFAULT operand of the CREATE-FILE-GROUP or MODIFY-FILE-GROUP-ATTRIBUTES command. If there is no default storage class defined, or if the file generation is stored in an SF pubset, the file generation is given the same attributes as with STORAGE-CLASS= \*NONE with default values.

#### **STORAGE-CLASS = \*UPDATE**

*The operand is evaluated only for files in SM pubsets to which a storage class has already been assigned. The attributes are once more read from the storage class catalog and assigned to the file.*

The attributes are once more read from the storage class catalog and assigned to the file.

#### **STORAGE-CLASS = <composed-name 1..8>**

A file generation in an SM pubset is assigned the specified storage class. If the file generation has already been assigned the specified storage class, the attributes are not updated, so any changes made to the storage class in the intervening period do not come into effect. \*UPDATE can be used to ensure that the attributes are updated.

For a file generation in an SF pubset this value has the same effect as STORAGE-CLASS=\*NONE with default values.

#### **STORAGE-CLASS = \*NONE(...)**

The value has the same effect as \*UNCHANGED if all the following conditions are fulfilled:

- The file generation was or is being created on a volume set for permanent data storage.
- A default storage class is assigned to the user ID at the SM pubset in question.
- Physical allocation is not permitted.

Only in this case are the PERFORMANCE, USAGE, DISK-WRITE and AVAILABILITY operands and the SO-MIGRATION=\*ALLOWED specification ignored.

In all other cases, the properties of the file generation's storage location are determined on the basis of the following operands and no storage class is assigned to the file generation or a storage class which is already assigned is withdrawn.

The properties of the file generation's storage location are governed by the following operands. The file generation is not assigned a storage class, and any storage class already assigned is disregarded.

See the MODIFY-FILE-ATTRIBUTES command for descriptions of the suboperands

See the MODIFY-FILE-ATTRIBUTES command for descriptions of the other operands.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	DMS051E	Inconsistency in private disk pool or operand error detected
2	0	DMS0546	Catalog entry for specified file has reached maximum size
2	0	DMS054A	Insufficient disk space or access to disk not possible
2	0	DMS06A9	Some generations of this FGG are missing
	1	CMD0202	Syntactical or semantic error in command
	32	DMS05C7	Unexpected internal error in DMS
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0102	Wildcard selection action: processing interrupted by *TERMINATE or by K2 key in verification dialog
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset Guaranteed messages: DMS051B, DMS0681
	64	DMS051C	User not authorized to access pubset Guaranteed messages: DMS051C, DMS0681
	64	DMS0535	Specified file not shareable
	64	DMS0557	Invalid volume specification
	64	DMS055C	Catalog entry not found on specified private disk
	64	DMS057A	Specified storage class not compatible with FGG in terms of WORK-FILE attribute

	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS057F	Renaming of migrated file not permitted
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS0586	Currently not possible to access or reserve volume
	64	DMS0587	Use of specified command restricted by system administrator
	64	DMS0588	It was not possible to allocate disk space
	64	DMS05A0	Attribute modification not possible - data still in write cache
	64	DMS05BD	Invalid combination of file and volume set attributes
	64	DMS05CC	File name already cataloged
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0681	DMS error on accessing file
	64	DMS0684	File does not exist Guaranteed message: DMS0684
	64	DMS0610	Wildcard selection action: command execution defective for at least one of the selected files
	64	DMS0618	Unknown storage class
	64	DMS061A	Storage class catalog could not be read
	64	DMS0685	File not yet allocated storage space
	64	DMS0689	Operands only allowed for files not yet occupying storage space have been specified
	64	DMS06B5	File already open or catalog entry not updated after system error
	64	DMS06C4	File generation group not yet cataloged
	64	DMS06FF	BCAM connection severed
	128	DMS0506	Function not executed due to change in master
	130	DMS0524	System address space full
	130	DMS053C	No space in pubset catalog file
	130	DMS0582	File is currently locked or in use and cannot be processed
	130	DMS0585	Error detected during catalog processing or multihost processing Guaranteed messages: DMS053C

	130	DMS0586	Currently not possible to access or reserve volume
	130	DMS0588	It was not possible to allocate disk space
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

## Example

*Changing the file attributes of a file generation (storage space / primary and secondary allocations)*

**/show-file-attr max.group.2(\*4),inf=(alloc=\*yes) \_\_\_\_\_ (1)**

```
%0000000003 :2OSG:$USER1.MAX.GROUP.2(*0004)
% ----- ALLOCATION -----
% SUPPORT      = PUB          S-ALLOC      = 9          HIGH-US-PA = 0
% EXTENTS      VOLUME        DEVICE-TYPE    EXTENTS    VOLUME    DEVICE-TYPE
%      1      GVS2.2         D3435
% NUM-OF-EXT = 1
%:2OSG: PUBLIC:      1 FILE RES=          3 FRE=          3 REL=          3 PAGES
```

**/mod-file-gen max.group.2(\*12),  
sup=\*pub(space=\*relative(prim-alloc=90,sec-alloc=30)) \_\_\_\_\_ (2)**

**/show-file-attr max.group.2(\*4),inf=(alloc=\*yes) \_\_\_\_\_ (3)**

```
%0000000093 :2OSG:$USER1.MAX.GROUP.2(*0004)
% ----- ALLOCATION -----
% SUPPORT      = PUB          S-ALLOC      = 30         HIGH-US-PA = 0
% EXTENTS      VOLUME        DEVICE-TYPE    EXTENTS    VOLUME    DEVICE-TYPE
%      2      GVS2.2         D3435
% NUM-OF-EXT = 2
%:2OSG: PUBLIC:      1 FILE RES=          93 FRE=          93 REL=          93 PAGES
```

- (1) The SHOW-FILE-ATTRIBUTES command indicates that three PAM pages are reserved (initial allocation) for the file *MAX.GROUP.2(\*4)*.
- (2) The MODIFY-FILE-GENERATION-SUPPORT command raises the primary space allocation by 90 PAM pages and sets the secondary space allocation to 30 PAM pages (for subsequent storage space extensions).
- (3) The SHOW-FILE-ATTRIBUTES command indicates the new number of reserved pages (93) and the new secondary allocation (30).

---

## 4.14 MODIFY-FILE-GROUP-ATTRIBUTES

Modify catalog entry of file generation group

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE-GENERATION-GROUP
<b>Privileges:</b>	STD-PROCESSING TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The MODIFY-FILE-GROUP-ATTRIBUTES command amends the attributes of a file generation group. Only the owner, any co-owners (see the CREATE-FILE command, “Privileged functions”) and systems support personnel are allowed to modify all the attributes of a file generation group (FGG). Other users, provided they have write permission for the file, are allowed only to modify the CODED-CHARACTER-SET entry.

If the FGG is write-protected by a password, the password must have been added to the password table for the job (see the ADD-PASSWORD command).

The default value \*UNCHANGED in the corresponding operands means that the previously valid definition still applies.

#### *Privileged functions*

Systems support personnel can supplement the user information in the file catalog with one to eight bytes of information about the file generation group (ADM-INFORMATION operand).

By default, systems support (TSOS privilege) is a co-owner of all the files and file generation groups (and can therefore modify their catalog entries). When SECOS is used, this co-ownership can be restricted for permanent files.

#### *Verifying command execution*

The DIALOG-CONTROL operand governs whether a verification dialog is to be conducted with the user. The OUTPUT operand lets the user specify whether each file name that is processed is to be logged in a guaranteed message to SYSOUT. In conjunction with the chargeable SDF-P subsystem, the processed file names can be viewed in the S variable stream for guaranteed messages (SYSMSG; see also the ASSIGN-STREAM and EXECUTE-CMD commands in the “SDF-P” manual [34]).

## Overview of functions

```

## Operands

**GROUP-NAME** = <filename 1..47 without-gen-vers with-wild(80)>

Name of an existing file generation group. If the name includes wildcards, or if the specification is partially qualified, the command is executed for the associated set of file generation groups. Processing can be controlled and verified with the aid of the DIALOG-CONTROL and OUTPUT operands. Only systems support personnel (TSOS privilege) is allowed to use wildcards within the user ID.

**NEW-NAME** = \*SAME / <filename 1..47 without-gen-vers with-wild-constr(80)>

Specifies whether the file is to be renamed.

**NEW-NAME** = \*SAME

The current name of the FGG is retained.

**NEW-NAME** = <filename 1..47 without-gen-vers with-wild-constr(80)>

The FGG is to be renamed. The command is rejected if a catalog entry with the specified name already exists. It is also rejected for FGGs whose generations are on HSMS storage level S1 or S2 (see the STORAGE-LEVEL operand in the SHOW-FILE-ATTRIBUTES command).

If wildcards or a partially qualified name have been specified in the GROUP-NAME operand, a constructor can be used to specify how the new names of the selected FGGs are to be formed. The constructor string should be designed to ensure that the new names are unique; in other words, multiple renames must not produce the same name more than once.

*File generations on tape:* If some or all of the file generations are stored on tape, their names will be changed only in the catalog entry, not in the tape labels. These file generations can no longer be accessed.

**GENERATION-PARAMETER** = \*UNCHANGED / \*GENERATION-PARAMETER(...)

Specifies the attributes of the file generation group.

**GENERATION-PARAMETER** = \*GENERATION-PARAMETER(...)

Attributes of the file generation group.

**MAXIMUM** = \*UNCHANGED / <integer 1..255>

Defines how many file generations may be cataloged at the same time (see the OVERFLOW-OPTION operand).

**OVERFLOW-OPTION** = \*UNCHANGED / \*CYCLIC-REPLACE / \*REUSE-VOLUME / \*DELETE-ALL / \*KEEP-GENERATION

Specifies what action is to be taken if the maximum permitted number of file generations is exceeded (see the MAXIMUM operand). When the maximum permitted number is reached, the surplus file generations are deleted regardless of password protection, retention period (EXPIRATION-DATE) and the permitted mode of access (ACCESS).

---

**OVERFLOW-OPTION = \*CYCLIC-REPLACE**

The current oldest generation is deleted and its storage space, or the tapes it occupies, are released. In the catalog, the entries in the *LAST-GEN* and *FIRST-GEN* output fields (most recent/old existing generations) are updated.

**OVERFLOW-OPTION = \*REUSE-VOLUME**

The effect of OVERFLOW-OPTION=\*REUSE-VOLUME depends on the storage medium:

*For FGGs on public disks:* the oldest generation is deleted and its storage space returned to the system; the group entry is updated (see OVERFLOW-OPTION= \*CYCLIC-REPLACE).

*For FGGs on private disks:* the new generation is created and the oldest generation deleted, the volume being used for storage of the new generation. If the generation which is being deleted extends over several disks, the new generation is cataloged only on the first of these disks. The group entry is updated accordingly. Since the old generation is not deleted until the new generation has been created, lack of storage space on the disk may mean that it is impossible to create the new generation, even though OVERFLOW-OPTION=\*REUSE-VOLUME is specified.

*For FGGs on tape:* the oldest generation is deleted from the catalog, and the new generation is created on the tape thus released. The group entry is updated accordingly. OVERFLOW-OPTION=\*REUSE-VOLUME is not permitted for file generation groups on multifile tapes (file sets).

**OVERFLOW-OPTION = \*DELETE-ALL**

All generations of the FGG are deleted, and the new generation becomes the oldest one in the new series. The group entry is updated accordingly.

**OVERFLOW-OPTION = \*KEEP-GENERATION**

The file generations are not automatically deleted. The oldest file generations which overshoot the maximum are not deleted until OVERFLOW-OPTION or BASE-NUMBER is modified.

**BASE-NUMBER = \*UNCHANGED / \*ABSOLUTE(...) / \*RELATIVE-TO-LAST-GENERATION(...)**

Defines a reference point/a base generation to which all relative generation numbers refer. The names of the file generations can be specified with absolute (\*n) or relative ( $\pm n$ ) generation numbers.

**BASE-NUMBER = \*ABSOLUTE(...)**

Specifies the base value as an absolute value.

**NUMBER = <integer 0..9999>**

The generation number which represents the base value in absolute terms. Only the number of an existing, nonsurplus file generation may be specified.

**BASE-NUMBER = \*RELATIVE-TO-LAST-GENERATION(...)**

Specifies the base value indirectly:

**NUMBER = <integer -99..0>**

The value whose magnitude is to be subtracted from the last file generation number to give the absolute base value. The absolute base value calculated in this way must be the number of an existing, nonsurplus generation.

**PROTECTION = \*UNCHANGED / \*PARAMETERS(...)**

The protection attributes for the FGG.

**PROTECTION = \*PARAMETERS(...)**

The file generation group is given the specified protection attributes. For descriptions of the PROTECTION-ATTR, ACCESS, USER-ACCESS, BASIC-ACL, GUARDS, WRITE-PASSWORD, READ-PASSWORD, DESTROY-BY-

---

DELETE, AUDIT, SPACE-RELEASE-LOCK, EXPIRATION-DATE and FREE-FOR-DELETION operands, see the corresponding operand descriptions for the MODIFY-FILE-ATTRIBUTES command.

#### Notes

- Since file generations are not executable (program or procedure), they cannot be protected with an execute password (EXEC-PASSWORD). Likewise, for the same reason no execute permission can be set within BASIC-ACL or GUARDS.
- The protection attribute EXPIRATION-DATE is of no effect for file generations that have not been opened yet ( CRE-DATE=NONE).

#### **STOR-CLASS-DEFAULT = \*UNCHANGED / \*STD / <composed-name 1..8> / \*NONE**

*The operand is evaluated only for file generation groups in SM pubsets. Governs the properties of the storage location if no explicit specification is made when the file generation is created.*

Assigning a storage class simplifies the automatic management of storage space in an SM pubset (for details see the “Introduction to System Administration” [14]). The SHOW-STORAGE-CLASS command allows users to find out which storage classes of an SM pubset are available to them and which file attributes are set.

A file generation group for work files cannot be converted to a file generation group for normal files and vice versa.

The only specification allowed for a file generation group in an SF pubset is STOR-CLASS-DEFAULT=\*NONE.

#### **STOR-CLASS-DEFAULT = \*STD**

The pubset-specific default storage class from the user entry is used as the default storage class for the file generation group. If the file generation group is to be created in an SF pubset or if there is no default storage class defined in the user entry, the file generation group is given the same attributes as with STOR-CLASS-DEFAULT=\*NONE.

#### **STOR-CLASS-DEFAULT = <composed-name 1..8>**

The file generation group is assigned the specified storage class. The storage class must exist and be accessible to the user at the time when the assignment is made. This specification is ignored for a file generation group in an SF pubset; the FG is then given the same attributes as with STOR-CLASS-DEFAULT=\*NONE.

#### **STOR-CLASS-DEFAULT = \*NONE**

The value has the same effect as \*UNCHANGED if all the following conditions are fulfilled:

- The file generation group is located on a volume set for permanent data storage.
- A default storage class is assigned to the user ID at the SM pubset in question.
- Physical allocation is not permitted.

In all other cases, the properties of the file generation group’s storage location are determined on the basis of the \*NONE(...) structure and no storage class is assigned to the file generation group or an already assigned storage class is withdrawn.

The properties of the storage location for the file generations are governed by the specifications in the CREATE-FILE-GENERATION or MODIFY-FILE-GENERATION-SUPPORT command.

For descriptions of the SAVE, MANAGEMENT-CLASS, CODED-CHARACTER-SET, USER-INFORMATION, ADM-INFORMATION, DIALOG-CONTROL, and OUTPUT operands, see the corresponding operand descriptions for the MODIFY-FILE-ATTRIBUTES command.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	DMS051E	Inconsistency in private disk pool or operand error detected
2	0	DMS0546	Catalog entry for specified file has reached maximum size
2	0	DMS054A	Insufficient disk space or access to disk not possible
2	0	DMS06A9	Some generations of this FGG are missing
2	0	DMS06CA	Command executed, but invalid specification in BASE-NUMBER operand ignored
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0102	Wildcard selection action: processing interrupted by *TERMINATE or by K2 key in verification dialog
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset Guaranteed messages: DMS051B, DMS0681
	64	DMS051C	User not authorized to access pubset Guaranteed messages: DMS051C, DMS0681
	64	DMS0535	Specified file not shareable
	64	DMS053E	File already cataloged on private volume
	64	DMS055C	Catalog entry not found on specified private disk
	64	DMS0579	Invalid operand for temporary file or work file
	64	DMS057A	Specified storage class not compatible with WORK-FILE attribute
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS057F	Renaming of migrated file not permitted

	64	DMS0585	Error detected during catalog processing or multihost processing
	64	DMS0586	Currently not possible to access or reserve volume
	64	DMS0587	Use of specified command restricted by system administrator
	64	DMS059F	Specified value for number of backup versions invalid
	64	DMS05B5	Guard not available
	64	DMS05CC	File name already cataloged
	64	DMS05CE	First file name not cataloged
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0609	No access to system file
	64	DMS060D	Invalid file name for reference file (PROTECTION-ATTR)
	64	DMS0610	Wildcard selection action: command execution defective for at least one of the selected FGGs
	64	DMS0613	Unknown management class
	64	DMS0618	Unknown storage class
	64	DMS061A	Storage class catalog could not be read
	64	DMS06FF	BCAM connection severed
	128	DMS0506	Function not executed due to change in master
	130	DMS0586	Currently not possible to access or reserve volume
	130	DMS0588	It was not possible to allocate disk space
	130	DMS0524	System address space full
	130	DMS053C	No space in pubset catalog file
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected during catalog processing or multihost processing Guaranteed messages: DMS053C
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

## Examples

*Example 1: Changing the file attributes of a file generation group (OVERFLOW-OPTION)*

```
/show-file-attr max.group.2,inf=(org=*yes) _____ (1)
```

```
%0000000000 :2OSG:$USER1.MAX.GROUP.2 (FGG)
% ----- GENERATION-INFO -----
% MAXIMUM      = 3          BASE-NUM    = 0          OVERFL-OPT = CYCL-REPL
% FIRST-GEN    = 7          LAST-GEN    = 9
%:2OSG: PUBLIC:      1 FILE RES=          0 FRE=          0 REL=          0 PAGES
```

```
/show-file-attr max.group.2,select=(generation=*yes) _____ (2)
```

```
%          0 :2OSG:$USER1.MAX.GROUP.2 (FGG)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0007)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0008)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0009)
%:2OSG: PUBLIC:      4 FILES RES=          9 FRE=          9 REL=          9 PAGES
```

```
/mod-file-gr max.group.2,gen-par=(overflow-option=*keep-gen) - (3)
```

```
/cre-file-gen max.group.2(*10)
```

```
/cre-file-gen max.group.2(*11)
```

```

%          3 :2OSG:$USER1.MAX.GROUP.2(*0007)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0008)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0009)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0010)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0011)
%:2OSG: PUBLIC:      6 FILES RES=          15 FRE=          15 REL=          15 PAGES
```

```
/mod-file-gr max.group.2,gen-par=(overflow-option=*cyclic-replace) — (6)
```

```
/show-file-attr max.group.2,inf=(org=*yes) _____ (7)
```

```
%          0 :2OSG:$USER1.MAX.GROUP.2 (FGG)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0009)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0010)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0011)
%:2OSG: PUBLIC:      4 FILES RES=          9 FRE=          9 REL=          9 PAGES
```

```
/show-file-attr max.group.2,select=(generation=yes)
```

```
%      0 :2OSG:$USERXY01.MAX.GROUP.2 (FGG)
%      9 :2OSG:$USERXY01.MAX.GROUP.2(*0009)
%      9 :2OSG:$USERXY01.MAX.GROUP.2(*0010)
%      9 :2OSG:$USERXY01.MAX.GROUP.2(*0011)
%:2OSG: PUBLIC:      4 FILES RES=      27 FRE=      27 REL=      27 PAGES
```

- (1) Shows the file attributes of the file generation group *MAX.GROUP.2* (group entry). A maximum of 3 generations can exist. Every additional generation would replace the oldest existing generation at the time (OVERFLOW-OPTION= \*CYCLIC-REPLACE).
- (2) Shows the file generation group *MAX.GROUP.2* along with the associated generations. Generations \*0007 to \*0009 exist.
- (3) The OVERFLOW-OPTION specification (3) is modified to KEEP-GENERATION. Generations \*0010 and \*0011 are then created.
- (4) Output of the modified group entry.
- (5) Shows the group entry and all associated generations. There are now five existing generations. The generations \*0007 and \*0008 were not deleted when creating generations \*0010 and \*0011!
- (6) The OVERFLOW-OPTION specification now changed to CYCLIC-REPLACE.
- (7) Shows the modified group entry and the associated file generations. The “excess” generations \*0007 and \*0008 were deleted.

*Example 2: Changing the file attributes of a file generation group (BASE-NUMBER)*

```
/show-file-attr max.group.2,inf=(org=*yes) _____ (1)
```

```
%0000000000 :2OSG:$USER1.MAX.GROUP.2 (FGG)
% ----- GENERATION-INFO -----
% MAXIMUM      = 3          BASE-NUM      = 0          OVERFL-OPT = CYCL-REPL
% FIRST-GEN    = 9          LAST-GEN     = 11
%:2OSG: PUBLIC:      1 FILE RES=      0 FRE=      0 REL=      0 PAGES
%0000000000 :2OS2:$USER1.MAX.GROUP.2 (FGG)
```

```
/show-file-attr max.group.2,select=(generation=yes) _____ (2)
```

```
%      0 :2OSG:$USERXY01.MAX.GROUP.2 (FGG)
%      9 :2OSG:$USERXY01.MAX.GROUP.2(*0009)
%      9 :2OSG:$USERXY01.MAX.GROUP.2(*0010)
%      9 :2OSG:$USERXY01.MAX.GROUP.2(*0011)
%:2OSG: PUBLIC:      4 FILES RES=      27 FRE=      27 REL=      27 PAGES
```

```
/cre-file-gen max.group.2(+1) _____ (3)
```

```
% CMD0051 INVALID OPERAND 'GENERATION-NAME' _____ (4)
% DMS0681 DMS ERROR '06C7' WHEN ACCESSING FILE ':2OSG:$USER1.MAX.GROUP.2(+01)'.
FOR FURTHER INFORMATION: /HELP-MSG DMS06C7
```

```
/mod-file-gr max.group.2,gen-par=(base-number=absolut(11)) _____ (5)
```

```
/cre-file-gen max.group.2(+1) _____ (6)
```

```
/cre-file-gen max.group.2(+2)
```

```
/show-file-attr max.group.2,inf=(org=*yes) _____ (7)
```

```
%0000000000 :2OSG:$USER1.MAX.GROUP.2 (FGG)
% ----- GENERATION-INFO -----
% MAXIMUM      = 3          BASE-NUM    = 11          OVERFL-OPT = CYCL-REPL
% FIRST-GEN    = 11         LAST-GEN   = 13
%:2OSG: PUBLIC:      1 FILE RES=          0 FRE=          0 REL=          0 PAGES
```

```
/show-file-attr max.group.2,select=(generation=yes)
```

```
%          0 :2OSG:$USER1.MAX.GROUP.2 (FGG)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0011)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0012)
%          3 :2OSG:$USER1.MAX.GROUP.2(*0013)
%:2OSG: PUBLIC:      4 FILES RES=          9 FRE=          9 REL=          9 PAGES
```

- (1) Shows the group entry for the file generation group *MAX.GROUP.2*. The value entered as the base number for relative generation numbers is zero.
- (2) Shows all associated generations. The existing generations are \*0009 to \*0011.
- (3) The relative generation number *+1* is specified in an attempt to create a new generation.
- (4) The CREATE-FILE-GENERATION command is rejected since the *+1* specification in relation to the base number zero would produce generation \*0001, and the last created generation is \*0011.
- (5) The base number in the group entry is set to the number of the last generation created (\*0011). This makes it possible to begin relative specifications with *+1* again (instead of +12).
- (6) Generation \*0012 and \*0013 are created by specifying the relative generation numbers *+1* and *+2*.
- (7) Shows the group entry and all associated generations.

---

## 4.15 MODIFY-HEL-CHECK

Control HEL record threshold monitoring

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Error logging
<b>Domain:</b>	ERROR-LOGGING
<b>Privileges:</b>	HARDWARE-MAINTENANCE

### Function

The MODIFY-HEL-CHECK command controls threshold monitoring for hardware errors (HEL records). Once an error threshold has been reached, the message "CALL TELESERVICE" is displayed on the operator terminal (console) the next time the error occurs. However, the message is displayed only if the Teleservice alarm function has been enabled (see the MODIFY-HEL-TELESERVICE-ALARM command).

The following mechanisms are available for threshold monitoring control:

- Enabling/disabling the monitoring of all records of a monitoring class (control ID)
- Enabling/disabling the monitoring of all records for a device, which can be identified by its device mnemonic or its device address
- Enabling/disabling the monitoring of specific records or of a group of records with specific attributes (monitoring class, error type and error priority)
- The threshold can be set separately for each control mechanism
- The current threshold counter of a specific monitor setting can be reset

Each MODIFY-HEL-CHECK command with at least one nondefault value generates an additional threshold monitoring control record. No more than 50 control records are allowed. During threshold monitoring, all the control records are scanned in the order in which they were generated. Only the last control record found for the error which has occurred is evaluated. For that reason, control records which describe an error in detail should not be generated until after "general" control records (e.g. only for a monitoring class).

MODIFY-HEL-CHECK CHECK=\*STD with no other arguments causes all modifications made earlier to be reversed, with the result that any control records that have been added are deleted and only the default set of records remains (as at system startup).

MODIFY-HEL-CHECK CHECK=\*STD and other specifications (e.g. monitoring class, error type, device, etc.) only the control records that correspond to all the specifications made are deleted.

The command is rejected if HEL logging is disabled or the maximum allowable number of control records (message HEL0108) has been reached.

If logging is disabled and restarted with START-HEL-LOGGING during a system session, the number of HEL records being monitored remains unchanged.

The SHOW-HEL-CHECK command lists the active threshold monitoring control records.

---

## Format

### MODIFY-HEL-CHECK

**CHECK** = \*STD / \*ON / \*OFF

,**CONTROL-IDENTIFIER** = \*ANY / \*MCK / \*CCK / \*CRW / \*DISK / \*TAPE / \*SPOOL / \*BCAM /  
\*NINT / \*STAT

,**ATTRIBUTE** = \*ANY / \*HARDWARE-ERROR / \*UNCORRECTABLE / \*CORRECTABLE /  
\*TAPE-ERROR / \*OVERRUN

,**PRIORITY** = \*ANY / \*HIGH / \*MEDIUM / \*LOW

,**DEVICE** = \*ANY / <alphanum-name 2..4> / \*UNIT(...)

\*UNIT(...)

|       **PATH** = <alphanum-name 1..6>

,**MAXIMUM** = \*STD / <integer 1..255>

,**RESET-COUNT** = \*OFF / \*ON

## Operands

### **CHECK = \*STD / \*ON / \*OFF**

Specifies the HEL records for which threshold monitoring is to be enabled or disabled. The HEL records to be monitored can be identified more precisely with the selection operands CONTROL-IDENTIFIER, ATTRIBUTE, PRIORITY, and DEVICE, where a value of \*ANY means that the operand is not to be used as a selection criterion. If more than one selection operand is used, the arguments are logically ANDed.

### **CHECK = \*STD**

The CHECK setting defined by the system is applied to all the HEL records matching the specified selection criteria. If no selection criteria are defined, or if the selection operands are explicitly set to \*ANY, threshold monitoring is restored to the condition it was in at system startup (reset function). In this case, a threshold specification in the MAXIMUM operand is ignored.

When selection attributes are specified, only the control records that correspond to all the specifications made are deleted.

### **CHECK = \*ON**

Thresholds are monitored for all HEL records matching the specified selection criteria.

### **CHECK = \*OFF**

Threshold monitoring is disabled for all HEL records matching the specified selection criteria.

### **CONTROL-IDENTIFIER = \*ANY / \*MCK / \*CCK / \*CRW / \*DISK / \*TAPE / \*SPOOL / \*BCAM / \*NINT / \*STAT**

The selection criterion is the monitoring class to which the error reported in the HEL record is allocated.

Operand value	Monitoring class
*ANY	Not used as selection criterion
*MCK	M (machine check)
*CCK	C (channel check)
*CRW	R (channel report words)
*DISK	D (disk device error)
*TAPE	T (tape device error)
*SPOOL	S (spool device error)
*BCAM	B (error detected by BCAM)
*NINT	N (no interrupt)
*STAT	Z (device statistics)

**ATTRIBUTE = \*ANY / \*HARDWARE-ERROR / \*UNCORRECTABLE / \*CORRECTABLE / \*TAPE-ERROR / \*OVERRUN**

The selection criterion is the error type to which the error reported in the HEL record is allocated.

Operand value	Error type identification	
*ANY	Not used as selection criterion	
*HARDWARE-ERROR	Attribute H:	True hardware error
*UNCORRECTABLE	Attribute U:	Uncorrectable error; only affects devices of the “older” generation
*CORRECTABLE	Attribute C:	Software-correctable error; only affects devices of the “older” generation
*TAPE-ERROR	Attribute T:	Logical tape error
*OVERRUN	Attribute O:	Channel capacity exceeded (queued data cannot all be transferred); only affects devices which operate without an I/O buffer

**PRIORITY = \*ANY / \*HIGH / \*MEDIUM / \*LOW**

The selection criterion is the error priority assigned to the error reported in the HEL record.

**PRIORITY = \*ANY**

The error priority is not used as a selection criterion.

**PRIORITY = \*HIGH**

Selects HEL records assigned priority H (high-priority errors).

**PRIORITY = \*MEDIUM**

Selects HEL records assigned priority M (medium-priority errors).

---

**PRIORITY = \*LOW**

Selects HEL records assigned priority L (low-priority errors).

**DEVICE = \*ANY / <alphanum-name 2..4> / \*UNIT(...)**

The selection criterion is the hardware unit in which the error reported in the HEL record occurred.

**DEVICE = \*ANY**

The hardware unit affected by the error is not used as a selection criterion.

**DEVICE = <alphanum-name 2..4>**

Device mnemonic of a hardware unit.

Selects HEL records reporting errors affecting this hardware unit.

**DEVICE = \*UNIT(...)**

Selects HEL records reporting errors affecting this hardware unit. The hardware unit is identified by its device address in the associated PATH operand.

**PATH = <alphanum-name 1..6>**

Device address in the form cccccuu.

**MAXIMUM = \*STD / <integer 1..255>**

Sets the threshold which is to apply to the selected HEL records.

This operand is ignored if combined with CHECK=\*STD with no further selection criteria (reset function).

**MAXIMUM = \*STD**

Sets the threshold to 10.

**MAXIMUM = <integer 1..255>**

Threshold specification for the selected HEL records.

**RESET-COUNT = \*OFF / \*ON**

Governs whether the current threshold counter of a threshold monitoring mechanism is to be reset. The monitoring mechanism must be precisely defined in the CONTROL-IDENTIFIER, ATTRIBUTE, PRIORITY and/or DEVICE operands.

**RESET-COUNT = \*OFF**

The current threshold counter is not reset.

**RESET-COUNT = \*ON**

The current threshold counter is reset.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	32	HEL0100	Internal error
	32	HEL0105	Bourse problems
	32	HEL0108	Too many control commands
	64	HEL0010	Hardware error logging not active
	64	HEL0110	Privilege error

---

## Example

See SHOW-HEL-CHECK.

---

## 4.16 MODIFY-HEL-LOGGING

Control HEL record logging

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Error logging
<b>Domain:</b>	ERROR-LOGGING
<b>Privileges:</b>	HARDWARE-MAINTENANCE

### Function

The MODIFY-HEL-LOGGING command controls the scope of hardware error logging (HEL records). The command is rejected if HEL logging is disabled. The following control mechanisms are available:

- Enabling/disabling the monitoring of all records of a monitoring class (control ID)
- Enabling/disabling the monitoring of all records for a device, which can be identified by its device mnemonic or its device address
- Enabling/disabling the monitoring of specific records or of a group of records with specific attributes (monitoring class, error type and error priority)
- Enabling/disabling the monitoring of records which are excluded from logging

Each MODIFY-HEL-LOGGING command with at least one nondefault value generates an additional logging control record. No more than 50 control records are allowed.

The command is rejected if HEL logging is disabled or the maximum allowable number of control records (message HEL0108) has been reached.

MODIFY-HEL-LOGGING LOGGING=\*STD with no other arguments causes all modifications made earlier to be reversed, with the result that the default setting applies again (as at system startup).

If logging is disabled and restarted with START-HEL-LOGGING during a system session, the number of HEL records being logged remains unchanged.

The SHOW-HEL-LOGGING command lists the current settings.

---

## Format

### MODIFY-HEL-LOGGING

**LOGGING** = \*STD / \*ON / \*OFF

,**CONTROL-IDENTIFIER** = \*ANY / \*MCK / \*CCK / \*CRW / \*DISK / \*TAPE / \*SPOOL / \*BCAM /  
\*NINT / \*STAT

,**ATTRIBUTE** = \*ANY / \*HARDWARE-ERROR / \*UNCORRECTABLE / \*CORRECTABLE /  
\*TAPE-ERROR / \*OVERRUN

,**PRIORITY** = \*ANY / \*HIGH / \*MEDIUM / \*LOW

,**DEVICE** = \*ANY / <alphanum-name 2..4> / \*UNIT(...)

\*UNIT(...)

| **PATH** = <alphanum-name 1..6>

## Operands

**LOGGING = \*STD / \*ON / \*OFF**

Specifies the HEL records which are to be written to the log file. The HEL records to be logged can be identified more precisely with the selection operands CONTROL-IDENTIFIER, ATTRIBUTE, PRIORITY, and DEVICE, where a value of \*ANY means that the operand is not to be used as a selection criterion. If more than one selection operand is used, the arguments are logically ANDed.

**LOGGING = \*STD**

The LOGGING setting defined by the system is applied to all the HEL records matching the specified selection criteria (i.e. the submitter of the record determines the logging setting). If no selection criteria are defined, or if the selection operands are explicitly set to \*ANY, the scope of logging is restored to the condition it was in at system startup (reset function).

**LOGGING = \*ON**

All HEL records matching the specified selection criteria are written to the log file.

**LOGGING = \*OFF**

Logging is disabled for all HEL records matching the specified selection criteria.

**CONTROL-IDENTIFIER = \*ANY / \*MCK / \*CCK / \*CRW / \*DISK / \*TAPE / \*SPOOL / \*BCAM / \*NINT / \*STAT**

The selection criterion is the monitoring class to which the error reported in the HEL record is allocated.

Operand value	Monitoring class
*ANY	Not used as selection criterion
*MCK	M (machine check)
*CCK	C (channel check)
*CRW	R (channel report words)
*DISK	D (disk device error)
*TAPE	T (tape device error)
*SPOOL	S (spool device error)
*BCAM	B (error detected by BCAM)
*NINT	N (no interrupt)
*STAT	Z (device statistics)

**ATTRIBUTE = \*ANY / \*HARDWARE-ERROR / \*UNCORRECTABLE / \*CORRECTABLE / \*TAPE-ERROR / \*OVERRUN**

The selection criterion is the error type to which the error reported in the HEL record is allocated.

Operand value	Error type identification	
*ANY	Not used as selection criterion	
*HARDWARE-ERROR	Attribute H:	True hardware error
*UNCORRECTABLE	Attribute U:	Uncorrectable error; only affects devices of the “older” generation
*CORRECTABLE	Attribute C:	Software-correctable error; only affects devices of the “older” generation
*TAPE-ERROR	Attribute T:	Logical tape error
*OVERRUN	Attribute O:	Channel capacity exceeded (queued data cannot all be transferred); only affects devices which operate without an I/O buffer

**PRIORITY = \*ANY / \*HIGH / \*MEDIUM / \*LOW**

The selection criterion is the error priority assigned to the error reported in the HEL record.

**PRIORITY = \*ANY**

The error priority is not used as a selection criterion.

**PRIORITY = \*HIGH**

Selects HEL records assigned priority H (high-priority errors).

---

**PRIORITY = \*MEDIUM**

Selects HEL records assigned priority M (medium-priority errors).

**PRIORITY = \*LOW**

Selects HEL records assigned priority L (low-priority errors).

**DEVICE = \*ANY / <alphanum-name 2..4> / \*UNIT(...)**

The selection criterion is the hardware unit in which the error reported in the HEL record occurred.

**DEVICE = \*ANY**

The hardware unit affected by the error is not used as a selection criterion.

**DEVICE = <alphanum-name 2..4>**

Device mnemonic of a hardware unit.

Selects HEL records reporting errors affecting this hardware unit.

**DEVICE = \*UNIT(...)**

Selects HEL records reporting errors affecting this hardware unit. The hardware unit is identified by its device address in the associated PATH operand.

**PATH = <alphanum-name 1..6>**

Device address in the form ccccuu.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	32	HEL0100	Internal error
	32	HEL0105	Bourse problems
	32	HEL0108	Too many control commands
	64	HEL0010	Hardware error logging not active
	64	HEL0110	Privilege error

**Example**

See SHOW-HEL-LOGGING.

---

## 4.17 MODIFY-HEL-TELESERVICE-ALARM

Set Teleservice alarm

**Component:** BS2000 OSD/BC  
**Functional area:** Error logging  
**Domain:** ERROR-LOGGING  
**Privileges:** HARDWARE-MAINTENANCE

### Function

The MODIFY-HEL-TELESERVICE-ALARM command enables and disables the Teleservice alarm function. If the Teleservice alarm is on, the message "CALL TELESERVICE" is displayed on the operator terminal (console) when an error threshold is reached (see the MODIFY-HEL-CHECK command). When enabling the alarm function it is also possible to specify a period during which the message will be displayed, typically so that the alarm message will be issued during normal working hours only.

The command is rejected if HEL logging is disabled.

The SHOW-HEL-TELESERVICE-ALARM shows the current setting of the alarm function.

### Format

#### MODIFY-HEL-TELESERVICE-ALARM

**ALARM** = **\*STD** / **\*OFF** / **\*ON(...)**

**\*ON(...)**

| **FROM** = **\*UNCHANGED** / <time> / **\*STD**

| **,TO** = **\*UNCHANGED** / <time> / **\*STD**

### Operands

**ALARM = STD / \*OFF / \*ON(...)**

Governs whether the alarm message will be issued when an error threshold is reached. If the alarm function is enabled (ALARM=\*ON), it is possible to specify a period during which alarm messages are to be issued.

**ALARM = \*STD**

The value defined by the system is applied: ALARM=\*ON(FROM=\*STD,TO=\*STD)

**ALARM = \*OFF**

Disables the alarm function. No messages are issued if error thresholds are reached

**ALARM = \*ON(...)**

Enables the alarm function. Messages are issued when error thresholds are reached. Messages will be issued during the period indicated by the associated FROM and TO operands.

**FROM = \*UNCHANGED / <time> / \*STD**

Identifies the start of the period in which alarm messages are to be issued.

---

**FROM = \*UNCHANGED**

The current setting is left unchanged.

**FROM = <time>**

Time at which the period begins.

**FROM = \*STD**

The system default time is used (FROM=00:00:00).

**TO = \*UNCHANGED / <time> / \*STD**

Identifies the end of the period in which alarm messages are to be issued.

**TO = \*UNCHANGED**

The current setting is left unchanged.

**TO = <time>**

Time at which the period ends.

**TO = \*STD**

The system default time is used (TO=24:00:00).

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	32	HEL0100	Internal error
	32	HEL0105	Bourse problems
	64	HEL0010	Hardware error logging not active
	64	HEL0110	Privilege error

## Example

```
/mod-hel-tele-alarm alarm=*std _____ (1)
/show-hel-tele-alarm
```

```
% HEL0005 TELESERVICE-ALARM BY HEL IS ACTIVE. MONITORING-INTERVALL FROM
00:00:00 TO 24:00:00
```

```
/mod-hel-tel-alarm *on(from=8:15,to=16:45) _____ (2)
/mod-hel-tel-alarm *off _____ (3)
/show-hel-tele-alarm
```

```
% HEL0006 TELESERVICE-ALARM BY HEL IS DEACTIVATED.
```

```
/mod-hel-tele-alarm *on _____ (4)
/show-hel-tele-alarm
```

```
% HEL0005 TELESERVICE-ALARM BY HEL IS ACTIVE. MONITORING-INTERVALL FROM
08:15:00 TO 16:45:00
```

```
/show-hel-tele-alarm
```

```
% HEL0005 TELESERVICE-ALARM BY HEL IS ACTIVE. MONITORING-INTERVALL FROM
08:15:00 TO 16:45:00
```

```
/mod-hel-tele-alarm *on(from=*std) _____ (5)
/show-hel-tele-alarm
```

```
% HEL0005 TELESERVICE-ALARM BY HEL IS ACTIVE. MONITORING-INTERVALL FROM
00:00:00 TO 16:45:00
```

- (1) The MODIFY-HEL-TELESERVICE-ALARM command with ALARM=\*STD selects the default setting of the alarm function. The SHOW-HEL-TELESERVICE-ALARM command which follows it shows how the alarm is set: The alarm function is enabled, and alarms will be issued at all times.
- (2) Changes the period in which alarm messages are issued: messages will be displayed between 8:15 and 17:45.
- (3) Disables the alarm function, as indicated by the SHOW-HEL-TELESERVICE-ALARM command which follows.
- (4) MODIFY-HEL-TELESERVICE-ALARM with ALARM=\*ON switches the alarm function back on, and SHOW-HEL-TELESERVICE-ALARM shows that the modified alarm period setting has been retained (see Point 2).
- (5) MODIFY-HEL-TELESERVICE-ALARM with ALARM=\*ON(FROM=\*STD) sets the start of the alarm period to the system default value. The SHOW-HEL-TELESERVICE-ALARM command which follows shows the starting time is midnight.

## 4.18 MODIFY-IMON-SCI

Modify IMON SCI

<b>Component:</b>	IMON-GPN
<b>Functional area:</b>	System control and optimization
<b>Domain:</b>	SYSTEM-MANAGEMENT
<b>Privileges:</b>	SUBSYSTEM-MANAGEMENT

### Function

Systems support can use the MODIFY-IMON-SCI command to incorporate path name modifications in the SCI (System Configuration Inventory) of IMON and IMON-GPN.

A catalog ID (e.g. modification of the pubset with PVSREN), a user ID or a prefix can be modified. Systems support can also prepare the SCI for a new pubset.

### Format

#### MODIFY-IMON-SCI

```
SCI-NAME = *STD / <filename 1..50 without-gen-vers>
,REFERRED-PUBSET = *UNCHANGED / *PARAMETERS(...)
  *PARAMETERS(...)
    | OLD-NAME = <cat-id 1..4>
    | ,NEW-NAME = <cat-id 1..4>
,REFERRED-USER-ID = *UNCHANGED / *PARAMETERS(...)
  *PARAMETERS(...)
    | OLD-NAME = <name 1..8>
    | ,NEW-NAME = <name 1..8>
,REFERRED-PREFIX = *UNCHANGED / *PARAMETERS(...)
  *PARAMETERS(...)
    | OLD-NAME = *NONE / <partial-filename 2..7 without-cat-user>
    | ,NEW-NAME = *NONE / <partial-filename 2..7 without-cat-user>
```

---

## Operands

### **SCI-NAME =**

Name of the SCI.

### **SCI-NAME = \*STD**

The default SCI is used (\$TSOS.SYS.IMON.SCI and \$TSOS.SYS.IMON.SCI.GPN).

### **SCI-NAME = <filename 1..50 without-gen-vers>**

Specification of the foreign SCI, e.g. the SCI on an imported pubset (<filename 1..50 without-gen-vers> and <filename 1..50 without-gen-vers>.GPN).

### **REFERRED-PUBSET = \*UNCHANGED / \*PARAMETERS(...)**

Specifies the pubset whose modified name is to be registered in the SCI.

### **REFERRED-PUBSET = \*PARAMETERS(...)**

Specifications concerning the modified pubset name:

#### **OLD-NAME = <cat-id 1..4>**

Old catalog ID.

#### **NEW-NAME = <cat-id 1..4>**

New catalog ID.

### **REFERRED-USER-ID = \*UNCHANGED / \*PARAMETERS(...)**

Specifies the user ID for which the name change is to be included in the SCI.

### **REFERRED-USER-ID = \*PARAMETERS(...)**

Specifications concerning the modified user ID name:

#### **OLD-NAME = <name 1..8>**

Old name of user ID.

#### **NEW-NAME = <name 1..8>**

New name of user ID.

### **REFERRED-PREFIX = \*UNCHANGED / \*PARAMETERS(...)**

Specifies the prefix for which the change of name is to be included in the SCI.

### **REFERRED-PREFIX = \*PARAMETERS(...)**

Specifications concerning the modified prefix name:

#### **OLD-NAME = \*NONE / <partial-filename 2..7 without-cat-user>**

Old prefix name. \*NONE indicates that a prefix is not considered in the existing path names in the SCI (see Notes).

#### **NEW-NAME = \*NONE / <partial-filename 2..7 without-cat-user>**

New prefix name. \*NONE indicates that a prefix is not added to the existing path names in the SCI (see Notes).

---

## Notes

1. The three types of changes that can be made (pubset, user ID, prefix) are added, i.e. with the command

```
/MODIFY-IMON-SCI REFERRED-PVS=*PAR(OLD-NAME=R,NEW-NAME=N)
,REFERRED-USER-ID=*PAR(OLD-NAME=TSOSWRK,NEW-NAME=TSOS)
,REFERRED-PREFIX=*PAR(OLD-NAME=PREF1.,NEW-NAME=PREF2.)
```

all strings “:R:\$TSOSWRK.PREF1.” in existing path names are replaced by “:N:\$TSOS.PREF2.”

2. If \*NONE is specified for the old prefix and a value other than \*NONE for the new prefix, then a new prefix is added to the path name and an existing prefix is ignored.
3. If a value other than \*NONE is specified for the old prefix and \*NONE is specified for the new prefix, then the old prefix is removed from the path name.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command processed without errors
2	0	IMO9103	Partially modified
	32	IMO9101	Command terminated abnormally (system error in external call; internal error in IMON-GPN)
	64	CMD0216	Privilege error
	64	IMO9100	SCI not available, SCI version or format in IMON-GPN invalid, or problem when renaming IMON-SCI

---

## 4.19 MODIFY-IO-UNIT

Modify configuration attributes of input/output unit

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Device management
<b>Domain:</b>	DEVICE
<b>Privileges:</b>	OPERATING
<b>Routing code:</b>	G

### Function

Systems support can modify the configuration attributes of controllers or of devices dynamically using the MODIFY-IO-UNIT command. The path names can be modified for a controller or, for a device, the preferred input/output path. A controller with at least two channel links can be relinked without having to interrupt normal operation.

The timeout setting for devices can also be modified using this command.

The command is only accepted when changing configuration attributes, if dynamic reconfiguration was initiated successfully (see the START-CONFIGURATION-UPDATE command).

If only the timeout settings for devices (TIMEOUT operand) or the PAV settings (operand PAV-PREFERRED-DEVICE) are to be modified, the command may also be entered outside of a dynamic I/O configuration change (i.e. without START-CONFIGURATION-UPDATE command and regardless of the system type). Under VM2000, the command is only executed in the local system in these cases.

## Format

### MODIFY-IO-UNIT

**UNIT** = \***CONTROLLER**(...) / \***DEVICE**(...)

\***CONTROLLER**(...)

| **NAME** = <alphanum-name 2..2> / <x-text 4..4>

| ,**PATH** = \***NO** / list-poss(8): \***CHANNEL**(...)

| \***CHANNEL**(...)

| | **CHANNEL-PATH-ID** = <x-text 2..3>

| | ,**CONTROLLER-ADDRESS** = <x-text 1..2>

| | ,**PATH-STATE** = \***INCLUDED** / \***REMOVED**

| | ,**PORT-ID** = \***NONE** / <x-text 2..16>

\***DEVICE**(...)

| **NAME** = <alphanum-name 2..2> / <x-text 4..4> / \***RANGE**(...)

| \***RANGE**(...)

| | **FIRST-NAME** = <alphanum-name 2..2> / <x-text 4..4>

| | ,**NUMBER-OF-DEVICES** = <integer 2..256>

| ,**STATE** = \***UNCHANGED** / \***PREFERRED-PATH**(...) / \***PAV-PREFERRED-DEVICE**(...)

| \***PREFERRED-PATH**(...)

| | ,**PREFERRED-PATH** = \***NO** / \***YES**(...)

| | \***YES**(...)

| | | **CHANNEL-PATH-ID** = <x-text 2..3>

| \***PAV-PREFERRED-DEVICE**(...)

| | ,**PAV-PREFERRED-DEVICE** = \***UNCHANGED** / \***NO** / \***YES**

,**TIMEOUT** = \***UNCHANGED** / \***DEFAULT** / <integer 16..86400 *seconds*>

## Operands

**UNIT** = \***CONTROLLER**(...) / \***DEVICE**(...)

Specifies whether the configuration attributes of a controller or of a device are to be modified.

**UNIT** = \***CONTROLLER**(...)

The configuration attributes of a controller are to be modified.

---

**NAME = <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device code of the controller.

**PATH = \*NO / list-poss(8): \*CHANNEL(...)**

Specifies whether the input/output paths of the controller are to be modified. The default is \*NO, i.e. the paths are not modified.

**PATH = list-poss(8): \*CHANNEL(...)**

As many as eight input/output paths via which the controller is to be accessible in the future can be specified in a list. All paths have to be specified, i.e. even if only one path is being added, modified or removed, all the other paths that are to remain unchanged also have to be included in the list.

**CHANNEL-PATH-ID = <x-text 2..3>**

Specifies the number of the channel to which the controller is linked.

**CONTROLLER-ADDRESS = <x-text 1..2>**

Specifies the physical controller address.

**PATH-STATE = \*INCLUDED / \*REMOVED**

Specifies whether the link between the channel and the controller are available. The default is \*INCLUDED, i.e. the connection is available.

**PORT-ID = \*NONE / <x-text 2..16>**

Specifies whether the controller is connected to a channel type FC.

The default is \*NONE, i.e. the controller is not connected to a channel type FC.

**PORT-ID = <x-text 2..16>**

When a controller is connected to a channel type FC the WWPN (World Wide Port Name) of the controller port (16 hexadecimal characters) must be specified. The /SHOW-DEVICE-CONFIGURATION INF=\*INNER command for the controller can then be used to output the WWPN.

**UNIT = \*DEVICE(...)**

The configuration attributes of a device are to be modified.

**NAME = <alphanum-name 2..2> / <x-text 4..4> / \*RANGE(...)**

Mnemonic device code. A group of devices can be addressed using the \*RANGE operand value.

**NAME = \*RANGE(...)**

The modifications of the configuration attributes refer to a group of devices. Based on the mnemonics of the first device (FIRST-NAME operand), the mnemonics of the following devices are determined by adding 1 until the maximum number of devices defined in the NUMBER-OF-DEVICES operand is reached. The group can comprise as many as 256 devices. The maximum number has to be chosen so as not to exceed the value FFFF when the mnemonics are calculated.

**FIRST-NAME = <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device code of the first device.

**NUMBER-OF-DEVICES = <integer 2..256>**

Number of devices for which the modification is to be made.

**STATE = \*UNCHANGED / \*PREFERRED-PATH(...) / \*PAV-PREFERRED-DEVICE(...)**

Specifies whether a particular path should be preferred on input to or output from a device.

**STATE = \*PREFERRED-PATH(...)**

Specifies whether a path is to preferred on input/output if the device can be accessed via different paths.

---

**PREFERRED-PATH = \*NO**

No path is preferred on input/output.

**PREFERRED-PATH = \*YES(...)**

The path specified in the CHANNEL-PATH-ID operand should be preferred on input/output.

**CHANNEL-PATH-ID = <x-text 2..3>**

Designates the preferred path (Channel Path Identifier).

**STATE = \*PAV-PREFERRED-DEVICE(...)**

Specifies whether the PAV device is to be preferred on input/output under VM2000.

**PAV-PREFERRED-DEVICE = \*UNCHANGED**

The current setting remains unchanged.

**PAV-PREFERRED-DEVICE = \*YES**

The PAV device is preferred on input/output under VM2000.

**PAV-PREFERRED-DEVICE = \*NO**

The PAV device is no longer preferred.

**TIMEOUT = \*UNCHANGED / \*DEFAULT / <integer 16..86400 seconds >**

Specifies whether the standard timeout value for the devices named in the UNIT operand is to be modified.

When a controller is specified (UNIT=\*CONTROLLER), the settings apply to all devices linked to that controller. The timeout value only refers to devices and is independent of the input/output paths. If a device is connected through several controllers and if the timeout values are modified for several of the controllers, then it is always the most recent setting that takes effect for the device.

Changes to timeout values should only be effective for a limited time and for specific actions (e.g. during the online update of RAID system's firmware). The default timeout values should then be restored using TIMEOUT=\*DEFAULT.

**TIMEOUT = \*DEFAULT**

The system default timeout value is set. The value depends on the device type.

**TIMEOUT = <integer 16..86400 seconds >**

The new timeout value in seconds.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command processed without errors
	1	NKR0006	Syntax error
	64	CMD0216	Privilege error
1	64	NKR0169	System error
2	64	NKR0169	Wrong parameter
3	64	NKR0169	Dynamic I/O configuration change was rejected
4	64	NKR0169	Dynamic I/O configuration change is not supported
6	64	NKR0169	Internal input/output unit not defined
9	64	NKR0169	Input/output unit not defined
11	64	NKR0169	Path to input/output unit not removed
12	64	NKR0169	Dynamic I/O configuration change was not started
14	64	NKR0169	Configuration change was not performed in the guest system
19	64	NKR0169	Device is not a PAV device
16	128	NKR0169	Another guest system is currently being started
17	128	NKR0169	Another guest system is currently being terminated
18	128	NKR0169	Dynamic I/O configuration change is not supported by one or several guest systems

## 4.20 MODIFY-ISAM-CACHING

Change number of data spaces for ISAM cache areas

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** FILE  
**Privileges:** TSOS

### Function

The MODIFY-ISAM-CACHING command enables systems support to change the maximum number of data spaces for ISAM cache areas dynamically. ISAM creates these cache areas to add and manage cross-task ISAM pools.

The maximum number of usable data spaces can be increased only if the paging area is large enough. It may be necessary to enlarge the paging area up front.

Information on the maximum number of data spaces for ISAM cache areas and how they are used can be inquired using the SHOW-ISAM-CACHING command.

### Format

<b>MODIFY-ISAM-CACHING</b>	Alias: <b>MDISAMC</b>
<b>CACHE-SIZE</b> = * <u>UNCHANGED</u> / <integer 1..127>	

### Operands

**CACHE-SIZE** = \*UNCHANGED / <integer 1..127>

Specifies the maximum number of data spaces for ISAM cache areas.

**CACHE-SIZE** = \*UNCHANGED

The maximum number of data spaces for ISAM cache areas remains unchanged.

**CACHE-SIZE** = <integer 1..127>

Specifies the new maximum number of data spaces for ISAM cache areas. The existing value can be increased only if the paging area is large enough.

### Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
	32	DMS0A66	Internal error while executing the command
	64	CMD0216	Privileges error
	64	DMS0A67	ISAM cache cannot be extended/reduced
	129	DMS0A68	ISAM cache cannot be reduced at present

---

## 4.21 MODIFY-JOB

Modify job attributes of a batch job

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job processing
<b>Domain:</b>	JOB
<b>Privileges:</b>	STD-PROCESSING OPERATING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	J

### Function

The MODIFY-JOB command is used to change certain attributes of a batch job. The batch job must have been initiated from the user ID of the user issuing the command, and generally, it must be running under that user ID. In addition, the command may be used to address jobs on the local system which were generated under the issuing user ID but are running under a different user ID (extended access on the local system).

The following attributes can be modified:

- job class (JOB-CLASS operand)
- priority (JOB-PRIORITY operand)
- action to be taken following a system error (RERUN-AFTER-CRASH operand)
- scheduling attributes for ordinary jobs, scheduled jobs and repeat jobs (SCHEDULING-TIME=\*STD / \*PARAMETERS(...))
  - start time (START operand)
  - repeat time (REPEAT-JOB operand)
- scheduling attributes for calendar jobs (SCHEDULING-TIME=\*CALENDAR(...) operand)
  - calendar file (CALENDAR-NAME operand)
  - symbolic date (SYMBOLIC-DATE operand)
- limit on job repeats for a calendar job (LIMIT operand)
- additional attributes defined by the system administrator (JOB-PARAMETER operand)
- behavior after shutdown (FLUSH-AFTER-SHUTDOWN operand)
- logging to SYSLST (LOGGING operand)
- job name (JOB-NAME operand)
- protection against unintentional termination (PROTECTION operand)
- values for run priority, CPU time and the maximum number of SYSLST records (RESOURCES operand)

Values given for job class, priority, logging and the maximum number of SYSLST records, as well as start time and additional attributes, may be changed only if the batch job has not yet been started, i.e. if it is still in the TYPE 1 job queue. This can be checked with the SHOW-JOB-STATUS command. The job status of a monitoring job variable is logged as "\$S".

Wait states can be released for TYPE 1 user jobs (see [section "MODIFY-JOB"](#)).

In the case of a calendar job, the MODIFY-JOB command applies to the entire calendar job, i.e. including any future repeats.

Only those attributes may be defined that are permitted by the job class definition. A check on the specified job class can be made using the SHOW-JOB-CLASS command. Note also that the combination of some job attributes may produce differing results and that modifying certain attributes also causes the batch job type to change. For details see [section "Notes"](#).

The default value \*UNCHANGED mean that the existing specification continues to apply.

### *Privileged functions*

Privileged users (OPERATING or TSOS privilege) can modify the attributes of any batch job.

## Operands

### **JOB-IDENTIFICATION =**

Type of job identification. Jobs may be identified by TSN or by monitoring JV.

### **JOB-IDENTIFICATION = \*TSN(...)**

**TSN = <alphanum-name 1..4>**

Task sequence number of the required job.

### **JOB-IDENTIFICATION = \*MONJV(...)**

**MONJV = <filename 1..54 without-gen-vers>**

Name of the JV monitoring the desired job.

### **JOB-IDENTIFICATION = <alphanum-name 1..4>**

This operand value cannot be specified in guided dialog. Direct specification of the task sequence number of the desired job.

### **JOB-CLASS = \*UNCHANGED(...) / \*STD(...) / <name 1..8>(...)**

Job class into which the job is to be placed. Authorization for starting jobs in the various job classes is indicated by the user entry, which can be queried by means of the SHOW-USER-ATTRIBUTES command. The attributes of the permissible job classes can be queried using the SHOW-JOB-CLASS command.

### **JOB-CLASS = \*UNCHANGED(...)**

The job class remains unchanged. The JOB-PRIORITY, SCHEDULING-TIME (with scheduling attributes for scheduled, repeat and calendar jobs), LIMIT and RESOURCES attributes of the batch job are changed only if values other than \*UNCHANGED are explicitly specified:

**JOB-PRIORITY = \*UNCHANGED / \*STD / <integer 1..9>**

Job priority to be given to the batch job. The lower the value, the higher the priority. The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands. Specifying \*STD sets the preset value (default) of the job class definition for JOB-PRIORITY.

---

**SCHEDULING-TIME = \*UNCHANGED / \*STD / \*PARAMETERS(...) / \*BY-CALENDAR(...)**

Defines how scheduling times are specified for the batch job. Changing the existing setting may cause the batch job type to change (see [section "Changing the batch job type"](#)).

**SCHEDULING-TIME = \*STD**

The default settings for START and REPEAT-JOB scheduling time specifications for the selected job class apply (see the operands of the SCHEDULING-TIME=\*PARAMETERS(...) structure).

**SCHEDULING-TIME = \*PARAMETERS(...)**

Defines a scheduling time (start time) for the batch job (ordinary job or scheduled job). It is also possible to define job repeats (repeat job). See also the note on [section "Combinations of the START and REPEAT-JOB operands"](#).

**START =**

Starting time for the batch job. Values other than UNCHANGED are appropriate only if they are permitted in accordance with the definition of the job class (see the SHOW-JOB-CLASS command). The date may be given in the form "yymmdd" or "yyyy-mm-dd".

**START = \*UNCHANGED**

The specification valid previously remains in effect.

**START = \*STD**

The default value for the chosen job class applies.

**START = \*SOON**

The job is to be started as soon as possible, in accordance with its priority.

**START = \*IMMEDIATELY**

The job is to be started immediately.

**START = \*AT-STREAM-STARTUP**

The job is to be started upon startup of the job scheduler.

**START = \*WITHIN(...)**

The job is to be started within the specified time period.

**HOURS = 0 / <integer 0..23 hours >**

Number of hours.

**MINUTES = 0 / <integer 0..59 minutes >**

Number of minutes.

**START = \*AT(...)**

The job is to be started exactly at the time specified in the following.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes.

Seconds are not interpreted.

---

**START = \*EARLIEST(...)**

The job is to be started no earlier than the time specified.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes.  
Seconds are not interpreted.

**START = \*LATEST(...)**

The job is to be started no later than the time specified.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes.  
Seconds are not interpreted.

**REPEAT-JOB =**

Time interval at which the batch job is to be repeated. Values other than the default are appropriate only if permitted in accordance with the job class definition (see the SHOW-JOB-CLASS command). The time interval for the repetitions depends on the specification in the START operand; see the note on [section "Combinations of the START and REPEAT-JOB operands"](#). For the repetitions, the following applies:

- The i-th repetition (i >= 1) of a job is not started until the (i-1)th repetition has ended.
- Cancellation of the currently executing job (i) has no effect on the start of (i+1); (i >= 0).
- Cancellation of the entire job: Both the currently executing job (i) and the subsequent job (i+1) must be canceled, (i >= 0); (CANCEL-JOB command, or make job (i) the last job in the series using the MODIFY-JOB... command, REPEAT-JOB=\*NO).

**REPEAT-JOB = \*UNCHANGED**

The specification valid previously remains in effect.

**REPEAT-JOB = \*NO**

The batch job is not repeated.

**REPEAT-JOB = \*STD**

The default value for the chosen job class applies.

**REPEAT-JOB = \*DAILY**

Daily repetition at the time specified with START.

**REPEAT-JOB = \*WEEKLY**

Weekly repetition at the time specified with START.

**REPEAT-JOB = \*AT-STREAM-STARTUP**

Repetition following each startup of the job scheduler.

---

**REPEAT-JOB = \*PERIOD(...)**

Repetition after the specified time interval.

**HOURS = Q / <integer 0..23 hours >**

Number of hours.

**MINUTES = Q / <integer 0..59 minutes >**

Number of minutes.

**SCHEDULING-TIME = \*BY-CALENDAR(...)**

The batch job scheduling time and any repeat jobs are specified in the form of a symbolic date defined in a calendar file (calendar job). The entries in a calendar file can be listed with the SHOW-CALENDAR command. Creation of calendar files with the CALENDAR-EDITOR utility is described in the "Calendar" manual [4].

**CALENDAR-NAME = \*UNCHANGED / <filename 1..54 without-gen-vers >**

Name of the calendar file.

**SYMBOLIC-DATE = \*UNCHANGED / <filename 1..20 without-cat-user-vers > /  
<partial-filename 2..20 without-cat-user >**

Symbolic date which defines the scheduling time and any repetition cycles within the calendar file.

**LIMIT = \*UNCHANGED / \*STD / <integer 1..32767 > / \*BY-DATE(...)**

Governs how long a calendar job remains in existence. This limit applies in addition to the limits set by the calendar.

**LIMIT = \*STD**

The duration of the calendar job depends entirely on the symbolic date entry in the calendar. The specification is not evaluated for other batch job types.

**LIMIT = <integer 1..32767 >**

*This specification is only permitted for calendar jobs.*

Maximum number of repetitions of the calendar job. Whenever a job run is completed, a check is performed to determine whether the run counter has reached or exceeded the maximum number. If this is the case, the entire calendar job is terminated. Otherwise, the run counter is incremented by 1.

**LIMIT = \*BY-DATE(...)**

*This specification is only permitted for calendar jobs.*

Entries in the calendar file are only taken into account up to the specified limit. No further repeat job is generated for calendar entries after the limit; the calendar job terminates.

The limit refers solely to the schedule entries in the file, not to the real runtime of the jobs. Repeat jobs with a "permissible" start date are not subject to any further restrictions and are, for example, also started after the specified date if this was not possible earlier because of delays in the job scheduler.

The date specification consists of the day and the time:

**DATE = <date >**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time >**

Time of day.

**RESOURCES = \*UNCHANGED / \*STD / \*PARAMETERS(...)**

Values for run priority, CPU time and the maximum number of SYSLST records.

---

**RESOURCES = \*UNCHANGED**

Values for run priority, CPU time and the maximum number of SYSLST records remain unchanged.

**RESOURCES = \*STD**

Values for run priority, CPU time and the maximum number of SYSLST records remain unchanged.

**RESOURCES = \*PARAMETERS(...)**

The run priority, CPU time and the maximum number of SYSLST records can be changed within the limits permitted for the job class. The operand value \*UNCHANGED means that the relevant attribute is not changed.

**RUN-PRIORITY = \*UNCHANGED / \*STD / <integer 30..255>**

Run priority which the job is to be assigned. The lower the value, the higher the priority. The maximum permissible priority value is the lesser of the two values (i.e. the more favorable of the values) from the user catalog and the job class definition. If no maximum value is defined for the job class, the default run priority applies. The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

**RUN-PRIORITY = \*STD**

The standard run priority specified for the job class applies.

**CPU-LIMIT = \*UNCHANGED / \*STD / <integer 1..32767 seconds >**

Maximum CPU time, in seconds, that the batch job may consume. The maximum time permitted depends on the job class specified. See also [section "Time limits inBS2000"](#).

**CPU-LIMIT = \*STD**

The default value for the chosen job class applies.

**SYSLST-LIMIT = \*UNCHANGED / \*STD / <integer 0..999999>**

Specifies the maximum number of records the job is allowed to output to the system files SYSLST, SYSLST01, SYSLST02, ..., SYSLST99 and SYSOUT. The records for SYSOUT are counted separately from the records for SYSLST files. In the case of SYSLST, SYSOUT records are not taken into account, even if the setting LISTING=\*YES has been made to ensure that they are also written to SYSLST. This value must not be above the limit set in the job class definition. This limit may be queried using the SHOW-JOB-CLASS command.

If the specified number is exceeded, the batch job is terminated abnormally.

**SYSLST-LIMIT = \*STD**

The default value for the chosen job class applies.

**JOB-CLASS = \*STD(...)**

The batch job is to run in the default job class. If no values other than \*STD are explicitly specified for the attributes LIMIT, JOB-PRIORITY, SCHEDULING-TIME, and RESOURCES, these attributes are set in accordance with the default settings of the job class definition. These values are changed even if the job was already queued in the specified job class. The job class definition can be queried with the SHOW-JOB-CLASS command. In nonprivileged job classes, up to 32767 waiting jobs are permissible.

**JOB-PRIORITY = \*STD / \*UNCHANGED / <integer 1..9>**

Job priority which the job is to receive.

The default is \*STD, i.e. the preset value of the job class definition (otherwise corresponds to PRIORITY under JOB-CLASS=\*UNCHANGED(...)).

**JOB-PRIORITY = \*UNCHANGED**

The current job priority is to remain unchanged. If that priority is higher than the current maximum for the job class, the command is rejected.

---

**SCHEDULING-TIME = \*STD / \*UNCHANGED / \*PARAMETERS(...) / \*BY-CALENDAR(...)**

Defines how scheduling times are specified for the batch job. If the specifications applying until now are changed, this may lead to a change of the batch job type (see [section "Changing the batch job type"](#)).

**SCHEDULING-TIME = \*STD**

The default settings for START and REPEAT-JOB scheduling time specifications for the selected job class apply (see the operands of the SCHEDULING-TIME=\*PARAMETERS(...) structure).

**SCHEDULING-TIME = \*UNCHANGED**

The current scheduling time remains unchanged, provided that it is valid according to the job class definition. Scheduled and repeat jobs retain their START-JOB and REPEAT-JOB attribute values, and the values for the CALENDAR and SYMBOLIC-DATE and the relevant starting times and repeat cycles of calendar jobs.

**SCHEDULING-TIME = \*PARAMETERS(...)**

Defines a scheduling time (start time) for the batch job. It is also possible to define job repeats (repeat job).

**START = \*STD / \*UNCHANGED / \*SOON / \*IMMEDIATELY / \*AT-STREAM-STARTUP / \*WITHIN(...) / \*AT(...) / \*EARLIEST(...) / \*LATEST(...)**

Time when the job is to be started. The default value is \*STD, i.e. the value preset in the job class definition (otherwise corresponds to START under JOB-CLASS=\*UNCHANGED(...)).

**START = \*UNCHANGED**

*Specification permitted only for simple batch jobs, scheduled jobs and repeat jobs.* The current start attribute remains unchanged, provided that it is valid according to the job class definition.

**REPEAT-JOB = \*STD / \*UNCHANGED / \*NO / \*DAILY / \*WEEKLY / \*AT-STREAM-STARTUP / \*PERIOD(...)**

Time interval during which the job is to be repeated. The default value is \*STD, i.e. the value preset in the job class definition (otherwise corresponds to REPEAT-JOB under JOB-CLASS=\*UNCHANGED(...)).

**REPEAT-JOB = \*UNCHANGED**

*Specification only permitted for simple batch jobs, scheduled job and repeat jobs together with START=\*UNCHANGED.* The current repeat cycle remains unchanged, provided that it is valid according to the job class definition.

**SCHEDULING-TIME = \*BY-CALENDAR(...)**

The batch job scheduling time and any repeat jobs are specified in the form of a symbolic date defined in a calendar file (calendar job). The entries in a calendar file can be listed with the SHOW-CALENDAR command. Creation of calendar files with the CALENDAR utility is described in the "Calendar" manual [4].

**CALENDAR-NAME = \*UNCHANGED / <filename 1..54 without-gen-vers>**

Name of the calendar file.

**SYMBOLIC-DATE = \*UNCHANGED / <filename 1..20 without-cat-user-vers> / <partial-filename 2..20 without-cat-user>**

Symbolic date which defines the scheduling time and any repetition cycles within the calendar file.

**LIMIT = \*STD / \*UNCHANGED / <integer 1..32767> / \*BY-DATE(...)**

Governs how long a calendar job remains in existence. This limit applies in addition to the limits set by the calendar. The default is \*STD, i.e. the calendar job remains in existence for the duration resulting from the symbolic date in the calendar file (or else the LIMIT setting in JOB-CLASS=\*UNCHANGED). Values other than \*STD are allowed only for calendar jobs.

---

**RESOURCES = \*STD / \*UNCHANGED / \*PARAMETERS(...)**

Values for run priority, CPU time and the maximum number of SYSLST records.

**RESOURCES = \*STD**

Values for run priority, CPU time and the maximum number of SYSLST records remain unchanged.

**RESOURCES = \*UNCHANGED**

Values for run priority, CPU time and the maximum number of SYSLST records remain unchanged.

**RESOURCES = \*PARAMETERS(...)**

The run priority, CPU time and the maximum number of SYSLST records can be changed within the limits permitted for the job class. The operand value \*UNCHANGED means that the relevant attribute is not changed.

**RUN-PRIORITY = \*STD / \*UNCHANGED / <integer 30..255>**

Run priority which the job is to be assigned. The lower the value, the higher the priority. The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

**RUN-PRIORITY = \*STD**

The standard run priority specified for the job class applies.

**CPU-LIMIT = \*STD / \*UNCHANGED / <integer 1..32767 seconds >**

Maximum CPU time, in seconds, that the batch job may consume. The maximum time permitted depends on the job class specified. See also [section "Time limits inBS2000"](#).

**CPU-LIMIT = \*STD**

The default value for the chosen job class applies.

**SYSLST-LIMIT = \*STD / \*UNCHANGED / <integer 0..999999>**

Specifies the maximum number of records the job is allowed to output to the system files SYSLST, SYSLST01, SYSLST02, ..., SYSLST99 and SYSOUT. The records for SYSOUT are counted separately from the records for SYSLST files. In the case of SYSLST, SYSOUT records are not taken into account, even if the setting LISTING=\*YES has been made to ensure that they are also written to SYSLST. This value must not be above the limit set in the job class definition. This limit may be queried using the SHOW-JOB-CLASS command. If the specified number is exceeded, the batch job is terminated abnormally.

**SYSLST-LIMIT = \*STD**

The default value for the chosen job class applies.

**JOB-CLASS = <name 1..8>(..)**

The batch job is to run in the specified job class. If no values other than \*STD are explicitly specified for the attributes LIMIT, JOB-PRIORITY, SCHEDULING-TIME and RESOURCES, these attributes are set in accordance with the default settings of the job class definition. These values are changed even if the job was already queued in the specified job class. The job class definition can be queried with the SHOW-JOB-CLASS command. In nonprivileged job classes, up to 32767 waiting jobs are permissible.

**JOB-PRIORITY = \*STD / \*UNCHANGED / <integer 1..9>**

Job priority which the job is to receive.

The default value is \*STD, i.e. the preset value of the job class definition (otherwise corresponds to PRIORITY under JOB-CLASS=\*UNCHANGED(...)).

**JOB-PRIORITY = \*UNCHANGED**

The current job priority is to remain unchanged. If that priority is higher than the current maximum for the job class, the command is rejected.

---

**SCHEDULING-TIME = \*STD / \*UNCHANGED / \*PARAMETERS(...) / \*BY-CALENDAR(...)**

Defines how scheduling times are specified for the batch job. If the specifications applying until now are changed, this may lead to a change of the batch job type (see [section "Changing the batch job type"](#)).

**SCHEDULING-TIME = \*STD**

The default settings for START and REPEAT-JOB scheduling time specifications for the selected job class apply (see the operands of the SCHEDULING-TIME= \*PARAMETERS(...) structure).

**SCHEDULING-TIME = \*UNCHANGED**

The current scheduling time remains unchanged, provided that it is valid according to the job class definition. Scheduled and repeat jobs retain their START-JOB and REPEAT-JOB attribute values, and the values for the CALENDAR and SYMBOLIC-DATE and the relevant starting times and repeat cycles of calendar jobs.

**SCHEDULING-TIME = \*PARAMETERS(...)**

Defines a scheduling time (start time) for the batch job. It is also possible to define job repeats (repeat job).

**START = \*STD / \*UNCHANGED / \*SOON / \*IMMEDIATELY / \*AT-STREAM-STARTUP / \*WITHIN(...) / \*AT(...) / \*EARLIEST(...) / \*LATEST(...)**

Time when the job is to be started. The default value is \*STD, i.e. the value preset in the job class definition (otherwise corresponds to START under JOB-CLASS=\*UNCHANGED(...)).

**START = \*UNCHANGED**

*Specification permitted only for simple batch jobs, scheduled jobs, and repeat jobs.*

The current start attribute remains unchanged, provided that it is valid according to the job class definition.

**REPEAT-JOB = \*STD / \*UNCHANGED / \*NO / \*DAILY / \*WEEKLY / \*AT-STREAM-STARTUP / \*PERIOD(...)**

Time interval during which the job is to be repeated. The default value is \*STD, i.e. the value preset in the job class definition (otherwise corresponds to REPEAT-JOB under JOB-CLASS=\*UNCHANGED(...)).

**REPEAT-JOB = \*UNCHANGED**

*Specification permitted only for simple batch jobs, scheduled jobs, and repeat jobs together with*

*START=\*UNCHANGED.* The current repeat cycle remains unchanged, provided that it is valid according to the job class definition.

**SCHEDULING-TIME = \*BY-CALENDAR(...)**

The batch job scheduling time and any repeat jobs are specified in the form of a symbolic date defined in a calendar file (calendar job). The entries in a calendar file can be listed with the SHOW-CALENDAR command. Creation of calendar files with the CALENDAR utility is described in the "Calendar" manual [4].

**CALENDAR-NAME = \*UNCHANGED / <filename 1..54 without-gen-vers>**

Name of the calendar file.

**SYMBOLIC-DATE = \*UNCHANGED / <filename 1..20 without-cat-user-vers> / <partial-filename 2..20 without-cat-user>**

Symbolic date which defines the scheduling time and any repetition cycles within the calendar file.

**LIMIT = \*STD / \*UNCHANGED / <integer 1..32767> / \*BY-DATE(...)**

Governs how long a calendar job remains in existence. This limit applies in addition to the limits set by the calendar. The default is \*STD, i.e. the calendar job remains in existence for the duration resulting from the symbolic date in the calendar file (or else the LIMIT setting in JOB-CLASS=\*UNCHANGED). Values other than \*STD are allowed only for calendar jobs.

**RESOURCES = \*STD / \*UNCHANGED / \*PARAMETERS(...)**

Values for run priority, CPU time and the maximum number of SYSLST records.

---

**RESOURCES = \*STD**

Values for run priority, CPU time and the maximum number of SYSLST records remain unchanged.

**RESOURCES = \*UNCHANGED**

The job is assigned the default values for run priority, CPU time and the maximum number of SYSLST records for its job class.

**RESOURCES = \*PARAMETERS(...)**

The run priority, CPU time and the maximum number of SYSLST records can be changed within the limits permitted for the job class. The operand value \*UNCHANGED means that the relevant attribute is not changed.

**RUN-PRIORITY = \*STD / \*UNCHANGED / <integer 30..255>**

Run priority which the job is to be assigned. The lower the value, the higher the priority. The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

**RUN-PRIORITY = \*STD**

The standard run priority specified for the job class applies.

**CPU-LIMIT = \*STD / \*UNCHANGED / <integer 1..32767 seconds >**

Maximum CPU time, in seconds, that the batch job may consume. The maximum time permitted depends on the job class specified. See also [section "Time limits in BS2000"](#).

**CPU-LIMIT = \*STD**

The default value for the chosen job class applies.

**SYSLST-LIMIT = \*STD / \*UNCHANGED / <integer 0..999999>**

Specifies the maximum number of records the job is allowed to output to the system files SYSLST, SYSLST01, SYSLST02, ..., SYSLST99 and SYSOUT. The records for SYSOUT are counted separately from the records for SYSLST files. In the case of SYSLST, SYSOUT records are not taken into account, even if the setting LISTING=\*YES has been made to ensure that they are also written to SYSLST. This value must not be above the limit set in the job class definition. This limit may be queried using the SHOW-JOB-CLASS command.

If the specified number is exceeded, the batch job is terminated abnormally.

**SYSLST-LIMIT = \*STD**

The default value for the chosen job class applies.

**RERUN-AFTER-CRASH = \*UNCHANGED / \*NO / \*YES**

*The operand is not evaluated for repeat jobs.* Specifies whether the batch job is to be restarted during the next system session if processing has been aborted as the result of a system error or termination of the system session.

**JOB-PARAMETER = \*UNCHANGED / \*NO / <c-string 1..127>**

Specifies additional attributes for the selected job class-assuming that systems support has defined some and made them known.

**JOB-PARAMETER = \*NO**

No additional attributes.

**JOB-PARAMETER = <c-string 1..127>**

String of freely selectable characters issued by the system administrator to identify further job class attributes.

**FLUSH-AFTER-SHUTDOWN = \*UNCHANGED / \*NO / \*YES**

*This operand is ignored for calendar jobs.* Specifies whether the batch job is to be removed from the job queue if it has not been processed by the end of the session.

---

**LOGGING = \*UNCHANGED / \*PARAMETERS(...)**

Controls the logging of job progress.

**LOGGING = \*PARAMETERS(...)****LISTING = \*UNCHANGED / \*NO / \*YES**

Specifies whether the job run is also to be logged on SYSLST.

**PROTECTION = \*UNCHANGED / \*NONE / \*CANCEL**

Specifies whether a job is to be protected against being canceled unintentionally with the CANCEL-JOB command.

**PROTECTION = \*NONE**

The job is not protected against unintentional cancellation.

**PROTECTION = \*CANCEL**

The job is protected against unintentional cancellation. When an interactive job is terminated with the CANCEL-JOB command, the system demands an additional confirmation from the user. This is to avoid unintentional cancellation of a job, for instance through incorrect entry of the job number.

**JOB-NAME = \*UNCHANGED / \*NO / <name 1..8>**

The name of the job. The job can be accessed using this name (e.g. using SHOW-JOB-STATUS). Jobs that are started without a name being specified are also given this name.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	CMD0002	Warning: job in wait state due to lack of resources
	1	CMD0202	Syntax error
	32	CMD0221	system error
	64	JMS0630	Semantic error (see SYSOUT message)
	64	JMS0640	MONJV error, illegal access or invalid time of call
	130	JMS0620	Memory saturation

## Notes

### *Combinations of the START and REPEAT-JOB operands*

START=	REPEAT-JOB=		
	*AT-STREAM-STARTUP	*DAILY or *WEEKLY	*PERIOD
*IMMEDIATELY or *SOON	a)	c)	c)
*AT or *EARLIEST	a)	d)	f)
*LATEST or *WITHIN	a)	c)	g)
*AT-STREAM-STARTUP	b)	e)	e)

Table 62: START and REPEAT-JOB operand combinations in the MODIFY-JOB command

1. The first and all subsequent starts of the job take place as specified.
2. The first start of the job is made with START=\*AT-STREAM-STARTUP. All further starts take place after the startup of the job scheduler with START=\*SOON.
3. The base time for the repetition cycle is the time the job is accepted.
4. The specified point in time (START=..., TIME=...) is the base time for the repetition cycle.
5. The first start of the job follows startup of the job scheduler. This point in time is the base time for the repetition cycle. Further starts take place with START=\*SOON.
6. The specified point in time (START=..., TIME=...) is the base time for the repetition cycle. The second and all further starts take place with START=\*SOON.
7. The base time for the repetition cycle is the time the job is accepted. All further starts take place with START=\*SOON.

### *Validity of operand combinations depending on job status and batch job type*

Regardless of batch job type, all job attributes can be modified for TYPE 1 queued jobs (job status = waiting), with the following exceptions:

- The START and RERUN-AFTER-CRASH attributes must not be modified for repeat jobs.
- Modification of the LIMIT attribute is allowed for calendar jobs only.

With running jobs (TYPE 2; job status = running), the valid job attribute combinations depend on the batch job type. The following table shows which combinations are allowed:

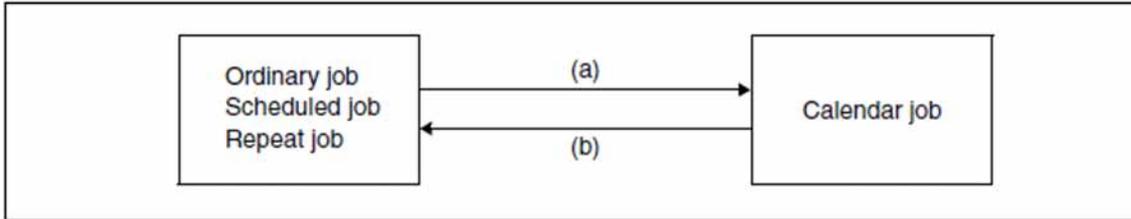

Job attribute	Batch job type		
	Ordinary job/ scheduled job	Repeat job	Calendar job
JOB-CLASS	-	-	-
JOB-PRIORITY	-	-	X
JOB-PARAMETER	-	-	X
SCHEDULING-TIME=*PARAMETERS(...)			
• START	-	-	-
• REPEAT	X	X	
• SCHEDULING-TIME=*BY-CALENDAR(...)	X	-	X
RERUN-AFTER-CRASH	X		X
LIMIT			X
RESOURCES=*PARAMETERS(...)			
• RUN-PRIORITY	X	X	X
• CPU-LIMIT	X	X	X
• SYSLST-LIMIT	-	-	-
FLUSH-AFTER-SHUTDOWN	X	X	
LOGGING=*PARAMETERS(...)			
• LISTING	-	-	-
PROTECTION	X	X	X
JOB-NAME	X	X	X

X: allowed  
 I: ignored  
 -: rejected with error message

Table 63: Valid changes to job attributes using MODIFY-JOB depending on batch job type

### Changing the batch job type

Modifying job attributes with the MODIFY-JOB command may also cause the batch job type to change:

1. Specifying SCHEDULING-TIME=\*BY-CALENDAR(...) turns the job into a calendar job.
2. A calendar job is turned into an ordinary job, a scheduled job or a repeat job by one of the following specifications:
  - SCHEDULING-TIME=\*PARAMETERS(...), with the new batch job type being governed by the START and REPEAT operands
  - JOB-CLASS=\*STD or <name>, but without SCHEDULING-TIME=\*CALENDAR(...); the new batch job type then depends on the default values for the START and REPEAT job attributes as defined in the job class

As there are interrelationships between individual job attributes, changing the batch job type may also have consequences for job attributes which are not explicitly modified with the MODIFY-JOB command. The following job attributes lose their significance for the new batch job type and are reset to the associated default value, accompanied by a message to that effect:

New batch job type	Implicitly modified job attributes
Calendar job	FLUSH-AFTER-SHUTDOWN=*NO
Repeat job	RERUN-AFTER-CRASH=*NO
	LIMIT=*STD
Scheduled job	LIMIT=*STD
Ordinary job	LIMIT=*STD

Table 64: Job attributes modified implicitly when the batch job type is changed with MODIFY-JOB

---

### *Releasing wait states*

The following wait states applying to TYPE 1 user jobs can be released using the MODIFY-JOB command:

- HELD-BY-COMMAND (see the HOLD-JOB command)  
This wait state can be released by changing the start attributes to START=\*IMMEDIATELY. Any wait state that applies simultaneously due to a lack of resources (waiting for pubset import or TSN release) is retained and a corresponding warning is issued.
- HELD-BY-CALENDAR  
This wait state can be released by specifying a new calendar file (CALENDAR-NAME) which is located on an accessible pubset. The wait state is also released if the calendar job is converted into a different batch job type by specifying SCHEDULING-TIME= \*PARAMETERS(START=\*IMMEDIATE, ...) (see also [section "Changing the batch job type"](#)).
- HELD-BY-PUBSET and HELD-BY-TSN  
These wait states are released by changing the start attributes to START=\*AT(...) or \*EARLIEST(...) and specifying a start time in the future. The availability of the resources is not checked until the currently set start time is reached.

---

## 4.22 MODIFY-JOB-CLASS

Modify limits and weight of job classes

**Component:** BS2000 OSD/BC  
**Functional area:** Job processing  
**Domain:** ERROR-LOGGING  
**Privileges:** TSOS  
OPERATING  
**Routing code:** J

### Function

The MODIFY-JOB-CLASS command allows systems support to alter the limits and weights of job classes. The job limits and weight of job classes are defined by means of the JMU statement DEFINE-JOB-CLASS. The modifications, which are valid until the next MODIFY-JOB-CLASS command or until the end of the session, apply only to those jobs that have not yet been released for starting.

CLASS-LIMIT=0 should only be declared briefly, if at all, after startup in order to prevent any jobs being started that could hinder the activation of the job schedulers at this stage.

A message is output on the console if the command is executed successfully.

The modified values can be displayed using the SHOW-SYSTEM-STATUS command.

The default value \*UNCHANGED in the corresponding operands means that the previously valid definition still applies.

### Format

**MODIFY-JOB-CLASS**

Alias: **MDJCL**

**CLASS-NAME** = <name 1..8>

,**CLASS-LIMIT** = \*UNCHANGED / <integer 0..4095>

,**CLASS-WEIGHT** = \*UNCHANGED / <integer 1..9>

,**CLASS-OPTIMUM** = \*UNCHANGED / <integer 0..4095>

---

## Operands

### **CLASS-NAME = <name 1..8>**

Name of the job class whose attributes are to be modified.

### **CLASS-LIMIT = \*UNCHANGED / <integer 0..4095>**

Defines the maximum number of jobs which may run at any given time in the specified job class.

A job transferred to the class scheduler for starting will be rejected if the CLASS-LIMIT has already been reached.

As soon as the value has fallen below the CLASS-LIMIT again, the scheduler managing the job classes is informed of this.

The only exceptions to this are express jobs, which can be started even when the class limit is reached.

### **CLASS-WEIGHT = \*UNCHANGED / <integer 1..9>**

Defines the weight of the job classes relative to each other.

This operand affects the selection of the job class from which a job is to be started. The higher the value for CLASS-WEIGHT, the greater is the weight and the urgency to start a job from the selected class.

### **CLASS-OPTIMUM = \*UNCHANGED / <integer 0..4095>**

Defines the number of jobs, which should ideally run within job class in order to reach a certain job mix.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JMS0630	Semantic error
	64	JMS0640	Command cannot be executed

## Example

```
/show-job-class jcb00050
```

```
%NAME.....:JCB00050
%CLASS LIMIT...:20

## 4.23 MODIFY-JOB-OPTIONS

Modify parameters for logging a job

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job processing
<b>Domain:</b>	JOB
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE OPERATING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION TSOS

### Function

The MODIFY-JOB-OPTIONS command controls the following for the user's own job:

- the form in which system messages are output (INFORMATION-LEVEL operand).
- the output of console messages (OPERATOR-INTERACTION operand).
- the maximum number of output records in SYSLST (SYSLST-LIMIT operand).
- the logging of the current job (LOGGING operand).

The SHOW-JOB-OPTIONS command lists the current settings.

#### *Privileged functions*

The privileged user (TSOS privilege) can change job monitoring for an ongoing job, i.e. start or stop job monitoring or assign another job variable for job monitoring (JOB-IDENTIFICATION and MONJV operands).

## Format

**MODIFY-JOB-OPTIONS**

Alias: **MDJO**

```
INFORMATION-LEVEL = *UNCHANGED / *STD / *MEDIUM / *MINIMUM
, OPERATOR-INTERACTION = *UNCHANGED / *STD / *NO / *YES
, SYSLST-LIMIT = *UNCHANGED / *STD / *NO-LIMIT / <integer 0..999999>
, LOGGING = *PARAMETERS (...)
    *PARAMETERS(...)
        | LISTING = *UNCHANGED / *STD / *NO / *YES
        | , HARDCOPY = *UNCHANGED / *STD / *NO / *YES
, JOB-IDENTIFICATION = *OWN / *TSN(...) / *MONJV(...)
    *TSN(...)
        | TSN = <alphanum-name 1..4>
    *MONJV(...)
        | MONJV = <filename 1..54 without-gen-vers>
, MONJV = *UNCHANGED / *NO / <filename 1..54 without-gen-vers>
```

## Operands

### **INFORMATION-LEVEL =**

Format in which system messages are output.

### **INFORMATION-LEVEL = \*UNCHANGED**

The value last defined in a MODIFY-JOB-OPTIONS command in the course of the current job applies (current assignment). If no value has been defined, \*MEDIUM applies.

### **INFORMATION-LEVEL = \*STD**

Equivalent to specifying \*MEDIUM.

### **INFORMATION-LEVEL = \*MEDIUM**

System messages are output in abbreviated form.

### **INFORMATION-LEVEL = \*MINIMUM**

System messages are output in coded form.

### **OPERATOR-INTERACTION =**

Specifies whether console messages caused by its own task and operator responses are to be output. Operator commands for controlling the current job (e.g. a change in priority), as well as general warning and error messages for the operator are not considered here.

---

**OPERATOR-INTERACTION = \*UNCHANGED**

The value last defined in a MODIFY-JOB-OPTIONS command in the course of the current job applies (current assignment). If a value is not yet defined, \*NO applies.

**OPERATOR-INTERACTION = \*STD / \*NO**

No console messages or operator responses are output.

**OPERATOR-INTERACTION = \*YES**

If possible, console messages or operator responses are output. In interactive mode, however, this cannot be guaranteed, since console messages may also be created asynchronously at times where the data display terminal is not ready to output.

**SYSLST-LIMIT =**

Maximum number of records that may be spooled out to SYSLST and SYSOUT during the currently executing job. The records are counted separately for SYSOUT and SYSLST respectively. In interactive mode, output records on SYSOUT are only counted if the output is (also) written to a file. In the case of SYSLST, SYSOUT records are not taken into account, even if the setting LISTING=\*YES has been made to ensure that they are also written to SYSLST.

This specification must not exceed the limit specified in the job class definition (this limit can be checked with the SHOW-JOB-CLASS command).

In batch mode, if the specified value is reached during logging, the job is terminated abnormally. In interactive mode, the system asks whether the job is to be ended or continued; if the job is continued, the counter is set to zero and the specified value again applies.

**SYSLST-LIMIT = \*UNCHANGED**

The value last defined in the course of the current job applies (defined when the job was started or last set with the MODIFY-JOB-OPTIONS command).

**SYSLST-LIMIT = \*STD**

The value specified in the job class definition applies.

**SYSLST-LIMIT = \*NO-LIMIT**

Unlimited number of records that may be spooled out to SYSLST and SYSOUT during the currently executing job. If there is a lower value specified in the job class definition, \*NO-LIMIT is rejected.

**SYSLST-LIMIT = <integer 0..999999>**

Specifies the maximum number of records that can be output to SYSLST and SYSOUT in the course of the current job.

This value must not be above the limit set in the job class definition.

**LOGGING = \*PARAMETERS(...)**

Information on logging of the job run.

**LISTING =**

Specifies whether the job run is also to be logged on SYSLST.

Console messages and operator responses (OPERATOR-INTERACTION operand) are supplemented with the time of day when logged on SYSLST.

System messages requiring an answer from the user, and the message ABNORMAL PROGRAM TERMINATION, are not logged.

In line mode, logging proceeds by lines, i.e. NL control characters are interpreted.

In format mode (menu), logging takes place continuously, i.e. in the log the format is destroyed, NL control characters are not interpreted.

---

**LISTING = \*UNCHANGED**

The value last defined in the course of the current job applies (defined when the job was started or last set with the MODIFY-JOB-OPTIONS command).

**LISTING = \*STD / \*NO**

The job run is not to be logged on SYSLST.

**LISTING = \*YES**

The job run is also to be logged on SYSLST.

**HARDCOPY =**

This operand is ignored in batch mode.

Specifies whether the job run is also to be logged on a hardcopy printer. Formats (menus) cannot be logged.

**HARDCOPY = \*UNCHANGED**

The value last defined in the course of the current job applies (defined when the job was started or last set with the MODIFY-JOB-OPTIONS command).

**HARDCOPY = \*STD / \*NO**

The job run is not to be logged on a hardcopy printer.

**HARDCOPY = \*YES**

The job run is also to be logged on a hardcopy printer.

**JOB-IDENTIFICATION =**

*This operand is available only to privileged users.*

Specifies the job for which job monitoring is to be changed. The job can be identified by means of the TSN or the job variable monitoring it.

**JOB-IDENTIFICATION = \*OWN**

Job monitoring is to be changed for the user's own task. The settings for INFORMATION-LEVEL, OPERATOR-INTERACTION, SYSLST-LIMIT and LOGGING can only be changed for the user's own task.

**JOB-IDENTIFICATION = \*TSN(...)**

Identifies the job by means of its TSN.

**TSN = <alphanum-name 1..4>**

Task sequence number of the required job.

**JOB-IDENTIFICATION = \*MONJV(...)**

Identifies the job by means of its monitoring job variable.

**MONJV = <filename 1..54 without-gen-vers>**

Name of the job variable which is monitoring the required job. The job must run on the local system.

**MONJV = \*UNCHANGED / \*NO / <filename 1..54 without-gen-vers>**

*This operand is available only to privileged users.*

Specifies whether job monitoring should be changed for the job specified in the operand.

**MONJV = \*NO**

The job is not to be monitored. If it is being monitored, job monitoring is terminated.

**MONJV = <filename 1..54 without-gen-vers>**

Specifies the job variable which is to monitor the required job. If the job was already being monitored by a job variable, job monitoring is passed on to the new job variable.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JMS0630	Semantic error (see SYSOUT message)

## Note

Modifying the MONJV assignment of a foreign task is done solely for job monitoring. The SHOW-JOB-STATUS command provides information about the current job monitoring for a task.

Information which is only visible locally within the task (JV link \*SMONJVJ, special job variable \$SYSJV.JOB-MONJV) remains unchanged.

---

## Examples

### Example 1

```
/mod-job-opt inf-level=*min,oper-interact=*yes,log=*par(list=*yes)—— (1)  
/show-job-opt
```

```
%  
% INFORMATION-LEVEL = MINIMUM OPERATOR-INTERACTION = YES  
% SYSLST-LIMIT = NO-LIMIT SYSOPT-LIMIT = NO-LIMIT  
% LOGGING : LISTING = YES HARDCOPY = NO
```

```
/xxx
```

```
% CMD0186 XXX
```

```
/mod-job-opt inf-level=*med _____ (2)  
/xxx
```

```
% CMD0186 OPERATION NAME 'XXX' UNKNOWN
```

```
/mod-job-opt log=*par(list=*no) _____ (3)
```

- (1) The following specifications are in effect:
  - coded form of messages on SYSOUT
  - logging of console messages and operator answers on SYSOUT
  - logging on SYSLST
  
- (2) The specifications are modified to:
  - unabbreviated message output on SYSOUT
  
- (3) Logging on SYSLST is deactivated.

*Example 2*

```
/mod-job-opt syslst-limit=100  
/show-job-opt
```

```
%  
% INFORMATION-LEVEL = MEDIUM OPERATOR-INTERACTION = YES  
% SYSLST-LIMIT = 100 SYSOPT-LIMIT = NO-LIMIT  
% LOGGING : LISTING = NO HARDCOPY = NO
```

```
/show-file-attr output=*syslst
```

```
% SSM2222 SPECIFIED MAXLST LIMIT REACHED. CONTINUE? REPLY (Y=YES; N=NO)?n  
GROUP: :2OSG:$USERXY01.MAX.GROUP.2  
BASE: 0011 FIRST: 0011 CURRENT: 0013  
%(MSG) % % EXC0736 ABNORMAL TASK TERMINATION. ERROR CODE 'SSM2223': /HELP-MSG SSM2223

```

- (1) The system file SYSLST is assigned file *LST.FILE*.
- (2) Logging to SYSLST is activated and a limit of 10 records specified.
- (3) Output from SHOW-FILE-ATTRIBUTES for all files starting with *ALT.LST.* is effected to SYSLST. The record limit is executed three times (message *SSM2222* is answered with *Y(YES)*).
- (4) The system file SYSLST receives the primary assignment again.
- (5) The SHOW-FILE command displays the contents of logging file *LST.FILE*.

---

## 4.24 MODIFY-JOB-STREAM

Modify execution priority of stream task

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** TSOS  
OPERATING

**Routing code:** J

### Function

The MODIFY-JOB-STREAM command allows system administrators to change the task scheduling priority defined with the JMU DEFINE-JOB-STREAM statement and to modify stream-specific parameters.

The modifications are valid until the next MODIFY-JOB-STREAM command or until the end of the session.

The default value \*UNCHANGED in the corresponding operands means that the previously valid definition still applies.

### Format

**MODIFY-JOB-STREAM**

Alias: **MDJSR**

**STREAM-NAME** = <name 1..8>

,**RUN-PRIORITY** = \*UNCHANGED / <integer 30..255>

,**STREAM-PARAMETER** = \*UNCHANGED / \***NO** / <c-string 1..127>

### Operands

**STREAM-NAME** = <name 1..8>

Name of the job stream whose attributes are to be modified.

**RUN-PRIORITY** = \*UNCHANGED / <integer 30..255>

Increases or decreases the program priority of the stream task.

**STREAM-PARAMETER** = \*UNCHANGED / **NO** / <c-string 1..127>

Defines whether stream-specific parameters are to be interpreted.

In addition to the standard scheduler and individual job scheduler can also interpret this operand.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	32	CMD0221	System error
	64	JMS0630	Semantic error
	64	JMS0640	Command cannot be executed
	132	JMS0620	Saturation reached

## Example

```
/show-job-stream jsstd1
```

```
REQUESTED DETAILS OF JOB STREAM: JSSTD1
NAME.....:JSSTD1
FILE.....:SYSENT.JOBSCHED.170
RUN PRIORITY..:130
DEFAULT.....:YES
START.....:AT-LOAD
STOP.....:AT-SHUTDOWN
STREAMPARAM   :JOB-PRIORITY=Y,CPU-TIME=Y,WAIT-TIME=Y,JOB-QUOTA=30,      LOGG
ING=NO
```

```
/mod-job-stream jsstd1,run-prio=100
```

```
% JMS0022 '/MODIFY-JOB-STREAM' COMMAND PROCESSED
```

```
/show-job-stream jsstd1
```

```
REQUESTED DETAILS OF JOB STREAM: JSSTD1
NAME.....:JSSTD1
FILE.....:SYSENT.JOBSCHED.170
RUN PRIORITY..:100
DEFAULT.....:YES
START.....:AT-LOAD
STOP.....:AT-SHUTDOWN
STREAMPARAM   :JOB-PRIORITY=Y,CPU-TIME=Y,WAIT-TIME=Y,JOB-QUOTA=30,      LOGG
ING=NO
```

---

## 4.25 MODIFY-JOB-SWITCHES

Toggle job switches

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

With the MODIFY-JOB-SWITCHES command, users can set (ON), clear (OFF) or invert (INVERT) their job switches.

For every job there are 32 job switches available (numbered 0 to 31). At the beginning of the job they are cleared and can be changed while the job is running:

- explicitly, with the MODIFY-JOB-SWITCHES command,
- implicitly, with the SET-JOB-STEP command (clears switches 16 to 31), or by means of utility routines (see [section "Job switches"](#)).

At the end of a job, all job switches are again cleared.

The current settings of the job switches can be queried using SHOW-JOB-SWITCHES.

### Format

**MODIFY-JOB-SWITCHES**

Alias: **MDJSW**

**ON** = \*UNCHANGED / list-poss(32): <integer 0..31>

,**OFF** = \*UNCHANGED / \*ALL / list-poss(32): <integer 0..31>

,**INVERT** = \*UNCHANGED / list-poss(32): <integer 0..31>

### Operands

**ON** = \*UNCHANGED / list-poss(32): <integer 0..31>

Job switches to be set to ON.

**OFF** = \*UNCHANGED / \*ALL / list-poss(32): <integer 0..31>

Job switches to be set to OFF. Specifying OFF=\*ALL sets all job switches to OFF.

**INVERT** = \*UNCHANGED / list-poss(32): <integer 0..31>

Job switches to be inverted.

The job switches specified are set from ON to OFF, or from OFF to ON.

**i** In one MODIFY-JOB-SWITCHES command, a job switch cannot be explicitly modified, i.e. switched on or off or inverted, more than once.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Contradictory entries
	32	EXC0041	System error

## Examples

**/show-job-sw**

```
ALL TASK SWITCHES SET OFF
```

**/mod-job-sw on=(4,5)** \_\_\_\_\_ (1)

**/show-job-sw**

```
TASK SWITCHES ON EQUAL-  
4, 5
```

**/mod-job-sw on=10,off=4,invert=1** \_\_\_\_\_ (2)

**/show-job-sw**

```
TASK SWITCHES ON EQUAL-  
1, 5, 10
```

(1) Job switches 4 and 5 are set to one.

(2) Job switch 10 is set to one, 4 is cleared, and 1 is inverted, i.e. changed from OFF to ON.

---

## 4.26 MODIFY-JV

Modify contents of job variable

<b>Component:</b>	JV
<b>Functional area:</b>	Job variables
<b>Domain:</b>	JOB-VARIABLES
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	J

This function is only available to the user if the chargeable software product JV has been loaded as a subsystem.

### Function

The MODIFY-JV command modifies the contents of a job variable. All or part of the JV is given a new value (SET-VALUE operand). The value being set may be specified directly as a character string or derived from another JV.

#### *Privileged functions*

Privileged users (OPERATING privilege and the TSOS user ID) can modify the contents of any user job variable.

By default, systems support (TSOS privilege) is a co-owner of all the job variables (and therefore possesses the same access rights). When SECOS is used, this co-ownership can be restricted for permanent job variables.

## Format

**MODIFY-JV**

Alias: **MDJV**

**JV-CONTENTS** = <filename 1..54 without-gen-vers> / [**\*SUBSTRING**](...) / **\*LINK**(...)

[**\*SUBSTRING**](...)

| **JV-NAME** = <filename 1..54 without-gen-vers>

| ,**POSITION** = 1 / <integer 1..256>

| ,**LENGTH** = \*REST / <integer 1..256>

**\*LINK**(...)

| **LINK-NAME** = <alphanum-name 1..7>

| ,**POSITION** = 1 / <integer 1..256>

| ,**LENGTH** = \*REST / <integer 1..256>

,**SET-VALUE** = <c-string 1..254 with-low> / <x-string 1..508> /

<filename 1..54 without-gen-vers> / [**\*SUBSTRING**](...) / **\*LINK**(...)

[**\*SUBSTRING**](...)

| **JV-NAME** = <filename 1..54 without-gen-vers>

| ,**POSITION** = 1 / <integer 1..256>

| ,**LENGTH** = \*REST / <integer 1..256>

**\*LINK**(...)

| **LINK-NAME** = <alphanum-name 1..7>

| ,**POSITION** = 1 / <integer 1..256>

| ,**LENGTH** = \*REST / <integer 1..256>

,**PASSWORD** = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / **\*SECRET**

## Operands

**JV-CONTENTS** = <filename 1..54 without-gen-vers> / **\*SUBSTRING**(...) / **\*LINK**(...)

Specifies the job variable contents which are to be changed.

A JV can be identified by its name or by its link name. Optionally, a subarea may be specified. The contents of the JV, or the specified subarea, are changed to the value specified in the SET-VALUE operand.

**JV-CONTENTS** = <filename 1..54 without-gen-vers>

Name of the JV. The contents of the entire JV are modified.

---

**JV-CONTENTS = \*SUBSTRING(...)**

The contents of the subarea identified by POSITION and LENGTH are modified. If POSITION and LENGTH are not specified, the contents of the entire JV are modified.

**JV-NAME = <filename 1..54 without-gen-vers>**

Name of the JV.

**POSITION = 1 / <integer 1..256>**

Position within the JV from which the change is to begin. An undefined area ahead of this position is filled with blanks.

**LENGTH = \*REST / <integer 1..256>**

Number of characters to be changed.

The sum of the numeric values specified in the POSITION and LENGTH operands must not exceed 257.

**LENGTH = \*REST**

The length of the JV value starting from the position specified in the POSITION operand up to position 256 applies. If the number of characters transferred is less than the number specified by the \*REST operand, no blank padding is performed; the subsequent area is (again) undefined.

**JV-CONTENTS = \*LINK(...)**

The JV is identified by a link name. If POSITION and LENGTH are not specified, the contents of the entire JV are modified; if they are, the contents of the specified subarea are modified.

**LINK-NAME = <alphanum-name 1..7>**

Link name of the JV.

**POSITION = 1 / <integer 1..256>**

Position within the JV from which the change is to begin. An undefined area ahead of this position is filled with blanks.

**LENGTH = \*REST / <integer 1..256>**

Number of characters to be changed.

The sum of the numeric values specified in the POSITION and LENGTH operands must not exceed 257.

**LENGTH = \*REST**

The length of the JV value starting from the position specified in the POSITION operand up to position 256 applies. If the number of characters transferred is less than the number specified by the \*REST operand, no blank padding is performed; the subsequent area is (again) undefined.

**SET-VALUE = <c-string 1..254 with-low> / <x-string 1..508> / <filename 1..54 without-gen-vers> / \*SUBSTRING(...)/ \*LINK(...)**

New value for the JV contents specified in the JV-CONTENTS operand. The value to be set may be

- It may be entered directly as a string (<c-string> or <x-string>); in the case of a C string the uppercase/lowercase distinction is significant.
- It may be derived from a JV identified by its name or its link name; a subarea may be specified.

If the value being supplied is longer than the value being changed, it is truncated; if it is shorter, it is padded with blanks.

The command is rejected if

- the JV specified does not exist

- the JV specified is not set (has no value)
- there is no access right for the specified JV
- the subarea of the JV indicated by POSITION and LENGTH is not fully defined.

**SET-VALUE = <filename 1..54 without-gen-vers>**

Name of the JV. The entire value of this JV is taken as the new value.

**SET-VALUE = \*SUBSTRING(...)**

The contents of the subarea identified by POSITION and LENGTH are taken as the new value. If no subarea is specified, the contents of the entire JV are taken.

**JV-NAME = <filename 1..54 without-gen-vers>**

Name of the JV.

**POSITION = 1 / <integer 1..256>**

Position within the JV from which the transfer is to be made.

**LENGTH = \*REST / <integer 1..256>**

Number of characters to be transferred.

The sum of the numeric values specified in the POSITION and LENGTH operands must not exceed 257.

**LENGTH = \*REST**

The length of the current JV value starting from the position specified in the POSITION operand applies.

**SET-VALUE = \*LINK(...)**

The contents of a JV identified by its link name are taken as the new value. If no subarea is specified, the contents of the entire JV are taken; if a subarea is specified, the contents of the specified subarea are used

**LINK-NAME = <alphanum-name 1..7>**

Link name of the JV.

**POSITION = 1 / <integer 1..256>**

Position within the JV from which the transfer is to be made.

**LENGTH = \*REST / <integer 1..256>**

Number of characters to be transferred.

The sum of the numeric values specified in the POSITION and LENGTH operands must not exceed 257.

**LENGTH = \*REST**

The length of the current JV value starting from the position specified in the POSITION operand applies.

**PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483648> / \*SECRET**

Write or read password for the JV to be changed.

The PASSWORD operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.
- The password entered is not logged.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	CMD0001	No action necessary
2	0	CMD0001	Command executed with a warning
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JVS04E0	Command not executable in the call environment; if possible, remove cause of error (see SYSOUT message JVS04xx)
	130	JVS04E1	Command cannot be executed at this time; for cause see SYSOUT message JVS04xx
	130	CMD2282	Subsystem JV not available for indefinite time

## Example

```
/mod-jv jv=hugo, set-val='I like SDF' _____ (1)  
/show-jv hugo
```

```
%I like SDF
```

```
/mod-jv jv=*link(lina),set-val=hugo _____ (2)  
/show-jv *link(lina)
```

```
%I like SDF
```

```
/mod-jv jv=(hugo,8,4),set-val=*link(lora,128,4) _____ (3)  
/show-jv hugo
```

```
%I like milk
```

```
/mod-jv jv=*link(lina,8,6),set-val=x'839686868585' _____ (4)  
/show-jv *link(lina)
```

```
%I like coffee
```

(1) The job variable HUGO is set to the value 'I like SDF'.

(2) The contents of the job variable HUGO are transferred to the job variable identified by the link name LINA.

- 
- (3) The contents of bytes 128 - 131 of the job variable identified by the link name LORA are transferred to bytes 8 - 11 of the job variable HUGO.
  - (4) Bytes 8 - 13 of the job variable identified by the link name LINA are set to the value X'839686868585'.

---

## 4.27 MODIFY-JV-ATTRIBUTES

Modify job variable attributes

<b>Component:</b>	JV
<b>Functional area:</b>	Job variables
<b>Domain:</b>	JOB-VARIABLES
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	\$ (with NBCONOPI=N) or J (with NBCONOPI=Y)

This function is only available to the user if the chargeable software product JV has been loaded as a subsystem.

### Function

The MODIFY-JV-ATTRIBUTES command modifies the catalog entry of a JV. The user can change the name of the JV (NEW-NAME), as well as redefine the protection attributes of a permanent JV:

- read/write access to the JV (ACCESS), component of standard access control,
- access by other user IDs (USER-ACCESS), part of standard access control,
- access rights which are assigned with the protection attribute BASIC-ACL, extended access control,
- protection by guards (GUARDS operand)
- passwords for the JV (WRITE-PASSWORD/READ-PASSWORD),
- retention period for the JV (RETENTION-PERIOD),
- release of the lock imposed on a monitoring JV (MONJV-PROTECTION).
- HSMS management class (MANAGEMENT-CLASS operand)

The catalog entry of a JV which is monitoring an executing job can only be modified if the lock is released. The catalog entry of a JV which is used in CJC commands and macros can likewise not be modified (information can be obtained via the SHOW-CJC-STATUS command).

### *Privileged functions*

By default, systems support (TSOS privilege) is a co-owner of all the job variables (and can therefore also modify their catalog entries). When SECOS is used, this co-ownership can be restricted for permanent job variables.

## Format

### MODIFY-JV-ATTRIBUTES

Alias: **MDJVA**

**JV-NAME** = <filename 1..54 without-gen-vers>

,**NEW-NAME** = \*SAME / <filename 1..54 without-gen-vers>

,**PROTECTION** = \*UNCHANGED / [\*PARAMETERS](...)

| | | **READ** = \*UNCHANGED / \*NO / \*YES

| | | ,**WRITE** = \*UNCHANGED / \*NO / \*YES

| | ,**OTHERS** = \*UNCHANGED / \*NO-ACCESS / [\*PARAMETERS](...)

| | [\*PARAMETERS](...)

| | | **READ** = \*UNCHANGED / \*NO / \*YES

| | | ,**WRITE** = \*UNCHANGED / \*NO / \*YES

| ,**GUARDS** = \*UNCHANGED / \*NONE / [\*PARAMETERS](...)

| [\*PARAMETERS](...)

| | **READ** = \*UNCHANGED / \*NONE / <filename 1..18 without-cat-gen-vers>

| | ,**WRITE** = \*UNCHANGED / \*NONE / <filename 1..18 without-cat-gen-vers>

| ,**WRITE-PASSWORD** = \*UNCHANGED / \*NONE / <c-string 1..4> / <x-string 1..8> /

| <integer -2147483648..2147483647> / \*SECRET

| ,**READ-PASSWORD** = \*UNCHANGED / \*NONE / <c-string 1..4> / <x-string 1..8> /

| <integer -2147483648..2147483647> / \*SECRET

```
| ,RETENTION-PERIOD = *UNCHANGED / <integer 0..32767 days>
| ,MONJV-PROTECTION = *UNCHANGED / *NO
,MANAGEMENT-CLASS = *UNCHANGED / *NONE / <composed-name 1..8>
```

## Operands

**JV-NAME = <filename 1..54 without-gen-vers>**

Existing name of the JV.

Nonprivileged users may specify their own user ID only.

**NEW-NAME = \*SAME / <filename 1..54 without-gen-vers>**

New name for the JV. Default value \*SAME, i.e. no new name for the JV.

A new name can be specified explicitly with catalog ID and user ID, but any attempt to change the previous catalog or user IDs is rejected as an error.

When renaming a permanent JV to a temporary JV, the protection attributes must be left at their default values (see the CREATE-JV command) or be set explicitly to the default values in the PROTECTION operand. Default settings for the protection attributes: ACCESS=\*WRITE, USER-ACCESS=\*OWNER-ONLY, BASIC-ACL=\*NONE, WRITE-PASSWORD=\*NONE, READ-PASSWORD=\*NONE, RETENTION-PERIOD=0

**PROTECTION =**

Protection attributes of the JV.

**PROTECTION = \*UNCHANGED**

The protection attributes remain unchanged.

A change in the protection attributes is not permissible for temporary JVs.

**PROTECTION = \*PARAMETERS(...)**

Specifies which protection attributes are to be changed.

\*UNCHANGED is the default value for all protection attributes: A protection attribute is only changed if the desired value is explicitly specified.

For temporary JVs, only the default values are permitted. Since only the creating job can access temporary JVs, no protection is required against foreign access.

If more than one access control mechanism is specified for a JV, the strongest mechanism activated applies. The table below lists the types of access control that exist, the corresponding protection attributes and their hierarchy (protection levels):

Access control method	Protection attribute	Prot. level
Standard access control	ACCESS and USER-ACCESS	0
Basic access control list	BASIC-ACL	1
Access control via guards	PASSWORD	2

Table 65: Hierarchy of access control methods

All other protection attributes of the file (e.g. passwords) are evaluated independently, without regard to the implemented protection level.

**ACCESS = \*UNCHANGED / \*WRITE / \*READ**

Write access (implicit read access) or only read access to the JV.

---

**USER-ACCESS = \*UNCHANGED / \*OWNER-ONLY / \*ALL-USERS**

Specifies whether external user IDs may access the JV.

**BASIC-ACL = \*UNCHANGED / \*NONE / \*PREVIOUS / \*PARAMETERS(...)**

Specifies whether a BACL is to be activated, changed or turned off for the job variable.

**BASIC-ACL = \*NONE**

An activated basic ACL is turned off for the JV. The access control is thereby effected in accordance with the values of USER-ACCESS and ACCESS (standard access control).

**BASIC-ACL = \*PREVIOUS**

An already existing BASIC-ACL entry is not changed.

If the JV is not protected by a basic ACL, a BASIC-ACL entry is created. Thereby the values of the standard access control (ACCESS and USER-ACCESS) are taken over into the BASIC-ACL entry in accordance with the following table:

Standard access control		BASIC-ACL protection					
USER-ACCESS	ACCESS	OWNER		GROUP		OTHERS	
		R	W	R	W	R	W
OWNER-ONLY	WRITE	Y	Y	N	N	N	N
OWNER-ONLY	READ	Y	N	N	N	N	N
ALL-USERS	WRITE	Y	Y	Y	Y	Y	Y
ALL-USERS	READ	Y	N	Y	N	Y	N

Table 66: Standard access control/BASIC-ACL

**BASIC-ACL = \*PARAMETERS(...)**

The BACL is activated for the job variable or individual access rights of an existing BACL are changed. The read and write access rights can be explicitly set or denied for each user class. User classes are:

- OWNER, i.e. user ID of the owner and systems support
- GROUP, i.e. all user IDs which belong to the group of the owner (except the owner and systems support). Definition of user groups is possible only when the software product SECOS is used. With regard to the possible use of SECOS, the same rights should be allocated for GROUP as for OTHERS.
- OTHERS, i.e. all user IDs which do not belong to the group of the owner.

BASIC-ACL is activated if the value \*NO-ACCESS or \*PARAMETERS is specified for at least one authorized user. In this case, the corresponding access authorization is set to "no access right" for those authorized users for whom the value \*UNCHANGED was not changed (corresponds to specifying \*NO-ACCESS).

**OWNER = \*UNCHANGED / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights are to be set for the owner. For a newly activated BASIC-ACL, \*UNCHANGED is treated in the same way as \*NO-ACCESS. With \*NO-ACCESS, the owner has no access rights.

**OWNER = \*PARAMETERS(...)**

The owner's access rights are entered as specified:

---

**READ = \*UNCHANGED / \*NO / \*YES**

Specifies whether read authorization is set.

\*UNCHANGED is the default value, i.e. no read authorization (corresponds to \*NO) when BASIC-ACL is reactivated.

**WRITE = \*UNCHANGED / \*NO / \*YES**

Specifies whether write authorization is specified.

Write authorization does *not* imply read authorization. \*UNCHANGED is the default value, i.e. no read authorization (corresponds to \*NO) when BASIC-ACL is reactivated.

**GROUP = \*UNCHANGED / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights are to be set for all user IDs from the group of the owner. Without SECOS, that is all user IDs which do not belong to a group other than that of the owner. For a newly activated BASIC-ACL, \*UNCHANGED is treated in the same way as \*NO-ACCESS. With \*NO-ACCESS, GROUP has no access rights.

**GROUP = \*PARAMETERS(...)**

Access rights are to be set as specified:

**READ = \*UNCHANGED / \*NO / \*YES**

Specifies whether read authorization is set.

\*UNCHANGED is the default value, i.e. no read authorization (corresponds to \*NO) when BASIC-ACL is reactivated.

**WRITE = \*UNCHANGED / \*NO / \*YES**

Specifies whether write authorization is specified.

Write authorization does *not* imply read authorization. \*UNCHANGED is the default value, i.e. no read authorization (corresponds to \*NO) when BASIC-ACL is reactivated.

**OTHERS = \*UNCHANGED / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights are to be set for user IDs which do not belong to the group of the owner. If SECOS is not used, access rights should be set as for

GROUP with regard to an analysis for future use of SECOS. For a newly activated BASIC-ACL, \*UNCHANGED is treated in the same way as \*NO-ACCESS. With \*NO-ACCESS, OTHERS has no access rights.

**OTHERS = \*PARAMETERS(...)**

Access rights are to be set as specified:

**READ = \*UNCHANGED / \*NO / \*YES**

Specifies whether read authorization is set.

\*UNCHANGED is the default value, i.e. no read authorization (corresponds to \*NO) when BASIC-ACL is reactivated.

**WRITE = \*UNCHANGED / \*NO / \*YES**

Specifies whether write authorization is specified.

Write authorization does *not* imply read authorization. \*UNCHANGED is the default value, i.e. no read authorization (corresponds to \*NO) when BASIC-ACL is reactivated.

**GUARDS = \*UNCHANGED / \*NONE / \*PARAMETERS(...)**

Specifies whether access control via GUARDS is to be activated or modified for the JV.

**GUARDS = \*NONE**

Access to the JV is not (is no longer) to be controlled via GUARDS.

---

## **GUARDS = \*PARAMETERS(...)**

Any existing access control via GUARDS for the JV is to be modified as specified. If no protection by guards has been defined for the JV, access control via GUARDS is activated only if a value other than \*UNCHANGED is specified for at least one of the READ or WRITE operands.

Access to the file is controlled via a guard, i.e. a specific object identifying all the conditions subject to which access will be granted: such as date, time and user ID. The GUARDS function unit of the chargeable software product SECOS (see the "SECOS" manual [35]) must be installed in order to create and maintain a guard. Each guard is uniquely identified by its name. Guard names resemble JV names: they are made up of two parts, the user ID (optional) and the name part (up to 8 characters). If no user ID is specified explicitly, the user's own ID is added implicitly. Each access mode can be controlled by a separate guard. If no guard is assigned for an access mode (\*NONE), access control will refuse any corresponding access (e.g. WRITE=\*NONE prevents all write access). Specifying GUARDS=\*PARAMETERS defines access control via GUARDS with all access modes being set to the default value \*NONE, i.e. neither read access to the JV nor write or execute access is allowed.

The GUARDS subsystem is not required in order to define access control via GUARDS. The appropriate checks by GUARDS are not performed until the JV is actually accessed: If a guard has been defined but is not available, all access of the type controlled by that guard is prohibited. No access at all is possible if the GUARDS subsystem is not available at the time of access.

### **READ = \*UNCHANGED / \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard controlling read access (up to 8 characters if no user ID is specified). The default value is \*NONE, i.e. no read access is granted.

### **WRITE = \*UNCHANGED / \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard controlling write access (up to 8 characters if no user ID is specified). The default value is \*NONE, i.e. no write access is granted.

### **WRITE-PASSWORD = \*UNCHANGED / \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

Write or read password for the JV to be modified. The WRITE-PASSWORD operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password .
- The password entered is not logged.

### **WRITE-PASSWORD = \*NONE**

No password for the JV. Any write password that may have been defined is removed.

### **READ-PASSWORD = \*UNCHANGED / \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

Password for protection against unauthorized reading. The READ-PASSWORD operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password .
- The password entered is not logged.

**READ-PASSWORD = \*NONE**

No password for the JV. Any read password that may have been defined is removed.

**RETENTION-PERIOD = \*UNCHANGED / <integer 0..32767 days>**

Retention period in days. In the catalog entry, the date in output field *EXPIR-DATE* is set to a value computed from the current date and the specified number of days. The JV is protected against being modified or deleted up to this date. The time for the defined expiration date is currently entered as 00:00:00 hours in the catalog. Specifying RETENTION-PERIOD=0 causes the expiration date to be set to the current date, thereby canceling any retention period set.

**MONJV-PROTECTION = \*UNCHANGED / \*NO**

Specifies whether the lock on the specified monitoring JV is to be retained. The system automatically locks monitoring job variables against write access until the job being monitored is ended.

**MONJV-PROTECTION = \*NO**

Any lock present is to be removed. The user should ensure that the monitored job has already been removed from the job queue (SHOW-JOB-STATUS).

**MANAGEMENT-CLASS = \*UNCHANGED / \*NONE / <composed-name 1..8>**

*Only for job variables on SM pubsets* Specifies whether the HSMS functions JV backup and (long-term) archival are to be controlled via a management class defined via HSMS. See the "HSMS, Volume 1" manual [18] for further details. Assignment of a management class is rejected in the following cases:

- the JV is to be created on an SF pubset
- the specified management class has not been defined for the SM pubset

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	CMD0001	No action necessary
2	0	CMD0001	Command executed with a warning
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JVS04E0	Command not executable in the call environment; if possible, remove cause of error (see SYSOUT message JVS04xx)
	130	JVS04E1	Command cannot be executed at this time; for cause see SYSOUT message JVS04xx
	130	CMD2282	Subsystem JV not available for indefinite time

## Example

```
/create-jv jv=test  
/show-jv-attr jv=test,inf=*all-attr
```

```
%0000000 :LEO:$USER1.TEST  
% USER-ACC   = OWNER-ONLY  ACCESS      = WRITE  
% CRE-DATE   = 2012-01-09  EXPIR-DATE = 2012-01-09  
% CRE-TIME   = 16:09:36   EXPIR-TIME = 00:00:00  
% READ-PASS  = NONE  
% WRITE-PASS = NONE  
%SUM 000001 JV'S; JV-VALUE = 00000000 BYTES
```

```
/mod-jv-attr jv=test,new-name=probe _____ (1)
```

```
/mod-jv-attr jv=probe,prot=(user-access=*all-users,write-pass=c'feh1',  
ret-per=10) _____ (2)
```

```
/show-jv-attr jv=probe,inf=*all-attr
```

```
%0000000 :LEO:$USER1.PROBE  
% USER-ACC   = ALL-USERS  ACCESS      = WRITE  
% CRE-DATE   = 2012-01-09  EXPIR-DATE = 2012-01-19  
% CRE-TIME   = 16:09:36   EXPIR-TIME = 00:00:00  
% READ-PASS  = NONE  
% WRITE-PASS = YES  
%SUM 000001 JV'S; JV-VALUE = 00000000 BYTES
```

```
/add-pass pass=c'feh1' _____ (3)
```

```
/del-jv jv=probe _____ (4)
```

```
% JVS04A3 ERROR WHEN DELETING JOB VARIABLE ':LEO:$USER1.PROBE'  
% JVS04B6 EXPIRATION DATE FOR JOB VARIABLE NOT YET REACHED. COMMAND REJECTED  
/
```

- (1) The job variable TEST is renamed PROBE.
- (2) The JV PROBE is made accessible to all users and receives a write password. It also cannot be modified or deleted for a period of 10 days.
- (3) The write password is added to the password table.
- (4) Because of the retention period of 10 days, the DELETE-JV command is rejected.

---

## 4.28 MODIFY-JV-CONDITIONALLY

Conditionally modify JV contents and branch to label

<b>Component:</b>	JV
<b>Functional area:</b>	Job variables
<b>Domain:</b>	JOB-VARIABLES
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

This function is only available to the user if the chargeable software product JV has been loaded as a subsystem.

### Function

The MODIFY-JV-CONDITIONALLY command checks the contents of a JV subarea against a reference value (IF-VALUE operand). If it finds a match, it assigns the tested area a new value (SET-VALUE operand) and branches to the specified destination (LABEL operand). The value set in the event of a match may be specified directly as a character string or derived from another JV. If there is no match, the JV value remains unchanged and processing continues with the command following the MODIFY-JV-CONDITIONALLY command.

This command is permitted only in ENTER files and in procedures. In interactive mode it is rejected, and is therefore not offered as a menu option.

### *Note*

During processing by MODIFY-JV-CONDITIONALLY (interval between comparing and modifying) the JV to be modified is protected against access by other jobs.

## Format

**MODIFY-JV-CONDITIONALL**

Alias: **MDJVC**

**JV-CONTENTS** = <filename 1..54 without-gen-vers> / [\***SUBSTRING**](...) / \***LINK**(...)

[\***SUBSTRING**](...)

|     **JV-NAME** = <filename 1..54 without-gen-vers>

|     , **POSITION** = 1 / <integer 1..256>

|     , **LENGTH** = \***REST** / <integer 1..256>

\***LINK**(...)

|     **LINK-NAME** = <alphanum-name 1..7>

|     , **POSITION** = 1 / <integer 1..256>

|     , **LENGTH** = \***REST** / <integer 1..256>

, **IF-VALUE** = <c-string 1..254 with-low> / <x-string 1..508>

, **SET-VALUE** = <c-string 1..254 with-low> / <x-string 1..508> / <filename 1..54 without-gen-vers> / \***LINK**(...)

\***LINK**(...)

|     **LINK-NAME** = <alphanum-name 1..7>

, **LABEL** = \***NONE** / <name 1..8>

, **PASSWORD** = \***NONE** / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \***SECRET**

## Operands

**JV-CONTENTS** = <filename 1..54 without-gen-vers> / \***SUBSTRING**(...) / \***LINK**(...)

Specifies the job variable contents which are to be checked and where appropriate changed.

A JV can be identified by its name or link name.

The specified subarea is checked against the reference value specified in the IF-VALUE operand. If there is a match, the tested area is changed to the value specified in the SET-VALUE operand. If there is no match, the JV contents remain unchanged.

**JV-CONTENTS** = <filename 1..54 without-gen-vers>

Name of the JV. Such entry is an abbreviation of **JV-CONTENTS**=\***SUBSTRING**(<jv-name>, 1, \***REST**)

**JV-CONTENTS** = \***SUBSTRING**(...)

The contents of the subarea identified by **POSITION** and **LENGTH** are checked and where appropriate changed.

**JV-NAME** = <filename 1..54 without-gen-vers>

Name of the JV.

---

**POSITION = 1 / <integer 1..256>**

Position within the JV at which checking and where appropriate changing is to begin.

**LENGTH = \*REST / <integer 1..256>**

Number of characters to be checked and where appropriate changed.

The sum of the numeric values specified in the POSITION and LENGTH operands must not exceed 257.

**LENGTH = \*REST**

For the comparison, the length of the reference value applies; for the modification, the length of the JV value starting from the position specified in the POSITION operand up to position 256. If the value to be transferred is shorter, no blanks are appended but instead the area following is (again) undefined.

**JV-CONTENTS = \*LINK(...)**

The JV is identified by its link name. If POSITION and LENGTH are not specified, the contents of the entire JV are checked and, if necessary, modified; if they are, the contents of the specified subarea are modified.

**LINK-NAME = <alphanum-name 1..7>**

Link name of the JV.

**POSITION = 1 / <integer 1..256>**

Position within the JV at which checking and where appropriate changing is to begin.

**LENGTH = \*REST / <integer 1..256>**

Number of characters to be checked and where appropriate changed. The sum of the numeric values specified in the POSITION and LENGTH operands must not exceed 257.

**LENGTH = \*REST**

For the comparison, the length of the reference value applies; for the modification, the length of the JV value starting from the position specified in the POSITION operand up to position 256. If the value to be transferred is shorter, no blanks are appended but instead the area following is (again) undefined.

**IF-VALUE = <c-string 1..254 with-low> / <x-string 1..508>**

Reference value against which the JV contents specified in the JV-CONTENTS operand are to be checked. The reference value must be specified as a string (<c-string> or <xstring>); in the case of a C string the uppercase /lowercase distinction is significant. If the comparison value is longer than the number of characters to be compared, it is truncated; if it is shorter, it is padded with blanks.

**SET-VALUE = <c-string 1..254 with-low> / <x-string 1..508> / <filename 1..54 without-gen-vers> / \*LINK(...)**

New value that the JV contents specified in the JV-CONTENTS operand will be given if the existing value matches the reference value (IF-VALUE). The value to be set may be

- specified directly as a character string (<c-string> or <x-string>); C strings are case-sensitive
- derived from a JV identified by name or link name.

If the value to be transferred is longer than the number of characters to be set, it is truncated; if it is shorter, it is padded with blanks.

The command is rejected if

- the JV specified does not exist
- the JV specified is not set (has no value)
- there is no access right for the specified JV.

---

**SET-VALUE = <filename 1..54 without-gen-vers>**

Name of the JV. The entire contents of this JV are taken as the new value.

**SET-VALUE = \*LINK(...)**

The contents of a JV identified by its link name are taken as the new value.

**LINK-NAME = <alphanum-name 1..7>**

Link name of the JV.

**LABEL = \*NONE / <name 1..8>**

(Non-S) label that identifies the command line (branch destination) at which processing is to be continued if the current JV value matches the reference value (IF-VALUE). If there is no match, processing continues with the next command. The default value is \*NONE, i.e. processing resumes with the next command. In this case, the command result (condition satisfied or not satisfied) in S procedures or dialog blocks can be derived from the command return code. For evaluation purposes, the next command must be SAVE-RETURNCODE since no error condition is present.

**PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

Write or read password for the JV to be modified. The PASSWORD operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.
- The password entered is not logged.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed because condition was satisfied
1	0	CMD0001	No action necessary as condition was not satisfied
2	0	CMD0001	Command executed with a warning
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JVS04E0	Command not executable in the call environment; if possible, remove cause of error (see SYSOUT message JVS04xx)
	130	JVS04E1	Command cannot be executed at this time; for cause see SYSOUT message JVS04xx
	130	CMD2282	Subsystem JV not available for indefinite time

**Note**

Other than the ADD-CJC-ACTION, SKIP-COMMANDS and WAIT-EVENT commands, the MODIFY-JV-CONDITIONALLY command does not work with real conditional expressions. As a consequence, the result of the comparison will deviate in the following cases:

- 
- If the JV range specified in the JV-CONTENTS operand is fully undefined, the command is rejected.
  - If a JV substring is specified that is longer than the defined range, the comparison will still be performed with the specified length. Since it is not possible to specify unspecified characters in the IF-VALUE reference value, the result of the comparison is always “not equal”.

---

## Example

```
.....
.....
/.RESRV  MOD-JV-COND  JV=*LINK(LOCK,8,4),IF-VAL='FREE',-
/
/          SET-VAL=$SYSJV.TSN,LABEL=RESRVD _____ (1)
/          WAIT-EVENT UNTIL=*JV(TIME-LIMIT=10,TIMEOUT-LABEL=RESRV)_____ (2)
/.RESRVD REMARK      'Belegung erfolgreich'
.....
.....
```

- (1) In bytes 8 -11 of the job variable identified by the link name LOCK the TSN of the user's own task is entered, provided the old contents have the value 'FREE'. In this case, command processing is resumed at the label RESRVD.
- (2) If the contents are checked and found not to be equal to the value 'FREE', the MODIFY-JV-CONDITIONALLY command is called again after a wait time of 10 seconds.

## 4.29 MODIFY-MASTER-CATALOG-ENTRY

Delete entry from MRSCAT of home pubset

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS  
**Routing code:** \$

### Function

The values for a catalog entry in the MRSCAT of the home pubset which are preset with the ADD-MASTER-CATALOG-ENTRY command can be modified using this command, both for single-feature pubsets (SF pubsets) and for system-managed pubsets (SM pubsets).

Note that this command cannot be used to change the pubset type or a volume set entry. Any changes that are made do not take effect until the next time the pubset is imported (IMPORT-PUBSET command).

The availability of the catalog can be governed with the IMPORT-PUBSET command.

The default value \*UNCHANGED in the relevant operands indicates that the previous specification remains valid.

### Format

#### MODIFY-MASTER-CATALOG-ENTRY

**ENTRY-NAME** = <cat-id 1..4>

,**PUBSET-TYPE** = **\*BY-PUBSET** / **\*SINGLE-FEATURE(...)** / **\*SYSTEM-MANAGED(...)**

, PUBRES-UNIT = *UNCHANGED / <alphanum-name 2..2> / <x-text 4..4>

```

## Operands

**ENTRY-NAME** = <cat-id 1..4>

Catalog ID of the pubset for which the MRSCAT entry is to be modified.

**PUBSET-TYPE** = **\*BY-PUBSET** / **\*SINGLE-FEATURE(...)** / **\*SYSTEM-MANAGED(...)**

Defines the type of pubset for which the MRSCAT entry is to be modified. The pubset type itself cannot be changed. The attributes specific to a pubset type cannot be modified unless the pubset type is specified explicitly.

**PUBSET-TYPE** = **\*BY-PUBSET**

The pubset type is read from the MRSCAT entry.

**PUBSET-TYPE** = **\*SINGLE-FEATURE(...)**

The pubset for which the MRSCAT entry is to be modified is an SF pubset.

**START-SPEEDCAT** = \*UNCHANGED / **\*NO** / **\*SPEEDCAT-TASK** / **\*OWN-TASK**

Specifies whether SCA should be started when this pubset is imported.

---

**START-SPEEDCAT = \*NO**

SCA should not be started when this pubset is imported.

**START-SPEEDCAT = \*SPEEDCAT-TASK**

SCA should be available and should run under a separate task, the SPEEDCAT task.

**START-SPEEDCAT = \*OWN-TASK**

SCA should be available and should run under the user's task.

**PHYSICAL-ALLOCATION = \*UNCHANGED / \*ADMINISTRATOR-ONLY / \*USER-ALLOWED**

Specifies whether users are allowed to make direct allocations to specific volumes of the pubset.

**PHYSICAL-ALLOCATION = \*ADMINISTRATOR-ONLY**

Users may not directly allocate the volumes of the pubset. This right is reserved for the privileged caller under TSOS.

**PHYSICAL-ALLOCATION = \*USER-ALLOWED**

On this pubset, nonprivileged users should also be permitted to allocate individual volumes directly.

**NEXT-CATALOG-EXPORT = \*UNCHANGED / \*NO-CONVERSION / \*V10-COMPATIBLE**

This operand is only still available for reasons of compatibility.

**ALLOCATION = \*UNCHANGED / \*PARAMETERS(...)**

Specifies whether particular allocation parameters should be set for file processing on the pubset.

**ALLOCATION = \*PARAMETERS(...)**

Specifies allocation parameters for the pubset, with the values which follow.

**SATURATION-LEVEL4 = \*UNCHANGED / \*STD / <integer 66..2147483647 2Kbyte >**

The allocation parameter is to be set for memory saturation level 4. If saturation levels have already been defined with the MODIFY-SPACE-SATURATION-LEVELS command, they should not be changed with the MODIFY-MASTER-CATALOG-ENTRY command because in that case there would be no checking of the saturation levels.

**SATURATION-LEVEL4 = \*STD**

The value defined in the system parameter L4SPDEF is to apply.

**SATURATION-LEVEL4 = <integer 66..2147483647 2Kbyte >**

Value of memory saturation level 4 which is to apply to this pubset.

**PRIMARY-ALLOCATION = \*UNCHANGED / \*STD / <integer 1..16777215 2Kbyte >**

The allocation parameter, for the primary allocation when a storage space request is made (file processing), is to be set.

**PRIMARY-ALLOCATION = \*STD**

The value defined in the system parameter DMPRALL is to apply.

**PRIMARY-ALLOCATION = <integer 1..16777215 2Kbyte >**

The value to be applied for this pubset, for primary storage space allocations during file processing. This value will apply as the default value for any user who does not specify a value for an initial allocation in a storage space request.

**SECONDARY-ALLOCATION = \*UNCHANGED / \*STD / <integer 1..32767 2Kbyte >**

The allocation parameter, for secondary allocations when a storage space request is made (file processing), is to be set.

---

**SECONDARY-ALLOCATION = \*STD**

The value defined in the system parameter DMSCALL is to apply.

**SECONDARY-ALLOCATION = <integer 1..32767 2Kbyte >**

The value to be applied for this pubset, for secondary storage space allocations during file processing. This value will apply as the default value for any user who does not specify a value for another allocation in a storage space request.

**MAXIMAL-ALLOCATION = \*UNCHANGED / \*STD / <integer 1..32767 2Kbyte >**

The allocation parameter, for doubling the secondary allocation when a storage space request is made (file processing), is to be set.

**MAXIMAL-ALLOCATION = \*STD**

The value defined in the system parameter DMMAXSC is to apply.

**MAXIMAL-ALLOCATION = <integer 1..32767 2Kbyte >**

The value to be applied for this pubset, for doubling of the secondary storage space allocation during file processing. This value will be the maximum value for any user, for whom the space remains inadequate even after a secondary allocation has been made. The value for the secondary allocation will be repeatedly doubled until the maximum value specified here is reached.

**PUBSET-TYPE = \*SYSTEM-MANAGED(...)**

The pubset for which the MRSCAT entry is to be modified is an SM pubset.

**CONTROL-VOLUME-SET = \*UNCHANGED / <cat-id 1..4>**

Specifies which volume set is to be used as the control volume set when the SM pubset is imported.

**CONTROL-VOLUME-SET = <cat-id 1..4>**

Indicates the catalog ID of the volume set which is to be used as the control volume set when the SM pubset is imported. The specified volume set must also be recorded as a control volume set in the SM pubset's configuration file.

**PARTNER-NAME = \*UNCHANGED / <alphanum-name 1..8>**

BCAM name of the processor for remote file access (RFA). A processor may only be specified if no MSCF connection exists, but remote file access is required.

**ACCESS-FAILURE = \*UNCHANGED / \*HOLD-JOBS / \*CANCEL-JOBS**

*Only for a shared pubset:*

Defines the behavior if the MSCF connection to the master of an imported shared pubset is lost.

**ACCESS-FAILURE = \*HOLD JOBS**

The pubset is set to the LOCAL-IMPORTED, QUIET state for the duration of the connection interruption. Tasks that access the pubset enter a wait state, the duration of which is defined by the BATCH-WAIT-TIME or DIALOG-WAIT-TIME parameter (see below).

**ACCESS-FAILURE = \*CANCEL-JOBS**

The pubset is set to the INACC state for the duration of the connection interruption. Attempts to access the pubset are immediately rejected - at program level with a corresponding return code, at command level by triggering a spin-off. The parameters BATCH-WAIT-TIME and DIALOG-WAIT-TIME are not evaluated.

**RESIDENT-BUFFERS = \*UNCHANGED / \*NO / \*YES**

Specifies whether resident or nonresident buffers are to be created. Please, note possible interaction with the NUMBER-OF-BUFFERS operand (see there).

---

**RESIDENT-BUFFERS = \*NO**

Nonresident buffers are created.

**RESIDENT-BUFFERS = \*YES**

Resident buffers are created.

**NUMBER-OF-BUFFERS = \*UNCHANGED / <integer 1..255>**

Defines the number of buffers.

**i** If the CATBUFR and BMTNUM system parameters were entered in MRSCAT as potentially active (command `ADD-MASTER-CATALOG-ENTRY RESIDENT-BUFFERS=*SYSTEM-STD, NUMBER-OF-BUFFERS=*SYSTEM-STD`) and only one of both operands was modified via the `MODIFY-MASTER-CATALOG-ENTRY` command, so the other one will be given the default value: `RESIDENT-BUFFERS=*NO, NUMBER-OF-BUFFERS=32` regardless `*UNCHANGED` was specified.

The buffer specification is evaluated - according to the following hierarchy - only when the pubset is imported:

1. Explicit parameter specification in the `IMPORT-PUBLIC-VOLUME-SET` command
2. Specifications via the `ADD-` or `MODIFY-MASTER-CATALOG-ENTRY` command.  
If only one of the operands `RESIDENT-BUFFERS` or `NUMBER-OF-BUFFERS` is specified, the default value applies to the other operand (`RESIDENT-BUFFERS=*NO, NUMBER-OF-BUFFERS=32`).
3. Specification according to system parameters `CATBUFR` and `BMTNUM`.
4. If the specified value of `NUMBER-OF-BUFFERS` is less than 32, it is increased to 32.

**BATCH-WAIT-TIME = \*UNCHANGED / <integer 0..2147483647 seconds>**

*Only for a shared pubset with the setting `ACCESS-FAILURE=*HOLD-JOBS`*

Time in seconds that batch jobs are to wait for the availability of pubsets that cannot be accessed due to a connection failure. If the time specified is exceeded, command processing is aborted with an error code and the spin-off mechanism is triggered.

**DIALOG-WAIT-TIME = \*UNCHANGED / <integer 0..2147483647 seconds>**

*Only for a shared pubset with the setting `ACCESS-FAILURE=*HOLD-JOBS`*

As with batch jobs, defines the wait time spread in the event of interactive accesses to pubsets in the `QUIET` status. If the time specified is exceeded, the interactive job receives a message and is resumed. The default value here is 30 seconds.

**SHARED-PUBSET = \*UNCHANGED / \*NO / \*YES**

Determines the shareability of the pubset for local processors.

**ACCESS-CONTROLLED = \*UNCHANGED / \*NO / \*YES(...)**

Specifies whether access to the pubset is to be restricted to one user ID.

**ACCESS-CONTROLLED = \*NO**

Access to the pubset is not subject to any restrictions.

**ACCESS-CONTROLLED = \*YES(...)**

Access to the pubset is to be restricted to one user ID. The `IMPORT-PUBSET` command is rejected with an error in the case of a shared pubset flagged as `ACCESS-CONTROLLED=*YES`.

**USER-IDENTIFICATION = \*UNCHANGED / <alphanum-name 1..8> / TSOS**

Specifies the user ID which is to have access to the pubset.

**USER-IDENTIFICATION = <alphanum-name 1..8>**

Specifies a user ID, in addition to the `TSOS` user ID, which is to be permitted access to the pubset.

**EAM = \*UNCHANGED / \*PARAMETERS(...)**

Specifies the `SYSEAM` file parameters specific to this pubset.

**EAM = \*PARAMETERS(...)**

Specifies the `SYSEAM` parameters which follow for the pubset.

---

**MAXIMAL-SIZE = \*UNCHANGED / \*STD / <integer 12..193536 2Kbyte >**

This operand is only supported for reasons of compatibility and is no longer evaluated.

**MINIMAL-SIZE = \*UNCHANGED / \*STD / <integer 12..193536 2Kbyte >**

Specifies the minimum size (number of half pages) that the SYSEAM file may occupy in the specified pubset.

**MINIMAL-SIZE = \*STD**

The value specified in the system parameter EAMMIN is to apply.

**MINIMAL-SIZE = <integer 12..193536 >**

Minimum size (number of half pages) that the SYSEAM file may occupy in the pubset.

**SECONDARY-ALLOCATION = \*UNCHANGED / \*STD / <integer 1..193536 2Kbyte >**

Specifies the secondary allocation for the SYSEAM file, for this pubset.

**SECONDARY-ALLOCATION = \*STD**

The value specified in the system parameter EAMSEC is to apply.

**SECONDARY-ALLOCATION = <integer 1..193536 2Kbyte >**

Value of the secondary allocation for the SYSEAM file (number of half pages). This value should be a multiple of 24.

**VIRTUAL-MEMORY = \*UNCHANGED / \*STD / <integer 0..8192 2Kbyte >**

Specifies the number of half pages to be used in determining the size of the EAM cache area in class 4 memory. A cache area can only be created for the SYSEAM file of the home pubset. The parameter has no effect for any other pubsets.

**VIRTUAL-MEMORY = \*STD**

The size of the EAM cache area will be determined from the value of the system parameter EAMMEM.

**VIRTUAL-MEMORY = <integer 0..8192 2Kbyte >**

The number of half pages specified here determines the size of the EAM cache area.

**REMOTE-IMPORT = \*UNCHANGED / \*BY-CONNECTION / \*BY-COMMAND-ONLY**

Defines how the remote import status can be changed.

**REMOTE-IMPORT = \*BY-CONNECTION**

The change is made on connection setup.

**REMOTE-IMPORT = \*BY-COMMAND-ONLY**

The remote import status can only be changed by a command.

**XCS-CONFIGURATION = \*UNCHANGED / \*NO / \*YES**

*For shared pubset only:* Defines whether the pubset may be automatically imported as an XCS pubset when a new XCS network is established.

**XCS-CONFIGURATION = \*NO**

The pubset must not be imported automatically as an XCS pubset. (The pubset may nonetheless be used as an XCS pubset using the SET-XCS-PUBSET command.)

**XCS-CONFIGURATION = \*YES**

The pubset is to be imported automatically as an XCS pubset by the MSCF subsystem when a new XCS network is established.

**PUBRES-UNIT = \*UNCHANGED / <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device name (MN) of the pubres of the SF pubset or of the volres of the SM pubset. VM2000 requires this entry when the pubset is specified by means of its catalog ID.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
2	0	CMS0002	Disk error
	1	CMS0011	Syntax error
	1	CMS0314	Syntax error in entry name or error in wildcard specification
	32	CMD0221	Internal system error
	32	CMS031F	MRSCAT parameter error
	32	CMS0310	Error during privilege checking
	32	CMS0317	MRSCAT is locked
	32	CMS0318	Synchronization error
	64	CMS0010	No authorization for command
	64	CMS0312	MRSCAT entry not found
	64	CMS0319	Pubset type conflict

**Note**

For handling of the buffer specifications, see the notes under the IMPORT-PUBSET command.

**Example**

*Locally modifying catalog entries and importing pubsets (MPVS)*

A, BAD and DAT are pubsets which are to be accessed locally via a single host. A is the home pubset.

The following commands must be issued:

/MOD-MAST ENTRY=	BAD , SHARE-PUB = *YES , DIALOG-WAIT = 30 , BATCH-WAIT = 28800
/MOD-MAST ENTRY=	DAT
/IMP-PUB PUBSET =	BAD , USE=*SHARE
/IMP-PUB PUBSET =	DAT

---

The MRSCAT catalog directory in the home pubset contains the following lines:

```
PUBSET    A:LOCAL-HOME  
PUBSET    BAD:LOCAL-IMPORTED,SHARED,MASTER-HOST=OWN-HOST  
PUBSET    DAT:LOCAL-IMPORTED
```

---

## 4.30 MODIFY-MEMORY-PARAMETERS

Modify settings for managing the big page memory

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	System control and optimization
<b>Domain:</b>	SYSTEM-MANAGEMENT SYSTEM-TUNING
<b>Privileges:</b>	OPERATING TSOS
<b>Routing code:</b>	R

This command is rejected on /390 architecture (SUs /390 and S servers) with the message EMM2350.

### Function

On SU x86, part of the main memory is made available as a big page memory for CISC FW compilation (1 big page is 4 Mbytes in size). When the system starts, `BIG-PAGE-QUOTA` in the `MEMORY` parameter set is used as a planned value for defining the percentage of the total main memory which is used as big page memory. The actual size of the big page memory is dependent on other factors, such as the possible number of logical machines (CPUs) and the minimum main memory.

The `MODIFY-MEMORY-PARAMETERS` command enables systems support to specify, while the system is operating, the management parameters of the big page memory from which the actual size of the big page memory is derived.

The following three management parameters can be modified using this command:

1. The percentage of main memory used for big pages (`BIG-PAGE-QUOTA` operand). This specification is a should-be value. When the value is modified the following must be taken into account:
  - An increase of this percentage can only lead to an increase of the big page memory during command execution if `EXTEND-BIG-PAGES=*ON-QUOTA-DEFICIENCY` is specified. Irrespective of the `EXTEND-BIG-PAGES` operand, increasing the percentage leads to an increase of the big page memory with a subsequent memory extension or increase of the minimum main memory under VM2000.
  - A reduction of this percentage can only lead to a reduction of the big page memory during command execution if `REDUCE-BIG-PAGES=*ON-QUOTA-EXCESS` is specified and unused big pages exist.
2. The specification of whether and in which situation big page memory can be reduced (`REDUCE-BIG-PAGES` operand). The following settings must be distinguished:
  - The big page memory may never be reduced.
  - The big page memory may only be reduced when there is a threat of core saturation.
  - The big page memory may only be reduced if its size exceeds the `BIG-PAGE-QUOTA` set. In this case big pages can be reduced within the command, in a subsequent command call with a lower percentage specification, or in the event of a memory reduction.

The settings “threatened core saturation” and “`BIG-PAGE-QUOTA` exceeded” can also be combined. Used big pages can also be requested back by CISC FW and then reduced.

3. The specification of whether and in which situation big page memory can be extended (EXTEND-BIG-PAGES operand). The following settings must be distinguished:

- The big page memory may never be extended.
- The big page memory may only be extended if there is an insufficient number of free big pages.
- The big page memory may only be extended if its size is below the specified BIG-PAGE-QUOTA. In this case big pages can be extended within the command, in a subsequent command call with a higher percentage specification, or in the event of a memory extension.

The settings “insufficient number of free big pages” and “below BIG-PAGE-QUOTA” can also be combined. Used big pages can also be requested back by CISC FW and then reduced.

If big pages are reduced or extended during command execution, the message EMM2309 shows the new size of the big page memory.

Information on the configuration of the main memory, including the use of big pages, is provided by the SHOW-MEMORY-CONFIGURATION command.

Details of managing big pages are described in the context of main memory administration in the “Introduction to System Administration” [14].

## Format

### MODIFY-MEMORY-PARAMETERS

**BIG-PAGE-QUOTA** = \*UNCHANGED / <integer 0..99>

,**REDUCE-BIG-PAGES** = \*UNCHANGED / \*NO /

list-poss(2): \*ON-QUOTA-EXCESS / \*ON-CORE-SATURATION

,**EXTEND-BIG-PAGES** = \*UNCHANGED / \*NO /

list-poss(2): \*ON-QUOTA-DEFICIENCY / \*ON-BIG-PAGE-SATURATION

## Operands

**BIG-PAGE-QUOTA** = \*UNCHANGED / <integer 0..99>

Specifies the percentage of main memory which is to be used for big pages.

**BIG-PAGE-QUOTA** = \*UNCHANGED

The percentage defined at system startup using the MEMORY parameter or using a preceding MODIFY-MEMORY-PARAMETERS command is not modified.

**BIG-PAGE-QUOTA** = <integer 0..99>

New percentage of main memory which is to be used for big pages.

**REDUCE-BIG-PAGES** = \*UNCHANGED / \*NO / list-poss(2): \*ON-QUOTA-EXCESS / \*ON-CORE-SATURATION

Specifies whether and in which situation big pages may be reduced and become available as normal main memory. The default is \*UNCHANGED, i.e. the setting is not modified.

**REDUCE-BIG-PAGES** = \*NO

Big pages are never reduced.

---

**REDUCE-BIG-PAGES = \*ON-QUOTA-EXCESS**

Big pages are to be reduced if the existing size of the big page memory exceeds the percentage assigned (see BIG-PAGE-QUOTA).

**REDUCE-BIG-PAGES = \*ON-CORE-SATURATION**

Big pages are to be reduced only if there is a threat of CORE saturation but this can be prevented by canceling a big page in the normal main memory. This value is also set at system startup.

The two reduction situations \*ON-QUOTA-EXCESS and \*ON-CORE-SATURATION can be combined by being specified in a list.

**EXTEND-BIG-PAGES = \*UNCHANGED / \*NO / list-poss(2): \*ON-QUOTA-DEFICIENCY / \*ON-BIG-PAGE-SATURATION**

Specifies if and in which situation big pages are expanded. Additional big pages reduce the available normal main memory accordingly.

The default is \*UNCHANGED, i.e. the setting is not modified.

**EXTEND-BIG-PAGES = \*NO**

Big pages should never be extended; that is, neither when below the BIG-PAGE-QUOTA nor in case of memory saturation of the big page memory.

**EXTEND-BIG-PAGES = \*ON-QUOTA-DEFICIENCY**

Big pages are only to be extended if the existing size of the big page memory exceeds the percentage assigned (see BIG-PAGE-QUOTA).

**EXTEND-BIG-PAGES = \*ON-BIG-PAGE-SATURATION**

Big pages are only to be extended if there is an insufficient number of free big pages. By this, however, the should-be value for big pages defined by the big page quota will not be exceeded, meaning the actual value is smaller than the should-be value because previously big pages were broken up due to a memory saturation or because the actual value has so far not reached the should-be value. The latter is dependent on the memory sizes under and over the memory minimum and/or the number of logical machines (CPU). This is also the value set at system startup.

The two reduction situations \*ON-QUOTA-DEFICIENCY and \*ON-BIG-PAGE-SATURATION can be combined by being specified in a list.

---

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
1	0	CMD0001	Warning: Operation has already taken place for object or no action was required
2	0	CMD0001	Warning: Operation has already taken place for object but could have negative consequences
	1	CMD2201	Interface error between SDF and command server
	3	CMD2203	SDF version not supported
	32	EMM2800	Internal error Guaranteed message: EMM2828
	64	CMD0216	Privilege error
	130	EMM2807	Operation cannot be executed due to lack of resources Guaranteed message: EMM2829

---

## 4.31 MODIFY-MIP-OPTIONS

Modify the MIP diagnostic settings

**Component:** MIP  
**Functional area:** Message processing  
**Domain:** MESSAGE-PROCESSING  
**Privileges:** TSOS

### Function

The MODIFY-MIP-OPTIONS command enables you to modify the diagnostic settings for message processing. In MIP you can specify that a dump should be taken for diagnostic purposes when a particular message is issued. The following settings are possible:

- Activate/deactivate dump
- Specify triggering message code
- Specify maximum number of dumps
- Take user or system dump
- Continue or terminate triggering task

### Format

#### MODIFY-MIP-OPTIONS

```
DUMP = *UNCHANGED / *NO / *YES  
,DUMP-MSG = *UNCHANGED / <alphanum-name 7..7>  
,DUMP-LIMIT = *UNCHANGED / *NO-LIMIT / <integer 1..100>  
,DUMP-TYPE = *UNCHANGED / *USER / *SYSTEM  
,TASK-STOP = *UNCHANGED / *YES / *NO
```

### Operands

**DUMP = \*UNCHANGED / \*NO / \*YES**

Specifies whether a dump should be taken if a particular message is issued (specified in the DUMP-MSG operand). DUMP=\*NO is preset for message processing at system startup.

**DUMP-MSG = \*UNCHANGED / <alphanum-name 7..7>**

Determines, via the message code, the message which is to trigger a dump when DUMP=\*YES is specified.

At system startup no message key for triggering a dump is specified.

**DUMP-LIMIT = \*UNCHANGED / \*NO-LIMIT / <integer 1..100>**

Specifies the maximum number of dumps which may be taken. No dump limit is specified at system startup (\*NO-LIMIT).

---

**DUMP-LIMIT = \*NO-LIMIT**

The number of dumps is unlimited.

**DUMP-LIMIT = <integer 1..100>**

Maximum number of dumps which can be taken.

**DUMP-TYPE = \*UNCHANGED / \*USER / \*SYSTEM**

Determines whether a user or system dump is taken. User dumps are preset at system startup.

**TASK-STOP = \*UNCHANGED / \*YES / \*NO**

Specifies whether the triggering task should be terminated. TASK-STOP=\*NO is preset at system startup.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	64	CMD0216	Semantic error
	64	NMH1121	Internal error Guaranteed message: NMH1121

---

## 4.32 MODIFY-MIP-PARAMETERS

Create/modify MIP parameter file, add/remove message files

**Component:** MIP  
**Functional area:** Message processing  
**Domain:** MESSAGE-PROCESSING  
**Privileges:** TSOS

### Function

The MODIFY-MIP-PARAMETERS command is used to modify the message file allocation table and the MIP parameter file and to create a new MIP parameter file. It can also add message files to the system and remove them from it. Any changes that are made apply throughout the system.

The SHOW-MIP-PARAMETERS command supplies information on the current settings of the MIP parameter file.

### Note

The command will be processed even if a message file specified for removal is not in the message file allocation table.

### Format

#### MODIFY-MIP-PARAMETERS

**SCOPE** = \*TEMPORARY / \*PERMANENT / \*NEXT-SESSION(...)

\*NEXT-SESSION(...)

| **PARAMETER-FILE** = \*CURRENT / <filename 1..54 without-gen>

,**ADD-MSG-FILE** = \*NONE / <filename 1..54 without-gen>

,**REMOVE-MSG-FILE** = \*NONE / <filename 1..54 without-gen>

### Operands

**SCOPE** = \*TEMPORARY / \*PERMANENT / \*NEXT-SESSION(...)

Defines how long the modification will remain in effect.

**SCOPE** = \*TEMPORARY

Only the *message file allocation table* which applies in the current system session is modified. That means that any changes that are made apply system-wide to the current system session only and have no effect on future sessions.

**SCOPE** = \*PERMANENT

Both the message file allocation table and the default MIP parameter file are modified. That means that the changes apply system-wide both to the current session and to future sessions.

If it is not possible to modify the MIP parameter file owing to an error (e.g. MIP parameter file locked, not enough space on the disk, DMS error), only the message file allocation table will be modified. In this case, the cause of the error must be eliminated, and then the command must be issued again.

**SCOPE = \*NEXT-SESSION(...)**

The specified MIP parameter file is modified. The name of the message file is stored in the MIP parameter file. No check is made to ensure that the message file actually exists and is in the correct format.

If it is not possible to modify the MIP parameter file owing to an error (e.g. MIP parameter file locked, not enough space on the disk, DMS error), the cause of the error must be eliminated, and then the command must be issued again.

**PARAMETER-FILE = \*CURRENT / <filename 1..54 without-gen>**

Identifies the MIP parameter file that is to be modified.

**PARAMETER-FILE = \*CURRENT**

The default MIP parameter file SYSPAR.MIP.vvv (vvv = current version) is to be modified.

**PARAMETER-FILE = <filename 1..54 without-gen>**

Name of the MIP parameter file that is to be modified. If there is no MIP parameter file by this name, a new file will be created.

**ADD-MSG-FILE = \*NONE / <filename 1..54 without-gen>**

Specifies the name of the message file which is to be activated or added to a parameter file. If the command is issued for a message file which is already active or included in a MIP parameter file, the message file is activated again or assigned top priority in the MIP parameter file (first position in the message file allocation table or MIP parameter file).

**ADD-MSG-FILE = <filename 1..54 without-gen>**

A file name alias defined using ACS is expanded to the full file name (including catalog and user ID) and stored in that form in the message file allocation table or MIP parameter file. If the name is not an alias, the specified file name is stored in the MIP parameter file "as is" (i.e. without the catalog and user IDs if these have not been specified).

**REMOVE-MSG-FILE = \*NONE / <filename 1..54 without-gen>**

Specifies the name of the message file which is to be deactivated.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
2	0	NMH1129	Warning
	32	NMH1121	Internal error
	32	NMH1125	System error
	32	NMH1181	System error
	64	CMD0216	Semantic error
	64	NMH1133	Semantic error

---

## 4.33 MODIFY-MONJV

Modify job monitoring JV

**Component:** JV

**Functional area:** Job variables

**Domain:** JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

This function is available to the user only if the chargeable software product JV has been loaded as a subsystem.

### Function

The following elements in the system section of a job monitoring job variable can be modified with the MODIFY-MONJV command:

- Time stamp (operand `TIMESTAMP`)
- Name of the job to be monitored (operand `DESCRIPTOR`)
- Job-specific information (operand `USER-INFORMATION`)

The format and position of the elements in the system section are described in the “JV” manual [20].

The caller must have write privileges.

When no job variable is specified, the command affects the monitoring job variable of the job from which the command was issued.

The command is only executed when the job variable monitors a job.

### Format

<b>MODIFY-MONJV</b>	Alias: <b>MDMJV</b>
<b>MONJV</b> = <b>*SMONJVJ</b> / <filename 1..54 without-gen-vers>	
, <b>TIMESTAMP</b> = <b>*UNCHANGED</b> / <b>*SET</b>	
, <b>DESCRIPTOR</b> = <b>*UNCHANGED</b> / <c-string 1..8 with-low>	
, <b>USER-INFORMATION</b> = <b>*UNCHANGED</b> / <c-string 1..58 with-low>	
, <b>PASSWORD</b> = <b>*NONE</b> / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> /	
<b>*SECRET</b>	

---

## Operands

**MONJV = \*SMONJVJ / <filename 1..54 without-gen-vers>**

Name of the monitoring job variable. The default value is \*SMONJVJ, i.e. the job variable that monitors its own job (it was linked to the \*SMONJVJ link name when the job was started, i.e. when the status was set to "\$R").

**TIMESTAMP = \*UNCHANGED / \*SET**

Specifies if a time stamp (in GMT time) is to be set for job monitoring (format: yyyy-mm-ddhhmmss). The default value is \*UNCHANGED, i.e. a new time stamp is not set.

**DESCRIPTOR = \*UNCHANGED / <c-string 1..8 with-low>**

Specifies if the name of the application to be monitored is to be set. The default value is \*UNCHANGED, i.e. no change is made. Right-justified input containing less than eight characters is padded with spaces.

**USER-INFORMATION = \*UNCHANGED / <c-string 1..58 with-low>**

Specifies if application-specific information is to be set. The default value is \*UNCHANGED, i.e. no change is made. Right-justified input containing less than 58 characters is padded with spaces.

**PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer-2147483648..2147483647> / \*SECRET**

Password that may be required for write access to the job variable. The default value is \*NONE, i.e. no password. The PASSWORD operand has the following special characteristics:

- The input field is automatically blanked out in an interactive dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^ permits concealed input of the password.
- The password entered is not logged.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	CMD0001	No action necessary
2	0	CMD0001	Command executed with a warning
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JVS04E0	Command not executable in the call environment; if possible, remove cause of error (see SYSOUT message JVS04xx)
	130	JVS04E1	Command cannot be executed at this time; for cause see SYSOUT message JVS04xx
	130	CMD2282	Subsystem JV not available for indefinite time

---

## Example

```
/set-logon-par user,12345678,'PASSWORD',monjv=test  
/show-jv test
```

```
;%R 09WXU1OSH      J0312012-01-27102849
```

```
/mod-monjv test,timestamp=*set,desc='APPLICTN',user-inf='User Info' — (1)
```

```
/show-jv test      _____ (2)
```

```
;%R 09WXU1OSH      J0312012-01-271028492012-01-27103438APPLICTN      User Info
```

(1) A time stamp is set in the job variable TEST, the DESCRIPTOR and USER-INFORMATION fields are supplied with any value you choose.

(2) The job variable TEST now contains the following values:

- TIMESTAMP: 2012-01-27103438
- DESCRIPTOR: 'APPLICTN'
- USER-INFORMATION='User Info'

## 4.34 MODIFY-MOUNT-PARAMETER

Set default values for mounting and dismounting

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** G

### Function

This command enables the operator to specify default values for mounting and dismounting tapes and disks. The operator can use the SHOW-MOUNT-PARAMETER command to find out which values are currently set.

### Format

#### MODIFY-MOUNT-PARAMETER

```
DISK-MOUNT = *UNCHANGED / *YES / *NO
,TAPE-MOUNT = *UNCHANGED / *YES / *NO
,ALLOCATE-TAPE = *UNCHANGED / *YES / *NO
,UNLOAD-RELEASED-TAPE = *UNCHANGED / *ACCORDING-TO-USER-REQUEST /
                        *REGARDLESS-OF-USER-REQUEST(...) / *IGNORE-USER-REQUEST
                        *REGARDLESS-OF-USER-REQUEST(...)
| TAPE-FAMILY = *ALL / *MBK
,NEXT-TAPE-MOUNT = *UNCHANGED / *BEST-GENERATED-DEVICE /
                  *LEAST-RECENTLY-USED-DEVICE / *BY-CONTROLLER
,PREMOUNT-MSG = *UNCHANGED / *ACCORDING-TO-USER-REQUEST / *IGNORE-USER-REQUEST /
                *PROCESS-USER-REQUEST-ASYNCH
,LOCATION = *ALL / *NONE / <alphanum-name 1..8>
```

### Operands

#### DISK-MOUNT =

Specifies whether the operator is ready to carry out disk mounting. The system default is \*YES.

#### DISK-MOUNT = \*UNCHANGED

The value valid up to now (previous MOD-MOUNT-PAR or presetting) remains unchanged (default value).

---

**DISK-MOUNT = \*YES**

The operator is ready to carry out disk mounting, i.e. allocation requests for unmounted private disks result in a MOUNT message.

**DISK-MOUNT = \*NO**

The operator is not ready to carry out disk mounting. Allocation requests for private disks which are to be mounted are automatically rejected by the system. REMOUNT and INOP messages are still output and require appropriate responses.

**TAPE-MOUNT =**

Specifies whether the operator is ready to carry out tape mounting. The system default is \*YES.

**TAPE-MOUNT = \*UNCHANGED**

The value valid up to now (previous MOD-MOUNT-PAR or presetting) remains unchanged (default value).

**TAPE-MOUNT = \*YES**

The operator is ready to carry out tape mounting, i.e. allocation requests for unmounted tapes result in a MOUNT message.

**TAPE-MOUNT = \*NO**

The operator is not ready to carry out tape mounting. Allocation requests for tapes which are to be mounted are automatically rejected by the system. REMOUNT, INOP and WP-MISSING messages are still output and require appropriate responses.

**ALLOCATE-TAPE =**

Specifies whether the system can allocate tapes which are already online without operator support (without a MOUNT message). The system default is \*YES.

**ALLOCATE-TAPE = \*UNCHANGED**

The value valid up to now (previous MOD-MOUNT-PAR or presetting) remains unchanged (default value).

**ALLOCATE-TAPE = \*YES**

The system responds automatically to PREMOUNT, MOUNT and REMOUNT messages if the tape is recognized as being online.

**ALLOCATE-TAPE = \*NO**

The system does not respond to PREMOUNT, MOUNT and REMOUNT messages even if the appropriate tape is recognized as being online. The appropriate response must be entered by the operator.

**UNLOAD-RELEASED-TAPE =**

Specifies whether tapes are to be unloaded after their release if they have not already been unloaded by the user. The system default is \*ACCORDING-TO-USER-REQUEST.

Note that tapes are unloaded only if they have actually been used (the value of VOLUME-PHASE was IN-USE).

**UNLOAD-RELEASED-TAPE = \*UNCHANGED**

The value valid up to now (previous MOD-MOUNT-PAR or presetting) remains unchanged (default value).

**UNLOAD-RELEASED-TAPE = \*ACCORDING-TO-USER-REQUEST**

When tapes are released, they are unloaded according to user request.

**UNLOAD-RELEASED-TAPE = \*REGARDLESS-OF-USER-REQUEST(...)**

Tapes (streamer tapes and/or cartridges) are unloaded after their release if they were in use (PHASE = IN-USE).

**TAPE-FAMILY = \*ALL**

All tapes (streamer tapes and cartridges) are unloaded after their release.

---

**TAPE-FAMILY = \*MBK**

Only cartridges are unloaded after their release. Streamer tapes are unloaded after their release according to user request.

**UNLOAD-RELEASED-TAPE = \*IGNORE-USER-REQUEST**

A request to unload a tape volume after its release is ignored. Unload requests for streamer tape devices are always ignored by NDM. Unload requests for tape cartridge devices are only ignored if the device is being used in the “manual” operating mode. This enables cartridges to be changed during unmanned operation if the stackers involved have a supply of cartridges for this purpose.

**NEXT-TAPE-MOUNT =**

Specifies the device selection mode to be used by NDM to select the free device during tape allocation. The system default is \*BEST-GENERATED-DEVICE.

**NEXT-TAPE-MOUNT = \*UNCHANGED**

The device selection mode valid up to now remains unchanged.

**NEXT-TAPE-MOUNT = \*BEST-GENERATED-DEVICE**

NDM searches through the device table from the beginning, i.e. in the order predefined at system generation, and selects the first suitable free device.

**NEXT-TAPE-MOUNT = \*LEAST-RECENTLY-USED-DEVICE**

NDM searches through the device table and selects the least recently used device from the set of suitable free devices. This “wraparound” allocation enables tape devices to be used more evenly.

**NEXT-TAPE-MOUNT = \*BY-CONTROLLER**

From the suitable free devices, NDM selects a device which is connected to a controller on which the fewest devices are in use. This ensures that the devices used are distributed evenly over the available controllers and channel paths. The device selection in NDM only takes the local device assignments into account. In conjunction with the DDAL function of the IORM subsystem (I/O Resource Manager, see the “Utility Routines” manual [9] ([Related publications](#))), optimization is extended to all guest systems of a BS2000 server.

**PREMOUNT-MSG =**

Controls the output of PREMOUNT messages (NKVT012).

**PREMOUNT-MSG = \*UNCHANGED**

The existing setting is left unchanged.

**PREMOUNT-MSG = \*ACCORDING-TO-USER-REQUEST**

Output of PREMOUNT messages is as for versions up to and including BS2000/OSD-BC V2.0.

**PREMOUNT-MSG = \*IGNORE-USER-REQUEST**

PREMOUNT messages are suppressed.

**PREMOUNT-MSG = \*PROCESS-USER-REQUEST-ASYNCH**

PREMOUNT messages are output as “normal” messages which do not require a response.

**LOCATION =**

Specifies whether the settings made or tapes are to depend on the storage location.

**LOCATION = \*ALL**

The settings do not depend on the storage location.

**LOCATION = \*NONE**

The settings only apply for devices which are not assigned to any storage location.

---

**LOCATION = <alphanum-name 1..8>**

The settings only apply for devices which are assigned to the specified storage location. The storage location must already be configured (see /ADD-DEVICE-DEPOT). After a storage location has been deleted, the storage-location-specific parameters are reset.

In the case of devices which are assigned to multiple storage locations with different parameters, the last specification made applies.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	NKV0001	Syntax error
	130	NKVD002	Disk monitor not available
	130	NKVT002	Tape monitor not available

**Note**

If spoolout to tape is being used in the current session, UNLOAD-RELEASED-TAPE= \*ACCORDING-TO-USER-REQUEST should always be set. This means that the spoolout tape will not be unloaded and have to be remounted every time a file is spooled out.

---

## 4.35 MODIFY-MSG-ATTRIBUTES

Define language for message output

**Component:** MIP

**Functional area:** Message processing

**Domain:** MESSAGE-PROCESSING

**Privileges:** STD-PROCESSING  
TSOS  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The MODIFY-MSG-ATTRIBUTES command is used to specify the language in which messages for his task are to be output. The user specifies which message files are to be searched for the message text in the required language. If these message texts are not found in the specified message files (activated system and/or task message files), messages will be output in the language defined in the MSGLPRI system parameter.

SDF output (such as data types and help texts) also takes the language code into account (see the “Introductory Guide to the SDF Dialog Interface” [15]).

The SHOW-MSG-FILE-ASSIGNMENT command displays the names of the activated system and task message files.

### Format

<b>MODIFY-MSG-ATTRIBUTES</b>
<b>TASK-LANGUAGE</b> = <u>*UNCHANGED</u> / *STD / *NO / <name 1..1>

### Operands

**TASK-LANGUAGE = \*UNCHANGED / \*STD / \*NO / <name 1..1>**

Specifies the language in which the messages are to be output.

**TASK-LANGUAGE = \*STD**

Message output takes place in the language defined in the user entry (see output field *DEFAULT-MSG-LANGUAGE* , SHOW-USER-ATTRIBUTES command). If the user entry contains no corresponding value, the language defined by the class 2 system parameter MSGLPRI is assumed.

e.g. E = English, D = German.

**TASK-LANGUAGE = \*NO**

Message output takes place in the language defined in the MSGLPRI system parameter.

**TASK-LANGUAGE = <name 1..1>**

Message output takes place in the language selected by the language code (e.g. TASK-LANGUAGE=E for English).

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	NHM1174	Syntax error
	64	CMD0216	Semantic error

---

## 4.36 MODIFY-MSG-FILE-ASSIGNMENT

Define message files for task

**Component:** MIP

**Functional area:** Message processing

**Domain:** MESSAGE-PROCESSING

**Privileges:** STD-PROCESSING  
OPERATING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION  
TSOS

**Routing code:** E

### Function

The MODIFY-MSG-FILE-ASSIGNMENT command enables the user to activate and deactivate additional message files (task message files) for his task.

The SHOW-MSG-FILE-ASSIGNMENT command displays the activated message files. The user can set the language for message output task-specifically by means of the MODIFY-MSG-ATTRIBUTES command.

#### *Privileged functions*

Systems support (TSOS or OPERATING privilege) can use SCOPE=\*SYSTEM to activate and deactivate message files on a system-global basis. Changes apply only to the current session (equivalent to the MODIFY-MIP-PARAMETERS command with SCOPE= \*TEMPORARY). Systems support can use the MODIFY-MIP-PARAMETERS command to make permanent changes.

### Format

<b>MODIFY-MSG-FILE-ASSIGNMENT</b>
<b>ADD-FILE = *NO / list-poss(8): &lt;filename 1..54 without-gen&gt;</b> <b>,REMOVE-FILE = *NO / list-poss(8): &lt;filename 1..54 without-gen&gt;</b> <b>,SCOPE = *STD / *SYSTEM / *TASK</b>

### Operands

**ADD-FILE = \*NO / list-poss(8): <filename 1..54 without-gen>**

Names of the message files to be activated. Up to 8 files may be specified. The message files activated in this way can be displayed via the SHOW-MSG-FILE-ASSIGNMENT command.

Message files are created by using the MSGMAKER utility routine (see the “Utility Routines” manual [9]).

**REMOVE-FILE = \*NO / list-poss(8): <filename 1..54 without-gen>**

Names of the message files to be deactivated. Up to 8 files may be specified. Only files that are activated as message files can be deactivated.

---

**SCOPE = \*STD / \*SYSTEM / \*TASK**

Applicability of the command.

**SCOPE = \*STD**

The applicability of the command is \*TASK for nonprivileged users and \*SYSTEM for privileged users.

**SCOPE = \*TASK**

The changes apply only to the calling task.

**SCOPE = \*SYSTEM**

*This value can only be specified by privileged users.*

Specifies that the modifications made in the range assignment list are to have a global system effect and are not restricted to the calling task. The changes apply only to the current session. Systems support can use the MODIFY-MIP-PARAMETERS command to make permanent changes.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error Guaranteed messages: NMH1102, NMH1109, NMH1180, NMH1183
	1	NMH1174	Syntax error
	32	NMH1121	Internal error
	32	NMH1181	Error in file processing Guaranteed messages: NMH1103, NMH1104, NMH1105, NMH1106, NMH1108, NMH1181
	64	CMD0216	Semantic error
	64	NMH1150	No authorization for command

---

## 4.37 MODIFY-MSG-OPTIONS

Control reception of unsolicited messages

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

With the MODIFY-MSG-OPTIONS command, users can control the reception of unsolicited messages for their jobs. The messages in question are asynchronous messages and messages from systems support or a system task, capable of reaching the user but not necessarily directly related to command processing.

It is possible for a user to receive the following messages:

- job-related messages sent to that user by systems support using the INFORM-JOB command
- messages sent to all users by systems support using the INFORM-ALL-JOBS command (broadcasts)
- messages from system tasks (e.g. on completion of a file transfer)

Users can configure their message reception requirements separately for three types of message:

- for job-related messages in the OPERATOR-MSG operand
- for messages to all users in the OPERATOR-BROADCAST operand
- for messages from system tasks in the SYSTEM-MSG operand

Urgent messages, e.g. messages at system shutdown, are always output.

At the start of a task, the following settings apply:

Operand	Setting at start of task
OPERATOR-BROADCAST	*YES
OPERATOR-MSG	*YES
SYSTEM-MSG	*NO
INFO-OUTPUT	*STD

Table 67: Base settings for reception of unsolicited messages

The INFO-OUTPUT operand further allows the user to control exactly where on the terminal the messages are output.

The current settings can be displayed with the SHOW-MSG-OPTIONS command.

## Accessing suppressed messages

While the MODIFY-MSG-OPTIONS command allows you to suppress the output of unsolicited messages if you find them irritating, the drawback is that you may fail to receive a message which is important to you.

You have the option of using the ASSIGN-SYSEVENT command to create an event stream to collect all the asynchronous messages sent to your interactive task, and then using the SHOW-SYSEVENT-LOG command to view its contents online. You can also page through the event stream.

A task with the OPERATING privilege can access the event stream directly (i.e. without assignment). However, in order also to receive the three message categories that can be suppressed with MODIFY-MSG-OPTIONS, the task must explicitly assign the system event stream using ASSIGN-SYSEVENT.

## Format

### MODIFY-MSG-OPTIONS

**OPERATOR-BROADCAST** = \*UNCHANGED / \*YES / \*NO

,**OPERATOR-MSG** = \*UNCHANGED / \*YES / \*NO

,**SYSTEM-MSG** = \*UNCHANGED / \*YES / \*NO

,**INFO-OUTPUT** = \*UNCHANGED / list-poss(2): \*STD / \*SYSTEMLINE

## Operands

### **OPERATOR-BROADCAST** = \*UNCHANGED / \*YES / \*NO

Specifies whether the user wants to receive messages sent to all users by systems support using the INFORM-ALL-JOBS command.

### **OPERATOR-MSG** = \*UNCHANGED / \*YES / \*NO

Specifies whether the user wants to receive messages sent to him by systems support using the INFORM-JOB command.

### **SYSTEM-MSG** = \*UNCHANGED / \*YES / \*NO

Specifies whether the user wants to receive messages sent to him by a system task. Example: notification of file transfer completion.

### **INFO-OUTPUT** = \*UNCHANGED / list-poss(2): \*STD / \*SYSTEMLINE

Specifies how messages sent by systems support are to be output on the terminal.

If \*STD is specified, the messages are output in the current screen line.

If \*SYSTEMLINE is specified, the messages are output in the display line, i.e. the bottom line of the screen.

If both values are specified, the messages are output in both the current screen line and the display line.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
1	32	NBR0940	Command not executed because no entry in the TCB was possible

---

## 4.38 MODIFY-MSG-SUBSCRIPTION

Initiate or cancel message subscription

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Operator terminal control Message processing
<b>Domain:</b>	CONSOLE-MANAGEMENT
<b>Privileges:</b>	OPERATING
<b>Routing code:</b>	E

### Function

Logical BS2000 operator terminals (consoles) in particular may be required to respond to certain system messages. The MODIFY-MSG-SUBSCRIPTION command instructs the UCON message distribution mechanism to deliver certain system messages to a specific operator terminal (message subscription) or to cancel an existing subscription. A message subscription is not a request for messages to be output exclusively on a given operator terminal.

The command applies only to the operator terminal on which it is issued. It has no effect on other operator terminals.

The SHOW-MSG-SUBSCRIPTION command provides details of the current message subscription arrangements.

## Format

### MODIFY-MSG-SUBSCRIPTION

**ADD-MSG-ID** = **\*NONE** / list-poss (32): <name 1..7>

,**REMOVE-MSG-ID** = **\*NONE** / **\*ALL** / list-poss (32): <name 1..7>

,**ADD-SENDER** = **\*NONE** / **\*USER-ID(...)** / **\*TSN(...)** / **\*CONSOLE(...)**

**\*USER-ID(...)**

| **USER-ID** = **\*NONE** / list-poss (32): <name 1..8>

**\*TSN(...)**

| **TSN** = **\*NONE** / **\*SYSTEM-TASKS** / list-poss (32): <alphanum-name 1..4>

**\*CONSOLE(...)**

| **CONSOLE** = **\*NONE** / list-poss (32): <name 2..2> / <name 4..4>

,**REMOVE-SENDER** = **\*NONE** / **\*ALL** / **\*USER-ID(...)** / **\*TSN(...)** / **\*CONSOLE(...)**

**\*USER-ID(...)**

| **USER-ID** = **\*ALL** / list-poss (32): <name 1..8>

**\*TSN(...)**

| **TSN** = **\*ALL** / **\*SYSTEM-TASKS** / list-poss (32): <alphanum-name 1..4>

**\*CONSOLE(...)**

| **CONSOLE** = **\*ALL** / list-poss (32): <name 2..2> / <name 4..4>

,**DELIVER-OTHER-MSG** = **\*UNCHANGED** / **\*YES** / **\*NO**

## Operands

**ADD-MSG-ID = \*NONE / list-poss(32): <name 1..7>**

Specifies whether a message subscription is required for the operator terminal.

### *Note*

A message subscription can be suppressed in full or in part with the SET-MSG-SUPPRESSION command.

**ADD-MSG-ID = list-poss(32): <name 1..7>**

Specifies the name (ID) of the message which is to be delivered to the operator terminal under the message subscription mechanism. One message subscription is added for each name specified. A 7-character name matches exactly one message ID; a shorter name (1 to 6 characters) matches a group of message IDs all beginning with the specified string. It is not possible to subscribe to messages which required a response.

---

**REMOVE-MSG-ID = \*NONE / \*ALL / list-poss(32): <name 1..7>**

Specifies whether message subscriptions are to be canceled for the operator terminal.

**REMOVE-MSG-ID = \*ALL**

All message subscriptions ordered for the operator terminal are canceled.

**REMOVE-MSG-ID = list-poss(32): <name 1..7>**

Specifies the names (message IDs) of the message subscriptions which are to be canceled. One message subscription is canceled for each name specified, provided the subscription actually exists.

To cancel a message subscription you must specify the same name as was used when the subscription was ordered. For example, a subscription to all messages beginning with the string ABC123 (corresponding to ADD-MSG-ID=ABC123) cannot be canceled with REMOVE-MSG-ID=ABC1.

Similarly, it is not possible to reduce the number of messages in a subscription by canceling a specific message, e. g. using REMOVE-MSG-ID=ABC1234. The SET-MSG-SUPPRESSION command is provided for this purpose.

**ADD-SENDER = \*NONE / \*USER-ID(...) / \*TSN(...) / \*CONSOLE(...)**

Messages from the users specified are to be routed to the console.

The operand is only allowed when input at a physical or logical operator terminal. Input from an interactive task with the OPERATING privilege is not allowed.

**ADD-SENDER = \*NONE**

Default value.

No messages are added on the basis of sender attributes.

**ADD-SENDER = \*USER-ID(...)**

Messages that are sent by user tasks or system tasks with the specified user ID (via MSG7[X] or TYPIO macro calls) are delivered.

**USER-ID = \*NONE / list-poss(32): <name 1..8>**

One or several user IDs can be specified.

The default value is \*NONE, i.e. messages are not delivered.

**ADD-SENDER = \*TSN(...)**

Messages that are sent by user tasks or system tasks with the specified TSNs (via MSG7[X] or TYPIO macro calls) are delivered.

**TSN = \*NONE**

Default value. Messages are not delivered.

**TSN = \*SYSTEM-TASKS**

All console messages generated by system tasks are delivered.

**TSN = list-poss(32): <alphanum-name 1..4>**

Messages that are sent by user tasks or system tasks with the specified TSNs are delivered.

Leading zeroes do not have to be entered for the TSNs; TSN=AB is interpreted as 'BLANK'BLANK'AB' and not as '00AB'.

**ADD-SENDER = \*CONSOLE(...)**

Messages sent by the specified physical or logical consoles are delivered.

**CONSOLE = \*NONE / list-poss(32): <name 2..2> / <name 4..4>**

One or more consoles can be specified.

Physical consoles are specified through a two-position mnemonic name and logical consoles by means of a

---

four-position authorization name.

The default value is \*NONE, i.e. messages are not delivered.

**REMOVE-SENDER = \*NONE / \*ALL / \*USER-ID(...) / \*TSN(...) / \*CONSOLE(...)**

Message subscriptions previously defined through the sender attributes with MODIFY-MSG-SUBSCRIPTION (ADD-SENDER operand) are removed.

The operand is only allowed when entered from a physical or logical console. Input from an interactive task with the OPERATING privilege is not allowed.

**REMOVE-SENDER = \*NONE**

Default value. No message subscriptions are removed.

**REMOVE-SENDER = \*ALL**

All message subscriptions that were previously defined via sender attributes (ADD-SENDER operand) are removed.

**REMOVE-SENDER = \*USER-ID(...)**

Messages from specific user IDs that were previously defined via ADD-SENDER=\*USER-ID(...) are removed.

**USER-ID = \*ALL / list-poss (32): <name 1..8>**

One or several user IDs for which message subscription is to be removed can be specified.

The default value is \*ALL, i.e. messages from all user IDs are removed.

**REMOVE-SENDER = \*TSN(...)**

Messages from specific TSNs that were previously specified with ADD-SENDER=\*TSN(...) are removed.

**TSN = \*ALL / \*SYSTEM-TASKS / list-poss (32): <alphanum-name 1..4>**

One or several TSNs for which message subscription is to be removed can be specified.

The default value is \*ALL, i.e. messages from all TSNs are removed.

**REMOVE-SENDER = \*CONSOLE(...)**

Messages from specific consoles that were previously specified with ADD-SENDER=\*CONSOLE(...) are removed.

**CONSOLE = \*ALL / list-poss (32): <name 2..2> / <name 4..4>**

One or several consoles for which message subscription is to be removed can be specified.

The default value is \*ALL, i.e. messages from all consoles are removed.

**DELIVER-OTHER-MSG = \*UNCHANGED / \*YES / \*NO**

Governs whether the delivery of other (nonsubscription) messages to the operator terminal is to be affected.

This operand is allowed only if the command is entered at a physical or logical operator terminal.

**DELIVER-OTHER-MSG = \*UNCHANGED**

The delivery of other (nonsubscription) messages to the operator terminal is unchanged.

**DELIVER-OTHER-MSG = \*YES**

Any previously imposed suppression of nonsubscription messages is canceled.

**DELIVER-OTHER-MSG = \*NO**

Any nonsubscription messages are not delivered to the operator terminal, with the exception of messages requiring a response and messages directed explicitly to the operator terminal.

---

## Notes

- The command can be issued at all operator terminals, which means at physical and logical operator terminals (\$CONSOLE applications) and in interactive tasks with the OPERATING privilege. At physical and logical operator terminals the command affects the delivery of messages to the operator terminal from which the command was issued. In interactive tasks with the OPERATING privilege the command has consequences for the viewing of a system event stream (see the command SHOW-SYSEVENT-LOG TYPE=\*SYSTEM). For that reason the DELIVER-OTHER-MSG operand is not available in an interactive task, as suppressing the display of undirected messages (value \*NO) would in effect be identical with relinquishing all the operator roles for that task (see the RELEASE-OPERATOR-ROLE command).
- Suppression of the delivery of individual messages with the aid of the SET-MSG-SUPPRESSION command takes precedence over a message subscription initiated with the MODIFY-MSG-SUBSCRIPTION command. That means that it is possible to subscribe to a group of messages (e.g. all those with a message ID beginning with the string ABC) at an operator terminal and to exclude individual message IDs (e.g. message ABC1234) from the subscription set with the aid of the SET-MSG-SUPPRESSION command.
- The messages subscriptions specified with the REMOVE-MSG-ID and REMOVE-SENDER operands are always the first to be removed when the command is executed. The message subscriptions specified with the ADD-MSG-ID and ADD-SENDER operands are added to the subscription set.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
2	0	NBR0091	Some message IDs ignored
	1	CMD0202	Syntax error
	32	NBR0034	Error in command execution
	64	CMD0216	Required authorization not available

---

## 4.39 MODIFY-OPERATOR-ATTRIBUTES

Change assignment of operator roles to user IDs

**Component:** SRPMNUC  
**Functional area:** Operator function control  
**Domain:** SECURITY-ADMINISTRATION  
**Privileges:** SECURITY-ADMINISTRATION

### Function

This command is used to assign one or more operator roles to an operator identification, which is recorded in the user catalog for a pubset as a user ID. After this assignment has been made, an authorized application which is connected under this operator identification may then accept the specified operator role, and thus undertake a particular area of work within the operating function. The authorizations (work areas) which are linked to the operator role must have been specified beforehand by systems support, using a CREATE-OPERATOR-ROLE command.

It should be noted that when a MODIFY-OPERATOR-ATTRIBUTES command is executed both the user ID and the operator role must be recorded in the user catalog of the same pubset.

Systems support can obtain an overview of the roles which have been defined, and of their assignment to user IDs, by means of the commands SHOW-OPERATOR-ATTRIBUTES and SHOW-OPERATOR-ROLE.

### Format

**MODIFY-OPERATOR-ATTRIBUTES**

**USER-IDENTIFICATION** = <name 1..8>

,**PUBSET** = **\*HOME** / <cat-id 1..4>

,**REMOVE-OPERATOR-ROLE** = **\*NONE** / **\*ALL** / list-poss(48): <name 1..8>

,**ADD-OPERATOR-ROLE** = **\*NONE** / list-poss(48): <name 1..8>

### Operands

**USER-IDENTIFICATION** = <name 1..8>

The user ID (name of the authorized application) for which an assignment to an operator role is to be specified or amended on the pubset concerned.

**PUBSET** =

Specifies the pubset in whose user catalog the user ID and the operator role are recorded.

**PUBSET** = **\*HOME**

The assignment is to apply for the home pubset in the current session.

**PUBSET** = <cat-id 1..4>

Precise specification of the pubset to which the assignment is to apply.

**REMOVE-OPERATOR-ROLE** =

Specifies the operator roles which are to be withdrawn from the user ID on the specified pubset.

---

**REMOVE-OPERATOR-ROLE = \*NONE**

Preset value: no operator roles are to be withdrawn from the user ID.

**REMOVE-OPERATOR-ROLE = \*ALL**

All the operator roles previously assigned to the user ID on the nominated pubset are to be withdrawn.

**REMOVE-OPERATOR-ROLE = list-poss(48): <name 1..8>**

The exact specification of up to 48 operator roles which are to be withdrawn from the user ID.

**ADD-OPERATOR-ROLE =**

Specifies additional operator roles which are to be assigned to the user ID nominated, on the pubset.

**ADD-OPERATOR-ROLE = \*NONE**

Preset value: no additional operator roles are to be assigned to the user ID.

**ADD-OPERATOR-ROLE = list-poss(48): <name 1..8>**

The exact specification of up to 48 additional operator roles which are to be assigned to the user ID.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SRM6001	Command executed with a warning
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error
	130	SRM6030	Command cannot temporarily be executed

---

## 4.40 MODIFY-OPERATOR-ROLE

Change assignment of routing codes to operator role

**Component:** SRPMNUC  
**Functional area:** Operator function control  
**Domain:** SECURITY-ADMINISTRATION  
**Privileges:** SECURITY-ADMINISTRATION

### Function

This command is used to modify a list of routing (authorization) codes which have been assembled to form an “operator role”, and of which the specified pubset is aware. A modification involves either adding further routing codes to the existing operator role, from the list of up to 40 available codes, or withdrawing particular routing codes from the role.

### Format

#### MODIFY-OPERATOR-ROLE

**OPERATOR-ROLE** = <name 1..8>

,**PUBSET** = \*HOME / <cat-id 1..4>

,**REMOVE-ROUTING-CODES** = \*NONE / \*ALL / list-poss(40): \* / <alphanum-name 1..1>

,**ADD-ROUTING-CODES** = \*NONE / \*ALL / list-poss(40): \* / <alphanum-name 1..1>

### Operands

**OPERATOR-ROLE** = <name 1..8>

Specifies the name of the operator role which is to be amended. This is the name that an authorized user program must use whenever it wishes to undertake tasks (= routing codes) which are linked with this role.

**PUBSET** =

Specifies the pubset whose user catalog contains an entry for the role which is to be modified.

**PUBSET** = \*HOME

The operator role is recorded in the user catalog of the home pubset.

**PUBSET** = <cat-id 1..4>

Precise specification of the pubset in whose user catalog the operator role is recorded.

**REMOVE-ROUTING-CODES** =

Specifies the routing codes, and hence the areas of work, which are to be withdrawn from the existing operator role.

**REMOVE-ROUTING-CODES** = \*NONE

Preset value: no routing codes are to be withdrawn from the existing operator role.

**REMOVE-ROUTING-CODES** = \*ALL

All the routing codes previously assigned to the role are to be withdrawn.

---

**REMOVE-ROUTING-CODES = list-poss(40): \* / <alphanum-name 1..1>**

Precise specification of up to 40 routing codes which are to be withdrawn from the existing operator role. There is a table of the routing codes in the "Introduction to System Administration" [14].

**ADD-ROUTING-CODES =**

Specifies the additional routing codes, and hence the areas of work, which are to be assigned to the existing operator role.

**ADD-ROUTING-CODES = \*NONE**

Preset value: no additional routing codes are to be assigned to the existing operator role.

**ADD-ROUTING-CODES = \*ALL**

All the routing codes known to the system are to be assigned to the existing role.

**ADD-ROUTING-CODES = list-poss(40): \* / <alphanum-name 1..1>**

Precise specification of up to 40 additional routing codes which are to be assigned to the existing operator role. There is a table of the routing codes in the "Introduction to System Administration" [14].

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SRM6001	Command executed with a warning
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error
	130	SRM6030	Command cannot temporarily be executed

---

## 4.41 MODIFY-PAGING-AREA-ATTRIBUTES

Modify attributes of paging areas

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	System control and optimization
<b>Domain:</b>	SYSTEM-TUNING SYSTEM-MANAGEMENT
<b>Privileges:</b>	TSOS OPERATING
<b>Routing code:</b>	R

### Function

The MODIFY-PAGING-AREA-ATTRIBUTES command is used to modify the attributes of one or more paging areas.

### Format

#### MODIFY-PAGING-AREA-ATTRIBUTES

**VOLUME** = \*ALL / \*PUBSET(...) / list-poss(256): <vsn 1..6>

\*PUBSET(...)

| **PUBSET** = list-poss(256): <cat-id 1..4>

,**UTILIZATION** = \*LOW / \*MEDIUM / \*HIGH

### Operands

**VOLUME = \*ALL / \*PUBSET(...) / list-poss(256): <vsn 1..6>**

Specifies which paging files are to be changed.

**VOLUME = \*ALL**

Changes the attributes of all used paging files on SF and SM pubsets of the system.

**VOLUME = \*PUBSET(...)**

Specifies one or more SD pubsets. The attributes of the paging file are to be changed on each volume of the specified SF pubsets.

**PUBSET = list-poss(256): <cat-id 1..4>**

Specifies the SF pubsets via their catalog number.

**VOLUME = <vsn 1..6>**

Specifies the volume serial number (VSN) of the disk on which the paging file to be changed is located. Up to 256 disks can be specified.

**UTILIZATION = \*LOW / \*MEDIUM / \*HIGH**

Specifies how a paging file is to be utilized. This affects both use of the paging file and the duration and I/O rate of a reduction of the paging files.

---

Paging management takes this specification into account as far as possible, but it cannot guarantee that a paging file will be utilized in the desired manner. This ultimately depends on the actual paging rate and on the behavior of the paging load over time.

**UTILIZATION = \*LOW**

The paging file is to be utilized less intensively than envisaged in the paging strategy (the paging file will hold pages less frequently). This setting is particularly advisable if the paging file is intended to be removed from the paging area (paging file reduction) or if frequent DMS I/O is to be expected on the paging disk in addition to the paging I/O (typically applies to paging files in the home pubset).

UTILIZATION=\*LOW applies to the paging files in the home pubset if they are added to the paging area at system startup. Paging files that are not on the home pubset and that are added to the paging area via the paging parameter service are covered by UTILIZATION=\*MEDIUM.

**UTILIZATION = \*MEDIUM**

The paging file is to be used in accordance with the paging strategy, which means that paging files will be utilized evenly in proportion with their size.

**UTILIZATION = \*HIGH**

The paging file is to be utilized more intensively than envisaged in the paging strategy (the paging file will hold pages more frequently). This is typically helpful with small files, as it is a way to reduce the load on disks with large files, allowing the paging files to be utilized evenly, irrespective of size. It is also possible to cut the time required for the reduction of large paging files.

**Notes**

- Before the attributes can be redefined, the paging file must already have been added to the paging area. The pubset of the paging file which is having its attributes redefined need not have been imported.
- If a paging file which is being released is relatively heavily utilized, you must anticipate the command taking a long time to relocate the virtual pages to other paging files, heavy I/O traffic, and a high CPU load. To lessen these loads and to simplify the reduction process, it is advisable not to start reduction immediately, but first to minimize the paging utilization of the paging file in question (UTILIZATION operand, value \*LOW). From then on the paging file in question will (as far as possible) no longer be used to hold virtual pages. Thereafter, through page access and release, the contents of the associated paging file will be diminished in size, with the result that less I/O is needed to swap the pages out in the actual reduction process. There is, however, a chance that it will not be possible to get by without swapping pages into the paging file because the paging rate is too high, or conversely that the pages in the paging file will not be accessed. In these cases the command will have no effect.

Whether modifying the paging utilization to \*LOW will bring the hoped-for success can be determined with the SHOW-PAGING-CONFIGURATION command: If the free size of the paging area concerned increases, the modification was successful. The SHOW-PAGING-CONFIGURATION command also indicates the time when the actual reduction process is to start. This may be after a few minutes, but periods of an hour or more are also conceivable.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	32	EMM2800	The function cannot be continued because of an internal error Guaranteed messages: EMM2818, EM2828
	64	EMM2804	The paging area on the specified volume is not in use Guaranteed message: EMM2851
	64	EMM2805	The MRSCAT entry of the pubset is missing. Guaranteed message: EMM2824
	128	EMM2807	The function cannot be continued due to a lack of resources Guaranteed messages: EMM2819, EM2829

**i** When lists are specified, command processing is aborted in the event of an error with a return code of EMM2800 or EMM2807. In all other cases processing continues.

## Examples

The paging file on disk 2OSW.0 is to be utilized less intensively because reduction of the paging area is planned:

```
/MODIFY-PAGING-AREA-ATTRIBUTES VOLUME=2OSW.0, UTILIZATION=*LOW
```

---

## 4.42 MODIFY-POSIX-USER-ATTRIBUTES

Modify POSIX user attributes

<b>Component:</b>	SRPMNUC
<b>Functional area:</b>	User management POSIX administration and application
<b>Domain:</b>	USER-ADMINISTRATION
<b>Privileges:</b>	STD-PROCESSING POSIX-ADMINISTRATION USER-ADMINISTRATION

### Function

The MODIFY-POSIX-USER-ATTRIBUTES command modifies the POSIX user attributes of a BS2000 user ID in the user catalog of the specified pubset.

Each time a new BS2000 user ID is set up (with the ADD-USER command), its POSIX user attributes are automatically set to the POSIX defaults (as defined with the MODIFY-POSIX-USER-DEFAULTS command). Where necessary, these POSIX user attributes can be changed.

Systems support can enter a BS2000 user ID as a new POSIX user with the ADD-POSIX-USER command.

The following users are authorized to do so:

- holders of the POSIX-ADMINISTRATION or USER-ADMINISTRATION privilege, for all BS2000 user IDs on all pubsets.
- group administrators, for the group and subgroup members they are in charge of on the pubset they manage. However, the following restrictions apply to group administrators:
  - A group administrator's ADM-AUTHORITY authorization governs the POSIX user attributes which that administrator is allowed to modify.
  - The range of values a group administrator is allowed to assign to POSIX user attributes is limited.

Details are given in the relevant operand descriptions.

The current POSIX default values can be displayed by means of the SHOW-POSIX-USER-ATTRIBUTES.

---

## Format

### MODIFY-POSIX-USER-ATTRIBUTES

**USER-IDENTIFICATION** = <name 1..8>

,**PUBSET** = **\*HOME** / <cat-id 1..4>

,**USER-NUMBER** = **\*UNCHANGED** / **\*BY-POSIX-USER-DEFAULTS** / **\*HOME** / <integer 0..60002>

,**GROUP-NUMBER** = **\*UNCHANGED** / **\*BY-POSIX-USER-DEFAULTS** / **\*GROUP-ADMINISTRATOR** /  
<integer 0..60002>

,**COMMENT** = **\*UNCHANGED** / **\*BY-POSIX-USER-DEFAULTS** / **\*NONE** / <c-string 1..255 with-low>

,**DIRECTORY** = **\*UNCHANGED** / **\*BY-POSIX-USER-DEFAULTS** / **\*ROOT** /  
<posix-pathname 1..1023 without-wild>

,**PROGRAM** = **\*UNCHANGED** / **\*BY-POSIX-USER-DEFAULTS** / **\*SHELL** /  
<posix-pathname 1..1023 without-wild>

## Operands

**USER-IDENTIFICATION** = <name 1..8>

BS2000 user ID for which the POSIX user attributes are to be changed.

**PUBSET** =

Pubset for which the POSIX user attributes in the user catalog are to be changed.

**PUBSET** = **\*HOME**

The change affects the home pubset.

**PUBSET** = <cat-id 1..4>

The change affects the pubset with the specified catalog ID.

**USER-NUMBER** =

The user number which is automatically allocated when a BS2000 user ID is set up can be changed.

The USER-NUMBER attribute is a security issue, as the user number governs the associated privileges and determines who is the owner of a file. Group administrators cannot change the user number unless they have at least the group administrator privilege MANAGE-MEMBERS; and the range of values they can assign is restricted:

- They cannot allocate a user number of 0, which is the root privilege.
- They can only change the default user number.
- They can only allocate user numbers which are greater than the default user number.
- They cannot allocate duplicate user numbers.
- On a data pubset they can only assign the user number of the BS2000 user ID of the same name on the home pubset.

**USER-NUMBER** = **\*UNCHANGED**

The user number is not changed.

---

**USER-NUMBER = \*BY-POSIX-USER-DEFAULTS**

The user number is given the value of the corresponding POSIX default attribute as recorded in the user catalog of the specified pubset.

**USER-NUMBER = \*HOME**

The user number of the BS2000 user ID of the same name on the home pubset is used. This value is meaningful only if the user number is being changed on a data pubset. It is redundant on the home pubset.

**USER-NUMBER = <integer 0..60002>**

The user number is given the specified value.

**GROUP-NUMBER =**

The group number which is automatically allocated when a BS2000 user ID is set up can be changed.

The GROUP-NUMBER attribute is a security issue, as POSIX does not check the admissibility of the BS2000 user /group combination against the POSIX group catalog when a user logs in.

Group administrators cannot change the group number unless they have at least the group administrator privilege MANAGE-MEMBERS, and the range of values they can assign is restricted:

- They can allocate only the default group number or the group number of the group administrator for the BS2000 user group to which the BS2000 user ID belongs.
- They cannot allocate a different group number for their own BS2000 user ID.

**GROUP-NUMBER = \*UNCHANGED**

The group number is not changed.

**GROUP-NUMBER = \*BY-POSIX-USER-DEFAULTS**

The group number is given the value of the corresponding POSIX default attribute as recorded in the user catalog of the specified pubset.

**GROUP-NUMBER = \*GROUP-ADMINISTRATOR**

Allocates the group number owned by the group administrator of the BS2000 user group to which the BS2000 user ID belongs.

**GROUP-NUMBER = <integer 0..60002>**

The group number is given the specified value.

**COMMENT =**

The comment can be changed. Further information relating to the owner of the BS2000 user ID can be added as appropriate.

*Note*

This comment is used, for example, by mail programs to describe the sender.

**COMMENT = \*UNCHANGED**

The comment is not changed.

**COMMENT = \*BY-POSIX-USER-DEFAULTS**

The value is taken from the corresponding POSIX default attribute as recorded in the user catalog of the specified pubset.

**COMMENT = \*NONE**

No comment is added.

---

**COMMENT = <c-string 1..255 with-low>**

The specified comment is added.

**DIRECTORY =**

The absolute path name of the user's login directory can be changed. This attribute is not a security issue, as it governs only the value of the HOME shell variable and the initial value of the working directory. It cannot be used to bypass file and directory protection attributes.

**DIRECTORY = \*UNCHANGED**

The absolute path name is not changed.

**DIRECTORY = \*BY-POSIX-USER-DEFAULTS**

The value is taken from the corresponding POSIX default attribute as recorded in the user catalog of the specified pubset.

**DIRECTORY = \*ROOT**

The root directory "/" is allocated.

**DIRECTORY = <posix-pathname 1..1023 without-wild>**

The specified path name is allocated.

**PROGRAM =**

The program which is run after a remote login or after the START-POSIX-SHELL command can be changed. This attribute is not a security issue, as only such programs as the user is allowed to execute can be run.

**PROGRAM = \*UNCHANGED**

The program is not changed.

**PROGRAM = \*BY-POSIX-USER-DEFAULTS**

The value is taken from the corresponding POSIX default attribute as recorded in the user catalog of the specified pubset.

**PROGRAM = \*SHELL**

The default POSIX shell is started up.

**PROGRAM = <posix-pathname 1..1023 without-wild>**

The specified program is run.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
2	0	SRM6001	Command executed with warning
	32	SRM6020	Command rejected owing to system error
	64	SRM6040	Command rejected with error message
	130	SRM6030	Command rejected owing to insufficient resources

---

## Examples

The POSIXTST user ID is to be allocated a user number of 55 and a group number of 66. The login directory (home directory) is to be */home/posixtst*. Following a POSIX login, the Bourne shell is to be started up.

There is to be a comment reading: "posix-user@posix-server.com".

```
/MODIFY-POSIX-USER-ATTRIBUTES USER-ID=POSIXTST, -  
/  USER-NUMBER=55, -  
/  GROUP-NUMBER=66, -  
/  DIRECTORY=/home/posixtst, -  
/  PROGRAM=*SHELL, -  
/  COMMENT='posix-user@posix-server.com'
```

The PSXROOT user ID is to have root privileges. Its home directory is to be */home/psxroot*.

```
/MODIFY-POSIX-USER-ATTRIBUTES USER-ID=PSXROOT, -  
/  USER-NUMBER=0, -  
/  GROUP-NUMBER=0, -  
/  DIRECTORY=/home/psxroot,
```

---

## 4.43 MODIFY-POSIX-USER-DEFAULTS

Modify POSIX default attributes

<b>Component:</b>	SRPMNUC
<b>Functional area:</b>	User management POSIX administration and application
<b>Domain:</b>	USER-ADMINISTRATION
<b>Privileges:</b>	STD-PROCESSING POSIX-ADMINISTRATION USER-ADMINISTRATION

### Function

The MODIFY-POSIX-USER-DEFAULTS command modifies the POSIX default attributes in the user catalog of the specified pubset. It is available to the following users:

- holders of the POSIX-ADMINISTRATION or USER-ADMINISTRATION privilege, for all pubsets.
- group administrators of the \*UNIVERSAL group on the pubset which they manage.

The POSIX default attributes are applied when a new user entry is created (with the ADD-USER command).

The current POSIX default values can be displayed by means of the SHOW-POSIX-USER-DEFAULTS command

### Format

**MODIFY-POSIX-USER-DEFAULTS**

**PUBSET** = \*HOME / <cat-id 1..4>

,**USER-NUMBER** = \*UNCHANGED / <integer 0..60002>

,**GROUP-NUMBER** = \*UNCHANGED / <integer 0..60002>

,**COMMENT** = \*UNCHANGED / \*NONE / <c-string 1..255 with-low>

,**DIRECTORY** = \*UNCHANGED / \*ROOT / <posix-pathname 1..1023 without-wild>

,**PROGRAM** = \*UNCHANGED / \*SHELL / <posix-pathname 1..1023 without-wild>

### Operands

**PUBSET =**

Pubset for which the POSIX default attributes in the user catalog are to be changed.

**PUBSET = \*HOME**

The POSIX default attributes are changed in the user catalog of the home pubset.

**PUBSET = <cat-id 1..4>**

The POSIX default attributes are changed in the user catalog of the specified pubset.

---

**USER-NUMBER =**

The user number can be changed.

**USER-NUMBER = \*UNCHANGED**

The user number is not changed.

**USER-NUMBER = <integer 0..60002>**

The user number is given the specified value.

**GROUP-NUMBER =**

The group number can be changed.

**GROUP-NUMBER = \*UNCHANGED**

The group number is not changed.

**GROUP-NUMBER = <integer 0..60002>**

The group number is given the specified value.

**COMMENT =**

The comment can be changed.

*Note*

This comment is used, for example, by mail programs to describe the sender.

**COMMENT = \*UNCHANGED**

The comment is not changed.

**COMMENT = \*NONE**

No comment is added.

**COMMENT = <c-string 1..255 with-low>**

The specified comment is added.

**DIRECTORY =**

The absolute path name of the user's login directory can be changed.

**DIRECTORY = \*UNCHANGED**

The absolute path name is not changed.

**DIRECTORY = \*ROOT**

The root directory / is assigned as login directory.

**DIRECTORY = <posix-pathname 1..1023 without-wild>**

The specified path name is assigned as login directory.

**PROGRAM =**

The program started up after the user logs in can be changed.

**PROGRAM = \*UNCHANGED**

The program is not changed.

**PROGRAM = \*SHELL**

The default POSIX shell is started up.

**PROGRAM = <posix-pathname 1..1023 without-wild>**

The specified program is run.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
2	0	SRM6001	Command executed with warning
	32	SRM6020	Command rejected owing to system error
	64	SRM6040	Command rejected with error message
	130	SRM6030	Command rejected owing to insufficient resources

---

## 4.44 MODIFY-PRINT-JOB-ATTRIBUTES

Modify parameters for print job

<b>Component:</b>	SPOOL
<b>Functional area:</b>	Controlling spoolout jobs
<b>Domain:</b>	SPOOL-PRINT-ADMINISTRATION
<b>Privileges:</b>	STD-PROCESSING OPERATING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION PRINT-SERVICE-ADMINISTRATION

### Function

The MODIFY-PRINT-JOB-ATTRIBUTES command modifies the parameters of the PRINT-DOCUMENT command for a print job after the command has been accepted. The effect of this command is the same as issuing a new PRINT-DOCUMENT command with modified operands. However, some operands of the PRINT-DOCUMENT command cannot be modified. This depends on the status of the print job. For details see [section "Notes"](#).

If the default value \*UNCHANGED is specified then no changes are made to the initial value of the parameter in question.

Note that print jobs that have the status PREPROCESSING or ACTIVE cannot be modified. There are also constraints on other statuses (see the [section "Notes"](#)).

#### *Privileged functions*

RSO device administrators and spool and cluster administrators can modify the attributes of any print job scheduled for printing on any device that they manage. For more information on these user groups see the manuals "RSO" [32], "SPOOL" [43] and "Dprint" [10].

## Operands

**JOB-IDENTIFICATION = \*TSN(...) / \*MONJV(...) / \*SERVER-TSN(...) / \*CLIENT-TSN(...)**

Specifies how the job is identified.

**JOB-IDENTIFICATION = \*TSN(...)**

The print job is identified by its local task sequence number (TSN).

**TSN = <alphanum-name 1..4>**

TSN of the job to be modified.

**CLUSTER-NAME = \*LOCAL-CLUSTER / <name 1..8>**

Name of the cluster in which the print job is processed. If you specify a cluster name, the specified TSN is the TSN on the gateway host in the specified remote cluster. Only BS2000 clusters can be specified.

**JOB-IDENTIFICATION = \*MONJV(...)**

The print job is identified by its monitoring job variable.

**MONJV = <filename 1..54 without-gen-vers>**

This operand allows a print job to be addressed by means of its MONJV, provided the specified MONJV is accessible on the host at which the command is issued. Only print jobs in the local cluster can be addressed in this way.

**JOB-IDENTIFICATION = \*SERVER-TSN(...)**

The print job is identified by its TSN (task sequence number) on the server. Only print jobs in the local cluster can be addressed in this way.

**TSN = <alphanum-name 1..4>**

Task sequence number of the job to be modified on the server.

**SERVER-NAME = \*HOME / <alphanum-name 1..8>**

Name of the server on which the print job is being processed.

**JOB-IDENTIFICATION = \*CLIENT-TSN(...)**

Only for the cluster administrator. The print job is identified by its TSN on the client. Only print jobs in the local cluster can be addressed in this way.

**TSN = <alphanum-name 1..4>**

Task sequence number of the job to be modified on the client.

**CLIENT-HOST = <alphanum-name 1..8>**

Name of the client on which the print job is being processed.

**DOCUMENT-PART = \*UNCHANGED / \*PARAMETERS(...)**

Allows you to limit processing of the print file to only a part of it and thus change what was specified in the PRINT-DOCUMENT command.

The file to be printed (the input file) consists of a sequence of records, each of which can be identified by SPOOL by means of its record number or a string it contains. SPOOL also allows you to structure the print file by using strings as file marks. These file marks divide the file up into sections. SPOOL takes into account all the options set by the user and converts the input file into a file edited for printing (an output file). This file consists of logical lines and pages. The delimitation of part or parts of a file can apply to either the input file or the output file. The following alternatives for defining parts of a file are available in the substructures of this operand:

- **INPUT-SECTION:** the input file can be subdivided into sections on the basis of a specified string, or the whole file can be processed.

- **INPUT-PART:** only a certain number of the input file's records are processed. You can specify the first and last record by means of a record number, a section number or a string.
- **RECORD-PART:** of the records selected by means of the above operands, only a specified part of each record is processed.
- **OUTPUT-PART:** the whole input file is edited for printing, but output is limited to a subset of all logical print pages.

**DOCUMENT-PART = \*PARAMETERS(...)**

The part of the file to be processed can be specified in the following substructure.

**INPUT-SECTION = \*UNCHANGED / \*WHOLE-FILE / \*PARAMETERS(...)**

Specifies whether the file is to be structured by means of file marks, and thus allows you to change what was specified in PRINT-DOCUMENT.

**INPUT-SECTION = \*WHOLE-FILE**

The file is not structured. The whole input file is a single logical section.

**INPUT-SECTION = \*PARAMETERS(...)**

The file is structured by means of file marks that can be specified in the following substructure. You use the INPUT-PART operand to specify which sections of the structured print file are to be output.

**SECTION-IDENTIFIER = \*UNCHANGED / <c-string 1..60 with-low> / <x-string 1..120>**

Specifies the file marks by means of which the input file is to be structured. Any strings in the records can be used as file marks. These strings can be either in SECTION records, which are not printed, or in the print file's normal records, which are printed. A string can be specified in the form of printable characters or hexadecimal characters. You use the INPUT-PART operand to specify which sections of the structured print file are to be output. The search for the start of the section to be printed is executed in a separate "pseudo controller" task. Neither the user task nor the printer is locked while this is being done. A pseudo controller writes the address of the first record in the section to the SPOOL control block; the spoolout job can then be processed (PREPROCESSING). If the desired section is not found in the file, an error message appears on the trailer page (for the layout of this page see the "SPOOL" manual [43]).

**POSITION = \*UNCHANGED / \*STD / <integer 1..2047>**

Specifies the position at which the specified string begins in the SECTION record.

**POSITION = \*STD**

The relevant string begins by default at the start of the record, i.e.:

- in a SAM file: at the first byte after the record length field
- in an ISAM file with KEY-POS=5: at the first byte after the key
- in an ISAM file with KEY-POS > 5: at the first byte after the record length field.

**POSITION = <integer 1..2047>**

The relevant string begins at the specified byte (after the record length field).

**INPUT-PART = \*UNCHANGED / \*ALL / \*PARAMETERS(...)**

Specifies whether only a certain number of the input file's records are to be processed, and thus allows you to change what was specified in PRINT-DOCUMENT. You can specify the first and last record by means of a record number, a section number or a string.

**INPUT-PART = \*ALL**

All the file's records are to be processed.

---

**INPUT-PART = \*PARAMETERS(...)**

Only a certain number of the input file's records are to be processed. You can specify the first and last records.

**FIRST-RECORD = \*UNCHANGED / \*BEGIN-OF-FILE / <integer 1..2147483647> /\*BY-STRING-ID(...)**

Specifies the record as of which the file is to be processed. You can specify the first record in the file, the number of a record or file mark, or a string in a record.

**FIRST-RECORD = \*BEGIN-OF-FILE**

Output begins with the file's first record, even if SECTION records are specified.

**FIRST-RECORD = <integer 1..2147483647>**

Number of the SECTION record or normal record as of which a section of the file is to be output.

**FIRST-RECORD = \*BY-STRING-ID(...)**

The record in which a specified string occurs is the first record to be output.

**STRING = \*UNCHANGED / <c-string 1..60 with-low> / <x-string 1..120>**

Output begins with the record in which the specified string of printable or hexadecimal characters is found at a specific position.

**POSITION = \*UNCHANGED / STD / <integer 1..2047>**

Position within the record at which the specified string of hexadecimal characters begins. By default (STD), the FIRST-RECORD string begins at the start of the record, i.e.:

- in a SAM file: at the first byte after the record length field
- in an ISAM file with KEY-POS=5: at the first byte after the key
- in an ISAM file with KEY-POS > 5: at the first byte after the record length field.

**OCCURRENCE = \*UNCHANGED / <integer 1..32767>**

Specifies the record (containing the FIRST-RECORD string) as of which output is to start.

**LAST-RECORD = \*UNCHANGED / \*END-OF-FILE / <integer 1..2147483647> /\*BY-STRING-ID(...)**

Specifies the last record in the part of the file to be output. You can specify the last record in the file, the number of a record or file mark, or any string in a record.

*Note*

If the LAST-RECORD record is found before the FIRST-RECORD record, the PRINT-DOCUMENT command aborts.

**LAST-RECORD = \*END-OF-FILE**

Output continues until the end of the file, even if SECTION records are specified.

**LAST-RECORD = <integer 1..2147483647>**

Number of the last record (SECTION record or normal record) in the part of the file to be output.

**LAST-RECORD = \*BY-STRING-ID(...)**

Specifies that the last record is to contain a specified string.

**STRING = \*UNCHANGED / <c-string 1..60 with-low> / <x-string 1..120>**

Output ends with the record in which the specified string of printable or hexadecimal characters is found at a specific position in the file.

---

**POSITION = \*UNCHANGED / STD / <integer 1..2047>**

Position within the record at which the specified string of hexadecimal characters begins. By default (STD), the LAST-RECORD string begins at the start of the record, i.e.:

- in a SAM file: at the first byte after the record length field
- in an ISAM file with KEY-POS=5: at the first byte after the key
- in an ISAM file with KEY-POS > 5: at the first byte after the record length field.

**OCCURRENCE = \*UNCHANGED / <integer 1..32767>**

Specifies the occurrence of the record containing the LAST-RECORD string at which output is to stop.

**RECORD-PART = \*UNCHANGED / \*ALL / \*PARAMETERS(...)**

Specifies whether only a specific part of each of the records selected by means of the above operands is to be processed.

**RECORD-PART = \*ALL**

All of each selected record is to be processed.

**RECORD-PART = \*PARAMETERS(...)**

Only a specific part of each record is to be processed.

**FIRST-CHARACTER = \*UNCHANGED / <integer 2..32767>**

Allows a byte number (record column) to be specified indicating the point as of which the records of a file are to be output. (The bytes of a record are numbered consecutively from left to right starting with 1; ISAM keys and control characters are components of a record.) What happens depends on whether one of the values \*BY-EBCDIC-CONTROL, \*BY-IBM-CONTROL or \*BY-ASA-CONTROL is specified in the LINE-SPACING operand.

*If one of these values is specified.*

Output starts with the data byte following the specified byte number. The feed control character is interpreted irrespective of the entry for FIRST-CHARACTER, provided the value for FIRST-CHARACTER is less than the length of the record. If the specified value is greater than the length of the record, it is ignored (i.e. printing does not take place, nor does line feed).

*If none of these values is specified.*

Output starts with the data byte corresponding to the specified byte number.

If the records are longer than the form definition allows, printing continues on the next line. If CONTROL-MODE=\*PAGE-MODE is specified, an entry for FIRST-CHARACTER is problematical because SPOOL takes no account of the number of control characters in a record.

**LAST-CHARACTER = \*UNCHANGED / \*STD / <integer 1..32767>**

Specifies the byte indicating the point at which printing of each record is to stop. What happens depends on whether one of the values \*BY-EBCDIC-CONTROL, \*BY-IBM-CONTROL or \*BY-ASA-CONTROL is specified in the LINE-SPACING operand.

*If one of these values is specified.*

Output ends with the data byte following the specified byte number (unless FIRST-CHARACTER is specified for an ISAM file with KEY-POSITION=5, in which case output ends with the data byte corresponding to the specified byte number).

*If none of these values is specified.*

Output ends with the data byte corresponding to the specified byte number.

---

If the records are longer than the form definition allows, printing continues on the next line. If CONTROL-MODE=\*PHYSICAL is specified, an entry for LAST-CHARACTER is problematical because SPOOL takes no account of the number of control characters in a record.

Default (\*STD):

- end of print line (136)
- 2048 for an EAM file, SYSLST or SYSOUT.

**OUTPUT-PART = \*UNCHANGED / \*ALL / \*RANGE(...) / \*LAST(...)**

Specifies that the whole input file is to be edited for printing but that output is to be limited to a subset of all logical print pages and thus allows you to change what was specified in PRINT-DOCUMENT.

**OUTPUT-PART = \*ALL**

All logical print pages of the edited file are to be output.

**OUTPUT-PART = \*RANGE(...)**

Part of the file is to be output.

**FROM = \*UNCHANGED / \*BEGIN-OF-FILE / <integer 1..2147483647>**

Allows a page or line number in the print file to be specified as of which output is to start, as specified by the DIMENSION operand. By default, output commences at the beginning of the file. The pages in a print file are defined as described for the LINE-PER-PAGE operand (unless a control character produces a premature page feed).

**TO = \*UNCHANGED / \*END-OF-FILE / <integer 1..2147483647>**

Allows a page or line number in the print file to be specified at which output is to end, as specified by the DIMENSION operand.

By default, output terminates at the end of the file. Pages in a print file are defined by the LINE-PER-PAGE operand (unless a control character produces a premature page feed). The value specified here must be greater than that specified in the FROM operand.

**DIMENSION = \*UNCHANGED / \*PAGES / \*LINES**

Specifies whether the values in the FROM and TO operands are to be interpreted as page or line numbers.

**OUTPUT-PART = \*LAST(...)**

Only the last so many pages or lines of the print file are to be output.

**LAST = \*UNCHANGED / <integer 1..2147483647>**

Number of pages or lines to be output, calculated from the end of the file. The DIMENSION operand indicates whether the value is to be interpreted as a page or line number. Pages in a print file are defined by the LINE-PER-PAGE operand (unless a control character produces a premature page feed).

**DIMENSION = \*UNCHANGED / \*PAGES / \*LINES**

Specifies whether the value in the LAST operand is to be interpreted as a page or line number.

*Example of SECTION processing:*

The following sections of an ISAM file are to be output.

01000000		Line 0
02000000	*SECTION0001	
03000000		Line 1
04000000	*SECTION0002	
05000000		Line 2
06000000	*SECTION0003	
07000000		Line 4

Case: SECTION records in default positions.

```
PRINT-DOCUMENT datei, DOCUMENT-PART=*PAR( INPUT-SECTION = -  
      *PAR( SECT-ID=C' *SECTION', POS=*STD), INPUT-PART= *PAR( -  
      FIRST-RECORD=1, LAST-RECORD=3))
```

The following part of the file is printed:

e table below specifies how

03000000	Line 1
05000000	Line 2

**DOCUMENT-FORMAT = \*UNCHANGED / \*TEXT(...) / \*PAGE-FORMAT(...) / \*SPECIAL-FORMAT(...)**

Specifies the type of the document contents, i.e. the format of the file to be printed as regards the interpretation of feed control characters, printer control characters, font identifiers, RENO commands and/or VTSU codes. You can specify the following operands and the corresponding substructures here:

- \*TEXT: the file has no printer-specific control characters except for feed control characters.
- \*PAGE-FORMAT: the file has laser printer-specific control characters.
- \*SPECIAL-FORMAT: the file has special printer-specific control characters.

**DOCUMENT-FORMAT = \*TEXT(...)**

Except for feed control characters, the file has no printer-specific control characters. The position of the feed control character in the record can be specified in the substructure of the LINE-SPACING operand.

The data is sent to the printer unchanged. Since only the data to be printed is sent to the printer, records can be truncated.

The following applies to RSO:

Records of type A-1 or A-2 are to be printed (no control characters in the data stream); in other words, except for feed control characters in the first column of the records, no control characters are interpreted. This is also the reason why a font change is not possible. The form's default font or the first font specified for CHARACTER-SETS, if specified, is used. Nonprinting characters, i.e. characters with a hexadecimal value less than X'40', are output as

---

blanks. If the record length exceeds the maximum line length, the record is truncated in the printout. The maximum line length depends on the character spacing, which is defined by means of the font used (see the CHARACTER-SETS operand).

*Note*

RSO printer: The command evaluates only the first element of the font list if DOCUMENT-FORMAT=\*TEXT has an associated font list (operand: CHARACTER-SETS=...).

**LINE-PER-PAGE = \*UNCHANGED / \*STD / <integer 1..32767>**

Specifies how many lines (including header and blank lines) are to be printed on a page.

**LINE-PER-PAGE = \*STD**

If the operand is omitted, the number of lines per print page is calculated using the following formula, regardless of what has been specified for the HEADER-LINE operand: Number of lines =  $P * L - N - 6$

The name sections have the following meanings:

P = paper size in inches

L = line density

N = number of line before the first channel 1

*Printers with a loadable vertical format buffer*

- The vertical tab “channel 1” controls the line on which printing is to start. Unless otherwise specified, 2 blank lines are set before printing starts; i.e. channel 1 (CHANNEL 01) is in the third line of the loop.
- If the value specified for the LINE-PER-PAGE operand is greater than the specified number of lines in the loop, the value in the loop is used.
- A value specified here must be at least three times as large as the line feed specified for LINE-SPACING=1 /2/3 if the LINE-PER-PAGE operand is specified together with the HEADER-LINE and LINE-SPACING operands.

**LINE-SPACING = \*UNCHANGED / 1 / 2 / 3 / \*BY-EBCDIC-CONTROL(...) / \*BY-IBM-CONTROL(...) / \*BY-ASA-CONTROL(...)**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING = 1 / 2 / 3**

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an EBCDIC feed control character.

**CONTROL-CHAR-POS = \*UNCHANGED / \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**LINE-SPACING = \*BY-IBM-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**CONTROL-CHAR-POS = \*UNCHANGED / \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**LINE-SPACING = \*BY-ASA-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**CONTROL-CHAR-POS = \*UNCHANGED / \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**HEADER-LINE = \*UNCHANGED / \*NO / \*STD /list-poss(3): \*DATE / \*FIRST-RECORD / \*PAGE-NUMBER**

Specifies whether a header line is to be printed on every page (except the header and trailer pages).

**HEADER-LINE = \*NO**

No header line is printed.

**HEADER-LINE = \*STD**

The header has the following format:

Header	DATE yyyy-mm-dd	userid	nnnn	PAGE nnnn
Column	1	41(11,11)	60(21,67)	124 (77)

The first value in parentheses applies in the case of a form definition with a line length < 132 and >= 80 characters (with differing values). The second value in parentheses applies in the case of a form definition with a line length < 80 and >= 70 characters (with differing values).

jjjj-mm-tt	Year-Month-Day
userid	user ID
datei	file name
nnnn	Page number

Unless otherwise specified, the header line is followed by a blank line. The header is shifted in accordance with the LEFT-MARGIN operand, but the header line will be truncated at column 132.

DATE and PAGE are only present in the header line if the line size >= 032.

**HEADER-LINE = list-poss(3): \*DATE / \*FIRST-RECORD / \*PAGE-NUMBER**

The header has the following format:

HEADER-LINE=	DATE	FIRST-RECORD	PAGE-NUMBER
Header	DATE yyyy-mm-dd (yyyy-mm-dd)	First record	PAGE nnnn (nnnn, nnnn)
Column	1	21	124 (77.67)

**\*DATE:**

The value in parentheses applies in the case of a form definition with a line length < 132 and >= 70 characters (with differing values). \*PAGE-NUMBER: The first value in parentheses applies in the case of a form definition with a line length < 132 and >= 80 characters (with differing values). The second value in parentheses applies in the case of a form definition with a line length < 80 and >= 70 characters (with differing values).

yyyy-mm-dd	Year-Month-Day
First record	First logical record of the file
nnnn	Page number

If \*DATE, \*FIRST-RECORD or \*PAGE-NUMBER is omitted, the appropriate section is filled with blanks.

Unless otherwise specified, the header line is followed by a blank line.

The header is shifted in accordance with the LEFT-MARGIN operand, but the header line will be truncated at column 132.

\*DATE and \*PAGE are only present in the header line if the line size >= 032.

If \*FIRST-RECORD is specified, the first record is regarded as not belonging to the date.

**OUTPUT-FORMAT = \*UNCHANGED / \*CHARACTER / \*HEXADECIMAL**

Indicates whether the output format is character format only or character format and hexadecimal format.

**OUTPUT-FORMAT = \*CHARACTER**

Outputs in character format only. Records which exceed the length of a print line are truncated.

**OUTPUT-FORMAT = \*HEXADECIMAL**

Outputs the data records in character format and in hexadecimal format.

**Output format**

Each output line starts with an 8-byte prefix followed by data 50 bytes in length. Each output line is first printed using the appropriate font and then repeated in hexadecimal format.

**Format of the output line**

Column	Contents
1-4	Column number from which the data of the output record should begin
5-8	blank
From 9	Characters of the input record according to font; the individual characters are separated by a blank. The characters are repeated in hexadecimal format in the next line.

**DOCUMENT-FORMAT = \*PAGE-FORMAT(...)**

The file contains specific control characters for laser printers, and thus changes what was originally specified in PRINT-DOCUMENT.

**FORMAT-NAME = \*UNCHANGED / \*STD / <c-string 1..63 with-low>**

Name of the format in which the output data is transferred to the printer. If no value was entered for FORMAT-NAME, a default value is automatically deducted from the value of the CONTROL-MODE operand. This leads to the following results:

CONTROL-MODE = *PAGE-MODE(...)	FORMAT-NAME = *HP
CONTROL-MODE = *APA(...)	FORMAT-NAME = *SPDS
CONTROL-MODE = *LOGICAL / *PHYSICAL / *LINEMODE	FORMAT-NAME = *STD

---

The value FORMAT-NAME = \*STD means that the contents of the file to be printed out is irrelevant.

**CONTROL-MODE = \*UNCHANGED / \*PAGE-MODE(...) / \*LINE-MODE / \*LOGICAL(...) / \*PHYSICAL(...) / \*APA(...)**

Specifies how the control characters are to be interpreted.

**CONTROL-MODE = \*PAGE-MODE(...)**

The control characters are suitable for processing on page printers.

**PAGE-CONTROL-CHAR = \*UNCHANGED / \*YES / \*NO**

Specifies whether the control character list must be at the beginning of each page (i.e. always after branching to the vertical tab “channel 1” in the loop).

**PAGE-CONTROL-CHAR = \*YES**

The control character list must be there.

**PAGE-CONTROL-CHAR = \*NO**

No control character list at the beginning of the page. However, this means that the following functions cannot be controlled in the case of output to HP printers:

- Film overlays on individual pages in the file; specified in the MODIFY-PRINT-JOB-ATTRIBUTES command, a film overlay is used on each page of the print file of the spoolout job.
- Page copies for individual pages in the file; all the pages of the print file are output with as many copies as specified in the MODIFY-PRINT-JOB-ATTRIBUTES command.
- Column-oriented indentation on individual pages; the value specified in the MODIFY-PRINT-JOB-ATTRIBUTES command is valid for all the pages in the print file.
- FOB data overlay on individual pages in the file; specified in the MODIFY-PRINT-JOB-ATTRIBUTES command, an FOB data overlay is used on each page in the print file of the spoolout job.
- A copy reference number cannot be specified.
- Page rotation control for individual pages in the print file; all the pages are output in either portrait or landscape format, as specified in the MODIFY-PRINT-JOB-ATTRIBUTES command.

**CONTROL-TYPE = \*UNCHANGED / \*HP / \*COMPATIBLE**

Specifies whether the control characters are suitable for processing on HP or HP90 printers or whether they have to be converted.

**CONTROL-TYPE = \*HP**

The file contains HP or HP90 printer-specific control characters that can only be processed by these printers.

**CONTROL-TYPE = \*COMPATIBLE**

The file does not contain HP or HP90 printer-specific control characters. SPOOL must convert the control characters.

**LINE-SPACING = \*UNCHANGED / \*BY-EBCDIC-CONTROL / \*BY-IBM-CONTROL / \*BY-ASA-CONTROL**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING = \*BY-EBCDIC-CONTROL**

The contents of the first byte of each record are to be interpreted as an EBCDIC feed control character.

---

**LINE-SPACING = \*BY-IBM-CONTROL**

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**LINE-SPACING = \*BY-ASA-CONTROL**

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**CONTROL-MODE = \*LINE-MODE**

Only for RSO.

Records of type C (see the "SPOOL" manual [43]) are printed out. The records may contain data mixed with LINE-MODE control characters. LINE-MODE control characters are (in any combination):

- printer control characters (i.e. physical control character beginning with X'27' or X'3C')
- RENO commands
- VTSU codes

Control over record and file formats (including page and line feed with LINE-MODE control characters) rests solely with the user. With the 9025/9026 RENO page printer, users must also ensure that the printer is set to the correct start position on the paper. A loop is not interpreted. Nonprinting characters, i.e. characters with a hexadecimal value less than X'40', are output as blanks.

The spoolout job is executed with the default font of the form used until you change the font in the file with the aid of LINE-MODE control characters.

**CONTROL-MODE = \*LOGICAL(...)**

Only for RSO printers.

Specifies that records of type B-1 or B-2 are to be printed out, i.e. records which, in addition to a feed control character in the first byte, may contain data mixed with font identifiers, printer control characters, RENO commands, and VTSU codes (see the "RSO" manual [32], record type B-1/B-2).

With the exception of the VTSU codes VPA, NP, VT, NL and CR, which are output as blanks, the above-mentioned control characters are interpreted. A font identifier, a VTSU code or a RENO command remains valid until a new control character is specified.

If the font identifier is omitted, the default font for the form is used.

Since page feed is implemented via a loop or constant line feed when CONTROL-MODE=LOGICAL is specified, the file should not contain the RENO commands \LF, \FF and \CR. Setting the form height is likewise not permitted.

**LINE-PER-PAGE = \*UNCHANGED / \*STD / <integer 1..32767>**

Specifies how many lines (including header and blank lines) are to be printed on a page.

**LINE-PER-PAGE = \*STD**

If no value is specified, the number of lines per print page is calculated according to the following formula, regardless of the value in the HEADER-LINE operand:

$$\text{Number of lines} = P * L - N - 6$$

The name sections have the following meanings:

P = paper size in inches

L = line density

N = number of line before the first channel 1

If the value specified for the LINE-PER-PAGE operand is greater than the specified number of lines in the loop, the value in the loop is used. A value specified here must be at least three times as large as the line

---

feed specified for LINE-SPACING=1/2/3 if the LINE-PER-PAGE operand is specified together with the HEADER-LINE and LINE-SPACING operands.

**LINE-SPACING = \*UNCHANGED / 1 / 2 / 3 / \*BY-EBCDIC-CONTROL / \*BY-IBM-CONTROL / \*BY-ASA-CONTROL**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING = 1 / 2 / 3**

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an EBCDIC feed control character.

**CONTROL-CHAR-POS = \*UNCHANGED / \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**LINE-SPACING = \*BY-IBM-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**CONTROL-CHAR-POS = \*UNCHANGED / \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**LINE-SPACING = \*BY-ASA-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**CONTROL-CHAR-POS = \*UNCHANGED / \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**CONTROL-MODE = \*PHYSICAL(...)**

Only for RSO.

Specifies that contrary to an original definition in the PRINT-DOCUMENT command

- laser printer-specific control characters (local SPOOL) or
- records of type D-1 / D-2 (RSO) - i.e. data mixed with VTSU codes, printer control characters and RENO commands - are to be interpreted.

Control characters contained in the print data are interpreted. In the case of HP printers, a record for a 13.6-inch form may be up to 700 bytes long (including control characters and the escape character X'FF'). If the number of characters to be printed per record exceeds the physical capacity of the laser printer, the spoolout job is terminated abnormally. The maximum line length depends on the character pitch (see table of valid character spacings). The interpretation of control characters must be activated in the first record of each print page.

Output to local SPOOL devices:

When CONTROL-MODE = \*PAGE-MODE and CONTROL-TYPE = \*COMPATIBLE are specified, the X'FF' characters are converted to X'1F'. Laser printer-specific control characters in the records are interpreted. The first character in each record is interpreted as a feed control character. For ISAM files the key must be at the start of each record.

The file can be printed out using more than one font. The appropriate control characters can occur in any position in the text. The LEFT-MARGIN, PAGE-COPIES and LINE-PER-PAGE operands are ignored if they are specified together with CONTROL-MODE=\*PHYSICAL.

---

Output to RSO devices:

LINE-SPACING=\*NO is set automatically, which means that you must implement page and line feeds with LINE-MODE control characters (i.e. VTSU codes, printer control characters and RENO commands) in the file itself. If you specify LINE-SPACING=\*BY-EBCDIC-CONTROL for records of type D-2, the feed control character in the first byte is interpreted as a line or page feed control character. Nonprinting characters are also transferred to the printer (in contrast to CONTROL-MODE=\*LINE-MODE). The user is responsible for inserting the correct control characters in the file (including line spacing characters).

**LINE-SPACING = \*UNCHANGED / \*NO / 1 / 2 / 3 / \*BY-EBCDIC-CONTROL / \*BY-IBM-CONTROL / \*BY-ASA-CONTROL**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING = \*NO**

The contents of the first byte of each record are not interpreted as a control character.

**LINE-SPACING = 1 / 2 / 3**

Permitted only for RSO.

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL**

The contents of the first byte of each record are to be interpreted as an EBCDIC feed control character.

**LINE-SPACING = \*BY-IBM-CONTROL**

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**LINE-SPACING = \*BY-ASA-CONTROL**

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**CONTROL-MODE = \*APA(...)**

Specifies that the file to be printed contains APA printer control characters that are to be interpreted, and thus changes what was specified in PRINT-DOCUMENT.

**LINE-SPACING = \*UNCHANGED / \*BY-EBCDIC-CONTROL / \*BY-IBM-CONTROL / \*BY-ASA-CONTROL**

Specifies the type of the printer control characters (E, I or A).

**DOCUMENT-FORMAT = \*SPECIAL-FORMAT(...)**

Specifies that a printer-specific language is to be used in the document, and thus changes what was specified in PRINT-DOCUMENT. In this case, the SPOOL subsystem provides transparent control for the document. In other words, the file is transferred without interpretation.

**FORMAT-NAME = \*UNCHANGED / \*NONE / \*PCL / <c-string 1..63 with-low>**

Specification of the format to be processed. The document is processed in transparent mode.

**FORMAT-NAME = \*NONE**

The document is either processed by RSO in transparent mode or it is transferred to UNIX-based system without a specific format.

Data records of the types E-1 or E-2 are printed out by RSO (see the "RSO" manual [32]). With the exception of VTSU codes for RSO, the data records can contain optional characters. All characters of a data record are transferred by RSO to the printer without interpretation, with the exception of the line spacing control character in the first byte of the type E-2 data record.

The user is responsible for inserting the correct control characters in the file (including line spacing characters). If the LINE-SPACING operand is not specified, the default setting LINE-SPACING=\*NO applies and you have to include page feeds and line feeds in the file yourself using LINE-MODE control characters. If

---

LINE-SPACING=\*BY-EBCDIC-CONTROL is specified for type E-2 data records, the feed control character in the first byte is interpreted as a line feed or a page feed control character. If the LEFT-MARGIN operand is specified at the same time, blanks are included at the beginning of each data record and these indent the text by the desired number of columns when it is printed.

**FORMAT-NAME = \*PCL**

This value is only still available for reasons of compatibility.

**FORMAT-NAME = <c-string 1..63 with-low>**

This operand specifies that the contents of the document to be processed are of a specific type (e.g. HP LASERJET).

In the case of jobs which are directed to a cluster, the operand value is determined by the document format attribute which is transferred to the cluster. It is interpreted by Xprint or the foreign print system as the "content type" attribute of the print job (xpadd -job -ct...). This document content type fulfills part of the relevant requirements of ISO DPA class 1, which is required for interoperability between the BS2000 Spool & Print subsystems and foreign spool and print subsystems.

Jobs to RSO are printed by an RSO printer if it supports the format name specified or if a filter is available which will convert the format name into a format name supported by the printer.

If the value of CLUSTER-NAME refers to a BS2000 cluster or if none was specified, the length of the format name may not exceed 8 characters. If the FORMAT-NAME value is longer, the command is rejected. The file is printed by a printer that supports the specified format name.

In all cases, the printer must have been defined together with the format name in the SPOOL parameter file.

**LINE-SPACING = \*UNCHANGED / \*NO / 1 / 2 / 3 / \*BY-EBCDIC-CONTROL / \*BY-IBM-CONTROL / \*BY-ASA-CONTROL**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING = \*NO**

The contents of the first byte of each record are not interpreted as a control character.

**LINE-SPACING = 1 / 2 / 3**

Permitted only for RSO.

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL**

Only for RSO.

The contents of the first byte of each record are to be interpreted as an EBCIDC feed control character.

**LINE-SPACING = \*BY-IBM-CONTROL**

Only for RSO.

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**LINE-SPACING = \*BY-ASA-CONTROL**

Only for RSO.

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**PRINT-JOB-CONTROL = \*UNCHANGED / \*PARAMETERS(...)**

Determines whether parameters for controlling print job management which were originally assigned for this print job in the PRINT-DOCUMENT command are to be modified.

**PRINT-JOB-CONTROL = \*PARAMETERS(...)**

---

**CHECKPOINT = \*UNCHANGED / \*ON-PAGES / \*ON-SECTION-RECORDS**

This operand is only still available for reasons of compatibility.

**PRINT-JOB-NAME = \*UNCHANGED / <alphanum-name 1..8> / <c-string 1..8 with-low>**

Job name for the spoolout job.

The job name can be formed from a maximum of 8 characters from the set (A,...Z,0,...9,@, #,\$,.,-) but must not start with a hyphen or end with a period. It may only start with a period if this is followed by an alpha character; in this case, the period itself as part of the job name is not printed on the header page. The special character string period and hyphen (.-) may only be specified in quotes.

The job name is printed on the header page in the third uppercase line and also appears in the output of the SHOW-PRINT-JOB-STATUS command. If this operand is omitted the job name from the SET-LOGON-PARAMETERS command is used instead.

**PRINT-JOB-NAME = <alphanum-name 1..8> / <c-string 1..8 with-low>**

Job name which is to be assigned to the spoolout job (and which will overwrite any job name already assigned to the job issuing the command).

**PRINT-JOB-PRIORITY = \*UNCHANGED / <integer 30..255>**

Defines the urgency with which this spoolout job is started relative to other spoolout jobs.

**PRINT-JOB-PRIORITY = <integer 30..255>**

Priority to be assigned to the spoolout job. The highest priority you can assign is defined in the user catalog and can be displayed by means of the SHOW-USER-ATTRIBUTES command. If an invalid priority is entered (or no priority at all), the spoolout job is given the same priority as the job issuing the command.

**PRINT-JOB-CLASS =**

Defines the job class for the spoolout job.

**PRINT-JOB-CLASS = \*UNCHANGED**

The value for the print job class is retained.

**PRINT-JOB-CLASS = <integer 1..255>**

*Only the SPOOL administrator is allowed to select this value.*

The specified job class is assigned to the spoolout job.

**FAILURE-PROCESSING = \*UNCHANGED / \*PARAMETERS(...)**

Specifies whether a specific message page is to be created when an error occurs during current processing on an APA printer.

**FAILURE-PROCESSING = \*PARAMETERS(...)**

Specifies what happens in the event of an error.

**#MSG-PAGE = \*UNCHANGED / \*YES / \*NO**

Specifies whether the APA message page is to be printed. The APA message page contains error messages and warnings. If an APA printer is not being used, this parameter is ignored.

**SCHEDULING-TIME = \*UNCHANGED / \*STD / \*EARLIEST(...)**

Determines the scheduling time, i.e. the start time of the print job. When \*STD is specified, the print job is started on the basis of printer availability and the processing rules for print jobs.

**SCHEDULING-TIME = \*EARLIEST(...)**

The job is started at the earliest at the specified time on the specified date.

**DATE = \*UNCHANGED / \*TODAY / <date with-compl>**

Day on which the print job is started.

---

**TIME = \*UNCHANGED / <time>**

Time at which the print job is started.

**ENCRYPTION = \*UNCHANGED / \*YES / \*NO**

Specifies whether the print file is to be encrypted.

**LAYOUT-CONTROL = \*UNCHANGED / \*PARAMETERS(...)**

Contrary to original declarations, defines all parameters for describing the page layout in the PRINT-DOCUMENT command.

**LAYOUT-CONTROL = \*PARAMETERS(...)**

**PAGE-COPIES = \*UNCHANGED / \*STD / <integer 0..255>**

In local SPOOL mode, only for the printer types HP, HP90 and LP65.

Number of page copies.

This specifies how many times each individual page is to be repeated. The ADDITIONAL-COPIES operand allows additional printouts of the whole file to be requested.

A PRINT-DOCUMENT command with the PAGE-COPIES operand is rejected if the line number specified in the LINE-PER-PAGE operand is greater than the number of lines in the loop record minus the number of lines before the line on which the vertical tab "channel 1" is defined.

On an HP or HP90 printer, a maximum of 255 copies of a page can be printed in succession. PAGE-COPIES=255 has the same effect as PAGE-COPIES=254: one original and 254 copies are printed.

**PAGE-COPIES = \*STD**

*For LP65 printers:*

the number of page copies is as specified in the PCL file. For all other printer types:

PAGE-COPIES=0.

**LEFT-MARGIN = \*UNCHANGED / \*STD / <integer 0..31>**

Number of columns by which output is to be indented.

**LEFT-MARGIN = \*STD**

For all printers with the exception of RSO printers: The output text is to be indented by the specified number of columns.

*For all RSO printers:*

the output text is to be indented by the specified number \* 1/10 inch. The default value can be displayed by means of the SHOW-SPOOL-PARAMETERS command or SPERVE statement; the information is given in the PRINT-CMD-DEFAULTS:...LEFT-MARGIN = ... output field. The LEFT-MARGIN operand is ignored if the operand CONTROL-MODE=\*PHYSICAL is specified at the same time.

**TWO-SIDED = \*UNCHANGED / \*STD / \*NO / \*YES / \*TUMBLE**

Specifies whether the LP65 printer is to print the paper on one side or two.

**TWO-SIDED = \*STD**

The paper is printed on one side (simplex mode) or two (duplex mode), as defined in the PCL file.

**TWO-SIDED = \*NO**

The paper is printed on one side (simplex mode).

**TWO-SIDED = \*YES**

The paper is printed on two sides (duplex mode).

**TWO-SIDED = \*TUMBLE**

The paper is printed on two sides (duplex mode), and the pages are turned over from top to bottom rather than

---

left to right.

*Note*

The TWO-SIDED, ELECTRONIC-OVERLAY and PAGE-COPIES functions are linked and part of the same printer command. If only one of the operands is defined, default values will be generated for the others.

**ROTATION = \*UNCHANGED / \*NO / \*BY-CONTROL-CODES /list-poss(2): 0 / 90 / 180 / 270 / 0-180 / 180-0 / 90-270 / 270-90**

Specifies whether the pages to be printed from the spoolout job are to be rotated and if so by how many degrees. The print page set up in the printer is rotated (clockwise) by a certain number of degrees and printed on the form; for example, paper inserted in the printer in portrait format can be printed in landscape format. A separate loop is needed for pages rotated through 90<sup>0</sup>/270<sup>0</sup> (see the LOOP-NAME operand). Unless ROTATION=NO is specified, output is directed (automatically) to HP and HP90 printers. SHOW-SPOOL-PARAMETERS indicates whether an HP or HP90 printer with a page rotation module is available in the current SPOOL configuration: output field DEVICE-TYPE:..., ROT=YES/NO.

Spoolout jobs with page rotation are displayed in the outputs for the commands SHOW-USER-STATUS and SHOW-PRINT-JOB-STATUS JOB-ID=\*TSN(TSN=...).

The feed for rotated pages is always controlled via a separate loop (ROTATION-LOOP). If you have specified neither a ROTATION-LOOP for PRINT-DOCUMENT nor a form with a defined ROTATION-LOOP (see ADD-SPOOL-FORM), the default rotation loop R06 in the default form takes on feed control for the rotated pages. Header and trailer pages are not printed out in rotated format.

**ROTATION = \*NO**

Page rotation is not performed. Any control characters for page rotation in the file are not interpreted.

**ROTATION = \*BY-CONTROL-CODES**

Control characters for page rotation in the file are interpreted.

**ROTATION = 0 / 90 / 180 / 270**

Each print page is rotated by 90<sup>0</sup> / 180<sup>0</sup> / 270<sup>0</sup> (clockwise) and printed out. Control characters for page rotation contained in the file are not interpreted. A separate loop is needed for pages rotated through 90<sup>0</sup> / 270<sup>0</sup>. You must check that output with the specified loop does not lead to errors. If an error occurs, the job is rejected.

**ROTATION = 0-180 / 180-0 / 90-270 / 270-90**

The odd pages (number before the hyphen) and even pages (number after the hyphen) are to be printed at different angles.

**COVER-PAGES = \*UNCHANGED / \*PARAMETERS(...)**

Parameters for system exit routines relating to the printing of header and trailer pages.

**HEADER-PAGE-TEXT = \*UNCHANGED / \*NONE / <c-string 1..32>**

The specified information (maximum of 32 characters) is stored in the SCB for processing the system exits. The first 8 characters are printed on the header page as an uppercase line under the mailing box. Only alpha characters, digits and a number of special characters are printed on the header page (in outsize type). All other character codes are automatically replaced by the printable character '?'.  
  
*Format of the header page:*

1. User ID in outsize letters (10 lines + 2 blank lines)
2. Account number in outsize letters (10 lines + 2 blank lines)

3. Job name in outsize letters (10 lines + 2 blank lines)
4. Mailing box (address and identification field: 12 lines + 2 blank lines)
5. 'text' in outsize letters (10 lines + 2 blank lines)

*Priority sequence:*

- a. Mailing box (address and identification field: 12 lines + 2 blank lines)
- b. 'text' in outsize letters (10 lines + 2 blank lines)

**HEADER-EXIT-NUMBER = \*UNCHANGED / \*NO / <integer 1..2147483639>**

Number of header pages required.

The precise significance of this operand depends on the definitions made for the computer center. The default value is NO = 0.

**TRAILER-EXIT-NUMBER = \*UNCHANGED / \*NO / <integer 1..2147483639>**

Number of trailer pages required.

The precise significance of this operand depends on the definitions made for the computer center. The default value is NO = 0.

*Note*

The layout of the trailer page for local SPOOL is illustrated in the "SPOOL" manual [43].

**TABLE-REFERENCE-CHAR = \*UNCHANGED / \*NO / \*YES**

Specifies whether users select fonts for print page layout by means of control characters in the text. The selection can be made with the aid of TRCs (table reference characters), which reference a list of fonts from within the records. The list can either be part of the page definition (PAGEDEF) or can be declared by means of the CHARACTER-SETS operand. For a detailed explanation of how to use the TRC, see the "SPOOL" manual [43].

**TABLE-REFERENCE-CHAR = \*NO**

No font selection control characters (TRCs) are stored in the print file, or these characters are not to be evaluated.

**TABLE-REFERENCE-CHAR = \*YES**

The print file contains font selection control characters (TRCs) that are to be evaluated by SPS. Each TRC value represents a specific font that is to be used to print out the relevant record. The individual values (from X'00' to X'0F') must either be linked to the entries in the font list in PAGE-DEFINITION, in the order in which they occur, or must be explicitly linked to the fonts specified in the CHARACTER-SETS operand in the order in which they occur. Regardless of the number of different TRC values in the file, up to four fonts, specified in the form of a list, can be used to print the records. TRC values greater than X'03' (corresponding to the fourth value in the list) automatically reference the first font in the list.

**LANGUAGE-EXTENSION = \*UNCHANGED / \*NONE /\*PARAMETERS(...)**

This operand is only still available for reasons of compatibility.

**INPUT-TRAY-NUMBER = \*UNCHANGED / \*STD / \*IGNORE / <integer 1..99> / \*BY-FORMAT(...)**

Defines the paper input tray for the printer type LP65 or for the RSO printers 2030-PCL, 4011, 4812, 4813, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-EPLQ, 9000-EPSQ, 9000-PCL, 9004, 9011, 9012, 9013, 9014, 9015, 9021, 9022, 9022-200, 9025, 9026-PCL, 9026-RENO, 9097 and DJET. In the case of LP65 printers, the tray numbers 1 to 3 can be specified, whereas for RSO printers the tray numbers 1 to 99

---

can be specified.

*Only for LP65 printers:*

The paper input tray is to be selected by means of a PCL file or an entry at the printer control console. The PCL file can in turn select an input tray.

The order of priority for selecting an input tray is as follows:

1. the number of the input tray specified in PRINT-DOCUMENT
2. any selection via the PCL file specified in the PRINT-DOCUMENT command
3. any selection via the PCL file specified in the form definition in the SPOOL parameter file
4. the default values defined in the device record.

The following applies to all printers listed above:

- If a paper input tray is specified here, but is not applicable for the particular printer, the result is a printer error on most printer types.
- The PRINT-DOCUMENT command is rejected if the selected paper size is not available on the particular printer or if the paper size in the standard forms entries is larger than that for the selected paper.
- Printer resources such as prolog, epilog, DIA, member and font character files are sent before the paper input tray is selected.

**INPUT-TRAY-NUMBER = \*STD**

Paper is taken from the input tray defined in the device record of the printer in the SPOOL parameter file (DEFAULT-TRAY-NUMBER operand of the ADD-SPOOL-DEVICE statement. It is not possible to specify the paper size in this statement operand). The input tray selection is valid for the entire spoolout process, i.e. including processing of the header and trailer pages. If a standard paper size is specified, the printer selects the first input tray that contains this paper size. If this paper is not available, the printer switches to offline and the operator is prompted in the printer channel to insert the selected paper.

**INPUT-TRAY-NUMBER = \*IGNORE**

Only for RSO printers: Once this operand value is specified, RSO sends no further commands for input tray selection to the printer. The default setting of the printer is used.

**INPUT-TRAY-NUMBER = <integer 1..99>**

Number of the input tray from which the paper is taken for printing the file itself as well as the header page (HEADER-PAGE) and trailer page (TRAILER-PAGE). RSO does not check the specified value. Possible values: 1...99.

The following table shows the printer types and the corresponding maximum number of input trays (column headed "max.").

printer	Max.	printer	Max.	printer	Max.	printer	Max.
2030-PCL	2	9000	0	9002	0	9022	2
4011	2	9000-PCL	2	9003	0	9022-200	2
4812	2	9000-PRO	0	9004	3	9025	2
4813	2	9000-PS	0	9011	2	9026-PCL	4
4818-PCL	2	9000-EPFX	0	9012	2	9026-RENO	4
4821-PCL	2	9000-EPLQ	2	9013	3	9045-ANSI	0
4822-PCL	3	9000-EPSQ	2	9014	3	9046	0
4824-PCL	2	9001	0	9015	2	9645	0
4825-PCL	3	9001-31	0	9021	2	DJET	1
8121	0						

Table 68: Printer types and the corresponding maximum number of input trays

The table below specifies how RSO processes specific operand values depending on the device definition:

- INPUT-TRAY-NUMBER operand of the PRINT-DOCUMENT command specified
- Device definition of the ADD-SPOOL-DEVICE statement with the operand FORM-FEED = \*SINGLE-SHEET(DEFAULT-TRAY-NUMBER = ... )

Default in the device definition	Value of the INPUT-TRAY-NUMBER operand		
	*STD	1..99	*IGNORE
1..99	Sets default value (1) or value *LISTING (2)	Sets value (1) or value *LISTING (2)	Last tray specified is used
*IGNORE	Last tray specified is used	Sets value (1) or value *LISTING (2)	Last tray specified is used

(1) on single-sheet printers and printer type 9015 (list printer)

(2) on list printers other than printer type 9015

#### INPUT-TRAY-NUMBER = \*BY-FORMAT(...)

Defines the input tray by specifying the paper format.

**INPUT-TRAY-FORMAT = \*UNCHANGED / \*A3 / \*A4 / \*A5 / \*B4 / \*B5 / \*FOLIO / \*INVOICE / \*EXEC / \*LEGAL / \*LETTER / \*DOUBLE-LETTER / \*MONARCH / \*COMMERCIAL-10 / \*DL / \*C5 / \*MANUAL / \*A3-UNCUT / \*A4-UNCUT / \*LEDGER**

Apart from \*MANUAL, each operand value corresponds to a paper format. To ensure that the values for PAGE-SIZE and LINE-SIZE specified in the FORM operand do not exceed the permissible maximum values for the selected paper format, the values of the FORM operand are compared with the permissible

maximum values for the paper format. The table below contains the maximum permissible values for PAGE-SIZE and LINE-SIZE for each paper format and indicates which printers support the paper format. With all paper formats the sheets are taken from the first input tray which contains sheets in the given format.

<b>paper format</b>	<b>max. PAGE-SIZE</b>	<b>max. LINE-SIZE</b>	<b>applicable to printers of the type</b>
A3	165	116	9026-PCL und 9026-RENO
A4	116	82	9021, 9000-PCL, 9026-PCL, 9026-RENO, 2030-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
A5	82	58	4818-PCL, 4822-PCL, 4825-PCL, 9026-PCL and 9026-RENO
B4	143	101	2030-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4825-PCL, 9000-PCL, 9026-RENO
B5	101	71	9026-PCL and 9026-RENO
FOLIO	129	85	9026-RENO
INVOICE	85	55	9026-PCL and 9026-RENO
EXEC	105	72	9021, 9000-PCL, 9026-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
LEGAL	140	85	9021, 9000-PCL, 9026-PCL, 9026-RENO, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
LETTER	110	85	9021, 9000-PCL, 9026-PCL, 9026-RENO, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
DOUBLE-LETTER	150	117	9026-RENO
MONARCH	75	38	9021, 9000-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL und 4825-PCL
COMMERCIAL-10	95	41	9021, 9000-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
DL	86	43	9021, 9000-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
C5	90	63	9021, 9000-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL

Table 69: Paper size

---

**INPUT-TRAY-FORMAT = \*MANUAL**

Form feed is manual. You should, therefore, insert a new sheet each time a new page is to be printed or the printer prompts you to do so.

The following printers support manual feed: 9004, 9014, 9015, 9021, 9022, 9022-200, 9026-Reno, 9026-PCL, 2030-PCL, 4812, DJET, 4814-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL and 9000-PCL.

**OUTPUT-TRAY-NUMBER = \*UNCHANGED / \*STD / \*IGNORE / \*SORTER(...)/ <integer 1..99>**

Specifies the paper output tray for LP65 printers and for the RSO printers 2030-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-PCL, 9014, 9015, 9026-PCL and 9026-RENO.

**OUTPUT-TRAY-NUMBER = \*STD**

Paper is output to the default tray defined in the device record (SPOOL parameter file). The output tray selection is valid for the entire spoolout process, i.e. including processing of header and trailer pages.

*Only for LP65 printers:*

Selection of the output tray by BS2000 can be prevented by a PCL file or by making an appropriate entry at the printer control console. In these cases, the entries for OUTPUT-TRAY-NUMBER have no effect. An output tray can also be defined in the PCL file.

The order of priority for selecting an output tray is as follows:

1. the output tray number specified in PRINT-DOCUMENT, provided this is not prevented by a PCL file or an entry at the printer console.
2. any selection via the PCL file specified in the PRINT-DOCUMENT command.
3. any selection via the PCL file specified in the form definition in the SPOOL parameter file.
4. the default values defined in the device record.any selection via the PCL file specified in the PRINT-DOCUMENT command.

**OUTPUT-TRAY-NUMBER = \*IGNORE**

*Only for RSO printers.*

If this value is specified, the printer controller does not send an output tray selection code to the printer. This allows you to define the output tray in the prolog file.

**OUTPUT-TRAY-NUMBER = <integer 1..99>**

Specifies the output tray to be used for the current job. Only the values 1..3 are valid for LP65 printers.

RSO printer types	Output tray number	Output tray selection
2030-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-PCL	1	Top output tray
	2	Bottom output tray
9014	1	Stacker
	2	Front output tray
9015	1	Uncut in rear output tray
	2	Cut in rear output tray
	3	Uncut in front output tray
	4	Cut in front output tray
9026-RENO	1..20	Appropriate output tray of the sort mechanism

**OUTPUT-TRAY-NUMBER = \*SORTER(...)**

*Only for RSO printers:*

Specifies that the sort mechanism is to be used for the current job. OUTPUT-TRAY-NUMBER = \*SORTER(...) is permissible for 9026-RENO, 4822-PCL and 4825-PCL printers. This sort mechanism can be used for up to 20 output trays. It cannot be controlled by the default values defined in the device record.

**SORT-MODE = \*UNCHANGED**

The sorting mechanism is left unchanged.

**SORT-MODE = \*NO**

All pages in the document are output to the sort trays from bottom to top. Exception 9026-RENO: here the pages are output to an output tray to provide optimum access.

**SORT-MODE = \*GROUP**

Each copy of a particular page - if multiple copies are specified in PAGE-COPIES - is output to a separate sort tray. The printer does not return to the first sort tray until it is ready to start outputting the next page in sequence. When the print job is completed, each sort tray used contains a complete copy of the printed document.

*Example*

There are three pages in the file, and PAGE-COPIES=1 is specified:

Page 3	Page 3	
Page 2	Page 2	
Page 1	Page 1	
<b>Tray 1</b>	<b>Tray 2</b>	<b>Tray 3</b>

**SORT-MODE = \*COLLATE**

All copies of a page - is multiple copies are specified in PAGE-COPIES - are collected in one sort tray. The copies of the next page are placed in the next sort tray. The sort trays are used from bottom to top.

*Example*

There are three pages in the file, and PAGE-COPIES=2 is specified:

Page 1	Page 2	Page 3
Page 1	Page 2	Page 3
Page 1	Page 2	Page 3
<b>Tray 1</b>	<b>Tray 2</b>	<b>Tray 3</b>

**SORT-MODE = \*STACKER**

*Cannot be used for the 9026 Printer.*

All printed pages are output to the stacker of the sort mechanism, to a maximum of 500 pages. This mode is suitable if a single copy of a very long document is to be printed.

**SORT-MODE = \*AUTOMATIC**

*Applicable to the 9026 only.* The sort mode is selected automatically depending on the number of copies per page requested in PAGE-COPIES and the number of sort trays available. The printed pages are output unsorted, as with \*NO, if the number of copies specified in PAGE-COPIES is the same as the number of sort trays; they are grouped by document, as with \*GROUP, if the number of copies specified in PAGE-COPIES is less than the number of sort trays; and they are collected a page at a time, as with \*COLLATE, if the number of copies specified in PAGE-COPIES is greater than the number of sort trays.

*Note*

Header and trailer pages are printer resources such as prolog, epilog, DIA, member and font character file are sent before output tray selection and are therefore not included in sorting.

**TOP-OFFSET = \*UNCHANGED / \*IGNORE / <integer -255..255>**

Defines in millimeters the margin between the top of the physical sheet and the top of the print page. First the print page is positioned on the paper and only then is the lettering within the page rotated and positioned. This means that when the print page is moved with respect to the paper page the orientation of the text within the print page is ignored.

This operand is permissible only for 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-PCL, 9021,

---

9022-200 and 2030-PCL printers.

*Note*

Only TOP-OFFSET=\*IGNORE can be specified in conjunction with DOCUMENT-FORMAT=\*SPECIAL-FORMAT.

**TOP-OFFSET = \*IGNORE**

The printer controller does not set a margin between the first line and the top edge of the sheet. The preset printer value or the setting in the prolog file defines the margin that is effective when the document is printed.

**TOP-OFFSET = <integer -255..255>**

The permissible range of values is -255 to +255. Positive values move the first line down. Negative values move it up.

**LEFT-OFFSET = \*UNCHANGED / \*IGNORE / <integer -255..255>**

Defines in millimeters the margin between the left edge of the physical sheet and the left edge of the print page. First the print page is positioned on the paper and only then is the lettering within the page rotated and positioned. This means that when the print page is moved with respect to the paper page the orientation of the text within the print page is ignored.

This operand is permissible only for 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-PCL, 9021, 9022-200, 9026-PCL and 2030-PCL printers.

*Note*

Only LEFT-OFFSET=\*IGNORE can be specified in conjunction with DOCUMENT-FORMAT=\*SPECIAL-FORMAT.

**LEFT-OFFSET = \*IGNORE**

The printer controller does not set a margin between the print page and the left edge of the sheet. The preset printer value or the setting in the prolog file defines the margin that is effective when the document is printed.

**LEFT-OFFSET = <integer -255..255>**

The permissible range of values is -255 to +255. Positive values move the print page to the right. Negative values move it to the left.

**RESOURCE-DESCRIPTION = \*UNCHANGED / \*PARAMETERS(...)**

Contrary to original declarations, defines all print resources to be used for the printout in the PRINT-DOCUMENT command.

**RESOURCE-DESCRIPTION = \*PARAMETERS(...)**

**FORM-NAME = \*UNCHANGED / \*STD / <alphanum-name 1..6>**

Specifies the paper (form) to be used for output (e.g. STD, STDSF1, STDWA4). Default forms must be defined in the SPOOL parameter file for all printer types. With SHOW-SPOOL-FORMS you can output the entries to SYSOUT. The SPOOL parameter file also specifies whether header and trailer pages are to be printed.

**FORM-NAME = \*STD**

Default form.

**FORM-NAME = <alphanum-name 1..6>**

Name of the form with which the spoolout job is to be processed. A loop (or a page and format definition for

APA printers) is implicitly named when the form is specified. The associated loop (or the PAGEDEF and FORMATDEF) must be in a particular printer control file. The following table shows which printer control file must contain this loop (or the PAGEDEF and FORMDEF) for the relevant printer type:

Output device	Printer control file with loop for specified form
Printers 3337, 3338, 3339, 3348, 3349, 3365, LP-EMULATED	\$SYSSPOOL.PRFILE
Printers: 3351, 3353, 2090, 2140, 2240	\$SYSSPOOL.PRFILE or the PRFILE user specified in the USER-RESOURCES-FILE operand
APA printer	\$SYSSPOOL.SYSPRT.SPS.<version> or the SPSLIB user specified in the USER-RESOURCES-FILE operand

The loop named implicitly via the FORM-NAME operand is ignored if the LOOP-NAME operand is specified at the same time. If the FORM-NAME and LOOP-NAME operands are omitted, the file is printed out using the default form entered for the printer type.

A loop explicitly specified in the LOOP-NAME operand must have the same length as the loop record assigned to the form used.

No loops can be specified for APA printers. If page and format specifications are made in the FORM-NAME operand, these are used for printing header, trailer and message pages, even if the PAGE-DEFINITION and FORM-DEFINITION operands are explicitly assigned.

**LOOP-NAME = \*UNCHANGED / \*STD / <alphanum-name 1..3>**

Name of the loop to be loaded into the feed information buffer (VFB/FCB). The loop name must not include the characters '\$', '&' or '@'.

**LOOP-NAME = \*STD**

Feed control for the spoolout job is to be implemented with the default loop of the form used.

**LOOP-NAME = <alphanum-name 1..3>**

Name of the loop which is to control line feed. The length of the specified loop must match the length of the default loop of the form used.

A loop for feed control is needed for the HP and HP90 printers (3351, 3353, 2090, 2140) and printers of types 3337, 3338, 3339, 3348, 3349 and 3365. Loops are stored in the PRFILE resource library. If no loop is specified, the implicit entries in the FORM-NAME operand are used. If the FORM-NAME or LOOP-NAME operand is omitted, default values apply.

**ROTATION-LOOP-NAME = \*UNCHANGED / \*STD / <alphanum-name 1..3>**

*Only for HP and HP90 printers with a page rotation module.*

Specifies the loop to control output in landscape format.

The loop name must not include the characters '\$', '&' or '@'.

**ROTATION-LOOP-NAME = \*STD**

Output of rotated pages is to be controlled by the default rotation loop of the specified form or the default rotation loop R06 of the default form (if no form was specified in the PRINT-DOCUMENT command).

**ROTATION-LOOP-NAME = <alphanum-name 1..3>**

Name of the loop with which line feed for the rotated pages is to be controlled.

**CHARACTER-SETS = \*UNCHANGED / \*STD / \*POOL(...) / \*BY-EXTENDED-NAME(...) /**

**list-poss(16): <alphanum-name 1..3>**

---

Names of the fonts or font pools (only for HP and HP90 printers) to be used for output. Up to 4 fonts may be specified in the list for local SPOOL, up to 16 for RSO. For local SPOOL, the fonts must be contained in the \$SYSSPOOL.PRFILE resource library or in a user PRFILE (specified by means of the USER-RESOURCES-FILE operand).

If more than four fonts are to be used, a font pool must be specified.

If more than one font is to be used in a spoolout job, CONTROL-MODE=\*PAGE-MODE must be specified. For DOCUMENT-FORMAT=\*TEXT, only the first specified font is used for printing the (entire) file. The name of the first font and the number of specified fonts are shown in the output for the command SHOW-PRINT-JOB-STATUS JOB-IDENTIFICATION=TSN(TSN=...).

If the HEADER-LINE operand is specified, the first font specified or the font pool specified with an index for CHARACTER-SETS=\*POOL is used for the header line. The default value for CHARACTER-SETS for the form used can be displayed using SHOW-SPOOL-FORMS; the information is given in the C-S output field. With HP printers the following must be borne in mind: Systems support can specify whether the header page is printed with the default font or with the font specified in CHARACTER-SETS. This default value can be displayed by means of the command or SPSEVE statement SHOW-SPOOL-PARAMETERS; the information is given in the HEADER-PAGE: CHARACTER-SET=... output field.

#### **CHARACTER-SETS = \*STD**

The default font is selected for this printer type from the desired form. It can be displayed by means of SHOW-SPOOL-FORMS.

#### **CHARACTER-SETS = \*POOL(...)**

Only PRFILEs may contain descriptions of font pools. If a font pool is specified, the spoolout job will be processed on an HP or HP90 printer.

##### **POOL-NAME = \*UNCHANGED / <alphanum-name 1..4>**

Specifies a font pool (with a maximum of 64 fonts for an HP printer or 46 fonts for an HP90 printer) from which one or more fonts are to be used for output. All the fonts of this font pool are loaded into the font buffer when the spoolout job is executed.

##### **POOL-INDEX = \*UNCHANGED / <integer 0..64>**

Number of the font from the font pool with which the spoolout job is to be processed. The number of the font is determined by its position in the definition of the font pool. The specified font is used if POOL-INDEX is specified together with CONTROL-MODE= \*PAGE-MODE.

#### **CHARACTER-SETS = \*BY-EXTENDED-NAME(...)**

Specifies the fonts to be interpreted by SPS when the TABLE-REFERENCE-CHAR operand is used.

##### **NAME = \*UNCHANGED / <alphanum-name 1..8>**

Names of the fonts to be linked with the TRC value in the print file (each TRC value represents a specific font). Regardless of the number of different TRC values in the file, up to four fonts, specified in the form of a list, can be used to print the records. TRC values greater than X'03' (corresponding to the fourth value in the list) automatically reference the first font in the list.

#### **CHARACTER-SETS = list-poss(16): <alphanum-name 1..3>**

Names of the fonts with which the spoolout job is to be processed. For DOCUMENT-FORMAT=\*TEXT (default), only the first specified font is used for printing.

For laser printers in local SPOOL mode, a maximum of four fonts may be specified. The printer control characters for changing fonts are only interpreted if CONTROL-MODE=\*PAGE-MODE is also specified. In the case of RSO printers, a maximum of 16 fonts may be specified. Font identifiers (CSIs) in the text are only interpreted if CONTROL-MODE=\*LOGICAL is specified at the same time. The command is rejected if a list of fonts is specified in conjunction with DOCUMENT-FORMAT=\*TEXT.

---

**CHAR-SET-ATTRIBUTES = \*UNCHANGED / \*ALL / \*RESTRICTED**

*Only for RSO.*

Specifies whether all or only selected font attributes are supported for the spoolout job. Such attributes are, for instance, character type, near letter quality (NLQ), color, etc. (see command or SPSEVERE statement SHOW-SPOOL-CHARACTER-SETS). This operand does not apply to header and trailer pages.

**CHAR-SET-ATTRIBUTES = \*ALL**

All the attributes of the fonts used for printout are supported for the current spoolout job.

**CHAR-SET-ATTRIBUTES = \*RESTRICTED**

Only the following three attributes are supported:

- character type
- language
- NLQ (NEAR-LETTER-QUALITY)

**OVERLAY-RESOURCES = \*UNCHANGED / \*PARAMETERS(...)**

Specifies whether a film overlay - in the case of HP90 and 3365 printers an EFO data overlay - or an FOB data overlay is to be used for processing a spoolout job.

**ELECTRONIC-OVERLAY = \*UNCHANGED / \*NONE / <alphanum-name 2..2>**

Specifies whether a film overlay - in the case of HP90 and 3365 printers an EFO data overlay - is to be used for processing a spoolout job.

**ELECTRONIC-OVERLAY = \*NONE**

No film overlay (HP90 and 3365: no EFO data overlay) is used for output.

**ELECTRONIC-OVERLAY = <alphanum-name 2..2>**

Name of the film overlay (HP90 and 3365: EFO data overlay) to be used for processing the spoolout job (the name must be agreed with systems support).

**OVERLAY = \*UNCHANGED / \*STD / \*NONE / \*PARAMETERS(...)**

Specifies for LP65 printers whether EFO data overlays are to be used on the recto and/or verso.

They must be stored in the printer memory. The OVERLAY, TWO-SIDED and PAGE-COPIES operands are part of one and the same LP65 printer command and are consequently linked to one another. If only the OVERLAY operand is specified, SPOOL will generate default values for the other two operands.

These default values are overwritten by each value specified in a PCL file or at the printer control console.

For a summary of the possible combinations of these three linked functions, see the description of the LP65 printer type in the "SPOOL" manual [43].

**OVERLAY = \*STD**

The EFO data overlays defined in the PCL file are used.

**OVERLAY = \*NONE**

No EFO data overlays are used for output.

**OVERLAY = \*PARAMETERS(...)**

The specified EFO data overlays are used for output.

**FACE-SIDE = \*UNCHANGED / \*NONE / <integer 1..127>**

Identification number of the overlay to be used on the recto.

---

**REVERSE-SIDE = \*UNCHANGED / \*NONE / <integer 1..127>**

Identification number of the overlay to be used on the verso.

**FORMS-OVERLAY-BUFFER = \*UNCHANGED / \*NONE / <alphanumeric-name 1..4>**

Specifies whether an FOB data overlay is to be used for processing the spoolout job (see the “SPOOL” manual [43] for a description of an overlay).

**FORMS-OVERLAY-BUFFER = \*NONE**

o FOB data overlay is used for output.

**FORMS-OVERLAY-BUFFER = <alphanumeric-name 1..4>**

Name of the overlay to be used for processing the spoolout job.

If an overlay is specified, the file is printed out on an HP or HP90 printer.

Use of an overlay for the spoolout job is indicated in the output of the command SHOW-PRINT-JOB-STATUS JOB-IDENTIFICATION=TSN(TSN=...).

**PAGE-DEFINITION = \*UNCHANGED / \*STD / <integer 1..50000> / <alphanumeric-name 1..8>**

Specifies which page definition is to be used for output on LP65 or APA printers.

**PAGE-DEFINITION = \*STD**

The standard definition specified in the SPSLIB is to be used (see the table of SPSLIB standard definitions in the “SPOOL” [43] manual).

**PAGE-DEFINITION = <integer 1..50000>**

Only for LP65 printers:

Number of the PCL file with which the print file is to be output.

**PAGE-DEFINITION = <alphanumeric-name 1..8>**

The page definition with the specified name is to be used. This must be in the SPSLIB.

**i** The first two characters of the specified name must be “P1”. If they are not, the command is rejected.

**FORM-DEFINITION = \*UNCHANGED / \*STD / <alphanumeric-name 1..8>**

Specifies which format definition is to be used for output on APA printers.

**FORM-DEFINITION = \*STD**

The default definition specified in the SPSLIB is to be used.

**FORM-DEFINITION = <alphanumeric-name 1..8>**

The format definition with the specified name is to be used. This must be in the SPSLIB.

**i** The first two characters of the specified name must be “F1”. If they are not, the command is rejected.

**USER-RESOURCES-FILE = \*UNCHANGED / \*STD / <filename 1..44 without-gen-vers>**

Specifies a user file containing all the resources required for output on different printer types: user-defined loops, fonts, overlays, font pools, code translation tables, and SPS data stream definitions. The following can be specified:

- a user PRFILE containing loops, fonts, overlay entries (FORMS-OVERLAY-BUFFER operand) and font pool entries (CHARACTER-SETS operand)
- a user SPSLIB containing the PAGEDEFs (PAGE-DEFINITION operand), FORMDEFs (FORM-DEFINITION operand), fonts, page segments, overlays and raster image data

- a user RSOFIL (only for RSO) containing loops

**USER-RESOURCES-FILE = \*STD**

If no user PRFILE, SPSLIB or RSOFIL is specified, the information is taken from the following files: \$SYSSPOOL.PRFILE, \$SYSSPOOL.SYSPRT.SPS.<version> or \$SYSSPOOL.RSOFIL, respectively.

The required resources are taken from \$SYSSPOOL.PRFILE, \$SYSSPOOL.SYSPRT.SPS.<version> or \$SYSSPOOL.RSOFIL.

**USER-RESOURCES-FILE = <filename 1..44 without-gen-vers>**

Name of a user PRFILE, SPSLIB or RSOFIL, which may contain a catalog ID and a user ID. SPOOL uses this file name with the suffix .PRFILE, .SPSLIB or .RSOFIL. The string can contain up to 28 characters without the catalog ID and user ID, to ensure that this user file can be called from any ID.

If the file name is specified without a user ID, the file is searched for under the user ID of the caller first, then under SYSSPOOL. If it is not found, the command is rejected. If a user ID is specified, the file is searched for under this ID only.

*Example 1*

```
PRINT-DOCUMENT DATEI , USER-RESOURCES-FILE=$XX.XX
```

A search is carried out for the \$XX.XX.PRFILE file. If the file is not found, the command is rejected.

*Example 2*

If the catalog ID is specified, the search is limited to the specified subset:

```
PRINT-DOCUMENT DATEI , USER-RESOURCES-FILE=:A:XXXXX
```

The file :A:\$userid.XXXXX.PRFILE is searched for. If the relevant file is not found, the search for the file :A:\$SYSSPOOL.XXXXX.PRFILE is continued. If this file is not found, the command is rejected.

*Example 3*

```
PRINT-DOCUMENT DATEI , USER-RESOURCES-FILE=:A:$XX.XXXXX
```

The file :A:\$XX.XXXXX.PRFILE is searched for. If it is not found, the command is rejected.

If the file is on an exported PVS (EXPORT-PUBSET command), all spoolout jobs that require this PVS are placed in the KEEP queue. When the PVS becomes available again (IMPORT-PUBSET command), the spoolout jobs are restarted.

**TRANSLATION-TABLE = \*UNCHANGED / \*NONE / \*PARAMETERS(...)**

Specifies whether a code translation table is to be used for processing the spoolout job. The code translation table is necessary if the default escape character 'FF' is to be replaced by a random character.

**TRANSLATION-TABLE = \*NONE**

No code translation table is used.

**TRANSLATION-TABLE = \*PARAMETERS(...)**

A code translation table is used.

**NAME = \*UNCHANGED / <alphanum-name 1..8>**

Name of the code translation table to be used for processing the spoolout job.

---

**FILE = \*UNCHANGED / \*SYSTEM / <filename 1..44 without-gen-vers>**

The specified code translation table is by default taken from the \$SYSSPOOL.PRFILE (\*SYSTEM) file; for RSO printers a user RSOFILE can also be specified.

**RESOURCES-LOCATION = \*UNCHANGED / \*STD / \*HOME / \*SERVER**

*Only for Dprint.* Specifies, when the optional Distributed Print Services subsystem (Dprint) is used, whether the resources of the client or those of the server are to be used for printing the document.

**RESOURCES-LOCATION = \*STD**

The value from the GEN record of the SPOOL parameter file is to be used.

**RESOURCES-LOCATION = \*HOME**

The print job is to be executed using the print resources defined on the client system. In this case, an extract containing all the required print resources is taken from the resource file (i.e. a print resources container is created) and transferred to the selected server.

**RESOURCES-LOCATION = \*SERVER**

The print job is to be executed using the print resources defined on the server system. In this case, no print resources container is created and transferred.

**TO-PRINTER = \*UNCHANGED / \*PARAMETERS(...)**

Modifying the original declarations specifies the requested target devices for the print output in the PRINT-DOCUMENT command.

**TO-PRINTER = \*PARAMETERS(...)**

**PRINTER-NAME = \*UNCHANGED / \*STD / <alphanum-name 1..8> / \*IPP(...)**

Specifies the requested target printer of the print job. You can specify a distributed local printer pool, a nondistributed local printer pool, an RSO printer pool or an RSO printer.

*If you specify a printer pool:*

The job is output on any printer in the specified device pool. The pool must be defined in the SPOOL parameter file and can contain up to 16 RSO devices or 16 local SPOOL devices, but not both at the same time.

Device pools are managed by means of the SPSEVE statements ADD-, MODIFY-, REMOVE-, and SHOW-PRINTER-POOL (see the "SPSERVE" manual [44]).

The spoolout job is rejected if:

- no printer type from the device pool is assigned in the PRINT-DOCUMENT command (see the SHOW-SPOOL-FORMS command or SPSEVE statement)
- the ELECTRONIC-OVERLAY operand is specified.

Please bear in mind that the pool can contain various types of devices: if the file to be printed contains control characters that are only interpreted by a certain printer type, a printer of this type should be specified (implicitly) in the MODIFY-PRINT-JOB-ATTRIBUTES command.

**PRINTER-NAME = \*STD**

The spoolout job is to be processed on the default device type specified in the SPOOL parameters (PRINT-CMD-DEFAULTS).

**PRINTER-NAME = <alphanum-name 1..8>**

*Only for RSO.*

Symbolic name of the RSO device on which the spoolout job is to be processed.

**PRINTER-NAME = \*IPP(...)**

*Only for RSO.*

The spoolout job is to be processed on an IPP printer.

**URL = \*UNCHANGED / <c-string 1..1023 with-low>**

Specifies the Web address of the IPP printer.

**FQDN = \*UNCHANGED / \*NONE / <c-string 1..1023 with-low>**

Fully-qualified name of the domain to which the IPP printer is assigned.

**PRINTER-TYPE = \*UNCHANGED / \*ANY / \*HP-PRINTER / \*LP65-PRINTER / \*APA-PRINTER**

Specifies which printer type is to process the print job. Only local printer types may be specified.

**PRINTER-TYPE = \*ANY**

A specific printer type is not requested. In this case, the SPOOL subsystem automatically determines the permitted printer types that can process the user request. \*ANY must be specified for output on RSO printers.

**PRINTER-TYPE = \*HP-PRINTER**

The spoolout job is to be processed on an HP or HP90 printer.

\*HP-PRINTER includes the following printer types: 2090/2140/2240(HP90). The control characters for HP and HP90 laser printers are identical; a spoolout job for an HP printer can be processed on an HP90 printer and vice versa.

Selection of the printer type is affected by whether the CONTROL-MODE operand is specified at the same time:

Printer selection	CONTROL-MODE = *PAGE-MODE (default value)	CONTROL-MODE =*PAGE-MODE (CONTROL-TYPE=*HP)
<b>PRINTER-TYPE = *ANY</b>	Output can take place to all printer types	Output can take place to HP or HP90 printers. Other control characters are converted to HP/HP90 control characters.
	The following also applies for HP-/HP90 printers: Conversion of the OVERPRINT functions to the LINE-MERGE function.	
<b>PRINTER-TYPE = *HP-PRINTER</b>	Output can only be processed on HP and HP90 printers. The OVERPRINT function is converted to the LINE-MERGE function.	
	Restrictions for PRFILE: The file may not contain the character X'FF'.	Support of the HP-specific control characters. Restriction: The file may only contain the character X'FF' as an escape character when control character evaluation is enabled (CHAR-SET-ATTRIBUTES = *ALL)

*Note for HP/HP90 printers*

If the entries in MODIFY-PRINT-JOB-ATTRIBUTES specify output to an HP or HP90 laser printer, a PRFILE must be available. If they are not, the command is rejected. If there is no HP/HP90 available in an installation, or only devices with insufficient configurations (not enough fonts, no graphics buffer for FOBs or no page rotation module, for example), the jobs can only be output to replay tape. Systems support can run the SHOW-SPOOL-JOB-STATUS command to obtain information on these jobs.

---

**PRINTER-TYPE = \*LP65-PRINTER**

The spoolout job is to be processed on an LP65 printer.

**PRINTER-TYPE = \*APA-PRINTER**

The spoolout job is to be processed on a 2050-APA-PRINTER, 2090-APA-PRINTER or 2090-TWIN-PRINTER.

**REDIRECTION-ALLOWED = \*UNCHANGED / \*STD / \*YES / \*NO**

Specifies whether a device administrator can redirect the spoolout job to a different printer. This does not affect the redirection of jobs by the user or by systems support.

**REDIRECTION-ALLOWED = \*STD**

Means YES for RSO print jobs. SPOOL print jobs are ignored.

**REDIRECTION-ALLOWED = \*YES / \*NO**

Can only be specified for RSO print jobs, not for SPOOL print jobs.

**CLUSTER-NAME = \*UNCHANGED / <alphanum-name 1..8>**

Specifies the cluster to which the print job is to be transferred.

*Only for Dprint:* To transfer the print job to a UNIX-based system, a cluster name defined in the Dprint configuration file must be specified. The remote clusters defined in the Dprint configuration file can be displayed by means of the SHOW-DPRINT-REMOTE-CLUSTERS command (for a detailed explanation, see the "Dprint" manual [10]).

Use of the CLUSTER-NAME operand is restricted to one print job from the local cluster or from the local SPOOL to a remote cluster. As soon as the remote cluster has accepted the print job, the resources of the remote cluster become effective. From this time the CLUSTER-NAME operand can no longer be applied to the redirected print job.

**OUTPUT-FORMAT = \*UNCHANGED / \*NONE / <c-string 1..63 with-low>**

Specifies which printer language is to be used for the print job.

**OUTPUT-FORMAT = \*NONE**

No output format was specified. The format of the document is compatible with the printer language of the printer selected. If a cluster was specified in the CLUSTER-NAME operand, the value of the DOCUMENT-FORMAT operand is forwarded to the UNIX-based system.

**OUTPUT-FORMAT = <c-string 1..63 with-low>**

Specifies a specific content type (e.g. HP\_LASERJET) for the document to be printed. The document format is incompatible with the format which is supported by the printer. Only when a cluster is supported in the CLUSTER-NAME operand is it permissible to specify OUTPUT-FORMAT=<c-string 1..63 with-low>. In this case the value of the OUTPUT-FORMAT operand is transferred to the UNIX-based system.

**VIRTUAL-PRINTER = \*UNCHANGED / \*STD / \*ALLOWED / \*NOT-ALLOWED / MUST(...)**

This operand enables the print job to be forwarded for processing to an application via a virtual printer.

**VIRTUAL-PRINTER = \*STD**

The virtual printer which is to receive the print job is determined through the SPOOL parameter file. Assignment of the print job to a virtual printer is given precedence. If no virtual printer is active when the print job is added to the list of print jobs, the print job is assigned to a real printer.

**VIRTUAL-PRINTER = \*ALLOWED**

This print job may be forwarded to an application program via a virtual printer. What virtual printer receives the

---

print job is only determined when the job is assigned. Assignment of the print job to a virtual printer is given precedence. If no virtual printer is active when the print job is added to the list of print jobs, the print job is assigned to a real printer.

**VIRTUAL-PRINTER = \*NOT-ALLOWED**

This print job should not be transferred to an application program via a virtual device.

**VIRTUAL-PRINTER = \*MUST(...)**

This print job is transferred to the virtual printer specified by the parameters in the brackets. If the printer's supervisor task is inactive, the print job waits.

**NAME = <alphanum-name 1..8>**

Specifies the device name which is linked to the supervisor. This device name appears in the device entry of the SPOOL parameter file.

**STRING = \*NONE / <c-string 1..32>**

Passes a character string on to the application program.

**ADDITIONAL-COPIES = \*UNCHANGED / <integer 0..255>**

Specifies how many additional times the file is to be printed.

The entry can also be made in parentheses. Each additional printout has its own header page. Default: 0 (no additional printouts).

**LOCK-FILE = \*UNCHANGED / \*YES / \*NO**

Specifies whether the file is to be protected as long as the spoolout job is in the wait state (TYPE 4, see output of the SHOW-PRINT-JOB-STATUS command). During this time the file can only be read. As a rule, tape files are never locked. During processing of the spoolout job (TYPE 5, see output of the SHOW-PRINT-JOB-STATUS command), the file is protected irrespective of the setting of this operand.

A spoolout job is created even if the file to be output is reserved by a SECURE-RESOURCE-ALLOCATION command. This reservation must, however, be canceled by the time the spoolout job is processed; otherwise, the job is not executed. The file to be output is locked until the end of the session if the LOCK-FILE=\*YES operand is specified in the PRINT-DOCUMENT command and the job cannot be executed owing to reservation.

**LOCK-FILE = \*YES**

The file is protected while the spoolout job is in the wait state. LOCK-FILE=\*YES is ignored if one of the values \*OMF, \*SYSLST or \*SYSOUT is specified for the operand at the same time. A PRINT-DOCUMENT command for a library element with LOCK=\*YES is rejected. File protection offered by LOCK-FILE=\*YES remains in force even if the spoolout job is not processed until the next system run.

**LOCK-FILE = \*NO**

The file is not protected while the spoolout job is in the wait state. The file can be deleted or modified before processing of the spoolout job commences.

LOCK-FILE=\*NO is ignored for temporary files.

**DELETE-AFTER-PRINT = \*UNCHANGED / \*NO / \*YES(...) / \*DESTROY(...)**

Specifies whether the file is to be deleted after output has terminated and, if so, whether its catalog entry and the data are to be overwritten with X'00..0'. Default: the file is not deleted after printing and not overwritten with binary zeros. The user must have write access to the file. If the file to be output belongs to a file generation group (see the FROM-FILE operand), the DELETE-AFTER-PRINT operand is ignored. If a spoolout job is used to print several elements of a PLAM library with INPUT-SECTION(...), the DELETE-AFTER-PRINT operand is set to \*NO (i.e. suppressed). This operand may not be specified in conjunction with \*SYSLST, SYSLSTnn or \*SYSOUT.

**DELETE-AFTER-PRINT = \*NO**

The file is not to be deleted after printing (unless it is an EAM or system file).

### **DELETE-AFTER-PRINT = \*YES(...)**

The file is to be deleted as soon as output has been completed.

#### **LINE-TRUNCATION = \*UNCHANGED / \*STD / \*DELETE-FILE / \*KEEP-FILE**

Specifies what happens if lines are truncated.

#### **LINE-TRUNCATION = \*STD**

The default value from the SPOOL parameter is valid. You can display this value by means of the SHOW-SPOOL-PARAMETERS command or SPSEIVE statement (field: ERROR-PR=(TRUNC=)).

#### **LINE-TRUNCATION = \*DELETE-FILE**

Processing of the spoolout job continues (i.e. DELETE-AFTER-PRINT=\*YES is executed). An appropriate warning is printed on the trailer page.

#### **LINE-TRUNCATION = \*KEEP-FILE**

Processing of the spoolout job is continued, but the file is not subsequently deleted.

### **DELETE-AFTER-PRINT = \*DESTROY(...)**

Not for EAM and cataloged system files.

Specifies that once the file has been printed both its catalog entry and the data itself are to be overwritten with binary zeros.

#### **LINE-TRUNCATION = \*UNCHANGED / \*STD / \*DELETE-FILE / \*KEEP-FILE**

Specifies what happens if lines are truncated.

#### **LINE-TRUNCATION = \*STD**

The default value from the SPOOL parameter is valid. You can display this value by means of the SHOW-SPOOL-PARAMETERS command or SPSEIVE statement (field: ERROR-PR=(TRUNC=)).

#### **LINE-TRUNCATION = \*DELETE-FILE**

Processing of the spoolout job continues (i.e. DELETE-AFTER-PRINT=\*DESTROY is executed). An appropriate warning is printed on the trailer page.

#### **LINE-TRUNCATION = \*KEEP-FILE**

Processing of the spoolout job is continued, but neither the catalog entry nor the data of the file itself is overwritten with binary zeros.

## **Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error Guaranteed messages: SCP0894, SCP1032, SCP1031
2	0	SCP0897	TSN not found
2	0	SCP0930	PRFILE not available
2	0	SCP1000	JV processing error. MONJV ignored Guaranteed message: SCP1000
2	0	SCP1056	Error releasing the file
2	0	SCP1058	DELETE-FILE entry not permitted

2	0	SCP1061	Error during server access
2	0	SCP1069	Output restart from the beginning
2	0	SCP1070	Job cannot be released
2	0	SCP1076	No information available on this job
2	0	SPS0455	JVS error in SPOOL MONJV Guaranteed message: SPS0455
2	0	SPS0469	JV is already being used or has been destroyed Guaranteed message: SPS0469
2	0	SPS0464	JV subsystem not loaded
2	0	SPS0870	SLOT/SCB inconsistency
	1	CMD0202	Syntax error
	1	SCP0973	Semantic error
	32	SCP0974	System error. Command rejected
	64	SCP0975	No authorization for command Guaranteed message: SCP0972
	64	SCP0976	Invalid operand value Guaranteed messages: SCP0858, SCP0995, SCP0997, SCP1030, SCP1028, SCP1029
	128	SCP0896	DPRINTCL not loaded Guaranteed message: SCP0896
	128	SCP0996	JV subsystem not available Guaranteed message: SCP0996
	128	SCP1049	RSO not loaded
	128	SPS0266	SPOOL subsystem in the wait state

## Notes

1. If a value of an operand originally specified in the PRINT-DOCUMENT command is modified, this modification has an effect not only on the operand itself but also on the structures which are subordinate to this operand: All suboperands within the structure are preset with default values.
2. Jobs which were issued in an earlier SPOOL run < V3.0 and were taken over by means of a replay tape or warm startup, and print jobs which were initiated by the WRITE-SPOOL-TAPE command cannot be modified.
3. In the event of a command error (syntax, semantics or inadmissible modifications), the requested modifications are ignored.
4. The table below shows which operand modifications can be performed depending on the status of the print job, where the symbols used have the following meaning:
  - x Modification permitted for the operand and all suboperands (operands which are included in substructures).
  - Modification not permitted

(\*) If the job is active on a synchronous virtual device, the application running under control of this virtual device can modify the job.

Operands of MOD-PRINT-JOB-ATTR	Print job statuses						
	WFT	FT	WP	PRE	WT	ACT	KP
DOCUMENT-FORMAT	x	x	x	-	x	(*)	x
PRINT-JOB-CONTROL	x	x	x	-	x	(*)	x
LAYOUT-CONTROL	x	x	x	-	x	(*)	x
RESOURCE-DESCRIPTION	x	x	x	-	x	(*)	x
TO-PRINTER	x	x	x	-	x	(*)	x

Table 70: Changes with MODIFY-PRINT-JOB-ATTRIBUTES contingent upon the job status

5. The file attributes must remain unchanged between acceptance of the print job (PRINT-DOCUMENT command) and termination of the output (actual output on the device). The MODIFY-PRINT-JOB-ATTRIBUTES command consequently ignores any change to the file attributes.
6. When at least one member of the FAMILY is active in the case of FAMILY processing, any modification of the print job is rejected.
7. Print jobs in the KEEP status remain in the KEEP status after being modified even if they have been redirected to another server by means of automatic server selection.
8. When a document has been partially printed and the corresponding print job is interrupted, any modification which includes a modification to the layout results in the print job being repeated from the start of the document.
9. Please refer to the "Dprint" manual [10] for Dprint-specific information for Dprint jobs.

---

## 4.45 MODIFY-PRINTER-OUTPUT-STATUS

Change administration parameters for printers

<b>Component:</b>	SPOOL
<b>Functional area:</b>	Controlling spoolout job
<b>Domain:</b>	SPOOL-PRINT-ADMINISTRATION
<b>Privileges:</b>	STD-PROCESSING OPERATING PRINT-SERVICE-ADMINISTRATION SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The MODIFY-PRINTER-OUTPUT-STATUS command modifies the administration parameters for the specified printer.

If the default value \*UNCHANGED is specified then no changes are made to the initial value of the parameter in question.

**i** Starting with BS2000 OSD/BC V11.0, printers that are connectable to the channel are no longer supported. However, print jobs for “local” printers defined in SPOOL are still accepted and can be forwarded to real, LAN-connected high-performance printers by using a SPOOL add-on product (e.g. ROUTER by Océ).  
The state of the printer in BS2000 has no effect on this forwarding. The MODIFY-PRINTER-OUTPUT-STATUS command is therefore now only relevant for RSO printers and virtual devices. For local printers, it is still accepted but has no effect.

#### *Restrictions for APA printers*

The following operands must not be specified for APA printers:

- FORMS-OVERLAY
- PRINT-SAMPLE
- ROTATION
- TWO-UP-PROCESSING
- FORMS-OVERLAY-BUFFER
- CHARACTER-SET-NUMBER

## Privileged functions

RSO device administrators and spool and cluster administrators can modify the administration parameters of printers that they manage.

For more information on these user groups see the manuals “RSO” [32], “SPOOL” [43] and “Dprint” [10].

The following operands can only be used with the privilege TSOS or OPERATING:

- DEVICE-NAME=\*ANY-LOCAL-PRINTER(...)
- ROTATION
- FORMS-OVERLAY-BUFFER
- CHARACTER-SET-NUMBER

## Format

### MODIFY-PRINTER-OUTPUT-STATUS

**DEVICE-NAME** = \*ANY-LOCAL-PRINTER(...) / \*RSO-PRINTER(...)

## Operands

### DEVICE-NAME =

Output devices for which administration parameters are to be modified.

### DEVICE-NAME = \*ANY-LOCAL-PRINTER(...)

Administration parameters are to be modified for local printers which will be defined in greater detail below.

#### NAME = list-poss(8): <alphanum-name1..8>

Mnemonic or logical device names of the printers whose assignment parameters are to be modified for waiting spoolout jobs. A maximum of eight device names may be specified.

#### DESTINATION = \*UNCHANGED / \*NONE / \*STD / \*ADD(...) / \*REMOVE(...) /

#### list-poss(16): \*CENTRAL / <alphanum-name 1..8>

Indicates whether and how the assignment of the specified local printers to a pool is modified.

#### DESTINATION = \*NONE

The list of local pools for the specified printers is cleared, i.e. spoolout jobs for these pools are no longer processed.

#### DESTINATION = \*STD

Standard pools for local printers.

The list of assigned pools for local printers is replaced by a list of standard pools containing the specified local printers (SPOOL parameter file).

#### DESTINATION = \*ADD(...)

Pools for local printers which are to be added to an existing list of local pools to which spoolout jobs for the specified printers can be directed.

#### DESTINATION-LIST = list-poss(16): \*CENTRAL / <alphanum-name 1..8>

List of pools for local printers to be added.

#### DESTINATION = \*REMOVE(...)

Pools for local printers to be removed from an existing list of local pools to which spoolout jobs for the specified printers can be directed.

#### DESTINATION-LIST = list-poss(16): \*CENTRAL / <alphanum-name 1..8>

List of pools for local printers to be removed.

#### DESTINATION = list-poss(16): \*CENTRAL / <alphanum-name 1..8>

List of local pools to which spoolout jobs for the specified printers can be directed.

#### FORM-NAME = \*UNCHANGED / \*ALL / \*STD / \*EQUIVALENT(...) / \*EXCEPT(...) /

#### \*EQUIVALENT-EXCEPT(...) / \*ADD(...) / \*REMOVE(...) / list-poss(16): <alphanum-name 1..6>

Names of the forms with which spoolout jobs can be processed on the specified printers.

#### FORM-NAME = \*ALL

Spoolout jobs can be processed on the specified printers irrespective of the form used.

#### FORM-NAME = \*STD

Spoolout jobs can be processed on the specified printers with all the equivalent forms permitted in the SPOOL parameter file for the specified printers.

#### FORM-NAME = \*EXCEPT(...)

Forms with which spoolout jobs cannot be processed on the specified printers.

---

**FORMS-LIST = list-poss(16): <alphanum-name 1..6>**

List of excluded forms.

**FORM-NAME = \*EQUIVALENT(...)**

Spoolout jobs can be processed on the specified printers with equivalent forms. Printout is not interrupted when the form changes.

**EQUIVALENT-FORMS = \*ALL / list-poss(16): <alphanum-name 1..6>**

List of equivalent forms.

**FORM-NAME = \*EQUIVALENT-EXCEPT(...)**

Equivalent forms with which spoolout jobs cannot be processed on the specified printers.

**FORMS-LIST = list-poss(16): <alphanum-name 1..6>**

List of excluded equivalent forms.

**FORM-NAME = \*ADD(...)**

Forms to be added to an existing list of forms with which spoolout jobs can be processed on the specified printers.

**FORMS-LIST = list-poss(16): <alphanum-name 1..6>**

List of forms to be added.

**FORM-NAME = \*REMOVE(...)**

Forms which are to be removed from an existing list of forms with which spoolout jobs can be processed on the specified printers.

**FORMS-LIST = list-poss(15): <alphanum-name 1..6>**

List of forms to be removed.

**FORM-NAME = list-poss(16): <alphanum-name 1..6>**

List of forms with which spoolout jobs can be processed on the specified printers. If there is already a (positive) list of forms for the specified printers it is replaced by this new list. Each time the form changes printout is interrupted and a message is displayed at the console.

**FORMS-OVERLAY = \*UNCHANGED / \*ALL / \*NONE / \*ONLY / \*EXCEPT(...) / \*ADD(...) / \*REMOVE(...) / list-poss(16): <alphanum-name 2..2>**

Film overlays with or without which spoolout jobs can be processed on the specified laser printers.

**FORMS-OVERLAY = \*ALL**

Spoolout jobs can be processed on the specified laser printers irrespective of the film overlays specified.

**FORMS-OVERLAY = \*NONE**

Only spoolout jobs which do not use film overlays can be processed on the specified printers.

**FORMS-OVERLAY = \*ONLY**

Only spoolout jobs which use a film overlay (any) can be processed on the specified printers.

**FORMS-OVERLAY = \*EXCEPT(...)**

Film overlays with which spoolout jobs cannot be processed on the specified laser printers.

**FORMS-OVERLAY-LIST = list-poss(16): <alphanum-name 2..2>**

List of excluded film overlays.

---

**FORMS-OVERLAY = \*ADD(...)**

Film overlays to be added to an existing list of overlays with which spoolout jobs can be processed on the specified laser printers.

**FORMS-OVERLAY-LIST = list-poss(16): <alphanum-name 2..2>**

List of film overlays to be added.

**FORMS-OVERLAY = \*REMOVE(...)**

Film overlays which are to be removed from an existing list of film overlays with which spoolout jobs can be processed on the specified laser printers.

**FORMS-OVERLAY-LIST = list-poss(15): <alphanum-name 2..2>**

List of film overlays to be removed.

**FORMS-OVERLAY = list-poss(16): <alphanum-name 2..2>**

List of film overlays with which spoolout jobs can be processed on the specified laser printers.

If there is already a (positive) list of film overlays for the specified printers, it is replaced by this new list.

**HOST-NAME = \*UNCHANGED / \*ALL-CLUSTERS / \*LOCAL-CLUSTER / \*HOME / \*EXCEPT(...) / \*ADD(...)  
/ \*REMOVE(...) / list-poss(16): <name 1..8> / <c-string 1..8 with-low>**

Specifies for a local printer the hosts from which print jobs are processed.

**HOST-NAME = \*ALL-CLUSTERS**

Print jobs from all hosts are processed on the specified printer.

**HOST-NAME = \*LOCAL-CLUSTER**

Print jobs from all hosts in the local cluster are processed on the specified printer.

**HOST-NAME = \*HOME**

Only print jobs from the local host are processed on the specified printer.

**HOST-NAME = \*EXCEPT(...)**

Print jobs from all hosts except those specified in the EXCEPT list are processed on the specified printer.

**HOST-LIST = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

BCAM names of the hosts whose jobs are not to be processed.

**HOST-NAME = \*ADD(...)**

The specified hosts are added to the printer's existing ACCEPT list of hosts from which print jobs are processed.

**HOST-LIST = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

BCAM names of the hosts to be added.

**HOST-NAME = \*REMOVE(...)**

The specified hosts are removed from the printer's existing ACCEPT list of hosts from which print jobs are processed.

**HOST-LIST = list-poss(15): <alphanum-name 1..8> / <c-string 1..8 with-low>**

BCAM names of the hosts to be removed.

**HOST-NAME = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

Only print jobs from hosts in this ACCEPT list are processed on the specified printer.

---

**PRINT-SAMPLE = \*UNCHANGED / \*NO / \*YES**

Indicates whether a print sample is to be produced for the first spoolout job to arrive for printout with modified assignment parameters. For printers of type LP65 (page printers) PRINT-SAMPLE=\*YES is rejected.

**TRACE = \*UNCHANGED / \*NO / \*YES (...)**

For APA printers only; switches trace on or off.

**TRACE = \*YES (...)**

**LEVEL = \*COMPLETE / \*STATUS / \*BLOCK-CONTROL**

Specifies which files should be written to the trace file.

**LEVEL = \*COMPLETE**

Default value for local SPOOL devices. The trace should be logged in full, the trace file is \$SYSSPOOL.SYSTRC.SPOOL.<dev-name>.yyy-mm-dd.hh-mm (see also the description of the trace data in the "SPOOL" manual [43]).

**LEVEL = \*STATUS**

For APA jobs only: trace and status data should be logged.

**LEVEL = \*BLOCK-CONTROL**

For APA jobs only: trace, status and block control data should be logged.

**DEVICE-NAME = \*RSO-PRINTER(...)**

Administration parameters are to be modified for RSO printers to be defined in detail below.

**NAME = list-poss(8): <alphanum-name 1..8>**

Names of active RSO printers whose assignment parameters are to be modified for waiting spoolout jobs. A maximum of eight names may be specified.

**DESTINATION = \*UNCHANGED / \*NONE / \*STD / \*ADD(...) / \*REMOVE(...) /**

**list-poss(16): <alphanum-name 1..8>**

Indicates whether and how the assignment of the specified RSO printers to a pool is modified.

**DESTINATION = \*NONE**

The list of RSO pools for the specified printers is cleared, i.e. spoolout jobs for these RSO pools are no longer processed.

**DESTINATION = \*STD**

Standard RSO pools.

The list of assigned pools is replaced by a list of standard pools containing the specified RSO printers (SPOOL parameter file).

**DESTINATION = \*ADD(...)**

RSO pools which are to be added to an existing list of RSO pools to which spoolout jobs for the specified printers can be directed.

**DESTINATION-LIST = list-poss(16): <alphanum-name 1..8>**

List of RSO pools to be added.

**DESTINATION = \*REMOVE(...)**

RSO pools to be removed from an existing list of RSO pools to which spoolout jobs for the specified printers can be directed.

**DESTINATION-LIST = list-poss(16): <alphanum-name 1..8>**

List of RSO device pools to be removed.

---

**DESTINATION = list-poss(16): <alphanum-name 1..8>**

List of RSO pools to which spoolout jobs for the specified printers can be directed.

**FORM-NAME = \*UNCHANGED / \*STD / \*EQUIVALENT(...) / \*EQUIVALENT-EXCEPT(...) / <alphanum-name 1..6> / \*ADD(...) / \*REMOVE(...)**

Defines the forms with which spoolout jobs can be processed on the specified printers.

**FORM-NAME = \*STD**

Spoolout jobs can be processed with all the equivalent forms permitted in the SPOOL parameter file for the relevant RSO printers.

**FORM-NAME = \*EQUIVALENT(...)**

Spoolout jobs can be processed on the specified printers with equivalent forms.

**EQUIVALENT-FORMS = \*ALL / list-poss(16): <alphanum-name 1..6>**

Spoolout jobs can be processed on the specified printers with all the equivalent forms or with one of the equivalent forms contained in the list.

**FORM-NAME = \*EQUIVALENT-EXCEPT(...)**

Equivalent forms with which spoolout jobs cannot be processed on the specified printers.

**FORMS-LIST = list-poss(16): <alphanum-name 1..6>**

List of excluded equivalent forms.

**FORM-NAME = list-poss(16): <alphanum-name 1..6>**

Forms with which spoolout jobs can be processed on the specified printers.

**FORM-NAME = \*ADD(...)**

Forms to be added to an existing list of forms with which spoolout jobs can be processed on the specified printers.

**FORMS-LIST = list-poss(16): <alphanum-name 1..6>**

List of forms to be added.

**FORM-NAME = \*REMOVE(...)**

Forms which are to be removed from an existing list of forms with which spoolout jobs can be processed on the specified printers.

**FORMS-LIST = list-poss(15): <alphanum-name 1..6>**

List of forms to be removed.

**PRINT-SAMPLE = \*UNCHANGED / \*NO / \*YES**

Indicates whether a print sample is to be produced.

In RSO mode a print sample can be requested for public devices which print on continuous paper (not page printers).

**TRACE = \*UNCHANGED / \*NO / \*YES**

Indicates whether a TRACE file is to be created.

**ALLOWED-ACCESSES = \*UNCHANGED / list-poss(4): <c-string 1..4>**

This operand defines which accesses are allowed. It is permitted for any RSO printer.

**ALLOWED-ACCESSES = \*UNCHANGED**

The current access mechanism is left unchanged.

---

**ALLOWED-ACCESSES = list-poss(4): <c-string 1..4>**

List of allowed accesses. The following values are possible:

C`RSO` RSO print jobs can be assigned to the active printer.

C`UTM` UTM print jobs can be assigned to the active printer.

**USER-IDENTIFICATION = \*UNCHANGED / \*ALL / \*EXCEPT(...) / \*ADD(...) / \*REMOVE(...) / list-poss(16): <name 1..8> / <c-string 1..8 with-low>**

User IDs under which spoolout jobs can be processed on the specified printers.

**USER-IDENTIFICATION = \*ALL**

Spoolout jobs can be processed on the specified printers under all user IDs.

**USER-IDENTIFICATION = \*EXCEPT(...)**

User IDs under which spoolout jobs cannot be processed on the specified printers.

**USER-IDENT-LIST = list-poss(16): <name 1..8> / <c-string 1..8 with-low>**

List of excluded user IDs.

**USER-IDENTIFICATION = \*ADD(...)**

User IDs to be added to an existing list of user IDs under which spoolout jobs can be processed on the specified printers.

**USER-IDENT-LIST = list-poss(16): <name 1..8> / <c-string 1..8 with-low>**

List of user IDs to be added.

**USER-IDENTIFICATION = \*REMOVE(...)**

User IDs which are to be removed from an existing list of user IDs under which spoolout jobs can be processed on the specified printers.

**USER-IDENT-LIST = list-poss(15): <name 1..8> / <c-string 1..8 with-low>**

List of user IDs to be removed.

**USER-IDENTIFICATION = list-poss(16): <name 1..8> / <c-string 1..8 with-low>**

List of user IDs under which spoolout jobs can be processed on the specified printers.

If there is already a (positive) list of user IDs for the specified printers, it is replaced by this new list.

**SPOOLOUT-CLASS = \*UNCHANGED / \*ALL / \*EXCEPT(...) / \*ADD(...) / \*REMOVE(...) / list-poss(16): <integer 1..255>**

Spoolout classes from which spoolout jobs can be processed on the specified printers.

**SPOOLOUT-CLASS = \*ALL**

Spoolout jobs from all spoolout classes can be processed on the specified printers.

**SPOOLOUT-CLASS = \*EXCEPT(...)**

Spoolout classes from which spoolout jobs cannot be processed on the specified printers.

**SPOOLOUT-CLASS-LIST = list-poss(16): <integer 1..255>**

List of excluded spoolout classes.

**SPOOLOUT-CLASS = \*ADD(...)**

Spoolout classes to be added to an existing list of spoolout classes from which spoolout jobs can be processed on the specified printers.

**SPOOLOUT-CLASS-LIST = list-poss(16): <integer 1..255>**

List of spoolout classes to be added.

---

**SPOOLOUT-CLASS = \*REMOVE(...)**

Spoolout classes to be removed from an existing list of spoolout classes from which spoolout jobs can be processed on the specified printers.

**SPOOLOUT-CLASS-LIST = list-poss(15): <integer 1..255>**

List of spoolout classes to be removed.

**SPOOLOUT-CLASS = list-poss(16): <integer 1..255>**

List of spoolout classes from which spoolout jobs can be processed on the specified printers.

If there is already a (positive) list of spoolout classes for the specified printers, it is replaced by this new list.

**SPOOLOUT-NAME = \*UNCHANGED / \*ALL / \*EXCEPT(...) / \*ADD(...) / \*REMOVE(...) /**

**list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

Job names under which spoolout jobs can be processed on the specified printers.

**SPOOLOUT-NAME = \*ALL**

Spoolout jobs can be processed on the specified printers irrespective of the job name.

**SPOOLOUT-NAME = \*EXCEPT(...)**

Job names under which spoolout jobs cannot be processed on the specified printers.

**SPOOLOUT-NAME-LIST = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

List of excluded job names.

**SPOOLOUT-NAME = \*ADD(...)**

Job names to be added to an existing list of job names under which spoolout jobs can be processed on the specified printers.

**SPOOLOUT-NAME-LIST = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

List of job names to be added.

**SPOOLOUT-NAME = \*REMOVE(...)**

Job names which are to be removed from an existing list of job names under which spoolout jobs can be processed on the specified printers.

**SPOOLOUT-NAME-LIST = list-poss(15): <alphanum-name 1..8> / <c-string 1..8 with-low>**

List of job names to be removed.

**SPOOLOUT-NAME = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

List of job names under which spoolout jobs can be processed on the specified printers. If there is already a (positive) list of job names for the specified printers, it is replaced by this new list.

**ACCOUNT = \*UNCHANGED / \*ALL / \*EXCEPT(...) / \*ADD(...) / \*REMOVE(...) /**

**list-poss(16): <alphanum-name 1..8>**

Account numbers with which spoolout jobs can be processed on the specified printers.

**ACCOUNT = \*ALL**

Spoolout jobs can be processed on the specified printers irrespective of the account number.

**ACCOUNT = \*EXCEPT(...)**

Account numbers under which spoolout jobs cannot be processed on the specified printers.

**ACCOUNT-LIST = list-poss(16): <alphanum-name 1..8>**

List of excluded account numbers.

---

**ACCOUNT = \*ADD(...)**

Account numbers to be added to an existing list of account numbers under which spoolout jobs can be processed on the specified printers.

**ACCOUNT-LIST = list-poss(16): <alphanum-name 1..8>**

List of account numbers to be added.

**ACCOUNT = \*REMOVE(...)**

Account numbers which are to be removed from an existing list of account numbers under which spoolout jobs can be processed on the specified printers.

**ACCOUNT-LIST = list-poss(15): <alphanum-name 1..8>**

List of account numbers to be removed.

**ACCOUNT = list-poss(16): <alphanum-name 1..8>**

List of account numbers under which spoolout jobs can be processed on the specified printers.

If there is already a (positive) list of account numbers for the specified printers it is replaced by this new list.

**EXIT-ROUTINES = \*UNCHANGED / \*NOT-ACTIVE / \*ACTIVE**

Indicates whether EXIT routines are to be called for spoolout to the specified printers.

**ROTATION = \*UNCHANGED / \*ANY / \*YES / \*NO / \*MANUAL**

Indicates whether spoolout jobs which require the page rotation module can be processed on the specified printers.

**ROTATION = \*ANY**

Spoolout jobs can be processed on the specified printers whether they require the page rotation module or not.

**ROTATION = \*NO**

Only spoolout jobs which do not require the page rotation module can be processed on the specified printers.

**ROTATION = \*YES**

Only spoolout jobs which require the page rotation module can be processed on the specified printers.

**ROTATION = \*MANUAL**

In contrast to the value \*NO, the operator can access the page rotation module manually via hardware switches. In this case, all the pages are printed out in rotated form.

**TWO-UP-PROCESSING = \*UNCHANGED / \*ANY / \*YES / \*NO / \*MODE-1 / \*MODE-2**

This operand is only still available for reasons of compatibility.

**FORMS-OVERLAY-BUFFER = \*UNCHANGED / \*ANY / \*ONLY / \*NO / \*RANGE(...)**

Indicates whether spoolout jobs which use an FOB data overlay can be processed on the specified virtual devices.

**FORMS-OVERLAY-BUFFER = \*ANY**

Spoolout jobs with and without FOB data overlays can be processed on the specified virtual devices. The maximum possible FORMS-OVERLAY-BUFFER value is taken from the corresponding default device entry.

**FORMS-OVERLAY-BUFFER = \*ONLY**

Only spoolout jobs which require an FOB data overlay can be processed on the specified virtual devices. The maximum possible FORMS-OVERLAY-BUFFER value is taken from the corresponding default device entry.

**FORMS-OVERLAY-BUFFER = \*RANGE(...)**

Only spoolout jobs with FOB data overlays which lie within the specified size range (in sublines) can be processed on the specified virtual devices.

---

**LOW = \*UNCHANGED / <integer 0..32767>**

Lower limit of the range.

**HIGH = \*UNCHANGED / <integer 0..32767>**

Upper limit of the range.

**PRIORITY = \*UNCHANGED / \*ALL / \*RANGE(...)**

Priorities with which spoolout jobs can be processed on the specified printers.

**PRIORITY = \*ALL**

Spoolout jobs can be processed on the specified printers irrespective of their priority.

**PRIORITY = \*RANGE(...)**

Spoolout jobs with priorities within this range can be processed on the specified printers.

**FROM = \*UNCHANGED / <integer 30..255>**

Lower limit of the range.

**TO = \*UNCHANGED / <integer 30..255>**

Upper limit of the range.

**CHARACTER-SET-NUMBER = \*UNCHANGED / \*ALL / \*ONE / RANGE(...)**

Spoolout jobs can be processed on the specified virtual devices according to the number of character sets required.

**CHARACTER-SET-NUMBER = \*ALL**

Spoolout jobs can be processed on the specified virtual devices irrespective of the number of character sets required. The maximum possible number of required character sets is taken from the corresponding default device entry.

**CHARACTER-SET-NUMBER = \*ONE**

Only spoolout jobs which require no more than one character set can be processed on the specified virtual devices.

**CHARACTER-SET-NUMBER = \*RANGE(...)**

Spoolout jobs with a number of required character sets which falls within the range can be processed on the specified virtual devices.

**LOW = \*UNCHANGED / <integer 1..32767>**

Minimum number of required character sets.

**HIGH = \*UNCHANGED / <integer 1..32767>**

Maximum number of required character sets.

**REVISION-NUMBER = \*ANY / <integer 1..255>**

Number of the revision.

The number given must match the current revision number.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error Guaranteed message: SPS0B06
2	0	SCP0915	Element to be deleted not found
2	0	SCP0954	Only first 100 pools activated for the device
	1	CMD0202	Syntax error
	1	SCP0973	Semantic error
	32	SCP0974	System error. Command rejected
	64	SCP0975	No authorization for command
	64	SCP0976	Invalid operand value Guaranteed messages: SCP0907, SCP0944, SCP0951, SCP0957, SCP0967, SPS0168
	128	SPS0896	Subsystem not loaded/ready Guaranteed message: SCP0896
	128	SCP0911	RSO subsystem in dump creation or restart phase
	128	SCP0992	SPS subsystem not loaded or not supported

---

## 4.46 MODIFY-PROCEDURE-OPTIONS

Modify procedure attributes during procedure execution

<b>Component:</b>	SDF-P-BASYS
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The MODIFY-PROCEDURE-OPTIONS command allows most of the procedure attributes defined with SET-PROCEDURE-OPTIONS at the start of a procedure to be modified during procedure execution. The attributes that it cannot be used to modify are CALLER (permissible procedure call), INPUT-FORMAT (input record format) and SYSTEM-FILE-CONTEXT.

MODIFY-PROCEDURE-OPTIONS must not be called when the procedure is on hold (i.e. execution has been interrupted).

If MODIFY-PROCEDURE-OPTIONS is called from within an include procedure, its scope is restricted to that include procedure; in other words, modifications are not applied to the calling procedure.

The IMPLICIT-DECLARATION (implicit variable declaration) and JV-REPLACEMENT (job variable replacement) settings can also be modified interactively. At the start of the task the following settings apply in interactive mode:

```
IMPLICIT-DECLARATION = *YES
JV-REPLACEMENT = *AFTER-BUILTIN-FUNCTION
```

The default values (\*UNCHANGED) mean that the existing setting is retained. The effects of the various settings are described in detail in the operand description section of the SET-PROCEDURE-OPTIONS command.

### *Restrictions*

The SUPPRESS-SDP-MSG setting (SDF-P message suppression) can be modified at any time. The other settings can only be modified if the chargeable SDF-P subsystem is in use.

Users with SECURITY-ADMINISTRATION, SAT-FILE-EVALUATION or SAT-FILE-MANAGEMENT privilege can use the command in procedures only.

## Format

### MODIFY-PROCEDURE-OPTIONS

**IMPLICIT-DECLARATION** = \*UNCHANGED / \*YES / \*NO

**,LOGGING-ALLOWED** = \*PARAMETERS(...) / \*NO / \*YES

\*PARAMETERS(...)

| **CMD** = \*UNCHANGED / \*YES / \*NO

| **,DATA** = \*UNCHANGED / \*YES / \*NO

**,INTERRUPT-ALLOWED** = \*UNCHANGED / \*YES / \*NO

**,DATA-ESCAPE-CHAR** = \*UNCHANGED / \*NONE / '&&' / '#' / '\*' / '@' / '\$' / \*STD

| **MSG-ID** = list-poss(2000): <alphanum-name 7..7>

\*REMOVE(...)

| **MSG-ID** = list-poss(2000): <alphanum-name 7..7>

## Operands

**IMPLICIT-DECLARATION** = \*UNCHANGED / \*YES / \*NO

*This setting can only be modified in conjunction with SDF-P.*

Specifies whether implicit declarations are allowed. Can also be specified interactively.

**LOGGING-ALLOWED** = \*PARAMETERS(...) / \*YES / \*NO

*This setting can only be modified in conjunction with SDF-P.*

Governs whether procedure logging is allowed.

**LOGGING-ALLOWED** = \*PARAMETERS(...)

The user can configure logging separately for commands and data records.

**CMD** = \*UNCHANGED / \*YES / \*NO

*This setting can only be modified in conjunction with SDF-P.*

Specifies whether command logging is allowed.

**DATA** = \*UNCHANGED / \*YES / \*NO

*This setting can only be modified in conjunction with SDF-P.*

Specifies whether data record logging is allowed.

---

**INTERRUPT-ALLOWED = \*UNCHANGED / \*YES / \*NO**

*This setting can only be modified in conjunction with SDF-P.*

Specifies whether the procedure may be interrupted by means of the K2 key or the HOLD-PROCEDURE command.

**DATA-ESCAPE-CHAR = \*UNCHANGED / \*NONE / '&&' / '#' / '\*' / '@' / '\$' / \*STD**

*This setting can only be modified in conjunction with SDF-P.*

Specifies whether variables are to be replaced and expressions evaluated in data records and defines the character with which the relevant variables or expressions begin. Permissible characters are &, #, \*, @, and \$. Specifying & is equivalent to specifying \*STD (as on command level). If the character & is to be specified explicitly, it must be entered *twice*.

**DATA-ERROR-HANDLING = \*UNCHANGED / \*YES \*NO**

*This setting can only be modified in conjunction with SDF-P.*

Specifies whether SDF-P error recovery is to be triggered in the following cases:

- data (without a leading slash or with a leading double slash) is found at a point where commands are expected
- &<variable> or & on its own occurs within data, and <variable> is not known either as an S variable or as a builtin function.

**JV-REPLACEMENT = \*UNCHANGED / \*NONE / \*AFTER-BUILTIN-FUNCTION**

*This setting can only be modified in conjunction with SDF-P.*

Specifies whether job variable replacement is to be carried out.

**ERROR-MECHANISM = \*UNCHANGED / \*SPIN-OFF-COMPATIBLE / \*BY-RETURNCODE**

*This setting can only be modified in conjunction with SDF-P.*

Specifies whether the error handling mechanism is to be compatible with spin-off for non-S procedures or whether nonzero subcode1 values are to be taken into account. This setting has no effect on error handling for statements.

**SUPPRESS-SDP-MSG = \*UNCHANGED / \*NONE / \*ADD(...) / \*REMOVE(...)**

Determines whether the setting governing the suppression of certain SDF-P messages (message class SDP) is to be modified. The option applies only to the calling procedure (it is not propagated).

**SUPPRESS-SDP-MSG = \*NONE**

All SDF-P messages are output.

**SUPPRESS-SDP-MSG = \*ADD(...)**

Set of SDF-P messages to be added to those which are not output.

**MSG-ID=list-poss(2000): <alphanum-name 7..7>**

List of message ID numbers (message class SDP).

**SUPPRESS-SDP-MSG = \*REMOVE(...)**

Set of (suppressed) SDF-P messages which are now to be output again.

**MSG-ID=list-poss(2000): <alphanum-name 7..7>**

List of message ID numbers (message class SDP).

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SDP0118	Command in incorrect context
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	130	SDP0099	No further address space available

## Example

```
/SET-PROCEDURE-OPTIONS, LOGGING-ALLOWED=*NO  
...  
/MODIFY-PROCEDURE-OPTIONS, LOGGING-ALLOWED=*YES  
...
```

At the start of the procedure, logging is not allowed, as defined in the SET-PROCEDURE-OPTIONS command. Once the MODIFY-PROCEDURE-OPTIONS command has been issued, command and data record logging is allowed.

---

## 4.47 MODIFY-PUBSET-CACHE-ATTRIBUTES

Modify PFA cache configuration for pubset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Caching media control Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Function

The MODIFY-PUBSET-CACHE-ATTRIBUTES command enables systems support to define or modify the configuration of a PFA cache, for use as a fast buffer for the data in an SF pubset or in a volume set of an SM pubset.

In addition, the system can be instructed how to behave in the following circumstances:

- On pubset startup or cache activation, the desired cache configuration cannot be made available at all or not with the required size (SIZE-TOLERANCE operand).
- On pubset startup, the SF pubset or the volume set of an SM pubset can no longer be linked to the cache area assigned in the previous pubset session (FORCE-IMPORT operand).

If the command refers to an SF pubset, there must already be an MRSCAT entry for the pubset. The pubset need not have been imported. The values specified in the command are stored in the pubset's MRSCAT entry. When the MRSCAT entry is created, the values are assigned default settings.

If the command refers to an SM pubset, there are two different situations to consider:

- Modifying the cache configuration of a volume set: The SM pubset to which the volume set belongs must be online. In addition, the status of the volume set must be either "normal use" or "defined only". The values are stored in the SM pubset's configuration file. When the SM pubset is generated (or when a volume set is logically added with the MODIFY-PUBSET-DEFINITION-FILE command), the values are initialized with default settings.
- Modifying the control information for pubset startup: The SM pubset need not have been imported. The defined values are stored in the pubset's MRSCAT entry, as they relate to the pubset as a whole and not just to specific volume sets.

The attributes configured with the MODIFY-PUBSET-CACHE-ATTRIBUTES command can be checked with the SHOW-PUBSET-CACHE-ATTRIBUTES command. This information is also contained in the output of the SHOW-PUBSET-PARAMETERS command.

A detailed description of the cache media main memory (\*MAIN-MEMORY) will be found in the "DAB" manual [5].

## Format

### MODIFY-PUBSET-CACHE-ATTRIBUTES

**PUBSET** = <cat-id 1..4>

,**PUBSET-TYPE** = \*SINGLE-FEATURE / \*SYSTEM-MANAGED(...)

\*SYSTEM-MANAGED(...)

| **VOLUME-SET** = \*UNCHANGED / <cat-id 1..4>

,**CACHE-MEDIUM** = \*UNCHANGED / \*NO-CACHE / \*MAIN-MEMORY(...)

\*MAIN-MEMORY(...)

| **CACHE-SEGMENT-SIZE** = \*UNCHANGED / \*4KB / \*8KB / \*16KB / \*32KB

| ,**FORCE-OUT** = \*UNCHANGED / \*NO / \*AT-LOW-FILLING / \*AT-HIGH-FILLING

| ,**CACHED-FILES** = \*UNCHANGED / \*BY-USER-SELECTED / \*BY-SYSTEM / \*ALL

,**FORCE-IMPORT** = \*UNCHANGED / \*NO / \*BY-OPERATOR

,**CACHE-SIZE** = \*UNCHANGED / <integer 1..32767>(...

<integer 1..32767>(...

| **DIMENSION** = \*UNCHANGED / \*KILOBYTE / \*MEGABYTE

,**SIZE-TOLERANCE** = \*UNCHANGED / \*YES / \*NO

## Operands

**PUBSET** = <cat-id 1..4>

ID of the pubset for which a cache configuration is to be defined or modified.

**PUBSET-TYPE** = \*SINGLE-FEATURE / \*SYSTEM-MANAGED(...)

Specifies the type of pubset for which a new entry is to be created in the MRSCAT.

**PUBSET-TYPE** = \*SINGLE-FEATURE

The pubset is an SF pubset.

**PUBSET-TYPE** = \*SYSTEM-MANAGED(...)

The pubset is an SM pubset. The PFA cache configuration is defined or modified for the volume set specified next.

**VOLUME-SET** = \*UNCHANGED / <cat-id 1..4>

Identifies the volume set.

**CACHE-MEDIUM** = \*UNCHANGED / \*NO-CACHE / \*MAIN-MEMORY(...)

Identifies the cache medium in which the cache area is to be created. The first prerequisite for this is that the hardware requirements are satisfied, and the second is that a cache handler (DAB), required to serve the cache, is available and is active.

---

**CACHE-MEDIUM = \*NO-CACHE**

No cache medium is to be used for the specified pubset or volume set. This value is the default in the following cases:

- A new MRSCAT entry is created for an SF pubset (ADD-MASTER-CATALOG-ENTRY command).
- The initial values are defined for individual volume sets when an SM pubset is generated.
- A new volume set entry is generated in the course of dynamic pubset reconfiguration for an SM pubset (MODIFY-PUBSET-DEFINITION-FILE command).

**CACHE-MEDIUM = \*MAIN-MEMORY(...)**

Main memory is to be used as the caching medium.

If there is a system failure, data inconsistencies can arise if the cache medium has also been used as a write cache.

**CACHE-SEGMENT-SIZE = \*UNCHANGED / \*4KB / \*8KB / \*16KB / \*32KB**

Governs the size of a cache segment, i.e. the maximum size of the data areas swapped in by DAB in the event of a read miss in the cache. In automated caching (operand CACHED-FILES=\*BY-SYSTEM), DAB performs the most favorable prefetch for the file and the current application (regardless of the segment size). In the case of nonautomated caching the following applies: large segments are particularly suitable for sequential processing and for applications with highly localized cache utilization.

Small segments are preferable for applications with a random pattern of access. CACHE-SEGMENT-SIZE=\*32 KB is the default in the following cases:

- A new MRSCAT entry is created for an SF pubset (ADD-MASTER-CATALOG-ENTRY command).
- The initial values are defined for individual volume sets when an SM pubset is generated.
- A new volume set entry is generated in the course of dynamic pubset reconfiguration for an SM pubset (MODIFY-PUBSET-DEFINITION-FILE command).

**FORCE-OUT = \*UNCHANGED / \*NO / \*AT-LOW-FILLING / \*AT-HIGH-FILLING**

Defines the intervals at which the contents of the cache are written out to disk.

**FORCE-OUT = \*NO**

The data in the cache is not written out to disk until the file is closed. If no further data can be forced from the cache, subsequent I/O operations can no longer be handled by the cache.

**FORCE-OUT = \*AT-LOW-FILLING**

DAB uses a threshold value to control when the data in the cache is written out to disk. The threshold is when the cache is 25% full. This value is the default in the following cases:

- A new MRSCAT entry is created for an SF pubset (ADD-MASTER-CATALOG-ENTRY command).
- The initial values are defined for individual volume sets when an SM pubset is generated.
- A new volume set entry is generated in the course of dynamic pubset reconfiguration for an SM pubset (MODIFY-PUBSET-DEFINITION-FILE command).

**FORCE-OUT = \*AT-HIGH-FILLING**

DAB uses a threshold value to control when the data in the cache is written out to disk. The threshold is when the cache is 75% full.

**CACHED-FILES = \*UNCHANGED / \*BY-USER-SELECTED / \*BY-SYSTEM / \*ALL**

Governs which files are earmarked for caching.

---

**CACHED-FILES = \*BY-USER-SELECTED**

The user utilizes performance attributes to specify which files will use the cache. This value is the default in the following cases:

- A new MRSCAT entry is created for an SF pubset (ADD-MASTER-CATALOG-ENTRY command).
- The initial values are defined for individual volume sets when an SM pubset is generated.
- A new volume set entry is generated in the course of dynamic pubset reconfiguration for an SM pubset (MODIFY-PUBSET-DEFINITION-FILE command).

**CACHED-FILES = \*BY-SYSTEM**

The automated, intelligent caching determines which DAB files have an impact on performance. The prefetch factor matching the access profile of the selected files is set and the files are monitored at regular intervals, in order to ensure optimum cache performance.

**CACHED-FILES = \*ALL**

Except for a few system files (file catalog, user catalog, etc.), all the files in the pubset use the cache, which means that files with the performance attribute STD are treated like files with the performance attribute HIGH. The default caching mode is read/write. This form of “blanket caching” should be used only if it can be assumed to have a positive impact on overall performance.

**FORCE-IMPORT = \*UNCHANGED / \*NO / \*BY-OPERATOR**

Specifies what the system is to do after a system crash, at the next IMPORT-PUBSET, if it is impossible to recreate the link to the cache area which was being used before the crash.

**FORCE-IMPORT = \*NO**

If the link to the cache area is defective, import processing will be terminated. This value is the default setting when a new MRSCAT entry is added with the ADD-MASTER-CATALOG-ENTRY command.

**FORCE-IMPORT = \*BY-OPERATOR**

If the link to the cache area is defective, either import processing will - if allowed by the operator - be continued without accessing the cache storage, or it will be terminated. If it is continued, it should be noted that data inconsistencies can occur in the pubset, and the old cache area will be cleared. Any files which are subject to data inconsistencies are appropriately marked, and can no longer be opened.

**CACHE-SIZE = \*UNCHANGED / <integer 1..32767>(…)**

Indicates the number of storage units to be provided for the cache area in the selected medium.

**CACHE-SIZE = <integer 1..32767>(…)**

Specifies the number of storage units in kilobytes or megabytes which are to be provided for the cache area in the selected medium. Whether this number is in kilobytes or megabytes is indicated in the substructure below.

**DIMENSION = \*UNCHANGED / \*KILOBYTE / \*MEGABYTE**

Indicates the dimension of the specified cache size. DIMENSION=\*MEGABYTE applies for newly-created entries.

**DIMENSION = \*KILOBYTE**

The value specified for CACHE-SIZE is given in kilobytes. A cache size of less than 32 KB is rounded up to 32 KB. Main memory is the only cache medium which can be sized in KB.

**DIMENSION = \*MEGABYTE**

The value specified for CACHE-SIZE is given in megabytes.

---

**SIZE-TOLERANCE = \*UNCHANGED / \*YES / \*NO**

Indicates whether the system is to tolerate a shortage of storage space in the cache when the cache area is created, so that there is less than the amount actually requested by the CACHE-SIZE operand.

**SIZE-TOLERANCE = \*YES**

If the requested size of cache is unavailable (even if there is no cache available), a smaller size should be accepted. This value is the default setting when a new MRSCAT entry is added with the ADD-MASTER-CATALOG-ENTRY command.

**SIZE-TOLERANCE = \*NO**

If the requested size of cache is unavailable, the import processing for this pubset should be terminated.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
2	0	CMS0002	Disk error
	1	CMS0011	Syntax error

## 4.48 MODIFY-PUBSET-DEFINITION-FILE

Modify SM pubset definitions

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Function

The MODIFY-PUBSET-DEFINITION-FILE command enables systems support to modify the configuration of a system-managed pubset (SM pubset) while the pubset is online. An entry in the pubset configuration file can be created, modified or deleted for each volume set in an SM pubset. When creating or modifying an entry, systems support can specify the following attributes of a volume set:

- usage mode as a file storage location for normal files or work files or as the S1 storage level of the HSMS subsystem (USAGE operand)
- level of file availability in terms of the availability of the volume set (AVAILABILITY operand)
- performance attributes of the volume set relative to file access (PERFORMANCE-ATTR attribute)

To modify the composition of pubsets and volume sets (to add a volume set, for example) you have to use the MODIFY-PUBSET-PROCESSING command.

The SHOW-PUBSET-DEFINITION-FILE command lists information on the current configuration. This information is also contained in the output of the SHOW-PUBSET-CONFIGURATION command.

The MODIFY-PUBSET-DEFINITION-FILE command is also supported for shared pubsets. In a shared-pubset network the command can be issued on the master system or on a slave system. A system message refers to the system issuing the command, unless preceded by message DMS136D. The latter includes the name of the system (master or slave) on which the error has occurred. If the command is entered on a slave system, the system name may also be the local system name.

## Format

### MODIFY-PUBSET-DEFINITION-FILE

**PUBSET** = <cat-id 1..4>

,**VOLUME-SET-ENTRY** = \*UNCHANGED / \*ADD(...) / \*MODIFY(...) / \*REMOVE(...)

\*ADD(...)

| **VOLUME-SET** = <cat-id 1..4>

| ,**USAGE** = \*STD / \*WORK / \*HSMS-CONTROLLED

| ,**AVAILABILITY** = \*STD / \*HIGH

| ,**PERFORMANCE-ATTR** = \*STD / \*PARAMETERS(...)

| \*PARAMETERS(...)

| | **PERFORMANCE** = list-poss (3): \*STD / \*HIGH / \*VERY-HIGH

| | ,**WRITE-CONSISTENCY** = \*BY-CLOSE / \*IMMEDIATE

\*MODIFY(...)

| **VOLUME-SET** = <cat-id 1..4>

| ,**USAGE** = \*UNCHANGED / \*STD / \*WORK / \*HSMS-CONTROLLED

| ,**AVAILABILITY** = \*UNCHANGED / \*STD / \*HIGH

| ,**PERFORMANCE-ATTR** = \*UNCHANGED / \*PARAMETERS(...)

| \*PARAMETERS(...)

| | **PERFORMANCE** = \*UNCHANGED / -list-poss (3): \*STD / \*HIGH / \*VERY-HIGH

| | ,**WRITE-CONSISTENCY** = \*UNCHANGED / \*BY-CLOSE / \*IMMEDIATE

\*REMOVE(...)

| **VOLUME-SET** = <cat-id 1..4>

## Operands

**PUBSET** = <cat-id 1..4>

Catalog ID of the pubset which is to have its configuration modified.

**VOLUME-SET-ENTRY** = \*UNCHANGED / \*ADD(...) / \*MODIFY(...) / \*REMOVE(...)

Specifies which operation is involved: defining the attributes of a new volume set, modifying those of an existing volume set, or deleting a volume set entry. The attributes of a volume set are stored in the form of an entry in the pubset configuration file.

---

**VOLUME-SET-ENTRY = \*ADD(...)**

A new volume set is defined for the pubset. A new entry with the following attributes is added to the configuration file:

**VOLUME-SET = <cat-id 1..4>**

Identifies the volume set and hence the entry for it in the configuration file.

**USAGE = \*STD / \*WORK / \*HSMS-CONTROLLED**

Specifies a usage mode for the volume set.

**USAGE = \*STD**

The volume set is to be used as a storage location for normal files. Work files (file attribute WORK) must not be stored there.

**USAGE = \*WORK**

The volume set is to be used as a storage location for work files only (file attribute WORK). These files may be deleted by systems support at freely selectable times. That makes it easier to remove the volume set from the pubset.

**USAGE = \*HSMS-CONTROLLED**

The volume set is used by the HSMS subsystem to implement storage level S1 and the backup volume set of an SM pubset. Users are not allowed to store files there.

**AVAILABILITY = \*STD / \*HIGH**

Governs the level of availability for files, in terms of the availability of the volume set.

**AVAILABILITY = \*STD**

The volume set does not offer enhanced availability.

**AVAILABILITY = \*HIGH**

The volume set offers enhanced availability.

**PERFORMANCE-ATTR = \*STD / \*PARAMETERS(...)**

Governs the performance attributes of the volume set relative to file access. These are logical attributes which are taken into account in the allocation of storage space. The hardware (e.g. cache) which is being used is not taken into account.

**PERFORMANCE-ATTR = \*STD**

No enhanced performance attributes are defined for the volume set.

**PERFORMANCE-ATTR = \*PARAMETERS(...)**

The following enhanced performance attributes are defined for the volume set:

**PERFORMANCE = list-poss(3): \*STD / \*HIGH / \*VERY-HIGH**

Determines the performance profile of the volume set with regard to I/O operations. Up to three values can be listed.

**PERFORMANCE = \*STD**

The volume set does not offer enhanced performance.

**PERFORMANCE = \*HIGH**

The volume set offers enhanced performance.

**PERFORMANCE = \*VERY-HIGH**

The volume set offers very high performance.

---

**WRITE-CONSISTENCY = \*BY-CLOSE / \*IMMEDIATE**

Governs the point at which data consistency is required after write operations.

**WRITE-CONSISTENCY = \*BY-CLOSE**

Data consistency is not required until after completion of CLOSE processing.

**WRITE-CONSISTENCY = \*IMMEDIATE**

Data consistency is required immediately upon completion of the write operation.

**VOLUME-SET-ENTRY = \*MODIFY(...)**

The attributes of an existing volume set are to be modified. The attributes specified next are modified in the entry in the configuration file. The default value of \*UNCHANGED means that the existing setting is retained.

**VOLUME-SET = <cat-id 1..4>**

Identifies the volume set and hence the entry which is to be modified in the configuration file.

**USAGE = \*UNCHANGED / \*STD / \*WORK / \*HSMS-CONTROLLED**

Specifies a usage mode for the volume set. In order for the usage mode to be modified, the volume set must be in DEFINED-ONLY status.

**USAGE = \*STD**

The volume set is to be used as a storage location for normal files. Work files (file attribute WORK) must not be stored there.

**USAGE = \*WORK**

The volume set is to be used as a storage location for work files only (file attribute WORK). These files may be deleted by systems support at freely selectable times. That makes it easier to remove the volume set from the pubset.

**USAGE = \*HSMS-CONTROLLED**

The volume set is used by the HSMS subsystem to implement storage level S1 and the backup volume set of an SM pubset. Users are not allowed to store files there.

**AVAILABILITY = \*UNCHANGED / \*STD / \*HIGH**

Governs the level of availability for files, in terms of the availability of the volume set.

**AVAILABILITY = \*STD**

The volume set does not offer enhanced availability. Changing \*HIGH to \*STD is possible only if the volume set is in DEFINED-ONLY status or does not contain any files which require high availability.

**AVAILABILITY = \*HIGH**

The volume set offers enhanced availability. It is always possible to change \*STD to \*HIGH. The files, however, are **not** implicitly relocated to a volume set offering enhanced availability.

**PERFORMANCE-ATTR = \*UNCHANGED / \*PARAMETERS(...)**

Governs the performance attributes of the volume set relative to file access. These are logical attributes which are taken into account in the allocation of storage space. The hardware (e.g. cache) which is being used is not taken into account.

**PERFORMANCE-ATTR = \*PARAMETERS(...)**

The following enhanced performance attributes are modified for the volume set:

**PERFORMANCE = \*UNCHANGED / list-poss(3): \*STD / \*HIGH / \*VERY-HIGH**

Determines the performance profile of the volume set with regard to I/O operations. Up to three values can be listed.

---

**PERFORMANCE = \*STD**

The volume set does not offer enhanced performance.

**PERFORMANCE = \*HIGH**

The volume set offers enhanced performance.

**PERFORMANCE = \*VERY-HIGH**

The volume set offers very high performance.

**WRITE-CONSISTENCY = \*UNCHANGED / \*BY-CLOSE / \*IMMEDIATE**

Governs the point at which data consistency is required after write operations.

**WRITE-CONSISTENCY = \*BY-CLOSE**

Data consistency is not required until after completion of CLOSE processing.

**WRITE-CONSISTENCY = \*IMMEDIATE**

Data consistency is required immediately upon completion of the write operation.

**VOLUME-SET-ENTRY = \*REMOVE(...)**

The entry for a volume set is to be removed from the configuration file. The volume set must at the time be in DEFINED-ONLY status.

**VOLUME-SET = <cat-id 1..4>**

Identifies the volume set and hence the entry which is to be removed.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	32	CMD0221	Internal system error
	32	DMS138A	Internal parameter error
	32	DMS1398	Reconfiguration no longer possible
	64	CMD0216	No authorization to issue command
	64	DMS1381	Volume set conflict
	64	DMS1384	Operand not modifiable
	64	DMS1385	Control volume set cannot be removed
	64	DMS138B	Pubset does not exist
	64	DMS138C	Pubset not accessible
	64	DMS138D	Pubset type conflict
	64	DMS138E	Volume set not defined
	64	DMS1390	Earlier reconfiguration job not yet completed
	64	DMS1395	Maximum number of volume sets exceeded
	64	DMS1397	Reconfiguration of partner system not supported
	64	DMS1399	Maximum number of MRSCAT entries reached
	64	DMS139D	Volume not accessible
	128	DMS1386	Not enough class 4/5 memory
	128	DMS1389	Error in transmission to partner system
	128	DMS139A	Another pubset reconfiguration job is still in progress
	128	DMS139C	Pubset configuration file still locked

---

## 4.49 MODIFY-PUBSET-PROCESSING

Modify pubset composition

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Function

The MODIFY-PUBSET-PROCESSING command enables systems support to modify the composition of pubsets:

- Individual disks (volumes) can be added to or removed from a single-feature pubset (SF pubset).
- Individual volume sets can be added to or removed from a system-managed pubset (SM pubset).
- Individual disks (volumes) can be added to or removed from a volume set which forms part of an SM pubset.

When individual volumes are added to a pubset or a volume set, they can at the same time be supplied with an allocation lock. Systems support can use the MODIFY-PUBSET-RESTRICTIONS command (q.v) to define other usage restrictions for volumes in an SF pubset or for volumes in a volume set which is part of an SM pubset.

The command is also supported for shared pubsets. In a shared-pubset network, the command can be issued on the master system or on a slave system. A system message refers to the system issuing the command, unless preceded by message DMS136D. The latter includes the name of the system (master or slave) on which the error has occurred. If the command is entered on a slave system, the system name may also be the local system name.

#### *Pubset extension with homogeneity check*

The homogeneity check is performed for the currently supported full replication forms (see the respective manual "SHC-OSD" [37]).

If in the course of pubset extension a volume is detected which has different mirroring properties from volumes which have already been processed, the answerable message DMS1369 is output to SYSOUT. Depending on the caller's answer, one of the following procedures is selected:

- Extension of the pubset is aborted.
- Extension of the pubset is continued despite the fact that the volume which has just been processed was recognized as inhomogeneous. Here the message DMS136B is output on the console for every further volume with different mirroring properties.

## Format

| | **\*REMOVE**(...)

| | | **VOLUME** = <vsn 1..6>

---

## Operands

**PUBSET = <cat-id 1..4>**

Identifies the pubset which is to have its composition modified.

**PUBSET-TYPE = \*SINGLE-FEATURE(...) / \*SYSTEM-MANAGED(...)**

Specifies whether the pubset is an SF or SM pubset.

**PUBSET-TYPE = \*SINGLE-FEATURE(...)**

The pubset is an SF pubset. Only individual volumes can be added or removed. An allocation lock can be imposed on volumes which are added.

**VOLUME-ASSIGNMENT = \*UNCHANGED / \*ADD(...) / \*REMOVE(...)**

Specifies whether a volume is to be added or removed. The default is \*UNCHANGED, i.e. the composition of the pubset is left unchanged.

**VOLUME-ASSIGNMENT = \*ADD(...)**

A volume is to be added to the pubset. The volume serial number (VOLUME operand) must comply with the naming conventions for public volumes.

**VOLUME = <vsn 1..6>**

Identifies the volume by its volume serial number.

**ALLOCATION-ON-VOLUME = \*NOT-RESTRICTED / \*NOT-ALLOWED**

Governs the allocation options on the volume being added.

**ALLOCATION-ON-VOLUME = \*NOT-RESTRICTED**

Storage space may be allocated on the volume being added.

**ALLOCATION-ON-VOLUME = \*NOT-ALLOWED**

Storage space allocation on the volume being added is not allowed.

**CHECK-PUBSET-MIRRORS = \*NO / \*YES**

Determines whether the homogeneity of the pubset is to be checked. A pubset is homogeneous when all volumes of the pubset have the same mirroring properties.

**CHECK-PUBSET-MIRRORS = \*NO**

No homogeneity check is performed.

**CHECK-PUBSET-MIRRORS = \*YES**

A homogeneity check is performed when the volume is added.

**VOLUME-ASSIGNMENT = \*REMOVE(...)**

A volume is to be removed from the pubset. The volume in question must be completely empty.

**VOLUME = <vsn 1..6>**

Identifies the volume by its volume serial number.

**PUBSET-TYPE = \*SYSTEM-MANAGED(...)**

The pubset is an SM pubset. Entire volume sets can be added or removed. Individual volumes can be added to or removed from assigned volume sets.

**VOLUME-SET-SUPPORT = \*UNCHANGED / \*ADD(...) / \*REMOVE(...) / \*MODIFY(...)**

Specifies whether a volume set is to be added or removed or whether the composition of a volume set which is already available is to be modified.

---

**VOLUME-SET-SUPPORT = \*ADD(...)**

A volume set which has been entered to the pubset configuration file (see the MODIFY-PUBSET-DEFINITION-FILE command) is to be added to the pubset and thereby made available.

**VOLUME-SET = <cat-id 1..4>**

Identifies the volume set.

**CHECK-PUBSET-MIRRORS = \*NO / \*YES**

Determines whether the homogeneity of the pubset is to be checked. A pubset is homogeneous when all volumes of the pubset have the same mirroring properties.

**CHECK-PUBSET-MIRRORS = \*NO**

No homogeneity check is performed.

**CHECK-PUBSET-MIRRORS = \*YES**

A homogeneity check is performed when the volume set is added.

**VOLUME-SET-SUPPORT = \*REMOVE(...)**

A volume set which is available to the pubset is to be removed and thereby taken out of service. One of the following conditions must be met for this to be done:

- a. The volume set must be in NORMAL-USE status and must be empty, which means that it must contain no files other than the TSOSCAT file catalog. In addition, the volume set may not be the only one which supports the default file format. The NEW-FILE-ALLOCATION restriction must be set to \*NOT-ALLOWED (see the MODIFY-PUBSET-RESTRICTIONS command).
- b. The volume set is defective, which means that it must be in IN-HOLD or DEFECT status. It can be put into this status either by a system component (such as CMS) or by systems support using the MODIFY-PUBSET-RESTRICTIONS command (PROCESSING-STATE operand).

**VOLUME-SET = <cat-id 1..4>**

Identifies the volume set.

**CONDITION = \*EMPTY-VOLUME-SET / \*VOLUME-SET-DEFECTS**

Specifies which of the above conditions for volume set removal must be met.

**CONDITION = \*EMPTY-VOLUME-SET**

The volume set cannot be removed unless condition a) is met. If this is not the case, processing terminates abnormally.

**CONDITION = \*VOLUME-SET-DEFECTS**

The volume set cannot be removed unless condition b) is met. If this is not the case, processing terminates abnormally.

**i** Processing is performed even for nonempty volume sets. Any files which are still in them are lost. A volume set in IN-HOLD status switches to DEFECT status and cannot be made available again. To allow for selective restoration of lost files, their names are stored in a file that can be used for reconstruction with HSMS: :<pubsetid>:\$TSOS.SYS.PUBSET.DEFECT.<volset-id>.<date>.<time>

**TERMINATE-JOBS = \*NO / \*YES**

Governs whether processing is to continue if reservations for the volume set are still in existence.

**TERMINATE-JOBS = \*NO**

Processing terminates abnormally if reservations for the volume set are still in existence.

**TERMINATE-JOBS = \*YES**

If reservations for the volume set are still in existence, the jobs which hold the reservations are terminated by the system and processing continues.

**VOLUME-SET-SUPPORT = \*MODIFY(...)**

A volume is to be added to or removed from a volume set which is already available in the SM pubset.

**VOLUME-SET = <cat-id 1..4>**

Identifies the volume set.

**VOLUME-ASSIGNMENT = \*UNCHANGED / \*ADD(...) / \*REMOVE(...)**

Specifies whether a volume is to be added or removed. The default is \*UNCHANGED, which means that the volume set stays as it is.

**VOLUME-ASSIGNMENT = \*ADD(...)**

A volume is to be added to the volume set.

**VOLUME = <vsn 1..6>**

Volume serial number of the volume which is to be added.

**ALLOCATION-ON-VOLUME = \*NOT-RESTRICTED / \*NOT-ALLOWED**

Governs the allocation options on the volume being added.

**ALLOCATION-ON-VOLUME = \*NOT-RESTRICTED**

Storage space may be allocated on the volume being added.

**ALLOCATION-ON-VOLUME = \*NOT-ALLOWED**

Storage space allocation on the volume being added is not allowed.

**CHECK-PUBSET-MIRRORS = \*NO / \*YES**

Determines whether the homogeneity of the pubset is to be checked. A pubset is homogeneous when all volumes of the pubset have the same mirroring properties.

**CHECK-PUBSET-MIRRORS = \*NO**

No homogeneity check is performed.

**CHECK-PUBSET-MIRRORS = \*YES**

A homogeneity check is performed when the volume is added.

**VOLUME-ASSIGNMENT = \*REMOVE(...)**

A volume is to be removed from the volume set.

**VOLUME = <vsn 1..6>**

Volume serial number of the volume which is to be removed.

**Return codes**

## 4.50 MODIFY-PUBSET-RESTRICTIONS

Modify usage restrictions for pubset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Function

The MODIFY-PUBSET-RESTRICTIONS command enables systems support to impose and lift usage restrictions on single-feature pubsets (SF pubsets) and on system-managed pubsets (SM pubsets).

Only volume-specific restrictions can be imposed on SF pubsets. Restrictions on SM pubset may also relate to volume sets.

Volume-specific restrictions can be modified only if the associated volume set of the SM pubset or the associated SF pubset is available.

Restrictions on volume sets relating to new file allocation (\*NEW-FILE-ALLOCATION) and volume set access (\*VOLUME-SET-ACCESS) can be modified even if the associated volume set is merely defined in the pubset configuration file (DEFINED-ONLY status).

The SHOW-PUBSET-RESTRICTIONS command lists information on the current configuration. This information is also contained in the output of the SHOW-PUBSET-CONFIGURATION command.

The command MODIFY-PUBSET-RESTRICTIONS is also supported for shared pubsets. In a shared-pubset network, the command can be issued on the master system or on a slave system. A system message refers to the system issuing the command, unless preceded by message DMS136D. The latter includes the name of the system (master or slave) on which the error has occurred. If the command is entered on a slave system, the system name may also be the local system name.

| | **\*NOT-ALLOWED**(...)

| | | **VOLUME** = <vsn 1..6>

| | **\*PHYSICAL-ONLY**(...)

| | | **VOLUME** = <vsn 1..6>

		<b>*NOT-RESTRICTED(...)</b>
		<b>VOLUME = *ALL / &lt;vsn 1..6&gt;</b>

## Operands

**PUBSET = <cat-id 1..4>**

Identifies the pubset which is to have its usage restrictions modified.

**PUBSET-TYPE = \*SINGLE-FEATURE(...) / \*SYSTEM-MANAGED(...)**

Specifies whether the pubset is an SF or SM pubset.

**PUBSET-TYPE = \*SINGLE-FEATURE(...)**

The pubset is an SF pubset. Only usage restrictions on individual volumes can be modified.

**ALLOCATION-ON-VOLUME = \*UNCHANGED / \*NOT-ALLOWED(...) / \*PHYSICAL-ONLY(...) / \*NOT-RESTRICTED(...)**

Governs whether storage space can be allocated on a volume.

**ALLOCATION-ON-VOLUME = \*NOT-ALLOWED(...)**

Storage space allocation on the volume specified next is not allowed.

**VOLUME = <vsn 1..6>**

Identifies the volume by its volume serial number.

**ALLOCATION-ON-VOLUME = \*PHYSICAL-ONLY(...)**

Space allocation on the volume specified next is allowed only if the volume was specified explicitly when initially requested (see the VOLUME operand of the CREATE-FILE command, for example).

**VOLUME = <vsn 1..6>**

Identifies the volume by its volume serial number.

**ALLOCATION-ON-VOLUME = \*NOT-RESTRICTED(...)**

The volume-specific restrictions are lifted for all volumes (default setting) or for the volume specified next.

**VOLUME = \*ALL / <vsn 1..6>**

Identifies the volume by its volume serial number. The default is \*ALL, which means the restrictions on all volumes are lifted.

**PUBSET-TYPE = \*SYSTEM-MANAGED(...)**

The pubset is an SM pubset. Usage restrictions on entire volume sets and on individual volumes can be modified.

**VOLUME-SET = <cat-id 1..4>**

Identifies the volume set.

**RESTRICTION = \*UNCHANGED / \*NEW-FILE-ALLOCATION(...) / \*VOLUME-SET-ACCESS(...) / \*PROCESSING-STATE(...) / \*ALLOCATION-ON-VOLUME(...)**

Defines the type of usage restriction. Restrictions may relate to the creation of new files on the volume set, access to the volume set, or the operating mode of the volume set, or they may be volume-specific restrictions.

**RESTRICTION = \*NEW-FILE-ALLOCATION(...)**

Governs whether the creation of new files is allowed on the volume set.

**MODE = \*UNCHANGED / \*NOT-ALLOWED / \*PHYSICAL-ONLY / \*NOT-RESTRICTED**

Determines the scope of restrictions on new file allocation. The default is \*UNCHANGED, which means that the existing setting is left unchanged.

---

**MODE = \*NOT-ALLOWED**

New file allocation is not allowed on the volume set.

**i** Changing to \*NOT-ALLOWED is not permitted if the volume set is the only one which supports the default file format.

**MODE = \*NOT-RESTRICTED**

New files may also be created implicitly by the system on the volume set.

**i** Changing \*NOT-ALLOWED to \*PHYSICAL-ONLY or \*NOT-RESTRICTED is allowed only if there is no restriction on access to the volume set (see RESTRICTION=\*VOLUME-SET-ACCESS).

**RESTRICTION = \*VOLUME-SET-ACCESS(...)**

Governs whether access to the volume set is possible.

**MODE = \*UNCHANGED / \*ADMINISTRATOR-ONLY / \*NOT-RESTRICTED**

Defines who is to have access to the volume set.

**MODE = \*ADMINISTRATOR-ONLY**

Only systems support has access to the volume set.

**MODE = \*NOT-RESTRICTED**

Access to the volume set is unrestricted.

**i** Changing \*NOT-RESTRICTED to \*ADMINISTRATOR-ONLY is allowed only if there are restrictions on new file allocation on the volume set (see RESTRICTION=\*NEW-FILE-ALLOCATION).

**RESTRICTION = \*PROCESSING-STATE(...)**

Governs whether the volume set is operable and therefore available.

**MODE = \*UNCHANGED / \*HOLD / \*RESTART**

Governs the operating mode of the volume set. The default is \*UNCHANGED, i.e. the operating mode does not change.

**MODE = \*HOLD**

The volume set is marked as temporarily inoperable (IN-HOLD status). This may be necessary if access to the volume set is no longer possible, typically due to channel errors, and the volume set needs to be removed from the SM pubset (see VOLUME-SET-SUPPORT=\*REMOVE in the MODIFY-PUBSET-PROCESSING command). If errors occur, the volume set may also be switched to the comparable DEFECT status by a system component.

**MODE = \*RESTART**

A temporarily inoperable volume set is to be made operable again.

**RESTRICTION = \*ALLOCATION-ON-VOLUME(...)**

Governs whether space allocation is restricted on individual volumes of a volume set.

**MODE = \*UNCHANGED / \*NOT-ALLOWED(...) / \*PHYSICAL-ONLY(...) / \*NOT-RESTRICTED(...)**

Determines the scope of restrictions on space allocation on an individual volume. The default is \*UNCHANGED, which means that the existing setting is left unchanged.

---

**MODE = \*NOT-ALLOWED(...)**

Storage space allocation on the volume specified next is not allowed.

**VOLUME = <vsn 1..6>**

Identifies the volume by its volume serial number.

**MODE = \*PHYSICAL-ONLY(...)**

Space allocation on the volume specified next is allowed only if the volume was specified explicitly when initially requested (see the VOLUME operand of the CREATE-FILE command, for example).

**VOLUME = <vsn 1..6>**

Identifies the volume by its volume serial number.

**MODE = \*NOT-RESTRICTED(...)**

The volume-specific restrictions are lifted for all volumes (default setting) or for the volume specified next.

**VOLUME = \*ALL / <vsn 1..6>**

Identifies the volume by its volume serial number. The default is \*ALL, which means the restrictions on all volumes are lifted.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	32	CMD0221	Internal system error
	32	DMS138A	Internal parameter error
	32	DMS1398	Reconfiguration no longer possible
	64	CMD0216	No authorization to issue command
	64	DMS1381	Volume set conflict

	128	DMS1386	Not enough class 4/5 memory
	128	DMS139A	Another pubset reconfiguration job is still in progress
	128	DMS139C	Pubset configuration file still locked

---

## 4.51 MODIFY-PUBSET-SPACE-DEFAULTS

Modify disk space management defaults

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management System control and optimization
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Function

The MODIFY-PUBSET-SPACE-DEFAULTS command enables systems support to modify pubset-specific defaults for disk space management. The defaults that are set are for primary and secondary allocation, the maximum value for secondary allocation doubling, and the default file format for SM pubsets.

The pubset for which the defaults are to be modified generally has to be in service. In the case of SF pubsets, though, changes to values which are not to come into effect until the next startup can also be made when the pubset is not in service.

The SCOPE operand governs when modifications take effect and how long the effect lasts. With SF pubsets, a permanent change applies only to the system on which it was made. An exception is made when the change is requested from a slave system, in which case it applies only to the current master system.

In the case of a pubset which does not yet have any permanently configured values, suitable values are established when the pubset is taken into service. The settings of the DMPRALL, DMSCALL, and DMMAXSC system parameters are taken into account. Permanent settings of these values for an SF pubset can also be defined with the ADD-MASTER-CATALOG-ENTRY command.

Systems support can use the SHOW-PUBSET-SPACE-DEFAULTS command to find out which pubset-specific space management defaults are set. This information is also contained in the output of the SHOW-PUBSET-PARAMETERS command.

---

## Format

### MODIFY-PUBSET-SPACE-DEFAULTS

**PUBSET** = <cat-id 1..4>

,**PUBSET-TYPE** = \*ANY / \*SYSTEM-MANAGED(...)

    \*SYSTEM-MANAGED(...)

        |   **FILE-FORMAT** = \*UNCHANGED / \*K / \*NK2 / \*NK4

,**PRIMARY-ALLOCATION** = \*UNCHANGED / \*STD / <integer 1..16777215 2Kbyte>

,**SECONDARY-ALLOCATION** = \*UNCHANGED / \*STD / <integer 1..32767 2Kbyte>

,**MAXIMAL-ALLOCATION** = \*UNCHANGED / \*STD / <integer 1..32767 2Kbyte>

,**SCOPE** = \*PERMANENT / \*TEMPORARY / \*NEXT-PUBSET-SESSION

## Operands

**PUBSET** = <cat-id 1..4>

Identifies the pubset which is to have its space management defaults modified.

**PUBSET-TYPE** = \*ANY / \*SYSTEM-MANAGED(...)

Specifies the pubset type. The default is \*ANY, which means that the pubset type is irrelevant because only the defaults governing the size of the space allocation are to be changed.

**PUBSET-TYPE** = \*SYSTEM-MANAGED(...)

The pubset is explicitly an SM pubset. This is the only case in which the default file format can also be changed.

**FILE-FORMAT** = \*UNCHANGED / \*K / \*NK2 / \*NK4

Governs the default file format. The system uses this value if the user does not explicitly specify a file format or specifies \*BY-PUBSET-DEFAULT (see the FILE-PREFORMAT operand in the CREATE-FILE command). The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**FILE-FORMAT** = \*K

If no file format is specified, files are created as K files.

**FILE-FORMAT** = \*NK2

If no file format is specified, files are created as NK files in 2K format.

**FILE-FORMAT** = \*NK4

If no file format is specified, files are created as NK files in 4K format.

**PRIMARY-ALLOCATION** = \*UNCHANGED / \*STD / <integer 1..16777215 2Kbyte>

Governs the default primary allocation for storage space requests. The system uses this value if the user does not specify a value explicitly or specifies \*STD (see the operand SPACE=\*STD in the CREATE-FILE command). The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**PRIMARY-ALLOCATION** = \*STD

The value of the DMPRALL system parameter is used as the primary allocation default.

---

**PRIMARY-ALLOCATION = <integer 1..16777215 2Kbyte>**

Number of PAM pages to be set as the primary allocation default.

**SECONDARY-ALLOCATION = \*UNCHANGED / \*STD / <integer 1..32767 2Kbyte>**

Governs the default secondary allocation for storage space requests. The system uses this value if the user does not specify a value explicitly or specifies \*STD (see the SPACE=\*STD or SECONDARY-ALLOCATION=\*STD operand in the CREATE-FILE or MODIFY-FILE-ATTRIBUTES command). The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**SECONDARY-ALLOCATION = \*STD**

The value of the DMSCALL system parameter is used as the secondary allocation default.

**SECONDARY-ALLOCATION = <integer 1..32767 2Kbyte>**

Number of PAM pages to be set as the secondary allocation default.

**MAXIMAL-ALLOCATION = \*UNCHANGED / \*STD / <integer 1..32767 2Kbyte>**

Governs the maximum value for secondary allocation doubling. The value of the secondary allocation for a file is doubled each time the reserved space is extended until the maximum value specified here is reached. The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**MAXIMAL-ALLOCATION = \*STD**

The value of the DMMAXSC system parameter is used as the maximum allocation default.

**MAXIMAL-ALLOCATION = <integer 1..327672 2Kbyte>**

Number of PAM pages to be set as the maximum allocation default.

**SCOPE = \*PERMANENT / \*TEMPORARY / \*NEXT-PUBSET-SESSION**

Defines how long the setting applies and when it comes into effect.

**SCOPE = \*PERMANENT**

The setting takes immediate effect and applies until the next modification.

**SCOPE = \*TEMPORARY**

The setting takes immediate effect and applies only for the duration of the current pubset session, i.e. until the pubset is taken out of service.

**SCOPE = \*NEXT-PUBSET-SESSION**

The setting applies until the next permanent modification. However, the setting does not take effect until the start of the next pubset session.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
2	0	DMS1402	Action only partly successful
	1	CMD0202	Syntax error
	32	CMD0221	Internal system error
	64	CMD0216	Required authorization not available
	64	DMS1401	File format not supported

## 4.52 MODIFY-RESOURCE-COLLECTION

Control secure queue and collector task selection

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** J

### Function

The MODIFY-RESOURCE-COLLECTION command can be used by systems support to control the secure queue and selection of the collector task.

### Format

<b>MODIFY-RESOURCE-COLLECTION</b>
<b>ACTION</b> = *ADD-COLLECTOR / *REMOVE-COLLECTOR / *SET-COLLECTOR , <b>TSN</b> = <alphanum-name 1..4>

### Operands

#### **ACTION =**

Determines whether the specified job is taken into account when selecting the collector task.

#### **ACTION = \*ADD-COLLECTOR**

The specified job is taken into account when selecting the collector task within the system. This state corresponds to the presetting at the time the job enters the secure queue. This command has no effect unless a MODIFY-RESOURCE-COLLECTION command specifying ACTION=\*REMOVE-COLLECTOR has been issued for the same job.

#### **ACTION = \*REMOVE-COLLECTOR**

The specified job is not taken into account when the collector task is selected by the system. If the specified job is the collector, it loses this collector attribute. However, this does not prevent the job in question from reserving resources; it merely cannot collect them one after the other, and instead must wait until all its requests can be met at once.

#### **ACTION = \*SET-COLLECTOR**

The specified job becomes the collector task. If it is already the collector task, the command has no effect. If another job is the collector, it loses its collector attribute. The setting of the collector task has priority over its selection by the system.

#### **TSN = <alphanum-name 1..4>**

Specifies the task sequence number of the job for which the MOD-RES command has been issued.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error
	64	NKS0023	Command not executed Task not in secure queue
	64	NKS0024	Command not executed with ACTION=*SET-COLL Establishment not confirmed by task
	64	NKS0026	Command not executed with ACTION=*REM-COLL Task currently being established as collector
	64	NKS0027	Command not executed with ACTION=*SET-COLL Collector currently being set up
	64	NKS0028	Command not executed with ACTION=*SET-COLL Task is already collector
	64	NKS0029	Command not executed with ACTION=*SET-COLL Task no longer in secure queue
	64	NKS0041	Control task for secure queue not active with TSN=NKS. Command not executed.
	64	NKS0043	Internal error in NKRRORQH module

## Notes

- If a job loses its collector attribute, all existing reservations are canceled. The job waits in the secure queue until all reservation requests can be met at once.
- The collector attributes can be modified for each job in the secure queue as often as required. These attributes (collector, noncollector, to be taken into account at selection, not to be taken into account) are, however, only valid as long as the job is contained in the secure queue. When a job leaves (or re-enters) the secure queue the default attributes apply (noncollector, to be taken into account at selection).
- Mount requests are only issued at the operator terminal (console) when all the resources required for the job have been reserved. The mounting of volumes takes place in a subsidiary phase of secure processing. The MODIFY-RESOURCE-COLLECTION command has, therefore, no effect on jobs waiting for a reply to a MOUNT message.
- The MODIFY-RESOURCE-COLLECTION command with the REMOVE or SET operand is rejected if at the time of command input a job is turned into a collector task.

---

## 4.53 MODIFY-SDF-OPTIONS

Activate user syntax file and change SDF option settings

<b>Component:</b>	SDF
<b>Functional area:</b>	SDF control
<b>Domain:</b>	SDF
<b>Privileges:</b>	STD-PROCESSING TSOS HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

With the MODIFY-SDF-OPTIONS command, the user can

- activate or deactivate user syntax files (user syntax files are generated using the SDF-A utility routine; see the “SDF-A” manual [33])
- change the settings of SDF options for specific tasks:
  - type of dialog guidance (GUIDANCE operand)
  - extent of logging (LOGGING)
  - input interface for utilities (UTILITY-INTERFACE operand)
  - syntax error dialog in procedures (PROCEDURE-DIALOGUE operand)
  - position of the continuation character (CONTINUATION operand)
  - syntax checking of commands (MODE operand)
  - syntax checking of statements (DEFAULT-PROGRAM-NAME operand)
  - selection of function key assignment (FUNCTION-KEYS operand)
  - storage of input (INPUT-HISTORY operand)

The settings of SDF options are taken from the global information of the activated system or group syntax file at the beginning of the task. If the user activates a user syntax file, the settings of SDF options are modified according to the global information contained in that file. When the OMNIS utility routine is used, however, the GUIDANCE=\*EXPERT mode is set at the beginning of the task and if the user syntax file is switched.

In (temporarily) guided dialog the operand form of the MODIFY-SDF-OPTIONS command contains as preset values the current settings, which can also be queried using the SHOW-SDF-OPTIONS command. The \*UNCHANGED operand states that the current setting is not to be modified.

In programs with an SDF interface, MODIFY-SDF-OPTIONS is available as a standard statement with the same syntax and functionality but without the MODE, DEFAULT-PROGRAM-NAME and COMMAND-STATISTICS operands.

---

### *Privileged functions*

Systems support (privilege TSOS) can use the CMD-STATISTICS operand to activate and deactivate the statistical recording of all commands issued in the system. All commands contained in the system or subsystem syntax files are taken into account.

The statistics are recorded in the SYS.SDF.CMD.STATISTICS file. If the statistics routine is active (CMD-STATISTICS=\*YES), SDF counts every command issued by running a counter for each command and each alias. If the statistics routine is deactivated (CMD-STATISTICS=\*NO), SDF evaluates the count and writes the edited statistics to the above-named file. Any existing statistics file is overwritten. SDF then resets the command counter to zero.

The edited statistics file contains:

- a header showing the date and time when the statistics routine was activated and deactivated.
- for each subsystem a title containing the name of the subsystem
- for each command of a subsystem the command name and the count.

## Operands

### **SYNTAX-FILE = \*UNCHANGED / \*ADD(...) / \*REMOVE(...)**

Indicates whether a user syntax file is to be activated or deactivated. Two or more user syntax files can be active at the same time.

A user syntax file to be activated must be accessible and shareable (if the job submitter is not the owner of the syntax file). If the syntax file is protected by basic ACL or GUARDS, the job submitter must have at least execute authorization (see the USER-ACCESS, BASIC-ACL and GUARDS operands in the CREATE-FILE and MODIFY-FILE-ATTRIBUTES commands respectively).

If the file is protected by an execute password, the password must be contained in the password table for the job (see ADD-PASSWORD command).

#### *Note*

For performance reasons, user syntax files which were created in an SDF version < V2.0A should be converted to the new syntax file format. This is done either while processing with SDF-A or by means of the SDF-I utility routine (CONVERT-SYNTAX-FILE statement).

### **SYNTAX-FILE = \*UNCHANGED**

The previous declaration continued to apply.

### **SYNTAX-FILE = \*ADD(...)**

One or more additional user syntax files are to be activated.

#### **ADD-NAME = list-poss(2000): \*STD / <filename 1..54>**

Specifies the user syntax file to be activated.

A list of two or more syntax files can also be specified.

#### **ADD-NAME = \*STD**

The user syntax file with the standard file name **SDF.USER.SYNTAX** is activated if it exists in the user ID.

#### **ADD-NAME = <filename 1..54>**

The specified user syntax file is activated.

### **SYNTAX-FILE = \*REMOVE(...)**

One or more user syntax files are to be deactivated.

#### **REMOVE-NAME = \*LAST / \*ALL / list-poss(2000): <filename 1..54> / \*STD**

Specifies the user syntax file to be deactivated.

A list of two or more syntax files can also be specified.

#### **REMOVE-NAME = \*LAST**

The last user syntax file activated is deactivated.

#### **REMOVE-NAME = \*ALL**

All activated user syntax files are deactivated.

#### **REMOVE-NAME = \*BY-SELECTION**

All activated user syntax files are displayed in a selection mask. Those which are to be deactivated can be marked in a mark column.

#### **REMOVE-NAME = <filename 1..54>**

The specified user syntax file is deactivated.

---

**REMOVE-NAME = \*STD**

The user syntax file with the standard file name **SDF.USER.SYNTAX** is deactivated.

**SYNTAX-FILE = \*NONE**

No user syntax file has been activated for the job.  
Currently active user syntax files are deactivated.

**GUIDANCE =**

Specifies the type of dialog guidance.

**GUIDANCE = \*UNCHANGED**

The previous declaration still applies.

**GUIDANCE = \*EXPERT**

The EXPERT form of unguided dialog is set:

The system requests command input with “/” and statement input with “//”. No syntax error dialog is carried out. Blocked input of commands/statements is possible, i.e. several commands/statements, separated by logical end-of-line characters, can be issued at the same time.

**GUIDANCE = \*NO**

The NO form of unguided dialog is set:

Depending on the language set (English (E) or German (D)), the system requests command input with “%CMD:” or “%KDO:” and statement input with “%STMT:” or “%ANW:”. A syntax error dialog allows input errors to be corrected without having to repeat the entire command/ statement. Blocked input of commands/statements is possible, i.e. several commands/statements, separated by logical-end-of-line characters, can be issued at the same time.

**GUIDANCE = \*MAXIMUM**

Guided dialog, maximum help level, is set:

All alternative operand values with suffixes, and all help texts for the displayed application domains, commands, statements and operands are displayed.

**GUIDANCE = \*MEDIUM**

Guided dialog, medium help level, is set:

All alternative operand values without suffixes, and all help texts for the displayed application domains, commands and statements are displayed.

**GUIDANCE = \*MINIMUM**

Guided dialog, minimum help level, is set:

Only default values for operands without suffixes are displayed.

**LOGGING =**

Specifies how inputs are to be logged. Input for operands defined as “secret” (attribute SECRET=\*YES) is never listed in a log.

**LOGGING = \*UNCHANGED**

The previous declaration still applies.

**LOGGING = \*INPUT-FORM**

In unguided dialog, input strings are logged exactly as entered. In guided dialog or following an error dialog, logging is performed as with \*ACCEPTED-FORM.

---

**LOGGING = \*ACCEPTED-FORM**

The following is logged:

- all names in their extended form
- all specified operands, each with its name and the specified value
- the final representation resulting from a correction dialog, if any.

Inputs of the guided dialog are concatenated to form a single string.

**LOGGING = \*INVARIANT-FORM**

The following is logged:

- all names with the default names defined in the syntax file
- all specified operands, each with its name and the specified value
- all optional operands implicitly contained in the input, each with its name and its default value
- the final representation resulting from a correction dialog, if any.

Inputs of the guided dialog are concatenated to form a single string.

**UTILITY-INTERFACE = \*UNCHANGED / \*OLD-MODE / \*NEW-MODE**

Controls the input interface of utility routines which offer an old and a new (SDF) interface in parallel.

**PROCEDURE-DIALOGUE = \*UNCHANGED / \*YES / \*NO**

Specifies whether the user is to be requested to correct error procedure commands during the execution of a procedure (syntax error dialog in procedures). At the same time, the operand controls the help request ("?" in the input) within procedures.

**CONTINUATION = \*UNCHANGED / \*OLD-MODE / \*NEW-MODE**

Determines the column in which the command continuation character is to be specified in procedure and ENTER files. If \*OLD-MODE is set, the continuation character must be in column 72 precisely. If \*NEW-MODE is set, it may be entered in any column from column 2 through 72.

**MENU-LOGGING = \*UNCHANGED / \*NO / \*YES**

Specifies whether menus of the guided dialog are to be logged in their entirety. This operand is restricted to diagnostic purposes.

**CMD-STATISTICS = \*UNCHANGED / \*NO / \*YES**

*Only systems support can specify this operand (privilege TSOS):*

Determines whether statistics on the issued commands are to be created from the system syntax file.

**MODE = \*UNCHANGED / \*EXECUTION / \*TEST(...)**

Specifies whether test mode is activated or deactivated.

**MODE = \*EXECUTION**

Test mode is deactivated.

**MODE = \*TEST(...)**

Test mode is activated. Commands issued after the MODIFY-SDF-OPTIONS command are subjected to a syntax check but not executed. The MODIFY-SDF-OPTIONS and SHOW-SDF-OPTIONS commands are *always* executed. The lower-ranking CHECK-PRIVILEGES operand determines whether the user has the privileges necessary for the input.

The treatment of statements in test mode can be defined in the DEFAULT-PROGRAM-NAME operand.

In *S procedures*, SDF-P control flow commands are executed as well. This may cause errors, since commands declaring or setting S variables are not executed in test mode. The chargeable SDF-P subsystem offers a special debugger for S procedures (see the section dealing with debugging aids in the “SDF-P” manual [34]).

**CHECK-PRIVILEGES = \*UNCHANGED / \*NO / \*YES**

Specifies whether the user’s privileges are checked in addition to the syntax check.

**CHECK-PRIVILEGES = \*NO**

The user’s privileges are not checked. This setting may be necessary, for example, if the procedure to be tested is created for other users.

**CHECK-PRIVILEGES = \*YES**

As well as the syntax check, SDF checks whether the user has the necessary privileges for the input.

**DEFAULT-PROGRAM-NAME = \*UNCHANGED / \*NONE / <structured-name 1..30>**

Determines whether in test mode (see MODE operand) SDF program statements (beginning with //) are to undergo a syntax check.

This check is performed on the basis of the syntax of the statements defined in the syntax file for the specified program name. The check is independent of the program call, since START-/LOAD-EXECUTABLE-PROGRAM commands (or START-/LOAD-PROGRAM) are not executed in test mode.

**FUNCTION-KEYS = \*UNCHANGED / \*STYLE-GUIDE-MODE / \*BY-TERMINAL-TYPE / \*OLD-MODE**

Determines the assignment of the function keys.

**FUNCTION-KEYS = \*STYLE-GUIDE-MODE**

The function keys are assigned according to the Fujitsu Technology Solutions Style Guide.

[K2]	Interrupt function
[F1]	Help function
[F3]	Exit function
[F5]	Refresh function (only in guided dialog)
[F6]	Exit-all function
[F7]	Scroll backward (only in guided dialog)
[F8]	Scroll forward (only in guided dialog)
[F9]	Execute RESTORE-SDF-INPUT INPUT=*LAST
[F11]	Execute function (only in guided dialog)
[F12]	Cancel function

**FUNCTION-KEYS = \*BY-TERMINAL-TYPE**

The function key assignment depends on the terminal type. If the terminal type supports the wider-ranging functionality of the Style Guide, SDF chooses the setting \*STYLE-GUIDE-MODE. Otherwise, SDF chooses the setting \*OLD-MODE.

---

*Note*

Such configuration evaluates the terminal type needed for calling terminal emulation. The type setting is defined by the description of the emulation program.

**FUNCTION-KEYS = \*OLD-MODE**

The function keys are assigned in Old mode, which is supported by all terminal types.

[K1]	Exit function
[K2]	Interrupt function
[K3]	Refresh function (only in guided dialog)
[F1]	Exit-all function
[F2]	Test function (only in guided dialog)
[F3]	Execute function (only in guided dialog)

**INPUT-HISTORY = \*UNCHANGED / \*ON(...) / \*OFF / \*RESET**

Determines whether the input buffer is activated, deactivated or reset.

**INPUT-HISTORY = \*ON(...)**

The input buffer is activated. SDF saves all syntactically correct inputs (commands and statements) to the input buffer. The commands or standard statements RESTORE-SDF-INPUT and SHOW-INPUT-HISTORY are not saved. Whether ISP commands are saved depends on what is specified in the PASSWORD-PROTECTION operand.

The SHOW-INPUT-HISTORY command (or standard statement) enables the user to display the saved inputs, while the RESTORE-SDF-INPUT command can be used to redisplay a specific input for entering again, either as it is or in modified form.

*Note*

Values specified for “secret” operands which match neither the default value nor a value defined via SECRET=\*NO are stored in the input buffer with “^” or in plain text, depending on the PASSWORD-PROTECTION operand.

Values specified for operands which are not “secret” are always stored in the input buffer in plain text. In individual cases these inputs can contain sensitive information (e.g. procedure parameters). The following steps will prevent such inputs from being displayed again via SHOW-INPUT-HISTORY or RESTORE-SDF-INPUT:

Before entering sensitive input, the input buffer must be deactivated and then activated again. If the inputs have already been saved, the input buffer can be reset with \*RESET, but it must be remembered that this will delete all saved inputs.

**NUMBER-OF-INPUTS = \*UNCHANGED / <integer 1..100>**

Maximum number of inputs to be saved.

---

**PASSWORD-PROTECTION = \*UNCHANGED / \*YES / \*NO**

*This operand is not permitted in procedure mode.*

Defines whether values specified for “secret” operands and ISP commands are stored in the input buffer.

**PASSWORD-PROTECTION = \*YES**

Values specified for “secret” operands are saved with “^” (equivalent to the operand value \*SECRET). ISP commands are not stored in the input buffer.

**PASSWORD-PROTECTION = \*NO**

Values specified for “secret” operands are stored in plaintext. ISP commands are also stored in the input buffer.

*Note*

Under this setting, passwords are displayed on the screen in plaintext with the SHOW-INPUT-HISTORY or RESTORE-SDF-INPUT command, and so may be seen by unauthorized users. Therefore, you should ensure that whenever you leave your terminal no unauthorized users can output the contents of the input buffer. If your terminal does not possess any appropriate security mechanisms (e.g. chipcard terminal), you should at least delete the input buffer before you leave.

**INPUT-HISTORY = \*OFF**

The input buffer is deactivated. Subsequent inputs are not saved, but all previously saved inputs can still be accessed.

**INPUT-HISTORY = \*RESET**

The input buffer is reset. The stored inputs are deleted and can no longer be accessed, while subsequent inputs are saved.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command terminated without errors
1	32	CMD0500	Syntax description in current syntax file invalid. Guaranteed message: CMD0500
	64	CMD0554	Command execution not successful. Guaranteed messages: CMD0300, CMD0302, CMD0490, CMD0508, CMD0509, CMD0552, CMD0554, CMD0555, CMD0579

- (1) The SHOW-SDF-OPTIONS command provides information on all activated syntax files and the SDF options that are set. The output of the subsystem syntax files can be very extensive, depending on the number of activated subsystems. This example shows only an excerpt.
- (2) A user syntax file SYSSDF.EXAMPLE.03 is additionally activated.
- (3) The user-specific information is displayed. The old user syntax file SDF.USER.SYNTAX remains active and the user syntax file SYSSDF.EXAMPLE.03 is additionally activated. The command definitions from SYSSDF.EXAMPLE.03 are used for commands defined in both user syntax files, as these are activated last.
- (4) The system switches to guided dialog mode.
- (5) The most recently activated user syntax file is deactivated and the system switches back to unguided dialog mode.
- (6) The repeated output of the user-specific SDF options shows that only the user syntax file SYSSDF.EXAMPLE.03 was deactivated.

---

## 4.54 MODIFY-SDF-PARAMETERS

Modify SDF parameters

<b>Component:</b>	SDF
<b>Functional area:</b>	SDF control
<b>Domain:</b>	SDF
<b>Privileges:</b>	TSOS
<b>Routing code:</b>	*

### Function

The MODIFY-SDF-PARAMETERS command enables systems support to exchange the system syntax file or subsystem syntax files, to allocate group syntax files to users and to define system-wide LOGON or LOGOFF procedures (each consisting of a call procedure and an include procedure).

Systems support can also define when and for how long these declarations are to take effect:

- effective immediately for the current session only
- effective immediately for an unlimited time
- effective as of the next session for an unlimited time.

The definitions are entered in the SDF parameter file. The name of the SDF parameter file is defined in the DSSM catalog for SDF. If no SDF parameter file was entered there, the SDF parameter file with the default name \$TSOS.SYSPAR.SDF is cataloged. If no SDF parameter file exists, it is created with the name from the DSSM catalog or with the default name.

A user is assigned a group syntax file regardless of the entry in the user catalog. A profile ID (PROFILE-ID operand in the ADD-USER/MODIFY-USER-ATTRIBUTES command; output in *PROFILE-ID* field via SHOW-USER-ATTRIBUTES) may be entered in the user catalog. The SDF parameter file contains the allocations of profile IDs to group syntax files, which are assigned to a user or user group with the corresponding profile ID.

Since an assigned group syntax file is activated during LOGON processing, any modification in the SDF parameter file or in the user catalog is effective only for tasks whose LOGON is issued afterwards. An exchange of the system syntax file, however, also affects running tasks.

An SDF parameter file can be created or modified off-line using the SDF-PAR utility routine. This utility is described in the “SDF Dialog Interface” manual [15].

## Format

### MODIFY-SDF-PARAMETERS

**SCOPE** = \*TEMPORARY / \*PERMANENT / \*NEXT-SESSION(...)

\*NEXT-SESSION(...)

| **PARAMETER-FILE-NAME** = \*CURRENT / <filename 1..54>

,**SYNTAX-FILE-TYPE** = \*UNCHANGED / \*SYSTEM(...) / \*GROUP(...) / \*SUBSYSTEM(...)

\*SYSTEM(...)

| **NAME** = <filename 1..54>

\*GROUP(...)

| **NAME** = \*NONE / <filename 1..54>

| ,**PROFILE-ID** = <structured-name 1..30>

| ,**HIERARCHY** = \*YES / \*NO

\*SUBSYSTEM(...)

| **NAME** = \*NONE / <filename 1..54>

| ,**SUBSYSTEM-NAME** = <structured-name 1..8>

,**SYSTEM-LOGON-PROC** = \*UNCHANGED / \*NO / \*STD / <filename 1..54>

,**SYSTEM-LOGON-INCL** = \*UNCHANGED / \*NO / \*STD / <filename 1..54>

,**SYSTEM-LOGOFF-PROC** = \*UNCHANGED / \*NO / \*STD / <filename 1..54>

,**SYSTEM-LOGOFF-INCL** = \*UNCHANGED / \*NO / \*STD / <filename 1..54>

## Operands

### SCOPE =

Specifies the scope of the activation which is being made.

For SCOPE = \*TEMPORARY or \*PERMANENT, it is not possible to deactivate the group syntax file, which belongs to the systems support profile ID. For SCOPE=\*PERMANENT or \*NEXT-SESSION, an SDF parameter file is created if it does not already exist.

### SCOPE = \*TEMPORARY

*For a system syntax file:*

The specified subsystem syntax file is activated or deactivated system-wide for all user jobs. However, it is not entered in the SDF parameter file and is ignored for the subsequent session.

*For a subsystem syntax file:*

The specified subsystem syntax file is activated or deactivated system-wide for all user jobs. However, it is not entered in the SDF parameter file and is ignored for the subsequent session.

---

*For a group syntax file:*

The specified group syntax file is assigned to the specified profile ID. This assignment only takes effect for subsequent user jobs (from the next LOGON in the current session). User jobs which are already in progress are not affected by the change.

The specified group syntax file is not entered in the SDF parameter file and is therefore ignored for the subsequent session. In the case of a deactivation (\*NONE), the existing profile ID and its associated group syntax file name are *not* deleted from the SDF parameter file.

*With SYSTEM-LOGON-PROC or SYSTEM-LOGON-INCL = \*NO:*

Deactivates the system-wide LOGON procedure (call or include procedure) for the next LOGON processing activities in the current session. The SDF parameter file is not modified.

*With SYSTEM-LOGON-PROC or SYSTEM-LOGON-INCL = <filename 1..54>:*

Activates the specified system-wide LOGON procedure (call or include procedure) for the all subsequent LOGON processing activities in the current session. As the SDF parameter file is not modified, this specification will apply only for the current session.

*With SYSTEM-LOGOFF-PROC or SYSTEM-LOGOFF-INCL = \*NO:*

The system-wide LOGOFF procedure is deactivated for all subsequent LOGOFF processing in the current session. The SDF parameter file is not changed.

*With SYSTEM-LOGOFF-PROC or SYSTEM-LOGOFF-INCL = <filename 1..54> or \*STD:*

The specified system-wide LOGOFF procedure is activated for all subsequent LOGOFF processing in the current session. Since the SDF parameter file is not modified, the specification applies only to the current session.

## **SCOPE = \*PERMANENT**

*For a system syntax file:*

The specified system syntax file is activated system-wide for all user jobs. In addition, the system syntax file name is entered in the SDF parameter file. It is therefore used in the next session.

*For a subsystem syntax file:*

The specified subsystem syntax file is activated system-wide for all user tasks. In addition, the syntax file name is entered in the SDF parameter file; it is therefore used in the next session. If a subsystem syntax file is being deactivated, the names of the subsystem and the associated subsystem syntax file are deleted from the SDF parameter file.

*For a group syntax file:*

The specified group syntax file is assigned to the specified profile ID. This assignment only takes effect for subsequent user jobs (from the next LOGON in the current session). User jobs which are already in progress are not affected by the change.

The specified group syntax file is entered in the SDF parameter file and is therefore used in the next session. In the case of a deactivation (\*NONE), the existing profile ID and its associated group syntax file name are deleted from the SDF parameter file.

*With SYSTEM-LOGON-PROC or SYSTEM-LOGON-INCL = \*NO:*

Deactivates the system-wide LOGON procedure (call or include procedure) for the next LOGON processing activities in the current session. Its name is deleted from the SDF parameter file. If one is available, the system-wide LOGON procedure with the default name will be used, starting from the next session.

*With SYSTEM-LOGON-PROC or SYSTEM-LOGON-INCL = <filename 1..54>:*

Activates the specified system-wide LOGON procedure (call or include procedure) for the all subsequent LOGON processing activities in the current session. Its name is stored in the SDF parameter file, and will therefore be used again in the next session.

---

*With SYSTEM-LOGOFF-PROC or SYSTEM-LOGOFF-INCL = \*NO:*

The system-wide LOGOFF procedure is deactivated for all subsequent LOGOFF processing in the current session. Its name is deleted from the SDF parameter file. If present, the system-wide LOGOFF procedure with the default name is used as of the next session.

*With SYSTEM-LOGOFF-PROC or SYSTEM-LOGOFF-INCL = <filename 1..54> or \*STD:*

The specified system-wide LOGOFF procedure is activated for all subsequent LOGOFF processing in the current session. Its name is stored in the SDF parameter file and is therefore also evaluated in the following session.

**SCOPE = \*NEXT-SESSION(...)**

*For a system syntax file:*

The specified system syntax file name is stored in the SDF parameter file, and will be used in the next session. The current session is not affected by this.

*For a subsystem syntax file:*

The specified subsystem syntax file name is stored in the SDF parameter file, and will be used in the next session. The current session is not affected by this. If a subsystem syntax file is being deactivated, the names of the subsystem and the associated subsystem syntax file are deleted from the SDF parameter file (the current session is not affected by this).

*For a group syntax file:*

The specified group syntax file is assigned to the specified profile ID in the SDF parameter file. This assignment only takes effect in the next session. User jobs which are already in progress, and subsequent ones in the present session, are not affected by the change. In the case of a deactivation (\*NONE), the existing profile ID and its associated group syntax file name are removed from the SDF parameter file. The group syntax file which belongs to the systems support profile ID need only be shareable if it will also be used by other user IDs.

The specified syntax file name is not checked before being stored in the SDF parameter file. Checking will take place in the next session.

*With SYSTEM-LOGON-PROC or SYSTEM-LOGON-INCL = \*NO:*

The name of the system-wide LOGON procedure (call or include procedure) is deleted from the SDF parameter file. This has no effect on the current session. If one is available, the system-wide LOGON procedure with the default name will be used, starting from the next session.

*With SYSTEM-LOGON-PROC or SYSTEM-LOGON-INCL = <filename 1..54>:*

The name of the specified system-wide LOGON procedure (call or include procedure) is stored in the SDF parameter file. This specification will apply from the next session, and has no effect on the current session.

*With SYSTEM-LOGOFF-PROC or SYSTEM-LOGOFF-INCL = \*NO:*

The name of the system-wide LOGOFF procedure is deleted from the SDF parameter file. If available, the system-wide LOGOFF procedure with the default name is used as of the next session. This specification does not affect the current session.

*With SYSTEM-LOGOFF-PROC or SYSTEM-LOGOFF-INCL = <filename 1..54> or \*STD:*

The name of the specified system-wide LOGOFF procedure is stored in the SDF parameter file. The specification applies as of the next session and does not affect the current session.

**PARAMETER-FILE-NAME = \*CURRENT / <filename 1..54>**

Specifies the name of the parameter file which is to be created or updated.

**PARAMETER-FILE-NAME = \*CURRENT**

Identifies the parameter file name for the current session.

---

**SYNTAX-FILE-TYPE =**

Specifies the type of syntax file concerned.

**SYNTAX-FILE-TYPE = \*SYSTEM(...)**

The syntax file is a system file.

**NAME = <filename 1..54>**

Specifies the name of the file to be used as the (basic) system syntax file.

**SYNTAX-FILE-TYPE = \*GROUP(...)**

The syntax file is a group file.

**NAME =**

Specifies the name of the file to be used as the group syntax file.

**NAME = \*NONE**

Deletes the assignment of the group syntax file to the specified profile ID.

**NAME = <structured-name 1..30>**

The specified group syntax file is assigned to the specified profile ID.

**PROFILE-ID = <structured-name 1..30>**

Defines the profile ID which was (or is to be) assigned to the group syntax file.

**HIERARCHY =**

Specifies whether the SDF file hierarchy is to be retained for the syntax analysis of the commands/statements in a user job with the specified profile ID, i.e. whether the system syntax file is to be referred to in making the syntax analysis.

**HIERARCHY = \*YES**

By default, the system syntax file is activated when a user ID is set up.

**HIERARCHY = \*NO**

The system syntax file is deactivated immediately after LOGON processing. For users with the specified profile ID, the definitions in the system syntax file then become irrelevant. The only definitions which apply are those stored in the assigned group syntax file. A group syntax file which is defined using HIERARCHY = \*NO *must* contain, in addition to the global information, at least the EXIT-JOB or LOGOFF command. Otherwise, it is not possible to terminate a user job which has the specified profile ID assigned to it.

**SYNTAX-FILE-TYPE = \*SUBSYSTEM(...)**

The syntax file is a subsystem syntax file.

**NAME = \*NONE / <filename 1..54>**

Specifies the name of the file which is to be used as the subsystem syntax file. If \*NONE is specified, the subsystem syntax file which belongs to SUBSYSTEM-NAME is deactivated.

**SUBSYSTEM-NAME = <structured-name 1..8>**

Specifies the name of the subsystem to which the subsystem syntax file belongs.

**SYSTEM-LOGON-PROC =**

Specifies whether a system-wide LOGON procedure is to run as a call procedure. The specifications made for a system-wide LOGON call procedure have different effects, depending on what is specified for the SCOPE operand.

**SYSTEM-LOGON-PROC = \*UNCHANGED**

There is to be no change in the system-wide LOGON call procedure.

---

**SYSTEM-LOGON-PROC = \*STD**

The system-wide LOGON call procedure with the default name TSOS.SYS.SDF.LOGON.SYSPROC is activated for all subsequent LOGON operations in the current session (see the SCOPE operand).

**SYSTEM-LOGON-PROC = \*NO**

Deactivates the system-wide LOGON call procedure (see the SCOPE operand).

**SYSTEM-LOGON-PROC = <filename 1..54>**

Activates the specified system-wide LOGON call procedure (see the SCOPE operand).

**SYSTEM-LOGON-INCL =**

The specified system-wide LOGON include procedure is activated. The specifications for the system-wide LOGON include procedure have different effects depending on the SCOPE operand.

**SYSTEM-LOGON-INCL = \*UNCHANGED**

There is to be no change in the system-wide LOGON include procedure.

**SYSTEM-LOGON-INCL = \*STD**

The system-wide LOGON include procedure with the default name TSOS.SYS.SDF.LOGON.SYSINCL is activated for the next LOGON operations in the current session (see the SCOPE operand).

**SYSTEM-LOGON-INCL = \*NO**

Deactivates the system-wide LOGON include procedure (see the SCOPE operand).

**SYSTEM-LOGON-INCL = <filename 1..54>**

Activates the specified system-wide LOGON include procedure (see the SCOPE operand).

**SYSTEM-LOGOFF-PROC =**

Specifies whether a system-wide LOGOFF procedure is to run as a call procedure. The specifications made for the system-wide LOGOFF call procedure have a different effect depending on the value of the SCOPE operand.

**SYSTEM-LOGOFF-PROC = \*UNCHANGED**

No change to the system-wide LOGOFF call procedure.

**SYSTEM-LOGOFF-PROC = \*NO**

The system-wide LOGOFF call procedure is deactivated (see also the description of the SCOPE operand).

**SYSTEM-LOGOFF-PROC = \*STD**

The system-wide LOGOFF call procedure with the default name \$TSOS.SYS.SDF.LOGOFF.SYSPROC is activated (see also the description of the SCOPE operand).

**SYSTEM-LOGOFF-PROC = <filename 1..54>**

The specified system-wide LOGOFF call procedure is activated (see also the description of the SCOPE operand).

**SYSTEM-LOGOFF-INCL =**

Specifies whether a system-wide LOGOFF procedure is to run as an include procedure. The specifications made for the system-wide LOGOFF include procedure have a different effect depending on the value of the SCOPE operand.

**SYSTEM-LOGOFF-INCL = \*UNCHANGED**

No change of the system-wide LOGOFF include procedure.

**SYSTEM-LOGOFF-INCL = \*NO**

The system-wide LOGOFF include procedure is deactivated (see also the description of the SCOPE operand).

## SYSTEM-LOGOFF-INCL = \*STD

The system-wide LOGOFF include procedure with the default name \$TSOS.SYS.SDF.LOGOFF.SYSINCL is activated (see also the description of the SCOPE operand).

## SYSTEM-LOGOFF-INCL = <filename 1..54>

The specified system-wide LOGOFF include procedure is activated (see also the description of the SCOPE operand).

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error
2	0	CMD0677	Access rights for the system syntax file have been changed (warning) Guaranteed message: CMD0677
2	0	CMD0689	HIERARCHY=*NO is not included in the current parameter file Guaranteed message: CMD0689
1	32	CMD0500	Invalid syntax specification in the current syntax file Guaranteed message: CMD0500
	64	CMD0556	Command executed unsuccessfully Guaranteed messages: CMD0300, CMD0302, CMD0490, CMD0508, CMD0509, CMD0556, CMD0557, CMD0671, CMD0672, CMD0674, CMD0678, CMD0679, CMD0681, CMD0682, CMD0687, CMD0688, CMD0690, CMD0814, CMD0815
1	64	CMD0601	Command reserved for use by systems support Guaranteed message: CMD0601

## Notes

- Access to the SDF parameter file (MODIFY-SDF-PARAMETERS command) is possible only for a task under the TSOS ID. Concurrent accesses of further tasks are rejected with an error message.
- The group syntax file allocated to the profile ID of user ID TSOS need not be shareable unless it is used by other user IDs. If the file is protected by BASIC-ACL or GUARDS, the user IDs must have at least execute permission.
- If SCOPE=\*NEXT-SESSION is specified, specified syntax file names and the procedure names are stored in the parameter file without being checked. Checking does not take place until the start of the next session.
- File names specified without a user ID are given the current catalog ID or user ID of the task.
- When replacing alias names, only the real file names are entered.
- Global information from subsystem syntax files is ignored.
- If SCOPE=\*TEMPORARY or \*PERMANENT is specified, the TSOS group syntax file cannot be deactivated.
- A subsystem syntax file may also be activated automatically by DSSM when the subsystem is started (defined in the subsystem declarations). If a subsystem syntax file has already been declared and hence activated for the subsystem in the SDF parameter file, only the last syntax file activated for the subsystem is evaluated. A syntax file automatically activated by DSSM cannot be removed for the subsystem by means of MODIFY-SDF-PARAMETERS; it can only be exchanged. Syntax files automatically activated by DSSM are deactivated again

---

by DSSM when the subsystem is shut down. Syntax files activated by means of the SDF parameter file must in all cases be deactivated with a suitable MODIFY-SDF-PARAMETERS command.

---

## 4.55 MODIFY-SPACE-SATURATION-LEVELS

Modify space saturation thresholds

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management System control and optimization
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS
<b>Routing code:</b>	\$

### Function

The MODIFY-SPACE-SATURATION-LEVELS command enables systems support to modify the threshold levels for storage space saturation monitoring on pubsets. The threshold settings are pubset-specific for single-feature pubsets (SF pubsets). With system-managed pubsets (SM pubsets) the thresholds are defined for each volume set.

A defined disk space saturation threshold is reached when the number of free PAM pages on an SF pubset or in a volume set on an SM pubset falls below the figure set for the saturation level. When a saturation level is reached, assigned console messages are output. From saturation level 4, requests for space from certain jobs are rejected. A system reserve (ZIP level) can be kept free for pubsets needed at system startup. The reserved space is not released for allocation until a ZIP start is performed (see the “Introduction to System Administration” [14]).

The pubset for which the saturation thresholds are to be modified generally has to be in service. In the case of SF pubsets, though, changes to values which are not to come into effect until the next startup can also be made when the pubset is not in service.

The SCOPE operand governs when modifications take effect and how long the effect lasts. With SF pubsets, a permanent change applies only to the system on which it was made. An exception is made when the change is requested from a slave system, in which case it applies only to the current master system.

In the case of a pubset which does not yet have any permanently configured values, suitable values are calculated when the pubset is taken into service. The setting of the L4SPDEF system parameter and the current capacity of the SF pubset, or that of the individual volume sets in the case of an SM pubset, are taken into account.

**i** Permanent settings of saturation level 4 for an SF pubset can also be defined with the ADD-MASTER-CATALOG-ENTRY command. If settings have already been defined with MODIFY-SPACE-SATURATION-LEVELS, they should not be changed with the MODIFY-MASTER-CATALOG-ENTRY command because in that case the threshold condition checking described below would not be performed.

When setting thresholds, make sure that the values for saturation levels 1 through 5 and the system reserve which is equivalent to saturation level 6 form a descending sequence; in other words, the following condition must be met:

LEVEL-1 >= LEVEL-2 >= LEVEL-3 >= LEVEL-4 >= LEVEL-5 >= ZIP-LEVEL

If threshold settings are to take immediate effect, the specified values must also not exceed the current capacity of the SF pubset or of the volume sets in the SM pubset.

Systems support can use the SHOW-SPACE-SATURATION-LEVELS command to find out which thresholds are currently set. This information is also contained in the output of the SHOW-PUBSET-PARAMETERS command. The SHOW-PUBSET-SPACE-ALLOCATION command provides information on how space is currently allocated.

## Format

### MODIFY-SPACE-SATURATION-LEVELS

```
PUBSET = <cat-id 1..4>
, PUBSET-TYPE = *SINGLE-FEATURE / SYSTEM-MANAGED(...)
    SYSTEM-MANAGED(...)
        |   VOLUME-SET = <cat-id 1..4>
, LEVEL-1 = *UNCHANGED / *STD / <integer 1..2147483647 2Kbyte>
, LEVEL-2 = *UNCHANGED / *STD / <integer 1..2147483647 2Kbyte>
, LEVEL-3 = *UNCHANGED / *STD / <integer 1..2147483647 2Kbyte>
, LEVEL-4 = *UNCHANGED / *STD / <integer 1..2147483647 2Kbyte>
, LEVEL-5 = *UNCHANGED / *STD / <integer 1..2147483647 2Kbyte>
, ZIP-LEVEL = *UNCHANGED / *STD / <integer 0..2147483647 2Kbyte>
, SCOPE = *PERMANENT / *TEMPORARY / *NEXT-PUBSET-SESSION
```

## Operands

**PUBSET** = <cat-id 1..4>

Identifies the pubset which is to have its space saturation monitoring thresholds modified.

**PUBSET-TYPE** = \*SINGLE-FEATURE / **\*SYSTEM-MANAGED**(...)

Specifies whether the pubset is an SF or SM pubset.

**PUBSET-TYPE** = \*SINGLE-FEATURE

The pubset is an SF pubset. The thresholds are defined on a pubset-global basis.

**PUBSET-TYPE** = **\*SYSTEM-MANAGED**(...)

The pubset is an SM pubset. The thresholds are defined for the volume set specified next.

**VOLUME-SET** = <cat-id 1..4>

Identifies the volume set.

**LEVEL-1** = \*UNCHANGED / **\*STD** / <integer 1..2147483647 2Kbyte>

Defines the threshold for saturation level 1. If the number of free PAM pages falls below the specified figure, saturation level 1 has been reached. The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**LEVEL-1** = **\*STD**

The threshold for saturation level 1 is calculated by the system.

---

**LEVEL-2 = \*UNCHANGED / \*STD / <integer 1..2147483647 2Kbyte>**

Defines the threshold for saturation level 2. If the number of free PAM pages falls below the specified figure, saturation level 2 has been reached. The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**LEVEL-2 = \*STD**

The threshold for saturation level 2 is calculated by the system.

**LEVEL-3 = \*UNCHANGED / \*STD / <integer 1..2147483647 2Kbyte>**

Defines the threshold for saturation level 3. If the number of free PAM pages falls below the specified figure, saturation level 3 has been reached. The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**LEVEL-3 = \*STD**

The threshold for saturation level 3 is calculated by the system.

**LEVEL-4 = \*UNCHANGED / \*STD / <integer 1..2147483647 2Kbyte>**

Defines the threshold for saturation level 4. If the number of free PAM pages falls below the specified figure, saturation level 4 has been reached. The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**LEVEL-4 = \*STD**

The value of the L4SPDEF system parameter is set as the threshold for saturation level 4.

**LEVEL-4 = <integer 1..2147483647 2Kbyte>**

Number of nonreserved PAM pages.

**LEVEL-5 = \*UNCHANGED / \*STD / <integer 1..2147483647 2Kbyte>**

Defines the threshold for saturation level 5. If the number of free PAM pages falls below the specified figure, saturation level 5 has been reached. The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**LEVEL-5 = \*STD**

The threshold for saturation level 5 is calculated by the system.

**ZIP-LEVEL = \*UNCHANGED / \*STD / <integer 0..2147483647 2Kbyte>**

Defines a system reserve of nonreserved space. This space can only be allocated if system startup takes the form of a ZIP start. The system reserve should be set to zero for pubsets which are never used at system startup. The default is \*UNCHANGED, which means that the existing setting is left unchanged.

**ZIP-LEVEL = \*STD**

A system reserve of 66 PAM pages is kept free for SF pubsets. No system reserve (equivalent to ZIP-LEVEL=0) is kept free for SM pubsets because they cannot be used at system startup.

**ZIP-LEVEL = <integer 0..2147483647 2Kbyte>**

Number of PAM pages to be kept free as a system reserve.

**SCOPE = \*PERMANENT / \*TEMPORARY / \*NEXT-PUBSET-SESSION**

Defines how long the setting applies and when it comes into effect.

**SCOPE = \*PERMANENT**

The setting takes immediate effect and applies until the next modification.

**SCOPE = \*TEMPORARY**

The setting takes immediate effect and applies only for the duration of the current pubset session, i.e. until the pubset is taken out of service.

---

**SCOPE = \*NEXT-PUBSET-SESSION**

The setting applies until the next permanent modification. However, the setting does not take effect until the start of the next pubset session.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
2	0	DMS1402	Action only partly successful
	1	CMD0202	Syntax error
	32	CMD0221	Internal system error
	64	CMD0216	User does not have the necessary privilege
	64	DMS140B	Pubset not available
	64	DMS140C	Pubset type conflict
	64	DMS140D	Volume set not available
	64	DMS140E	Specified values not in descending sequence
	64	DMS1403	Level higher than capacity
	64	DMS1404	Values do not match the previously set temporary values
	64	DMS1405	Values do not match the previously set defined values
	130	DMS140F	Not enough class 4/5 memory

---

## 4.56 MODIFY-SPOOLOUT-OPTIONS

Compress SPOOL output

**Component:** SPOOL

**Functional area:** Controlling spoolout job

**Domain:** SPOOL-PRINT-ADMINISTRATION

**Privileges:** STD-PROCESSING  
PRINT-SERVICE-ADMINISTRATION  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

This command compresses printouts by reducing line feeds.

The MODIFY-SPOOLOUT-OPTIONS command affects the way in which feed control characters in files edited for printing are handled during printout. You can define the degree of compression. Entries made here affect all subsequent PRINT-DOCUMENT commands in which interpretation of the feed control character has been explicitly requested (LINE-SPACING operand).

The entries lose their effect at the end of the job or when the MODIFY-SPOOLOUT-OPTIONS command is issued with corresponding arguments.

### Format

<b>MODIFY-SPOOLOUT-OPTIONS</b>
--------------------------------

<b>COMPRESS-OUTPUT</b> = <u>*UNCHANGED</u> / *NO / *MINIMUM / *MAXIMUM
--

### Operands

**COMPRESS-OUTPUT =**

Degree of compression.

**i** The COMPRESS-OUTPUT operand is ignored if the LINE-SPACING operand has not been specified with a value of \*BY-EBCDIC-CONTROL, \*BY-IBM-CONTROL or \*BY-ASA-CONTROL in the PRINT-DOCUMENT command.

**COMPRESS-OUTPUT = \*UNCHANGED**

The existing entry is valid (= \*NO at the start of a job).

**COMPRESS-OUTPUT = \*NO**

No compression, i.e. the entries in the PRINT-DOCUMENT command (LINE-SPACING operand) are not changed.

---

**COMPRESS-OUTPUT = \*MINIMUM**

Interprets the feed control characters in the edited file as follows:

Feed control character for	Line feed
1 line	1 line
2 lines	1 line
3 lines	2 lines
> 3 lines	3 lines

**COMPRESS-OUTPUT = \*MAXIMUM**

Selects a 1-line feed (minimum space requirement) for the output of edited files.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error

## 4.57 MODIFY-STORAGE-CLASS

Modify storage class definition

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

The MODIFY-STORAGE-CLASS command enables systems support to modify the definition of an existing storage class.

The SM pubset for which the storage class is defined must have been imported to the local system (in exclusive or shared mode).

All the file attributes which are modified for the storage class initially apply to new files assigned to the storage class. An existing file which belongs to the storage class will not be given the modified file attributes of the storage class until they are reassigned to the file in a MODIFY-FILE-ATTRIBUTES command which specifies STORAGE-CLASS=\*UPDATE.

### Format

#### MODIFY-STORAGE-CLASS

```
STORAGE-CLASS-NAME = <composed-name 1..8>
,PUBSET = <cat-id 1..4>
,FILE-ATTRIBUTES = *UNCHANGED / *PARAMETERS(...)
  *PARAMETERS(...)
    | IO-ATTRIBUTES = *UNCHANGED / *PARAMETERS(...)
    |   *PARAMETERS(...)
    |     | PERFORMANCE = *UNCHANGED / *STD / *HIGH / *VERY-HIGH
    |     | ,USAGE = *UNCHANGED / *READ-WRITE / *WRITE / *READ
    |     | ,DISK-WRITE = *UNCHANGED / *STD / *IMMEDIATE / *BY-CLOSE
    |     | ,AVAILABILITY = *UNCHANGED / *STD / *HIGH
    |     | ,FILE-PREFORMAT = *UNCHANGED / *BY-PUBSET-DEFAULT / *K / *NK2 / *NK4
    |     | ,WORK-FILE = *UNCHANGED / *NO / *YES
  ,STORAGE-CLASS-INFO = *UNCHANGED / *NONE / <c-string 1..720 with-low>
,PROTECTION = *UNCHANGED / *NONE / *BY-GUARDS(...)
```

---

**\*BY-GUARDS(...)**

| **GUARD-NAME** = <filename 1..18 without-cat-gen-vers>

,**VOLUME-SET-LIST** = **\*UNCHANGED** / **\*NONE** / <composed-name 1..8>

## Operands

**STORAGE-CLASS-NAME** = <composed-name 1..8>

Name of the storage class which is to have its definition modified.

**PUBSET** = <cat-id 1..4>

Identifies the pubset for which the storage class was created. The pubset must have been imported to the local system (in exclusive or shared mode).

**FILE-ATTRIBUTES** = **\*UNCHANGED** / **\*PARAMETERS(...)**

Specifies which pubset management requirements, representable in the form of file attributes, are to be modified. These file attributes apply to all new files to which the user assigns the storage class instead of explicit attributes (see the STORAGE-CLASS operand of the CREATE-FILE or MODIFY-FILE-ATTRIBUTES command).

An existing file which belongs to the storage class will not be given the modified file attributes of the storage class until they are reassigned to the file in a MODIFY-FILE-ATTRIBUTES command which specifies STORAGE-CLASS=\*UPDATE.

The default value, \*UNCHANGED, means that the existing setting of the file attributes in question is left unchanged.

**FILE-ATTRIBUTES** = **\*PARAMETERS(...)**

Specifies which file attributes are to be modified for files in the given storage class.

**IO-ATTRIBUTES** = **\*UNCHANGED** / **\*PARAMETERS(...)**

Specifies which performance requirements are to be modified for files in this storage class.

The default value, \*UNCHANGED, means that the existing setting of the file attributes in question is left unchanged.

**IO-ATTRIBUTES** = **\*PARAMETERS(...)**

Performance attributes are determined by the values of the PERFORMANCE and USAGE operands.

**PERFORMANCE** = **\*UNCHANGED** / **\*STD** / **\*HIGH** / **\*VERY-HIGH**

Specifies the performance attribute for files in this storage class. It indicates the priority required for the I/O operations selected in the USAGE operand.

**PERFORMANCE** = **\*STD**

No performance requirements are defined for files in this storage class. In this case the USAGE operand has no impact on file processing.

**PERFORMANCE** = **\*HIGH**

A cache should be used to process files in this storage class (high performance priority).

**PERFORMANCE** = **\*VERY-HIGH**

A cache should be used to process files in this storage class, and if possible the entire file should be kept permanently in the cache (highest performance priority, only available in the GS cache medium).

**USAGE** = **\*UNCHANGED** / **\*READ-WRITE** / **\*WRITE** / **\*READ**

Specifies the I/O operations for which enhanced performance (caching) is required. The default is \*READ-WRITE, i.e. the requirement applies to both read and write operations.

The requirement may also be applied only to write operations (\*WRITE) or only to read operations

---

(\*READ).

If the file has no special performance attribute (PERFORMANCE=\*STD), the USAGE operand has no impact on processing.

**DISK-WRITE = \*UNCHANGED / \*STD / \*IMMEDIATE / \*BY-CLOSE**

Specifies the time at which data consistency is required for files in this storage class after a write operation.

**DISK-WRITE = \*STD**

The default setting of \*STD is equivalent to \*IMMEDIATE for permanent files and to \*BY-CLOSE for temporary files.

**DISK-WRITE = \*IMMEDIATE**

The data in a file must be in a consistent state immediately on completion of a write operation, so a volatile write cache should not be used to process files in this storage class.

**DISK-WRITE = \*BY-CLOSE**

The data in a file does not have to be in a consistent state until after CLOSE processing, so a volatile write cache may be used to process files in this storage class.

**AVAILABILITY = \*UNCHANGED / \*STD / \*HIGH**

Specifies availability requirements for files in this storage class.

**AVAILABILITY = \*STD**

There are no special availability requirements.

**AVAILABILITY = \*HIGH**

Files in this storage class are required to have high availability (e.g. storage on mirrored disks).

**FILE-PREFORMAT = \*UNCHANGED / \*BY-PUBSET-DEFAULT / \*K / \*NK2 / \*NK4**

Governs the preferred file format for files in this storage class. This specification only applies when the catalog entry is created; it is used to determine the storage location automatically.

As long as the file does not yet have a creation date (CRE-DATE=NONE), the storage location is provisional and may still change in the course of OPEN processing.

**FILE-PREFORMAT = \*BY-PUBSET-DEFAULT**

The pubset-global default applies.

**FILE-PREFORMAT = \*K**

File in this storage class are to be created as K files.

**FILE-PREFORMAT = \*NK2**

File in this storage class are to be created as NK2 files.

**FILE-PREFORMAT = \*NK4**

File in this storage class are to be created as NK4 files.

**WORK-FILE = \*UNCHANGED / \*NO / \*YES**

Specifies whether files in this storage class are work files.

**WORK-FILE = \*NO**

Files in this storage class are created as normal files.

**WORK-FILE = \*YES**

Files in this storage class are created as work files. Systems support can delete work files at appointed times.

**STORAGE-CLASS-INFO = \*UNCHANGED / \*NONE / <c-string 1..720 with-low>**

Systems support can compose a brief text describing storage class attributes. It will typically relate to special pubset

---

management requirements which are defined by systems support but cannot be represented in the form of file attributes. This brief text is included in the output of the SHOW-STORAGE-CLASS command to inform the user of any special properties of the storage class.

**STORAGE-CLASS-INFO = \*NONE**

There is to be no explanatory text for the storage class. If one already exists, it is deleted.

**STORAGE-CLASS-INFO = <c-string 1..720 with-low>**

A brief text describing special properties of the storage class as defined by systems support. Any existing explanatory text is overwritten.

**PROTECTION = \*UNCHANGED / \*NONE / \*BY-GUARDS(...)**

Specifies whether access to the storage class is to be controlled by guards.

**PROTECTION = \*NONE**

Access to the storage class is not to be controlled by guards. Any existing guards protection is canceled.

**PROTECTION = \*BY-GUARDS(...)**

Allocation to the storage class and the listing of the storage class definitions are to be controlled by a guard. The guard named next defines conditions under which a user is allowed to access the storage class.

**GUARD-NAME = <filename 1..18 without-cat-gen-vers>**

Name of the guard.

**VOLUME-SET-LIST = \*UNCHANGED / \*NONE / <composed-name 1..8>**

Specifies whether a volume set list is to be assigned to the storage class.

**VOLUME-SET-LIST = \*NONE**

No volume set list is to be assigned to the storage class. Any existing assignment is canceled.

**VOLUME-SET-LIST = <composed-name 1..8>**

The specifies volume set list is assigned to the storage class. Any existing assignment is canceled.

The volume set list must already exist for this SM pubset.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	1	CMD0202	Syntax error in command
	32	CMD0221	Internal system error
	64	CMD0216	No authorization to issue command
	64	DMS148A	Storage class not defined
	64	DMS1497	Invalid file attribute combination
	64	DMS148B	Volume set list not defined
	64	DMS1485	Pubset not known
	64	DMS1486	Pubset is not a system-managed pubset

	129	DMS148E	Error on MSCF connection to master
	129	DMS148F	GCF subsystem not ready

---

## 4.58 MODIFY-SUBSYSTEM-PARAMETER

Modify subsystem parameters

<b>Component:</b>	DSSM
<b>Functional area:</b>	Subsystem management
<b>Domain:</b>	SYSTEM-MANAGEMENT
<b>Privileges:</b>	SUBSYSTEM-MANAGEMENT

### Function

A user with the SUBSYSTEM-MANAGEMENT privilege can run this command to modify the parameters governing a subsystem; only the parameters explicitly specified are changed.

The command modifies only the dynamic subsystem catalog, not the static catalog. Consequently, any changes that are made do not remain in effect at the next startup. To prevent the changes being lost, the SAVE-SUBSYSTEM-CATALOG command can be used to store them in a static catalog. Note, however, that changes which are useful for the current session may be pointless or even counter-productive after the next startup. (For example, a message file is assigned to a subsystem which has BEFORE-DSSM-LOAD as its activation point. If the subsystem is restarted during the current session, this may well be a useful change to make; but it cannot be implemented the next time the system is started up.)

**i** Before using this command it is essential to be well-informed about the subsystem that is being modified, as the command is capable of making far-reaching changes to the subsystem attributes.

The command has three different types of operand:

- operands which have their value stored in the dynamic subsystem catalog and take immediate effect (such as VERSION-COEXISTENCE).
- operands which have their value stored in the dynamic subsystem catalog but do not take effect until the next START-SUBSYSTEM command (such as LIBRARY).
- operands which are accepted only if the subsystem is not currently running (such as MESSAGE-FILE).

For further information see the “Subsystem Management” manual [49].

## Format

### MODIFY-SUBSYSTEM-PARAMETER

**SUBSYSTEM-NAME** = <structured-name 1..8>

,**VERSION** = <product-version mandatory-man-corr> / <product-version without-man-corr>

## Operands

**SUBSYSTEM-NAME** = <structured-name 1..8>

Specifies the name of the subsystem for which the parameters are to be changed.

**VERSION** = <product-version mandatory-man-corr> / <product-version without-man-corr>

Identifies the version number.

If a version number is specified, the format specified here must be identical to the format used when the subsystem was defined (release and correction status mandatory or not allowed; cf. SDF metasyntax).

**INSTALLATION-UNIT** =

Defines a name for the installed release unit. A value other than \*NONE must be specified for all subsystems installed using IMON if \*INSTALLED(LOGICAL-ID=…) is the value specified for any of the following operands: SUBSYSTEM-LIBRARY, REP-FILE, SUBSYSTEM-INFO-FILE, MESSAGE-FILE or SYNTAX-FILE.

**INSTALLATION-UNIT** = \*UNCHANGED

The name of the installed release unit remains unchanged.

**INSTALLATION-UNIT** = \*NONE

No name is allocated. This value is not allowed for any subsystem installed using IMON.

**INSTALLATION-UNIT** = \*STD

The name specified in the SUBSYSTEM-NAME operand is used as the name of the installed release unit.

**INSTALLATION-UNIT** = <text 1..30>

New name for the installed release unit.

**INSTALLATION-USERID** = \*UNCHANGED / \*NONE / <name 1..8> / \*DEFAULT-USERID

Changes the default user ID of the files associated with the subsystem (REP-FILE, SUBSYSTEM-LIBRARY, SYNTAX-FILE and MESSAGE-FILE, SUBSYSTEM-INFO-FILE operands). File names specified without a user ID are assumed to belong to the new installation user ID defined here.

A change to the installation user ID is rejected if the subsystem is active and there is a message file (MESSAGE-FILE operand) or a syntax file (SYNTAX-FILE operand) assigned to it with no user ID specified.

The change takes effect immediately.

**INSTALLATION-USERID** = \*UNCHANGED

The installation user ID is not changed.

---

**INSTALLATION-USERID = \*NONE**

Removes the installation user ID.

If an installation user ID existed before the command was issued, it is stripped from all files to which it was assigned.

**INSTALLATION-USERID = <name 1..8>**

The user ID given here will be the new installation user ID. The name of the user ID must be given without its dollar sign prefix '\$'.

**INSTALLATION-USERID = \*DEFAULT-USERID**

Selects the system default user ID as the installation user ID (which means that file names begin with '\$.').

**COPYRIGHT = \*UNCHANGED / \*NONE / <c-string 1..54>(…)**

Changes the copyright notice displayed when the subsystem is loaded.

The change takes effect as soon as the subsystem is restarted (START-SUBSYSTEM command).

**COPYRIGHT = \*UNCHANGED**

The copyright notice is not changed.

**COPYRIGHT = \*NONE**

No copyright notice is displayed.

**COPYRIGHT = <c-string 1..54>(…)**

Changes the copyright notice displayed when the subsystem is loaded.

**YEAR = \*YEAR-1990 / <c-string 4..4>**

Defines the year displayed as the first production year in the copyright notice. The default year is 1990. Any other year must be specified explicitly. Note that the operand value is not subjected to semantic validity checking.

**SUBSYSTEM-LIBRARY = \*UNCHANGED / \*STD / \*INSTALLED(…) /<filename 1..54 without-gen-vers>**

Changes the module library assignment for the specified subsystem (LIBRARY parameter). The module library supplies the code which is loaded for a subsystem which is not yet running.

The change takes effect as soon as the subsystem is restarted (START-SUBSYSTEM command).

**SUBSYSTEM-LIBRARY = \*UNCHANGED**

The setting is left unchanged.

**SUBSYSTEM-LIBRARY = \*STD**

Assigns the following default library name:

SYSLNK.<subsysname>.<subsysvers#>

The value of “subsysvers#” comprises three digits, which are the “mmn” elements specified in the SUBSYSTEM-NAME=...(VERSION=…) operand.

**SUBSYSTEM-LIBRARY = \*INSTALLED(…)**

The library name is determined by the invocation of IMON-GPN (the installation path manager).

**LOGICAL-ID =**

Defines the logical program or object module library name by which the library is known to IMON-GPN.

**LOGICAL-ID = \*UNCHANGED**

The logical name of the program or object module library is left unchanged.

**LOGICAL-ID = \*REFRESH**

The path name associated with the logical name has been changed and is now to be updated in the catalog. The logical name itself is left unchanged.

---

**LOGICAL-ID = <filename 1..30 without-catid-userid-gen-vers>**

New logical name for the program or object module library.

**DEFAULT-NAME =**

Name of the library if IMON-GPN is not available or if the logical ID is unknown.

**DEFAULT-NAME = \*UNCHANGED**

The library name is left unchanged.

**DEFAULT-NAME = <filename 1..54>**

New library name.

**SUBSYSTEM-LIBRARY = <filename 1..54 without-gen-vers>**

The fully qualified file name specified here is defined as the new library name (see Note 3).

**SUBSYSTEM-LOAD-MODE = \*UNCHANGED / \*STD / \*ADVANCED**

Defines how the subsystem is loaded.

**SUBSYSTEM-LOAD-MODE = \*UNCHANGED**

The subsystem loading mode is left unchanged.

**SUBSYSTEM-LOAD-MODE = \*STD**

BLS is invoked in STD run mode (via the BLS-DSSM interface \$PBBND1) to load the subsystem code as an object module.

**SUBSYSTEM-LOAD-MODE = \*ADVANCED**

BLS is invoked in ADVANCED run mode (via the BLS-DSSM interface \$PBBND1) to load the subsystem code as a link-and-load module.

**REP-FILE = \*UNCHANGED / \*STD / \*NO / \*INSTALLED(...) /<filename 1..54 without-gen-vers>**

Changes the REP patch file assignment for the specified subsystem version. REP patch files are designed to incorporate module updates in a subsystem which is not currently running.

The change takes effect as soon as the subsystem is restarted (START-SUBSYSTEM command).

**REP-FILE = \*UNCHANGED**

The REP patch file parameters are not changed.

**REP-FILE = \*STD**

Assigns the following default name for the REP patch file:

SYSREP.<subsysname>.<subsysvers#>

The value of "subsysvers#" comprises three digits, which are the "mmn" elements specified in the SUBSYSTEM-NAME=...(VERSION=...) operand.

**REP-FILE = \*NO**

There is no REP patch file for the subsystem.

**REP-FILE = \*INSTALLED(...)**

The name of the REP file is determined by the invocation of IMON-GPN (the installation path manager).

**LOGICAL-ID =**

Defines the logical REP file name by which the file is known to IMON-GPN.

**LOGICAL-ID = \*UNCHANGED**

The logical name of the REP file is left unchanged.

---

**LOGICAL-ID = \*REFRESH**

The path name associated with the logical name has been changed and is now to be updated in the catalog. The logical name itself is left unchanged.

**LOGICAL-ID = <filename 1..30 without-catid-userid-gen-vers>**

New logical name for the REP file.

**DEFAULT-NAME =**

Name of the REP file if IMON-GPN is not available or if the logical ID is unknown.

**DEFAULT-NAME = \*UNCHANGED**

The REP file name is left unchanged.

**DEFAULT-NAME = \*NONE**

No default name is assigned to the REP file.

**DEFAULT-NAME = <filename 1..54>**

New name for the REP file.

**REP-FILE = <filename 1..54 without-gen-vers>**

The fully qualified file name specified here is defined as the new REP patch file name (see Note 3).

**REP-FILE-MANDATORY = \*UNCHANGED / \*NO / \*YES**

Defines whether the subsystem is started if errors occur while the REP patch file is being processed. The change takes effect as soon as the subsystem is restarted (START-SUBSYSTEM command).

**REP-FILE-MANDATORY = \*UNCHANGED**

The current setting is left unchanged.

**REP-FILE-MANDATORY = \*NO**

Errors during processing of the REP patch file have no effect on subsystem loading.

**REP-FILE-MANDATORY = \*YES**

Dynamic subsystem management (DSSM) inhibits subsystem loading in the following cases:

- DMS errors during REP patch file processing (e.g. REP file not cataloged)
- errors during REP file validation
- REP file incorrectly named
- DMS errors during NOREF file processing

**MESSAGE-FILE = \*UNCHANGED / \*NO / \*INSTALLED / <filename 1..54 without-gen-vers>**

Changes the message file definition associated with the specified subsystem version. The subsystem version must not be running at the time.

DMS file naming requirements are not checked.

**MESSAGE-FILE = \*UNCHANGED**

The current setting is left unchanged.

**MESSAGE-FILE = \*NO**

No subsystem-specific message file is available.

This setting is needed for cases where BEFORE-DSSM-LOAD is defined as the activation point for the subsystem.

---

**MESSAGE-FILE = \*INSTALLED(...)**

The name of the message file is determined by the invocation of IMON-GPN (the installation path manager).

**LOGICAL-ID =**

Defines the logical message file name by which the file is known to IMON-GPN.

**LOGICAL-ID = \*UNCHANGED**

The logical name of the message file is left unchanged.

**LOGICAL-ID = \*REFRESH**

The path name associated with the logical name has been changed and is now to be updated in the catalog.  
The logical name itself is left unchanged.

**LOGICAL-ID = <filename 1..30 without-catid-userid-gen-vers>**

New logical name for the message file.

**DEFAULT-NAME =**

Name of the message file if IMON-GPN is not available or if the logical ID is unknown.

**DEFAULT-NAME = \*UNCHANGED**

The message file name is left unchanged.

**DEFAULT-NAME = \*NONE**

No default name is assigned to the message file.

**DEFAULT-NAME = <filename 1..54>**

New name for the message file.

**MESSAGE-FILE = <filename 1..54 without-gen-vers>**

The fully qualified file name specified here is defined as the new message file name (see Note 3).

**SUBSYSTEM-INFO-FILE = \*UNCHANGED / \*NO / \*INSTALLED(...) / <filename 1..54 without-gen-vers>**

Specifies which information file to use for the specified subsystem version.

**SUBSYSTEM-INFO-FILE = \*UNCHANGED**

The current setting is left unchanged.

**SUBSYSTEM-INFO-FILE = \*NO**

No information file is available.

**SUBSYSTEM-INFO-FILE = \*INSTALLED(...)**

The information file name is determined by the invocation of IMON-GPN (the installation path manager).

**LOGICAL-ID =**

Defines the logical information file name by which the file is known to IMON-GPN.

**LOGICAL-ID = \*UNCHANGED**

The logical name of the information file is left unchanged.

**LOGICAL-ID = \*REFRESH**

The path name associated with the logical name has been changed and is now to be updated in the catalog.  
The logical name itself is left unchanged.

**LOGICAL-ID = <filename 1..30 without-catid-userid-gen-vers>**

New logical name for the information file.

---

**DEFAULT-NAME =**

Name of the information file if IMON-GPN is not available or if the logical ID is unknown.

**DEFAULT-NAME = \*UNCHANGED**

The name of the information file is left unchanged.

**DEFAULT-NAME = \*NONE**

No default name is assigned to the information file.

**DEFAULT-NAME = <filename 1..54>**

New name for the information file.

**SUBSYSTEM-INFO-FILE = <filename 1..54 without-gen-vers>**

The fully qualified file name specified here is defined as the new information file name (see Note 3).

**SYNTAX-FILE = \*UNCHANGED / \*NO / \*INSTALLED(...) / <filename 1..54 without-gen-vers>**

Changes the syntax file definition associated with the specified subsystem version.

The syntax file contains the applicable command and operand values for the subsystem version.

The subsystem version must not be running when the command is issued.

DMS file naming requirements are not checked.

**SYNTAX-FILE = \*UNCHANGED**

The current setting is left unchanged.

**SYNTAX-FILE = \*NO**

No information file is available.

This setting is needed for cases where BEFORE-DSSM-LOAD or AT-DSSM-LOAD is defined as the activation point for the subsystem.

**SYNTAX-FILE = \*INSTALLED(...)**

The name of the syntax file is determined by the invocation of IMON-GPN (the installation path manager).

**LOGICAL-ID =**

Defines the logical syntax file name by which the file is known to IMON-GPN.

**LOGICAL-ID = \*UNCHANGED**

The logical name of the syntax file is left unchanged.

**LOGICAL-ID = \*REFRESH**

The path name associated with the logical name has been changed and is now to be updated in the catalog.

The logical name itself is left unchanged.

**LOGICAL-ID = <filename 1..30 without-catid-userid-gen-vers>**

New logical name for the syntax file.

**DEFAULT-NAME =**

Name of the syntax file if IMON-GPN is not available or if the logical ID is unknown.

**DEFAULT-NAME = \*UNCHANGED**

The syntax file name is left unchanged.

**DEFAULT-NAME = \*NONE**

No default name is assigned to the syntax file.

**DEFAULT-NAME = <filename 1..54>**

New name for the syntax file.

---

**SYNTAX-FILE = <filename 1..54 without-gen-vers>**

The fully qualified file name specified here is defined as the new syntax file name (see Note 3).

**DYNAMIC-CHECK-ENTRY = \*UNCHANGED / \*STD / \*NO / <text 1..8 without-sep>**

Changes the reference address used to check that the loaded encoding for the subsystem is correct.

**DYNAMIC-CHECK-ENTRY = \*UNCHANGED**

The current setting is left unchanged.

**DYNAMIC-CHECK-ENTRY = \*STD**

The reference address specified in the LINK-ENTRY operand is used as the reference address for dynamic checking.

**DYNAMIC-CHECK-ENTRY = \*NO**

No checking is performed. This setting is not allowed if the activation point defined for the subsystem is BEFORE-DSSM-LOAD.

**DYNAMIC-CHECK-ENTRY = <text 1..8 without-sep>**

The address specified here is defined as the new reference address for dynamic checking.

**CREATION-TIME = \*UNCHANGED / \*AT-CREATION-REQUEST / \*AT-SUBSYSTEM-CALL / \*AT-DSSM-LOAD / \*MANDATORY-AT-STARTUP / \*BEFORE-SYSTEM-READY / \*AFTER-SYSTEM-READY**

Changes the subsystem startup time.

**CREATION-TIME = \*UNCHANGED**

The current setting is left unchanged.

**CREATION-TIME = \*AT-CREATION-REQUEST**

The subsystem startup time is reset to the (generation) default setting of "Startup on START-SUBSYSTEM invocation".

**CREATION-TIME = \*AT-SUBSYSTEM-CALL(...)**

The subsystem startup time is changed to the value AT-SUBSYSTEM-CALL. That means that the subsystem starts up automatically in response to the first SVC or ISL call.

This operand value is available only for subsystems called by the SVC or ISL mechanism.

This operand value can be assigned to the specified subsystem version after it has been withdrawn, if necessary, from another subsystem version. If no other version has this attribute, it is directly transferred to the specified subsystem version. If some other subsystem version has this attribute, it is withdrawn from that subsystem, either immediately (if the subsystem is not running) or after the subsystem has closed down (if it is currently running). Subsystems with the attribute VERSION-COEXISTENCE=\*ALLOWED are an exception to this rule. Here, different versions of the same subsystem can have the attribute CREATION-TIME=\*AT-SUBSYSTEM-CALL at the same time.

As with SSCM, this attribute can only be allocated to a subsystem where the CALL entry is set to MODE=\*SVC/\*ISL.

**ON-ACTION =**

Determines what causes automatic loading of the subsystem.

**ON-ACTION = \*STD**

Default: loading begins when any SVC entry point belonging to the subsystem is called.

**ON-ACTION = \*ISL-CALL**

Loading begins when any ISL entry point belonging to the subsystem is called.

---

**ON-ACTION = \*ANY**

Loading begins when any SVC or ISL entry point belonging to the subsystem is called.

**CREATION-TIME = \*AT-DSSM-LOAD**

The subsystem is to be loaded under the control of the DSSM task during system initialization. It must be a privileged subsystem, and any address and dependency relations it has must be with subsystems which also have this startup attribute or the BEFORE-DSSM-STARTUP attribute.

The file name for this subsystem must be located on the home pubset under the TSOS user ID, as at startup time the user catalog is not accessible and IMPORT-PUBSET processing has not been completed.

These subsystems are not allowed to have a syntax file attached.

**CREATION-TIME = \*MANDATORY-AT-STARTUP**

The subsystem must be loaded during system initialization (Phase 2: after DSSM has been loaded). As with BEFORE-SYSTEM-READY, subsystem activation is initiated synchronously; but in this case, as opposed to BEFORE-SYSTEM-READY, loading of the subsystem must be completed **successfully**. Otherwise, the startup routine is sent a message indicating that a mandatory subsystem could not be loaded. The startup routine then decides whether to continue or abort processing.

The subsystem must be a privileged subsystem, and any address and dependency relations it has must be with subsystems which have the same startup attribute or either BEFORE-DSSM-STARTUP or AT-DSSM-LOAD. The file name for this subsystem must be cataloged on the home pubset.

**CREATION-TIME = \*BEFORE-SYSTEM-READY**

The subsystem is to be loaded during system initialization (Phase 2). Activation is initiated synchronously; control is not returned to the startup routine until after completion of loading (or a loading error). Once the startup routine has regained control, it can report SYSTEM READY.

The subsystem must be a privileged subsystem, and any address and dependency relations it has must be with subsystems which have the same startup attribute or one of BEFORE-DSSM-STARTUP, AT-DSSM-LOAD or MANDATORY-AT-STARTUP.

The file name for this subsystem must be cataloged on the home pubset.

**CREATION-TIME = \*AFTER-SYSTEM-READY**

Loading of the subsystem is initiated during system initialization (Phase 2). Loading is not synchronized with the startup routine, which can report SYSTEM-READY before loading of this subsystem has been completed.

Any address and dependency relations the subsystem has must be with subsystems which have the same startup attribute or one of BEFORE-DSSM-STARTUP, AT-DSSM-LOAD, MANDATORY-AT-STARTUP or BEFORE-SYSTEM-READY.

The files for the subsystem must be cataloged on the home pubset.

**INIT-ROUTINE = \*UNCHANGED / \*NO / <text 1..8 without-sep>**

Changes the subsystem initialization routine, provided that this does not affect the manner in which the subsystem functions.

The change takes effect immediately to allow the subsystem to be reconstructed if necessary.

**INIT-ROUTINE = \*UNCHANGED**

The current setting is left unchanged.

**INIT-ROUTINE = \*NO**

No initialization routine is carried out.

**INIT-ROUTINE = <text 1..8 without-sep>**

The name specified here is defined as the new reference address name for the subsystem (see Note 4).

---

**CLOSE-CTRL-ROUTINE = \*UNCHANGED / \*NO / \*DYNAMIC / <text 1..8 without-sep>**

Changes the subsystem's CLOSE-CTRL routine, provided that this does not affect the manner in which the subsystem functions.

The change takes effect immediately.

**CLOSE-CTRL-ROUTINE = \*UNCHANGED**

The current setting is left unchanged.

**CLOSE-CTRL-ROUTINE = \*NO**

DSSM processes the STOP-SUBSYSTEM and HOLD-SUBSYSTEM commands without invoking a CLOSE-CTRL routine.

**CLOSE-CTRL-ROUTINE = \*DYNAMIC**

The subsystem dynamically invokes the CLOSE-CTRL routine at the end of the initialization (INIT) routine. A reference address name must have been defined for the CLOSE-CTRL routine.

**CLOSE-CTRL-ROUTINE = <text 1..8 without-sep>**

The name specified here is defined as the new reference address name for the CLOSE-CTRL routine (see Note 4).

**STOPCOM-ROUTINE = \*UNCHANGED / \*NO / \*DYNAMIC / <text 1..8 without-sep>**

Changes the subsystem's STOPCOM routine, provided that this does not affect the manner in which the subsystem functions.

The change takes effect immediately.

**STOPCOM-ROUTINE = \*UNCHANGED**

The current setting is left unchanged.

**STOPCOM-ROUTINE = \*NO**

DSSM processes the STOP-SUBSYSTEM and HOLD-SUBSYSTEM commands without invoking a STOPCOM routine.

**STOPCOM-ROUTINE = \*DYNAMIC**

The subsystem dynamically invokes the STOPCOM routine at the end of the CLOSE-CTRL routine or, if no CLOSE-CTRL routine is defined, at the end of the initialization (INIT) routine.

**STOPCOM-ROUTINE = <text 1..8 without-sep>**

The name specified here is defined as the new reference address name for the STOPCOM routine (see Note 4).

**DEINIT-ROUTINE = \*UNCHANGED / \*NO / \*DYNAMIC / <text 1..8 without-sep>**

Changes the subsystem's DEINIT routine, provided that this does not affect the manner in which the subsystem functions.

The change takes effect immediately.

**DEINIT-ROUTINE = \*UNCHANGED**

The current setting is left unchanged.

**DEINIT-ROUTINE = \*NO**

DSSM processes the STOP-SUBSYSTEM and HOLD-SUBSYSTEM commands without invoking a DEINIT routine.

**DEINIT-ROUTINE = \*DYNAMIC**

The subsystem dynamically invokes the DEINIT routine at the end of the STOPCOM routine or, if no STOPCOM routine is defined, at the end of the CLOSE-CTRL routine. If no CLOSE-CTRL routine is defined either, the DEINIT routine is invoked at the end of the initialization (INIT) routine.

---

**DEINIT-ROUTINE = <text 1..8 without-sep>**

The name specified here is defined as the new reference address name for the DEINIT routine (see Note 4).

**STOP-AT-SHUTDOWN = \*UNCHANGED / \*NO / \*YES**

Causes DSSM to close down the subsystem automatically as soon as the SHUTDOWN (terminate session) command is issued.

The change takes effect immediately.

**STOP-AT-SHUTDOWN = \*UNCHANGED**

The current setting is left unchanged.

**STOP-AT-SHUTDOWN = \*NO**

DSSM ignores the subsystem when the SHUTDOWN command is issued.

**STOP-AT-SHUTDOWN = \*YES**

DSSM closes down the subsystem as soon as the SHUTDOWN command is issued (as with the STOP-SUBSYSTEM command).

**INTERFACE-VERSION = \*UNCHANGED / \*NO / <text 1..8 without-sep>**

Designates the entry point through which DSSM can access the interface version used for decoupled calling of the INIT, CLOSE-CTRL, STOPCOM and DEINIT routines.

The change takes effect immediately.

**INTERFACE-VERSION = \*UNCHANGED**

The current setting is left unchanged.

**INTERFACE-VERSION = \*NO**

None of the following entry point names is available:

INIT, DEINIT, STOPCOM, CLOSE-CTRL-ROUTINE.

**INTERFACE-VERSION = <text 1..8 without-sep>**

The name specified here is defined as the new entry point.

**SUBSYSTEM-HOLD = \*UNCHANGED / \*ALLOWED / \*FORBIDDEN**

Defines whether a command or macro can be used to halt or unload the subsystem. The change takes effect immediately.

**SUBSYSTEM-HOLD = \*UNCHANGED**

The current setting is left unchanged.

**SUBSYSTEM-HOLD = \*ALLOWED**

A command or macro can be used to halt or unload the subsystem.

**SUBSYSTEM-HOLD = \*FORBIDDEN**

As with the STOP-AT-SHUTDOWN operand value, the subsystem cannot be unloaded until the BS2000 system is closed down with the SHUTDOWN command.

**STATE-CHANGE-CMDS = \*UNCHANGED / \*ALLOWED / \*FORBIDDEN / \*BY-ADMINISTRATOR-ONLY**

Defines whether the DSSM commands START-SUBSYSTEM, RESUME-SUBSYSTEM, STOP-SUBSYSTEM and HOLD-SUBSYSTEM are allowed for the subsystem.

The change takes effect immediately.

In the event of a version change, this setting applies only to the new version being activated. The other, "old" version will always be deactivated.

---

**STATE-CHANGE-CMDS = \*UNCHANGED**

The current setting is left unchanged.

**STATE-CHANGE-CMDS = \*ALLOWED**

The listed commands can be issued from the console or under a user ID with the SUBSYSTEM-MANAGEMENT privilege.

**STATE-CHANGE-CMDS = \*FORBIDDEN**

The listed commands cannot be issued either from the console or under a user ID with the SUBSYSTEM-MANAGEMENT privilege.

**STATE-CHANGE-CMDS = \*BY-ADMINISTRATOR-ONLY**

The listed commands can be issued under a user ID with the SUBSYSTEM-MANAGEMENT privilege but not from the console.

**FORCED-STATE-CHANGE = \*UNCHANGED / \*ALLOWED / \*FORBIDDEN**

Defines whether the FORCED operand of the DSSM STOP-SUBSYSTEM and HOLD-SUBSYSTEM commands is allowed for the subsystem.

The change takes effect immediately.

**FORCED-STATE-CHANGE = \*UNCHANGED**

The current setting is left unchanged.

**FORCED-STATE-CHANGE = \*ALLOWED**

Use of the FORCED operand in these commands is allowed.

**FORCED-STATE-CHANGE = \*FORBIDDEN**

Use of the FORCED operand is forbidden.

**RESET = \*UNCHANGED / \*ALLOWED / \*FORBIDDEN**

Defines whether the RESET=\*YES operand of the DSSM START-SUBSYSTEM and RESUME-SUBSYSTEM commands is allowed for the subsystem.

The change takes effect immediately.

**RESET = \*UNCHANGED**

The current setting is left unchanged.

**RESET = \*ALLOWED**

The DSSM START-SUBSYSTEM and RESUME-SUBSYSTEM commands are accepted if issued with the operand RESET=\*YES.

**RESET = \*FORBIDDEN**

The DSSM START-SUBSYSTEM and RESUME-SUBSYSTEM commands are rejected if issued with the operand RESET=\*YES.

**RESTART-REQUIRED = \*UNCHANGED / \*NO / \*YES**

Defines whether the initialization (INIT) routine is invoked to restart the subsystem in the event of abnormal holder task termination.

The initialization routine is invoked during reconstruction of the holder task.

The change takes effect immediately.

**RESTART-REQUIRED = \*UNCHANGED**

The current setting is left unchanged.

---

**RESTART-REQUIRED = \*NO**

In the event of abnormal holder task termination, the subsystem is locked during reconstruction of the holder task.

**RESTART-REQUIRED = \*YES**

The initialization routine is invoked to restart the system.

**VERSION-COEXISTENCE = \*UNCHANGED / \*FORBIDDEN / \*ALLOWED**

Defines whether different versions of the subsystem can be active at the same time. The change takes effect immediately.

**VERSION-COEXISTENCE = \*UNCHANGED**

The current setting is left unchanged.

**VERSION-COEXISTENCE = \*FORBIDDEN**

Only one version of the subsystem can be active.

**VERSION-COEXISTENCE = \*ALLOWED**

Different versions of the subsystem can be active at the same time.

**VERSION-EXCHANGE = \*UNCHANGED / \*FORBIDDEN / \*ALLOWED**

Defines whether a new subsystem version can be activated without the need to delete the old version. The change takes effect immediately.

**VERSION-EXCHANGE = \*UNCHANGED**

The current setting is left unchanged.

**VERSION-EXCHANGE = \*FORBIDDEN**

A new subsystem version cannot be activated unless the old version has been totally deleted.

**VERSION-EXCHANGE = \*ALLOWED**

A subsystem version can be activated without the need to delete the other version.

**MEMORY-CLASS = \*UNCHANGED / \*SYSTEM-GLOBAL(...) / \*LOCAL-UNPRIVILEGED(...) / \*BY-SLICE(...)**

Changes the subsystem's memory class or defines the subsystem's position in main memory (above or below 16 megabytes). Note the following:

- A privileged subsystem cannot be changed to a nonprivileged subsystem.
- If the memory class is changed, all suboperands must be specified.
- A subsystem cannot be made LOCAL-UNPRIVILEGED if there is an address overlap between two LOCAL-UNPRIVILEGED subsystems sharing the same holder task.

The change takes effect as soon as the subsystem is restarted (START-SUBSYSTEM command).

**MEMORY-CLASS = \*UNCHANGED**

The current setting is left unchanged.

**MEMORY-CLASS = \*SYSTEM-GLOBAL(...)**

The memory class of the subsystem is changed to class 3 or class 4 memory.

**SUBSYSTEM-ACCESS = \*LOW / \*HIGH**

Defines the rights of access to the requested space and the location of the requested space in the address space.

---

**SUBSYSTEM-ACCESS = \*LOW**

Defines the rights of access to the requested space and the location of the requested space in the address space.

**SUBSYSTEM-ACCESS = \*HIGH**

Nonprivileged address space up to 2 gigabytes is requested.

**MEMORY-CLASS = \*LOCAL-UNPRIVILEGED(...)**

The memory pool is set up as class 5 memory (only for subsystems which are to be executed in the same way as programs).

**SIZE = \*UNCHANGED / <integer 1..32767 4Kbyte>**

Defines the size of the address space required for the memory pool in 4K pages. The defined value must large enough to hold the subsystem and all the units and load units dynamically loaded by the subsystem.

**SIZE = \*UNCHANGED**

The current setting is left unchanged.

**SIZE = <integer 1..32767 4Kbyte>**

The address space specified here defines the size of the memory pool.

**SUBSYSTEM-ACCESS = \*UNCHANGED / \*LOW / \*HIGH**

Defines the rights of access to the requested space and the location of the requested space in address space.

**SUBSYSTEM-ACCESS = \*UNCHANGED**

The current setting is left unchanged.

**SUBSYSTEM-ACCESS = \*SYSTEM**

Privileged address space is requested. The load address is above 16 MB.

**SUBSYSTEM-ACCESS = \*LOW**

Nonprivileged address space is requested. The load address is below 16 MB.

**SUBSYSTEM-ACCESS = \*HIGH**

Nonprivileged address space up to 2 gigabytes is requested.

**START-ADDRESS = \*UNCHANGED / \*ANY / <x-string 7..8>**

Defines the base address of the subsystem. It must be a multiple of X'100000'. The user is responsible for specifying an address which references class 6 memory.

**START-ADDRESS = \*UNCHANGED**

The current setting is left unchanged.

**START-ADDRESS = \*ANY**

The location of the subsystem in class 6 memory is defined by DSSM

**START-ADDRESS = <x-string 7..8>**

Address in the segment raster at which the base address of the subsystem is to be located. The address must be a multiple of X'100000'.

**MEMORY-CLASS = \*BY-SLICE(...)**

The specified subsystem is a no-privileged subsystem consisting of an LLM which is made up of shareable code (program area) and nonshareable code (data area).

The program area is loaded into shareable address space (equivalent to MEMORY-CLASS= \*SYSTEM-GLOBAL).

---

The data area is loaded into the user address space of the holder task and copied into the private user address spaces of the connected tasks at the same address.

If the subsystem is defined using \*BY-SLICE, note the following:

- If reserved address space designed to hold the data area already exists, the command is not executed unless there is enough space free within this reserved address area to hold the modified subsystem.
- If there is no such reserved address space, it will be created by the system. The tasks which are connected to the subsystem at the time when this reserved address space is created are not able to use the data area. When a task is first connected to a subsystem that was defined with \*BY-SLICE, DSSM informs the BLSSERV subsystem that the copy of the data area in the private user address space can be accessed with the VSVI1 macro. The VSVI1 macro informs the user about entries in the DBL tables. See the “BLSSERV” manual [3] for details on the macro. When the last connection is shut down, DSSM informs the BLSSERV subsystem that this private area can no longer be accessed. DSSM only accepts an address space change in the new \*BY-SLICE attribute if MODE=\*LINK was specified for the type of specified incoming job for the subsystem and CONNECTION-SCOPE=\*TASK / \*PROGRAM was specified for all subsystem entries.

**SIZE = <integer 1..32767 4Kbyte>**

Specifies the size of the requested space for the data area in 4K pages.

**LINK-ENTRY = \*UNCHANGED(...) / <text 1..8 without-sep>(…)**

Changes the reference address used for subsystem loading. It is also possible to specify whether automatic linking of modules in phases (AUTOLINK) is allowed.

The change takes effect as soon as the subsystem is restarted (START-SUBSYSTEM command).

**LINK-ENTRY = \*UNCHANGED(...)**

The current setting is left unchanged.

**AUTOLINK = \*UNCHANGED / \*ALLOWED / \*FORBIDDEN**

Defines whether automatic linking of modules in phases (AUTOLINK) is allowed

**AUTOLINK = \*UNCHANGED**

The current setting is left unchanged.

**AUTOLINK = \*ALLOWED**

AUTOLINK is allowed.

**AUTOLINK = \*FORBIDDEN**

AUTOLINK is not allowed.

**LINK-ENTRY = <text 1..8 without-sep>(…)**

The address specified here is used as the new reference address for subsystem loading.

**AUTOLINK = \*ALLOWED / \*FORBIDDEN**

Defines whether automatic linking of modules in phases (AUTOLINK) is allowed

**AUTOLINK = \*ALLOWED**

AUTOLINK is not allowed.

**AUTOLINK = \*FORBIDDEN**

AUTOLINK is allowed.

---

**UNRESOLVED-EXTERNALS = \*UNCHANGED / \*ALLOWED / \*FORBIDDEN**

Defines whether unresolved external references prevent subsystem startup.

**UNRESOLVED-EXTERNALS = \*UNCHANGED**

The current setting is left unchanged.

**UNRESOLVED-EXTERNALS = \*ALLOWED**

Unresolved external reference does not prevent subsystem startup.

This setting is intended for debugging purposes only.

**UNRESOLVED-EXTERNALS = \*FORBIDDEN**

Unresolved external reference prevent subsystem startup.

**CHECK-REFERENCES = \*UNCHANGED / \*YES / \*NO**

Defines whether DSSM is to check the status of subsystems with which there is a dependency relation. The status of these subsystems may determine whether loading or unloading of the subsystem is allowed.

The change takes effect immediately.

**CHECK-REFERENCES = \*UNCHANGED**

The current setting is left unchanged.

**CHECK-REFERENCES = \*YES**

DSSM checks the status of subsystems with which there is a dependency relation. Depending on the status of these subsystems, DSSM decides whether the subsystem referred to by this command can be loaded or unloaded.

**CHECK-REFERENCES = \*NO**

If the subsystem referred to by this command has a dependency relation with another subsystem, DSSM checks that the latter subsystem is loaded. If it is, the former subsystem can be loaded, even if the other subsystem is not yet runnable (the reference is held to be resolved).

The RESUME-SUBSYSTEM, STOP-SUBSYSTEM and HOLD-SUBSYSTEM commands are executed regardless of any dependency relations which may exist.

**CHANGE-STATE = \*UNCHANGED / \*YES / \*NO**

Restricts the use of subsystem control commands, or cancels a restriction currently in force. This operand is particularly significant in relation to a malfunctioning subsystem, as it can be used to prevent loading, activation, and deactivation of the subsystem for as long as it takes to eliminate the malfunction.

The change takes effect immediately. It is applicable only to the current session (it is not stored in the catalog referenced by the SAVE-SUBSYSTEM-CATALOG command). The next time the subsystem is started up, the operand value is set to \*NO.

**CHANGE-STATE = \*UNCHANGED**

The current setting is left unchanged.

**CHANGE-STATE = \*YES**

The commands locked by an operand value of CHANGE-STATE=\*NO in an earlier MODIFY-SUBSYSTEM-PARAMETER command are released for use, thus restoring full control of the subsystem.

**CHANGE-STATE = \*NO**

Prevents subsystem loading, activation, deactivation, suspending, resuming and unlocking. The following commands are locked until the next time the MODIFY-SUBSYSTEM-PARAMETER command is entered with CHANGE-STATE set to \*YES:

- START-SUBSYSTEM

- RESUME-SUBSYSTEM
- STOP-SUBSYSTEM
- HOLD-SUBSYSTEM
- REMOVE-SUBSYSTEM
- UNLOCK-SUBSYSTEM

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error Guaranteed message: ESM0254
	0	CMD0001	Command executed with warnings Guaranteed message: ESM0647
1	0	CMD0001	Command executed with warnings (no LOGICAL-ID found or message file (de) activated)
	1	ESM0414	Syntax error: invalid version specified
	1	ESM0415	Syntax error: invalid INSTALLATION-UNIT name specified
	1	ESM0653	Syntax error: invalid job entry name specified
	32	ESM0646	Internal DSSM problem during processing
	32	ESM0646	Internal error
	64	ESM0201	Subsystem not found
	64	ESM0269	Subsystem without SVC or ISL entry point
	64	ESM0280	Command not executed to avoid inconsistencies in the subsystem catalog
	64	ESM0340	Reserved address-space exhausted for subsystems with MEMORY-CLASS=*BY-SLICE
	64	ESM0613	Changes to the message or syntax file or the installation user ID not allowed. Subsystem must first be removed with STOP-SUBSYSTEM.
	64	ESM0617	Memory class changed; all parameters must be specified

---

## Notes

1. If the command changes subsystem attributes in such a way that they are given values that they already had before the command was issued, no change is made, but message ESM0647 is nonetheless issued to indicate that changes have been made. This can be avoided by using the default values (generally \*UNCHANGED).
2. The CREATION-TIME operand is designed to modify the parameters of subsystems added by means of ADD-SUBSYSTEM commands.
3. If file names are specified without a user ID in the SUBSYSTEM-LIBRARY, MESSAGE-FILE, SYNTAX-FILE, REP-FILE and SUBSYSTEM-INFO-FILE operands, the subsystem's installation user ID is searched for the files.
4. Changes to the INIT-ROUTINE, CLOSE-CTRL-ROUTINE, STOPCOM-ROUTINE and DEINIT-ROUTINE operands are accepted only if they do not impair the functioning of the subsystem.
5. If a change cannot be made, a message to that effect is sent to SYSOUT. Messages relating to accepted changes are written to the CONSLOG file.

## Example

Version 9.0 of the ARCHIVE subsystem is to be started up automatically as soon as the first SVC call is issued:

```
/MODIFY-SUBSYSTEM-PARAMETER SUBSYSTEM-NAME=ARCHIVE,VERSION='09.0', -  
/      CREATION-TIME=*AT-SUBSYSTEM-CALL
```

---

## 4.59 MODIFY-SYSFILE-OPTIONS

Define maximum length of log output records

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Job processing File processing
<b>Domain:</b>	JOB
<b>Privileges:</b>	STD-PROCESSING

### Function

With the MODIFY-SYSFILE-OPTIONS command, users can specify the maximum length of log output records. Logging is set with the MODIFY-JOB-OPTIONS command. The command has effect only if the log is directed to a cataloged file (SYSOUT is assigned to a file) and to SYSLST. Outputs to terminal are not influenced. The user can determine whether output is to be additionally directed into a file which is accessible while library elements are output to SYSLST or SYSOUT.

#### *Effect of maximum output record length*

Output records exceeding the specified record length are distributed over several lines when logged. These lines do not exceed the specified record line. The length of the output records also contains the “prefix” (e.g. blanks, the character strings *(IN)* or *(OUT)*), which precedes each record to be logged.

### Format

<b>MODIFY-SYSFILE-OPTIONS</b>
<b>LOGGING-LINE-SIZE</b> = <u>*UNCHANGED</u> / *STD / <integer 18..2044>
<b>,LIBRARY-OUTPUT-COPY</b> = <u>*UNCHANGED</u> / *YES / *NO / *BY-SYSTEM-PARAMETER

### Operands

#### **LOGGING-LINE-SIZE = \*UNCHANGED**

The default is \*UNCHANGED, i.e. the setting remains unchanged. At the beginning of a job, the default value of 132 is set. During logging, output records exceeding 132 characters in length are spread over two or more lines containing a maximum of 132 characters. Each continuation line thus created also contains a “prefix”.

#### *Example*

With LOGGING-LINE-SIZE=132, a 1000-byte-long data record is spread over eight lines for SYSOUT output to a cataloged file and over nine lines for hardcopy output.

#### **LOGGING-LINE-SIZE = \*STD**

The \*STD entry sets line size to the default value of 132.

#### **LOGGING-LINE-SIZE = <integer 16..2044>**

Sets the specified value. The largest specifiable value depends on the attributes of the file assigned: A SAM file with BUF-LEN=STD(1) on an NK disk can contain no more than one record with a length of 2032 bytes.

---

**LIBRARY-OUTPUT-COPY = \*UNCHANGED / \*YES / \*NO / \*BY-SYSTEM-PARAMETER**

Specifies whether the output records are additionally written into a file when SYSLST or SYSOUT is assigned to a PLAM library element. When a task starts, the SSMMILOG system parameter setting applies. The default value is \*UNCHANGED, i.e. the current setting remains unchanged.

**LIBRARY-OUTPUT-COPY = \*YES**

In each assignment of SYSLST or SYSOUT to a PLAM library element, a file is generated as a copy and each output record is also written into that file. The copy is assigned the following name:

S.LST.<lib>.<elem>.<tsn>.<counter>

or

S.OUT.<lib>.<elem>.<tsn>.<counter>

The name sections have the following meanings:

- lib: the first 7 characters of the PLAM library
- elem: the first 7 characters of the element
- tsn: the task's TSN
- counter: 4-position counter

**LIBRARY-OUTPUT-COPY = \*NO**

Output records are not copied.

**LIBRARY-OUTPUT-COPY = \*BY-SYSTEM-PARAMETER**

The setting of the SSMMILOG system parameter applies.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	64	CMD0216	Semantic error

---

## 4.60 MODIFY-SYSTEM-BIAS

Change maximum value for resident main memory pages

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-TUNING  
**Privileges:** TSOS  
OPERATING  
**Routing code:** R

### Function

After system initialization there are by default no more than 24 resident main memory pages available to all users together. The MODIFY-SYSTEM-BIAS command can be used to change the limit during system operation. A reasonable value must be chosen, as appropriate to the load and the types of job being performed. The value must at least comply with the condition specified in the MAX-RESIDENT-PAGES operand. A suitable method for determining an “optimum” value (resulting in no performance degradation) is described in the “Performance Handbook” [27].

Systems support can use the SHOW-SYSTEM-STATUS command, operand INFORMATION=\*SYSTEM-PARAMETERS to display the currently valid values.

The default value \*UNCHANGED in the corresponding operands means that the previously valid definition still applies.

### Format

**MODIFY-SYSTEM-BIAS**

**MAX-RESIDENT-PAGES** = \*UNCHANGED / <integer 0..2147483639 *4Kbyte*>

### Operands

**MAX-RESIDENT-PAGES** = \*UNCHANGED / <integer 0..2147483647 *4Kbyte*>

Maximum number of resident main memory pages available for user jobs.

The value must comply with the following condition:

$$0 \leq n \leq w - x - y - 256$$

where:	w	number of main memory pages
	x	number of class 1 memory pages
	y	number of class 3 memory pages
	256	saturation criterion

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	3	CMD0202	Function or unit not supported
	3	EXC0450	Parameter error
	3	EXC0451	Missing privilege
	3	EXC0452	Insufficient storage space available

---

## 4.61 MODIFY-SYSTEM-PARAMETERS

Modify system parameters

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-TUNING  
**Privileges:** TSOS

### Function

The systems support staff can modify the following parameters of the BS2000 system while it is operational with the aid of the MODIFY-SYSTEM-PARAMETERS command:

BLSCOPYN	JTABSMEM	SNAPTIME
BLSCOPYR	JTMAXMEM	SSMASEC
BLSLDPXS	JTSHMEM	SSMCOPT
BLSOPENX	JTSTDMEM	SSMMILOG
CONSDDE7	MIGHOST	SSMOUT
DIATTL	NBLOGT0	SSMSDEVB
DUMPCL5P	NBMSGCSD	SSMSDEVD
DUMPCTRL	NRTKILL	SYSGJASL
DUMPSD#	NUMBACK	SYSGJCPU
DUMPSEPA	PWERRORS	SYSGJPRI
DUMPSREF	PWPENTI	TCHOFLO
EACTETYP	RDTESTPR	TCHREAD
FILECRYP	SHUTARCH	TCHTACK
FST32GB	SHUTCTL	VMGIORAL
ISBLKCTL	SHUTPROC	WRTESTPR
ISBLKVAL	SNAPTIME	

System parameters have default values that can be modified using the parameter service while the system is being started. The system parameters define the character of the BS2000 system. The SHOW-SYSTEM-PARAMETERS command provides information on the current setting of the system parameters.

The system parameters and the possible settings are described with the SHOW-SYSTEM-PARAMETERS command.

---

## Format

**MODIFY-SYSTEM-PARAMETERS**

**PARAMETER** = <name 1..8>

,**VALUE** = <c-string 1..128> / <x-string 1..8> / <integer 0..2147483647>

## Operands

**PARAMETER** = <name 1..8>

Name of the system parameter to be modified. Only system parameters that can be modified while the system is operational are allowed.

**VALUE** = <c-string 1..128> / <x-string 1..8> / <integer 0..2147483647>

New value to be assigned to the system parameter. Note the value ranges allowed.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	1	CMD2201	Parameter error (see SYSOUT message NSI6260 for details)
	64	CMD0216	Requisite privilege missing

## 4.62 MODIFY-TAPE-OUTPUT-STATUS

Change administration parameters for tape devices

**Component:** SPOOL  
**Functional area:** Controlling spoolout job  
**Domain:** SPOOL-PRINT-ADMINISTRATION  
**Privileges:** OPERATING  
PRINT-SERVICE-ADMINISTRATION  
**Routing code:** S

### Function

The MODIFY-TAPE-OUTPUT-STATUS command changes the administration parameters for the specified tape devices.

If the default value \*UNCHANGED is specified then no changes are made to the initial value of the parameter in question.

### Format

#### MODIFY-TAPE-OUTPUT-STATUS

,REVISION-NUMBER = \*ANY / <integer 1..255>

## Operands

**UNIT = list-poss(8): <alphanum-name 2..2> / <alphanum-name 4..4>**

Mnemonic device names of the tape devices whose assignment parameters are to be modified for waiting spoolout jobs.

**DESTINATION =**

Defines the device pools for which the spoolout jobs which can be processed on the specified tape devices are intended.

**DESTINATION = \*NONE**

The list of local pools is cleared, i.e. spoolout jobs for local device pools are no longer processed on the specified tape devices.

**DESTINATION = \*ADD(...)**

Device pools which are to be added to an existing list of local pools for which the spoolout jobs which can be processed on the specified tape devices are intended.

**DESTINATION-LIST = list-poss(16): \*CENTRAL / <alphanum-name 1..8>**

List of local device pools to be added.

**DESTINATION = \*REMOVE(...)**

Local device pools which are to be removed from an existing list of pools for which the spoolout jobs which can be processed on the specified tape devices are intended.

**DESTINATION-LIST = list-poss(16): \*CENTRAL / <alphanum-name 1..8>**

List of local device pools to be removed.

**DESTINATION = list-poss(16): <alphanum-name 1..8> / \*CENTRAL**

List of local device pools for which the spoolout jobs which can be processed on the specified tape devices are intended.

**FORM-NAME =**

Names of the forms with which spoolout jobs can be processed on the specified tape devices.

**FORM-NAME = \*ALL**

Spoolout jobs can be processed on the specified tape devices irrespective of the form used.

**FORM-NAME = \*STD**

Only spoolout jobs with FORM=\*STD can be processed on the specified tape devices.

**FORM-NAME = \*EXCEPT(...)**

Forms with which spoolout jobs cannot be processed on the specified tape devices.

**FORMS-LIST = list-poss(16): <alphanum-name 2..2>**

List of excluded forms.

**FORM-NAME = \*ADD(...)**

Forms to be added to an existing list of forms with which spoolout jobs can be processed on the specified tape devices.

---

**FORMS-LIST = list-poss(16): <alphanum-name 1..6>**

List of forms to be added.

**FORM-NAME = \*REMOVE(...)**

Forms which are to be removed from an existing list of forms with which spoolout jobs can be processed on the specified tape devices.

**FORMS-LIST = list-poss(15): <alphanum-name 1..6>**

List of forms to be removed.

**FORM-NAME = list-poss(16): <alphanum-name 1..6>**

List of forms with which spoolout jobs can be processed on the specified tape devices.

If there is already a (positive) list of forms for the specified tape devices it is replaced by this new list.

**FORMS-OVERLAY =**

Film overlays with which spoolout jobs can be processed on the specified tape devices.

**FORMS-OVERLAY = \*ALL**

Spoolout jobs can be processed on the specified tape devices irrespective of the film overlays specified.

**FORMS-OVERLAY = \*NONE**

Only spoolout jobs which do not use film overlays can be processed on the specified tape devices.

**FORMS-OVERLAY = \*ONLY**

Only spoolout jobs which use (any) film overlay can be processed on the specified devices.

**FORMS-OVERLAY = \*EXCEPT(...)**

Film overlays with which spoolout jobs cannot be processed on the specified tape devices.

**FORMS-OVERLAY-LIST = list-poss(16): <alphanum-name 2..2>**

List of excluded film overlays.

**FORMS-OVERLAY = \*ADD(...)**

Film overlays to be added to an existing list with which spoolout jobs can be processed on the specified tape devices.

**FORMS-OVERLAY-LIST = list-poss(16): <alphanum-name 2..2>**

List of film overlays to be added.

**FORMS-OVERLAY = \*REMOVE(...)**

Film overlays which are to be removed from an existing list with which spoolout jobs can be processed on the specified tape devices.

**FORMS-OVERLAY-LIST = list-poss(15): <alphanum-name 2..2>**

List of film overlays to be removed.

**FORMS-OVERLAY = list-poss(16): <alphanum-name 2..2>**

List of film overlays with which spoolout jobs can be processed on the specified tape devices.

**USER-IDENTIFICATION =**

User IDs under which spoolout jobs can be processed on the specified tape devices.

**USER-IDENTIFICATION = \*ALL**

Spoolout jobs can be processed on the specified tape devices under all user IDs.

---

**USER-IDENTIFICATION = \*EXCEPT(...)**

User IDs under which spoolout jobs cannot be processed on the specified tape devices.

**USER-IDENT-LIST = list-poss(16): <name 1..8>**

List of excluded user IDs.

**USER-IDENTIFICATION = \*ADD(...)**

User IDs to be added to an existing list of user IDs under which spoolout jobs can be processed on the specified tape devices.

**USER-IDENT-LIST = list-poss(16): <name 1..8>**

List of user IDs to be added.

**USER-IDENTIFICATION = \*REMOVE(...)**

User IDs which are to be removed from an existing list of user IDs under which spoolout jobs can be processed on the specified tape devices.

**USER-IDENT-LIST = list-poss(15): <name 1..8>**

List of user IDs to be removed.

**USER-IDENTIFICATION = list-poss(16): <name 1..8>**

List of user IDs under which spoolout jobs can be processed on the specified tape devices. If there is already a (positive) list of user IDs for the specified tape devices, it is replaced by this new list.

**SPOOLOUT-CLASS =**

Spoolout classes from which spoolout jobs can be processed on the specified tape devices.

**SPOOLOUT-CLASS = \*ALL**

Spoolout jobs from all spoolout classes can be processed on the specified tape devices.

**SPOOLOUT-CLASS = \*EXCEPT(...)**

Spoolout classes from which spoolout jobs cannot be processed on the specified tape devices.

**SPOOLOUT-CLASS-LIST = list-poss(16): <integer 1..255>**

List of excluded spoolout classes.

**SPOOLOUT-CLASS = \*ADD(...)**

Spoolout classes to be added to an existing list of spoolout classes from which spoolout jobs can be processed on the specified tape devices.

**SPOOLOUT-CLASS-LIST = list-poss(16): <integer 1..255>**

List of spoolout classes to be added.

**SPOOLOUT-CLASS = \*REMOVE(...)**

Spoolout classes to be removed from an existing list of spoolout classes from which spoolout jobs can be processed on the specified tape devices.

**SPOOLOUT-CLASS-LIST = list-poss(15): <integer 1..255>**

List of spoolout classes to be removed.

**SPOOLOUT-CLASS = list-poss(16): <name 1..8>**

List of spoolout classes from which spoolout jobs can be processed on the specified tape devices.

If there is already a (positive) list of spoolout classes for the specified tape devices, it is replaced by this new list.

**SPOOLOUT-NAME =**

Job names under which spoolout jobs can be processed on the specified tape devices.

---

**SPOOLOUT-NAME = \*ALL**

Spoolout jobs can be processed on the specified tape devices irrespective of the job name.

**SPOOLOUT-NAME = \*EXCEPT(...)**

Job names under which spoolout jobs cannot be processed on the specified tape devices.

**SPOOLOUT-NAME-LIST = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

List of excluded job names.

**SPOOLOUT-NAME = \*ADD(...)**

Job names to be added to an existing list of job names under which spoolout jobs can be processed on the specified tape devices.

**SPOOLOUT-NAME-LIST = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

List of job names to be added.

**SPOOLOUT-NAME = \*REMOVE(...)**

Job names which are to be removed from an existing list of job names under which spoolout jobs can be processed on the specified tape devices.

**SPOOLOUT-NAME-LIST = list-poss(15): <alphanum-name 1..8> / <c-string 1..8 with-low>**

List of job names to be removed.

**SPOOLOUT-NAME = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

List of job names under which spoolout jobs can be processed on the specified floppy disk devices.

If there is already a (positive) list of job names for the specified tape devices it is replaced by this new list.

**ACCOUNT =**

Account numbers with which spoolout jobs can be processed on the specified tape devices.

**ACCOUNT = \*ALL**

Spoolout jobs can be processed on the specified tape devices irrespective of the account number.

**ACCOUNT = \*EXCEPT(...)**

Account numbers under which spoolout jobs cannot be processed on the specified tape devices.

**ACCOUNT-LIST = list-poss(16): <alphanum-name 1..8>**

List of excluded account numbers.

**ACCOUNT = \*ADD(...)**

Account numbers to be added to an existing list of account numbers under which spoolout jobs can be processed on the specified tape devices.

**ACCOUNT-LIST = list-poss(16): <alphanum-name 1..8>**

List of account numbers to be added.

**ACCOUNT = \*REMOVE(...)**

Account numbers which are to be removed from an existing list of account numbers under which spoolout jobs can be processed on the specified tape devices.

**ACCOUNT-LIST = list-poss(15): <alphanum-name 1..8>**

List of account numbers to be removed.

**ACCOUNT = list-poss(16): <name 1..8>**

List of account numbers under which spoolout jobs can be processed on the specified tape devices.

If there is already a (positive) list of account numbers for the specified tape devices it is replaced by this new list.

---

**ROTATION =**

Indicates whether spoolout jobs which require the page rotation module can be processed on the specified tape devices.

**ROTATION = \*ANY**

Spoolout jobs can be output on the specified tape devices whether they require the page rotation module or not.

**ROTATION = \*NO**

Only spoolout jobs which do not require the page rotation module can be processed on the specified tape devices.

**ROTATION = \*YES**

Only spoolout jobs which require the page rotation module can be processed on the specified tape devices.

**TWO-UP-PROCESSING = \*UNCHANGED / \*ANY / \*YES / \*NO / \*MODE-1 / \*MODE-2**

Specifies 'TWO-UP' processing for the specified HP90 (2090, 2140) printers (see the "SPOOL" manual [43]).

**FORMS-OVERLAY-BUFFER =**

Indicates whether spoolout jobs which use an FOB overlay can be processed on the specified tape devices.

**FORMS-OVERLAY-BUFFER = \*ANY**

Spoolout jobs with and without FOB overlays can be processed on the specified tape devices.

**FORMS-OVERLAY-BUFFER = \*ONLY**

Only spoolout jobs which require an FOB overlay can be processed on the specified tape devices.

**FORMS-OVERLAY-BUFFER = \*RANGE(...)**

Only spoolout jobs with FOB overlays which lie within the specified size range can be processed on the specified tape devices.

**LOW = \*UNCHANGED / <integer 0..32767>**

Lower limit of the range.

**HIGH = \*UNCHANGED / <integer 0..32767>**

Upper limit of the range.

**PRIORITY =**

Priorities with which spoolout jobs can be processed on the specified tape devices.

**PRIORITY = \*ALL**

Spoolout jobs can be processed on the specified tape devices irrespective of their priority.

**PRIORITY = \*RANGE(...)**

Spoolout jobs with priorities within this range can be processed on the specified tape devices.

**FROM = \*UNCHANGED / <integer 30..255>**

Lower limit of the range.

**TO = \*UNCHANGED / <integer 30..255>**

Upper limit of the range.

**CHARACTER-SET-NUMBER =**

Spoolout jobs can be processed on the specified tape devices according to the number of character sets required.

**CHARACTER-SET-NUMBER = \*ALL**

Spoolout jobs can be processed on the specified tape devices irrespective of the number of character sets required.

---

**CHARACTER-SET-NUMBER = \*ONE**

Only spoolout jobs which require no more than one character set can be processed on the specified tape devices.

**CHARACTER-SET-NUMBER = \*RANGE(...)**

Spoolout jobs with a number of required character sets which falls within the range can be processed on the specified tape devices.

**LOW = \*UNCHANGED / <integer 1..32767>**

Lower limit of the range.

**HIGH = \*UNCHANGED / <integer 1..32767>**

Upper limit of the range.

**SPOOLOUT-TYPE =**

Spoolout jobs for certain types of output device can be processed on the specified tape devices.

**SPOOLOUT-TYPE = \*ALL**

Spoolout jobs can be processed on the specified tape devices irrespective of the type of output device for which they were created.

**SPOOLOUT-TYPE = \*HP-PRINTER**

Only spoolout jobs for printers of type 3351/3353 can be processed on the specified tape devices.

**SPOOLOUT-TYPE = \*PRINTER**

Only spoolout jobs for printers can be processed on the specified tape devices.

**SPOOLOUT-TYPE = \*PAGE-PRINTER**

Only spoolout jobs for laser printers can be processed on the specified tape devices.

**SPOOLOUT-TYPE = \*BUFFER-LINE-PRINTER**

Only spoolout jobs for line printers with loadable buffers (3337, 3338, 3339, 3348, 3349) can be processed on the specified tape devices.

**SPOOLOUT-TYPE = \*LIST(...)**

Spoolout jobs for the specified list of device types can be processed on the specified tape devices.

**SELECTION-TYPE = \*MAY / \*MUST**

The selection of spoolout jobs

- is restricted to those which at least may be output on one of the specified device types (\*MAY)
- is restricted to those which must be output on one of the specified device types and may not be output on any device type than the ones specified (\*MUST).

**DEVICE-TYPE = list-poss(8): \*HP-PRINTER / \*LP-PRINTER / \*LP48-PRINTER / \*LP65-PRINTER / \*HP90-PRINTER / \*LP-EMULATED-PRINTER / \*2090-APA-PRINTER / \*2050-APA-PRINTER / \*2090-TWIN-PRINTER / \*PCL-PRINTER**

List of device types. For the symbolic names see the "SPOOL" manual [42].

**REVISION-NUMBER = \*ANY / <integer 1..255>**

The number given must match the current revision number.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SCP0915	Element to be deleted not found
2	0	SCP0954	Only first 100 pools activated for the device
	1	CMD0202	Syntax error
	1	SCP0973	Semantic error
	32	SCP0974	System error. Command rejected
	64	SCP0975	No authorization for command
	64	SCP0976	Invalid operand value

---

## 4.63 MODIFY-TASK-CATEGORIES

Control allocation of CPU, main memory and I/O processor resources to tasks

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-TUNING  
**Privileges:** TSOS  
OPERATING  
**Routing code:** R

### Function

Systems support staff can use the MODIFY-TASK-CATEGORIES command to define the number of tasks per category which are competing for the resources CPU, main memory and I/O processor (active tasks), to decide on the priorities of the categories, and to assign I/O priorities for the tasks of a category.

Together with the CHANGE-TASK-PRIORITY command, this command enables systems support staff to specify the distribution of the resources CPU and main memory to the individual tasks. In addition to the four categories with the standard names TP, DIALOG, BATCH and SYS, the task management also supports 12 further categories whose names are declared with the JMU utility routine.

Systems support can modify the assignment of individual tasks to a category using the MOVE-TASK-TO-CATEGORY command.

Systems support defines in the user catalog and job classes allocated to the user the task attributes the user can add on to his tasks.

The I/O priorities are evaluated solely by the IORM subsystem for task-specific control of inputs/outputs, with runtime control both by PRIOR and by the PCS subsystem.

The current values for resource distribution can be displayed by means of the SHOW-SYSTEM-STATUS command.

### Format

**MODIFY-TASK-CATEGORIES**

**CATEGORY-NAME** = <name 1..7> / \*DIALOG / \*BATCH / \*TP

,**WEIGHT-CODE** = \*UNCHANGED / <integer 1..511>

,**MINIMUM-ACTIVE-TASKS** = \*UNCHANGED / <integer 0..4095>

,**MAXIMUM-ACTIVE-TASKS** = \*UNCHANGED / <integer 0..4095>

,**IO-PRIORITY** = \*UNCHANGED / \*NONE / \*LOW / \*MEDIUM / \*HIGH

---

## Operands

**CATEGORY-NAME = <name 1..7> / \*DIALOG / \*BATCH / \*TP**

Name of the category.

**WEIGHT-CODE = \*UNCHANGED / <integer 1..511>**

This operand serves to weight the categories and controls task activation and task initiation (CPU allocation). It influences the relationships in which tasks are activated from categories. In addition, it is taken into consideration when setting the internal task priority which controls the CPU allocation.

A high value indicates a high degree of urgency.

**MINIMUM-ACTIVE-TASKS = \*UNCHANGED / <integer 0..4095>**

Minimum number of tasks in the specified category which must be active. This ensures a minimum workload per category.

**MAXIMUM-ACTIVE-TASKS = \*UNCHANGED / <integer 0..4095>**

Maximum number of tasks in the specified category which must be active. This operand establishes a workload limit in cases of overload.

**IO-PRIORITY = \*UNCHANGED / \*NONE / \*LOW / \*MEDIUM / \*HIGH**

Determines the I/O priority of all tasks of the specified category. This value is evaluated only if the IORM subsystem has been started and priority control is active (IORM statement IOPT\_SET\_ON=YES). The default \*NONE means that all tasks of this category are assigned an I/O priority which is derived from the task priority (implicit I/O priority).

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	EXC049B	The PCS subsystem, is active; details will only be stored for PRIOR
	64	EXC045D	Invalid parameter
	64	EXC046B	Invalid category name
	64	EXC046C	No access to the SYS category
	64	CMD0216	Privilege infringement

## Example

```
/show-sys-sta inf=*category
```

CATEGORY NAME	MIN MPL	MAX MPL	WT	#EXIS TING	#ACT	#READY	#RDY NOT INACT	ADMITTED	IO-PRIO
SYS	0030	0064	512	0101	0028	0000	0000		NONE
DIALOG	0001	0999	001	0001	0001	0000	0000		NONE
BATCH	0001	0999	001	0006	0000	0000	0000		NONE
TP	0001	0999	001	0007	0001	0000	0000		NONE
BATCHF	0001	0999	001	0005	0002	0000	0000		NONE

```
/mod-task category-name=dialog,min-act=10,max-act=100
```

```
% EXC046D PROCESSING OF /MODIFY-TASK-CATEGORIES COMPLETED
```

```
/show-sys-sta inf=*category
```

CATEGORY NAME	MIN MPL	MAX MPL	WT	#EXIS TING	#ACT	#READY	#RDY NOT INACT	ADMITTED	IO-PRIO
SYS	0030	0064	512	0101	0025	0000	0000		NONE
DIALOG	0010	0100	001	0001	0001	0000	0000		NONE
BATCH	0001	0999	001	0006	0000	0000	0000		NONE
TP	0001	0999	001	0007	0001	0000	0000		NONE
BATCHF	0001	0999	001	0005	0002	0000	0000		NONE
BATCHF	0001	0999	001	0002	0002	0000	0000		NONE

---

## 4.64 MODIFY-TERMINAL-OPTIONS

Modify logical terminal properties

**Component:** TIAM

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** STD-PROCESSING  
TSOS  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The MODIFY-TERMINAL-OPTIONS command allows users to change the logical properties of their terminals. This command may be used only in timesharing mode. The logical properties of the terminal are defined in the system by setting system parameters, by the (emulated) type of the terminal and through VTSU operating parameters.

**i** Real data display terminals can no longer be connected to modern servers. All currently used “data display terminals” are realized through emulation programs like MT9750 by FUJITSU. It is possible that some of the many available emulations have settings that were never available on the real data display terminals and are therefore not described in the BS2000 manuals. If in doubt, please refer to the manual of your data display terminal emulation.

The user can obtain information on the current settings and terminal attributes with the aid of the SHOW-TERMINAL-ATTRIBUTES command.

The user can set the following logical properties:

Logical property	Operand	Preset by
Type of control of screen overflow.	OVERFLOW-CONTROL	System parameter TCHOFFLO
Number of lines after which screen overflow occurs	MAXIMUM-LINES	Emulated terminal type
End-of-line character.	LINE-END-CHARACTER	VTSU operating parameter
Controls the display of outputs and the type of input	WRITE-READ-MODE	System parameter TCHREAD
Case-sensitive	LOWER-CASE	Emulated terminal type
Use of graphics characters	GRAPHICS	Emulated terminal type
Use of an APL character set	APL-CHARACTER-SET	Emulated terminal type
Support of a hardcopy printer	HARDCOPY	Emulated terminal type
Substitute characters for displaying nonprinting characters	SUBSTITUTE-CHARACTER	Dependent on terminal type: <ul style="list-style-type: none"> <li>• X'07' for all supported types ("smudge character")</li> </ul>
Acknowledgment procedure	ACKNOWLEDGE-OUTPUT	System parameter TCHTACK
Code table	CODED-CHARACTER-SET	Dependent upon <ul style="list-style-type: none"> <li>• terminal type</li> <li>• user entry</li> <li>• VTSU operating parameter</li> </ul> (see table below)
System input prompt	SYSTEM-PROMPT	Default is a slash(/)
Program input prompt (read with RDATA)	PROGRAM-PROMPT	Default is an asterisk (*)
Terminal roll-up mode	ROLL-UP	VTSU operating parameter TERMROLL

Table 71: Logical properties of the terminal (operand and presetting)

The following table shows the preset code tables for CODED-CHARACTER-SET, dependent of the terminal type, the user entry for the standard code, and the VTSU operating parameter TIAM-PERM8.

Terminal type / Terminal mode	7-bit	8-bit	8-bit / Unicode	8-bit / Unicode
Standard CCS	-	EDF03IRV	EDFxxx	EDFxxx
TIAM-PERM8	-	-	N <sup>1</sup>	Y <sup>2</sup>
Code table(setting after system startup)	EDF03IRV	EDF03IRV	EDF03IRV	EDFxxx

Table 72: Logical properties of the terminal (preset values for the code table)

<sup>1</sup> corresponds to /MODIFY-TERM-OPTIONS CODED-CHARACTER-SET=\*7-BIT

<sup>2</sup> corresponds to /MODIFY-TERM-OPTIONS CODED-CHARACTER-SET=\*8-BIT-DEFAULT

The default value \*UNCHANGED in the corresponding operands means that the previously valid definition still applies.

## Format

### MODIFY-TERMINAL-OPTIONS

**OVERFLOW-CONTROL** = \*UNCHANGED / \*NO-CONTROL / \*USER-ACKNOWLEDGE / \*TIME(...)

\*TIME(...)

|        **TIMEOUT** = \*STD / <integer 0..60>

,**PROGRAM-PROMPT** = \*UNCHANGED / \*STD / <c-string 1..32 with-low>

,**ROLL-UP** = \*UNCHANGED / \*STD / \*YES / \*NO

---

## Operands

### **OVERFLOW-CONTROL = \*UNCHANGED / \*NO-CONTROL / \*USER-ACKNOWLEDGE / \*TIME(...)**

Type of control in the event of screen overflow.

An overflow is assumed by the system whenever the number of screen lines (still) to be output exceeds the maximum number of lines (MAXIMUM-LINES). At the start of an output the last user input is taken into consideration in calculating the screen overflow. If the overflow control is effected through acknowledgments (\*USER-ACKNOWLEDGE), the acknowledgment request issued by the system is included in the maximum number of screen lines to be output.

### **OVERFLOW-CONTROL = \*NO-CONTROL**

No overflow control. In cases of long screen outputs, the system takes no steps to enable the ESCAPE function (K2 key) or to prevent the premature overwriting of data on the screen.

### **OVERFLOW-CONTROL = \*USER-ACKNOWLEDGE**

Overflow control by means of acknowledgments. When screen overflow occurs, the system requests the terminal user with the message % PLEASE ACKNOWLEDGE to enter an acknowledgment. The user can thus determine when the output is to be continued following a screen overflow. Any input other than ESCAPE and BREAK counts as an acknowledgment. After an acknowledgment is received, output is continued with the next screen.

### **OVERFLOW-CONTROL = \*TIME(...)**

Overflow control is effected on a time basis. The screen output is continued after the specified delay time has elapsed. When the last screen line is reached, the screen contents displayed are "scrolled" up appropriately with each further output line, and input or output data at the top of the screen is overwritten.

#### **TIMEOUT = \*STD / <integer 0..60>**

Delay time, in seconds, that is to pass when screen overflow has occurred before further output is displayed.

#### **TIMEOUT = \*STD**

The last value defined by the user applies. If the user does not specify a value, a wait time of 6 seconds is set.

### *Note*

The value set for time-based control (TIMEOUT) applies even when there is a switch in screen mode (e.g. a switch on termination of a line-mode output back to the formatted input mode of guided dialog).

### **MAXIMUM-LINES = \*UNCHANGED / <integer 3..255>**

Maximum number of lines that may be displayed until the next overflow control.

### **LINE-END-CHARACTER = \*UNCHANGED / \*NONE / <c-string 1..1>**

The operand only exists for reasons of compatibility and has no effect on any supported data display terminal types currently supported.

### **WRITE-READ-MODE = \*UNCHANGED / \*MODIFIED-FIELDS / \*NO-FIELDS**

Controls the display of output messages and the type of input.

### **WRITE-READ-MODE = \*MODIFIED-FIELDS**

Reads modified fields. Data is displayed on the screen in fields. Only the modified fields are transferred to the system.

### **WRITE-READ-MODE = \*NO-FIELDS**

Reads unprotected fields. Data is displayed on the screen without fields, input takes place from the beginning of the screen or from the cursor position.

---

**LOWER-CASE = \*UNCHANGED / \*YES / \*NO**

Specifies whether output of lowercase letters is to be possible.

**GRAPHICS = \*UNCHANGED / \*YES / \*NO**

Specifies whether a graphics option can be used.

**APL-CHARACTER-SET = \*UNCHANGED / \*YES / \*NO**

Specifies whether an APL character set can be used.

**HARDCOPY = \*UNCHANGED / \*NO / \*LOCAL / \*CENTRAL**

Specifies what type of hardcopy logging is to be possible.

**HARDCOPY = \*NO**

No hardcopy printer.

**HARDCOPY = \*LOCAL**

Local hardcopy printer, operable directly at the terminal. This operand is interpreted only if a local hardcopy device was assigned when the connection was established. Otherwise, the operand is ignored.

**HARDCOPY = \*CENTRAL**

The operand value only exists for reasons of compatibility and is equivalent to HARDCOPY=\*NO.

**SUBSTITUTE-CHARACTER = \*UNCHANGED / \*STD / <c-string 1..1> / <x-string 1..2>**

Substitute character to be used in place of nonprinting characters. In output texts, nonprinting characters are replaced by the specified substitute character.

**SUBSTITUTE-CHARACTER = \*STD**

A device-specific smudge character is used as the substitute character.

**ACKNOWLEDGE-OUTPUT = \*UNCHANGED / \*YES / \*NO**

Specifies whether terminal output is to be acknowledged within the system. The value set explicitly for ACKNOWLEDGE-OUTPUT applies for all subsequent output in program and system mode until a new setting is made with MODIFY-TERMINAL-OPTIONS or until EXIT-JOB/LOGOFF.

**ACKNOWLEDGE-OUTPUT = \*NO**

No internal acknowledgment.

Messages that are output immediately prior to EXIT-JOB or LOGOFF may be lost due to the connection being cleared down.

**CODED-CHARACTER-SET = \*UNCHANGED / \*7-BIT / \*8-BIT-DEFAULT / <name 1..8>**

Specifies whether the terminal is to operate in 7-bit or 8-bit mode.

**CODED-CHARACTER-SET = \*7-BIT**

The terminal operates in 7-bit mode.

**CODED-CHARACTER-SET = \*8-BIT-DEFAULT**

Activates the 8-bit code table of the user entry provided the entry contains an 8-bit code table. The terminal then operates in 8-bit mode. If the user entry contains no 8-bit code table, the terminal continues to operate in 7-bit mode.

---

**CODED-CHARACTER-SET = <name 1..8>**

Name of a code table (CCS). Depending on the explicit specification of a code in the VTSUCB (VTSU Control Block), the following situations may arise:

Standard CCS	7	7	7	7	7	7	name	name	name <sub>1</sub>	name	name	name <sub>1</sub>
8-bit terminal	n	n	n	j	j	j	n	n	n	j	j	j
MOD-TERM-OPT C-C-S =	7	8	name	7	8	name	7	8	name <sub>2</sub>	7	8	name <sub>2</sub>
Result	1)	2)	2)	3)	4)	7)	1)	2)	2)	5)	6)	8)

1. The command is accepted.

The terminal works in 7-bit mode. First item of information supplied by TSTAT: blank Second item of information supplied by TSTAT: blank

2. The command is rejected.

The terminal works in 7-bit mode. First item of information supplied by TSTAT: blank Second item of information supplied by TSTAT: blank

3. The command is accepted.

The terminal works in 7-bit mode, if no VTSUCB is used or if blanks were detected in the VTSUCB. First item of information supplied by TSTAT: blank Second item of information supplied by TSTAT: blank

4. The command is rejected.

The terminal works in 7-bit mode, if no VTSUCB is used or if blanks were detected in the VTSUCB. First item of information supplied by TSTAT: blank Second item of information supplied by TSTAT: blank

5. The command is accepted.

The terminal works in 7-bit mode, if no VTSUCB is used or if blanks were detected in the VTSUCB. The terminal works in 8-bit mode if a valid extended code name or \*EXTEND was defined in the VTSUCB. In this case, the standard CCS name is used. First item of information supplied by TSTAT: name Second item of information supplied by TSTAT: blank

6. The command is accepted.

The terminal works in 8-bit mode (with the character set name) if no VTSUCB is used or if blanks were detected in the VTSUCB. It likewise works in 8-bit mode if a valid character set name or \*EXTEND was detected in the VTSUCB. In this case, the character set name is used. First item of information supplied by TSTAT: name Second item of information supplied by TSTAT: name

7. The command is accepted if the name is supported by the terminal.

The terminal works in 8-bit mode (with the character set name) if no VTSUCB is used or if no character set name is specified in the VTSUCB. First item of information supplied by TSTAT: blank Second item of information supplied by TSTAT: name

8. The command is accepted if name<sub>2</sub> is supported by the terminal.

The terminal works in 8-bit mode (with the character set name<sub>2</sub>) if no VTSUCB is used or if no character set name is specified in the VTSUCB First item of information supplied by TSTAT: name<sub>1</sub> Second item of information supplied by TSTAT: name<sub>2</sub>

---

*Working with Unicode code tables*

The Unicode variant UTFE (CODED-CHARACTER-SET=UTFE specification) permits Unicode code tables to be used. To select this variant, the terminal mode must be *Unicode* and the terminal type *DSS9763*.

The CODED-CHARACTER-SET=UTFE specification is rejected if this variant cannot be selected. The entry is possible if the output of the SHOW-TERMINAL-ATTRIBUTES command displays the value 240 in one of the up to 16 code tables which are possible (see CHARACTER-SET-i output field in the CAPABILITIES information block, where i=1 to 16).

**SYSTEM-PROMPT = \*UNCHANGED / \*STD / <c-string 1..32 with-low>**

Specifies with which type of prompt the system requests command input.

**SYSTEM-PROMPT = \*STD**

The system prompt is a slash (/). This is the value set when the task is started.

**SYSTEM-PROMPT = <c-string 1..32 with-low>**

The system prompts input with this character string. A maximum of 32 characters may be entered. The string may contain wildcards for which the relevant value will be substituted:

Wildcard	Value substituted
#H	Host name
#J	Job name
#P	Processor name
#S	Station name
#U	user ID

**PROGRAM-PROMPT = \*UNCHANGED / \*STD / <c-string 1..32 with-low>**

Specifies with which type of prompt programs will request input read with RDATA.

**PROGRAM-PROMPT = \*STD**

Program entries read with RDATA are prompted with an asterisk (\*). This is the value set when the task is started.

**PROGRAM-PROMPT = <c-string 1..32 with-low>**

Program entries read with RDATA are prompted with this character string. A maximum of 32 characters may be entered. The string may contain wildcards for which the relevant value will be substituted (see SYSTEM-PROMPT operand).

**ROLL-UP = \*UNCHANGED / \*STD / \*YES / \*NO**

Specifies how "old" screen contents is to be treated (terminal roll-up mode).

**ROLL-UP = \*STD**

The value defined in the VTSU operating parameter TERMROLL in the VTSU parameter file applies.

**ROLL-UP = \*YES**

Old screen contents is rolled up.

**ROLL-UP = \*NO**

The old screen contents is deleted up to the write mark when reissued.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed successfully
1	0	CMD2201	Command not effective until the overflow control has been reactivated
2	0	TIA0500	Command executed with warning; at least one entry has been ignored because of a semantic error
	1	TIA0502	Syntax error
	32	TIA0122	Unrecoverable VTSU-B error
	64	CMD0216	Privilege error

## Example

`/show-file proc.time` \_\_\_\_\_ (1)

```

** Es ist jetzt 14:25:16 Uhr.
** Es ist jetzt 14:25:16 Uhr.
** Es ist jetzt 14:25:46 Uhr.
** Es ist jetzt 14:26:16 Uhr.
```

- (1) The SHOW-FILE command displays the contents of the file *PROC.TIME*. This is an S procedure which determines the current time ten times (builtin function TIME()) and outputs it to SYSOUT by means of the WRITE-TEXT command. *E(*END) terminates the output of the SHOW-FILE command.
- (2) Overflow control is deactivated (*OVERFLOW-CONTROL=\*NO-CONTROL*).
- (3) Calls the procedure *PROC.TIME*. Since no screen overflow occurs, the message giving the time is output ten times in succession. The time displayed does not change on account of the instantaneous output.
- (4) The character string *Host07:* is defined as the input prompt for commands.
- (5) Overflow control is set to *\*USER-ACKNOWLEDGE* with a maximum of 3 output lines.
- (6) Calls the procedure *PROC.TIME*. After every 3 lines the system requests an acknowledgment from the user. The first overflow occurs immediately after the first time output since the procedure call and acknowledgment request are included in calculating the maximum number of lines. The user acknowledges, for example by pressing the [DUE] key. The output then continues. Different times are displayed on account of the delay.

- 
- (7) Overflow control is set to a delay of 30 seconds. The maximum number of lines is not changed.
  - (8) Calls the procedure *PROC.TIME*. A delay of 30 seconds elapses after every 3 lines. The delay can be seen from the output time: the time advances 30 seconds after every three output lines.

---

## 4.65 MODIFY-TEST-OPTIONS

Modify task-specific settings for testing and diagnostics

<b>Component:</b>	AIDSYSA
<b>Functional area:</b>	Program control
<b>Domain:</b>	PROGRAM
<b>Privileges:</b>	all privileges bar OPERATING

### Function

The MODIFY-TEST-OPTIONS command allows the user to modify the task-specific test and diagnostic options:

- The test and diagnostic privilege values can be modified for the user's own tasks (PRIVILEGE operand). The maximum possible test privilege values for AID are defined in the user entry and cannot be exceeded.
- Users can control the options for requests for user and area dumps for their own tasks and tasks under their own user IDs (USERDUMP-OPTIONS operands). Users can specify whether a dump is to be generated in response to an event that is capable of generating a dump. They can specify the subset on which the created dumps are to be stored, whether duplicates of dumps are to be suppressed and the maximum number of dumps that are to be created. They can also specify whether a dump is to contain DIV windows and data spaces and swapped in areas of POSIX memory mapping.
- Users can permit or prohibit the use of the hardware or linkage audits for their own tasks (AUDIT operand).
- The static AID test with a lower test privilege can be permitted or prohibited for other tasks running under the user's own user ID (OWN-UID-DEBUGGING operand). If testing with reduced privileges is permitted then, in the case of read access to another task, the same test privileges as for the user's own task are sufficient. In the case of write access, a write privilege  $\geq 2$  is required.

#### *Privileged functions*

Privileged users (TSOS privilege) can control the dump request options for any task (TSN operand).

## Format

**MODIFY-TEST-OPTIONS**

Alias: **MDTSO**

**PRIVILEGE** = \*UNCHANGED / \*PARAMETERS(...)

\*PARAMETERS(...)

| **READ** = <integer 1..9>

| ,**WRITE** = <integer 1..9>

,**USERDUMP-OPTIONS** = \*UNCHANGED / \*PARAMETERS(...)

\*PARAMETERS(...)

| **TSN** = \*OWN / <alphanum-name 1..4> / <c-string 1..4>

| ,**DUMP** = \*UNCHANGED / \*STD / \*YES / \*NO / \*SYSTEM

| ,**DUMP-CONTENTS** = \*UNCHANGED / \*PARAMETERS(...)

| \*PARAMETERS(...)

| | **DATA-IN-VIRTUAL** = \*STD / \*NO / \*YES

| | ,**DATA-SPACES** = \*STD / \*NO / \*YES

| | ,**MEMORY-MAP** = \*STD / \*NO / \*YES

| ,**OUTPUT-PUBSET** = \*UNCHANGED / \*DEFAULT-PUBSET / <cat-id 1..4>

| ,**MAXIMUM-NUMBER** = \*UNCHANGED / \*UNLIMITED / <integer 1..255>

| ,**SUPPRESS-DUPLICATES** = \*UNCHANGED / \*NO / \*YES

,**AUDIT** = \*UNCHANGED / \*PARAMETERS(...)

\*PARAMETERS(...)

| **HARDWARE-AUDIT** = \*UNCHANGED / \*NOT-ALLOWED / \*ALLOWED

| ,**LINKAGE-AUDIT** = \*UNCHANGED / \*NOT-ALLOWED / \*ALLOWED

,**OWN-UID-DEBUGGING** = \*UNCHANGED / \*PARAMETERS(...)

\*PARAMETERS(...)

| **ACCEPT-ACCESS** = \*UNCHANGED / \*NO / \*YES(...)

| \*YES(...)

| | **PASSWORD** = \*NONE / <c-string 1..8>

| ,**ENABLE-ACCESS** = \*UNCHANGED / \*NO / \*YES(...)

| \*YES(...)

---

| | **PASSWORD** = <c-string 1..8>

## Operands

### **PRIVILEGE = \*UNCHANGED / \*PARAMETERS(...)**

Test privilege values for testing and diagnostics.

This operand is primarily required for testing using AID.

Values specified here must not exceed the maximum values specified in the user entry. In addition, in the user entry, systems support may specify whether consent of the operator is necessary to increase the values.

See SHOW-USER-ATTRIBUTES command, output fields *READ-PRIVILEGE*, *WRITE-PRIVILEGE* and *MODIFICATION*, grouped under *TEST-OPTIONS*.

### **PRIVILEGE = \*UNCHANGED**

The current specification applies, i.e. the values last set in MODIFY-TEST-OPTIONS, otherwise, the standard system values apply.

### **PRIVILEGE = \*PARAMETERS(...)**

#### **READ = <integer 1..9>**

Value for read privilege. Default value: 1

#### **WRITE = <integer 1..9>**

Value for write privilege. Default value: 1

### **USERDUMP-OPTIONS = \*UNCHANGED / \*PARAMETERS(...)**

Controls the output of user and area dumps for the user's own tasks and tasks under the user's own user ID.

### **USERDUMP-OPTIONS = \*PARAMETERS(...)**

#### **TSN = \*OWN / <alphanum-name 1..4> / <c-string 1..4>**

Specifies the task for which the output of user dumps is to be modified.

#### **TSN = \*OWN**

The modifications apply to the user's own task.

#### **TSN = <alphanum-name 1..4> / <c-string 1..4>**

TSN of the task to which the modifications are to apply. Nonprivileged callers may only specify tasks running under their own user IDs.

#### **DUMP = \*UNCHANGED / \*STD / \*YES / \*NO / \*SYSTEM**

Specifies whether a user or area dump is actually to be created in the event of a dump request.

#### **DUMP = \*UNCHANGED**

The current setting applies, i.e. the most recent setting for the specified task made using MODIFY-TEST-OPTIONS. In case no specification was made, the default system setting will be effective (corresponds to the operand value \*STD).

#### **DUMP = \*STD**

The standard control is in effect:

In interactive mode, the system asks: DUMP DESIRED? REPLY (Y=YES, N=NO)

If the user answers "N", the memory dump is suppressed. If the answer is "Y", the system outputs the memory dump and issues the message

DUMP IN PROGRESS, PLEASE WAIT

---

In batch mode and in procedures, the memory dump is suppressed and the following message is issued:

SYSTEM REGULATIONS PROHIBIT DUMP

**DUMP = \*YES**

Every memory dump is output.

**DUMP = \*NO**

No memory dump is to be output if cause for one occurs during the current job.

**DUMP = \*SYSTEM**

A system dump is generated instead of a user or area dump. However, this conversion to a system dump is performed only if one of the following conditions relating to test privileges is fulfilled:

- The task making the DUMP=\*SYSTEM setting possesses a read privilege  $\geq 3$ .
- The task in which the dump occurs possesses a read privilege  $\geq 3$ .

A converted dump is handled in the same way as a genuine system dump, i.e. the control mechanisms that apply to system dumps also apply to such dumps (instead of those applying to user and area dumps).

**DUMP-CONTENTS = \*UNCHANGED / \*PARAMETERS(...)**

Determines the content of user dumps for the specified task. These settings do not apply to area dumps.

**DUMP-CONTENTS = \*PARAMETERS(...)**

**DATA-IN-VIRTUAL = \*STD / \*NO / \*YES**

Specifies whether user dumps also contain DIV windows. The default value is \*STD, i.e. DIV windows are included in user dumps if no entry was made in the CDUMP macro.

**DATA-SPACES = \*STD / \*NO / \*YES**

Specifies whether user dumps also contain data spaces. The default value is \*STD, i.e. data spaces are included in user dumps if no entry was made in the CDUMP macro.

**MEMORY-MAP = \*STD / \*NO / \*YES**

Specifies whether user dumps contain swapped in areas of POSIX memory mapping. The default value is \*STD, i.e. POSIX mapping pages are issued in the user dumps if no particular specifications are made in the dump request.

**OUTPUT-PUBSET = \*UNCHANGED / \*DEFAULT-PUBSET / <cat-id 1..4>**

Defines the pubset on which any user or area dumps resulting from the specified task are to be created. They are stored on the corresponding pubset either under the task's user ID or, if the task involves protected data, under the SYSUSER user ID.

**OUTPUT-PUBSET = \*UNCHANGED**

The current setting applies, i.e. the most recent setting for the specified task made using MODIFY-TEST-OPTIONS. If no setting was made then the system defaults apply (OUTPUT-PUBSET=\*DEFAULT-PUBSET).

**OUTPUT-PUBSET = \*DEFAULT-PUBSET**

User or area dumps are stored on the default pubset declared for the user ID of the specified task in the user catalog. Dumps involving protected data are stored under the SYSUSER user ID on the default pubset.

**OUTPUT-PUBSET = <cat-id 1..4>**

Catalog ID of the pubset on which user or area dumps are to be stored.

**MAXIMUM-NUMBER = \*UNCHANGED / \*UNLIMITED / <integer 1..255>**

Defines the maximum number of user or area dumps that are to be generated for the specified task.

---

**MAXIMUM-NUMBER = \*UNCHANGED**

The current setting applies, i.e. the most recent setting for the specified task made using MODIFY-TEST-OPTIONS. If no setting was made then the system defaults apply (MAXIMUM-NUMBER=\*UNLIMITED).

**MAXIMUM-NUMBER = \*UNLIMITED**

There is no restriction on the maximum number of user or area dumps.

**MAXIMUM-NUMBER = <integer 1..255>**

Maximum number of user or area dumps.

**SUPPRESS-DUPLICATES = \*UNCHANGED / \*NO / \*YES**

Specifies whether the output of a user or area dump for the specified task should be suppressed if these represent duplicates of dumps that have already been created. A dump is treated as a duplicate if a dump with the same interrupt weight has already occurred at the same point within the same program.

**SUPPRESS-DUPLICATES = \*UNCHANGED**

The current setting applies, i.e. the most recent setting for the specified task made using MODIFY-TEST-OPTIONS. If no setting was made then the system defaults apply (SUPPRESS-DUPLICATES=\*NO).

**SUPPRESS-DUPLICATES = \*NO**

The output of dump duplicates should not be suppressed.

**SUPPRESS-DUPLICATES = \*YES**

The output of dump duplicates should be suppressed.

**AUDIT = \*UNCHANGED / \*PARAMETERS(...)**

Specifies whether hardware audits and linkage audits may be controlled using commands within a task.

**HARDWARE-AUDIT = \*UNCHANGED / \*NOT-ALLOWED / \*ALLOWED**

Specifies whether the hardware audit may be controlled using commands within the task.

**HARDWARE-AUDIT = \*NOT-ALLOWED**

The hardware audit may not be controlled using commands within the task.

**HARDWARE-AUDIT = \*ALLOWED**

The hardware audit may be controlled using commands within the task. Use of the hardware audit has to be allowed for the user ID.

**LINKAGE-AUDIT = \*UNCHANGED / \*NOT-ALLOWED / \*ALLOWED**

Specifies whether the linkage audit may be controlled using commands within the task.

**LINKAGE-AUDIT = \*NOT-ALLOWED**

The linkage audit may not be controlled using commands within the task.

**LINKAGE-AUDIT = \*ALLOWED**

The linkage audit may be controlled using commands within the task. Use of the hardware audit has to be allowed for the user ID.

**OWN-UID-DEBUGGING = \*UNCHANGED / \*PARAMETERS(...)**

Controls the static AID test with lower test privileges for other tasks running under the user's own user ID.

If testing with reduced privileges is permitted then, in the case of read access to another task, the same test

privileges as for the user's own task are sufficient. In the case of write access, a write privilege  $\geq 2$  is required.

If testing with lower privileges is not permitted then test privilege 8 is required for both reading and writing.

---

**OWN-UID-DEBUGGING = \*UNCHANGED**

The current setting applies, i.e. the most recent setting for the specified task made using MODIFY-TEST-OPTIONS. If no setting was made then the system defaults apply (ACCEPT-ACCESS=\*NO and ENABLE-ACCESS=\*NO).

**OWN-UID-DEBUGGING = \*PARAMETERS(...)****ACCEPT-ACCESS = \*UNCHANGED / \*NO / \*YES(...)**

Specifies whether the user's own task permits testing with lower test privileges by other tasks running under the user's ID.

**ACCEPT-ACCESS = \*UNCHANGED**

The current setting applies, i.e. the most recent setting for the specified task made using MODIFY-TEST-OPTIONS. If no setting was made then the system defaults apply (ACCEPT-ACCESS=\*NO).

**ACCEPT-ACCESS = \*NO**

The user's own task prohibits testing with a lower test privilege by other tasks running under the user's own ID.

**ACCEPT-ACCESS = \*YES(...)**

The user's own task prohibits testing with a lower test privilege by other tasks running under the user's own ID (observer tasks). It therefore declares itself as the test task.

**PASSWORD = \*NONE / <c-string 1..8>**

Specifies whether a password has to be entered in the event of testing by another task (observer task).

**PASSWORD = \*NONE**

No password is declared. Observer tasks do not have to log on explicitly at the test tasks.

**PASSWORD = <c-string 1..8>**

Password that has to be used by an observer task for testing (see the ENABLE-ACCESS operand). Only the password last specified by the test task can be used for logon.

**ENABLE-ACCESS = \*UNCHANGED / \*NO / \*YES(...)**

Specifies whether the user's own task can identify itself to a test task running under the user's own ID as an observer task for testing with lower privileges.

**ENABLE-ACCESS = \*UNCHANGED**

The current setting applies, i.e. the most recent setting for the specified task made using MODIFY-TEST-OPTIONS. If no setting was made then the system default applies (ACCEPT-ACCESS=\*NO). (ENABLE-ACCESS=\*NO).

**ENABLE-ACCESS = \*NO**

Observer task identification is revoked. This makes all previously specified passwords invalid.

**ENABLE-ACCESS = \*YES(...)**

The user's own task identifies itself to a test task running under the user's own ID as an observer task. Such a task is only permitted to observe a test task if the test task has not declared any password protection (in this case the setting ENABLE-ACCESS=\*YES is obsolete) or if one of the last 8 passwords entered for observation purposes corresponds to the password of the test task.

**PASSWORD = <c-string 1..8>**

Password used to identify the task to a test task.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed successfully
	1	CMD2201	Error in function call: function invalid
	3	CMD2203	Error in function call: version invalid
	1	IDA0300	Syntax error
	32	CMD0221	System error
	64	CMD0216	Error: command privilege missing
	64	IDA0301	Semantic error

---

## 4.66 MODIFY-USER-ATTRIBUTES

Modify catalog entry for user

**Component:** SRPMNUC

**Functional area:** User management

**Domain:** USER-ADMINISTRATION

**Privileges:** STD-PROCESSING  
USER-ADMINISTRATION

**Routing code:** \$

### Function

If an entry for the user catalog of the home pubset is modified, the access rights to BS2000 (e.g. account number, password of the user ID, etc.) and the access rights to a pubset (default catalog ID) can be reassigned. These specifications are only checked in the user catalog of the home pubset for user compliance (logon validation).

The command modifies user attributes on SF or SM pubsets, which means that the user catalog entry is modified for the associated ID.

If an entry is created in a user catalog of an imported pubset, pubset-specific information must be stored. Systems support must define an upper limit for the user up to which the user may occupy storage space on this pubset. In addition, it can grant the user permission to exceed this limit. These new declarations, however, take effect only after the user logs on again, not for current tasks.

The default value \*UNCHANGED in the corresponding operands means that the previously valid definition still applies.

#### *Restriction*

The only nonprivileged users (STD-PROCESSING privilege) authorized to issue this command are those designated as group administrators. The actions a group administrator can take are defined by systems support. For information on setting up and managing user groups see the "SECOS" manual [35].

## Format

```

## Operands

**USER-IDENTIFICATION** = <name 1..8>

Defines the name of the user ID for which the entry is to be modified.

**PROTECTION-ATTRIBUTE** = \*UNCHANGED / **\*PARAMETERS(...)**

Defines protection attributes.

**PROTECTION-ATTRIBUTE** = **\*PARAMETERS(...)**

Individual protection attributes are to be modified.

**LOGON-PASSWORD** = \*UNCHANGED / **\*NONE** / <c-string 1..8> / <c-string 9..32> /  
<x-string 1..16> / **\*SECRET**

Password protecting the user ID from unauthorized access (long password (<c-string 9..32>), see the MODIFY-USER-PROTECTION command).

**PASSWORD-ENCRYPTION** = \*YES / **\*NO**

The password of the user ID is encrypted after entry or is stored in its original form. Password encryption presupposes that the system parameter ENCRYPT=Y is set in the parameter file (see the "Introduction to System Administration" [14]).

**PASSWORD-MANAGEMENT** = \*UNCHANGED / **\*BY-USER** / **\*BY-ADMINISTRATOR** /  
**\*USER-CHANGE-ONLY**

Specifies the user's rights with regard to modification of his password.

---

! If SECOS is being used, the PASSWORD-MANAGEMENT is preset with the SECOS specific value \*LOGON-DEFAULT. This value cannot be changed using /MODIFY-USER-ATTRIBUTES. Changes with /MODIFY-USER-ATTRIBUTES are only possible if a value not equal \*LOGON-DEFAULT was assigned to the PASSWORD-MANAGEMENT with the SECOS command MODIFY-LOGON-PROTECTION (see the “SECOS, Volume 1” manual [35]).

**PASSWORD-MANAGEMENT = \*BY-USER**

The user may define, modify or delete a password.

**PASSWORD-MANAGEMENT = \*BY-ADMINISTRATOR**

Only systems support staff may define, modify or delete the password for the user ID.

**PASSWORD-MANAGEMENT = \*USER-CHANGE-ONLY**

The user may define and modify a password.

Deletion of the password, i.e. cancellation of access rights, is not permissible.

**TAPE-ACCESS = \*UNCHANGED / \*STD / \*PRIVILEGED / \*BYPASS-LABEL / \*ALL**

Defines whether error messages generated during label checking of tapes may be ignored for the user concerned.

**TAPE-ACCESS = \*STD**

Error messages must not be ignored.

**TAPE-ACCESS = \*PRIVILEGED**

The following error messages for input and output files may be ignored by the owner of the tape or by systems support staff:

- invalid volume serial number (VSN)
- tape is write-protected
- incorrect file set identifier in the HDR1 label of the tape

**TAPE-ACCESS = \*READ**

The user may ignore error messages relating to input files; label checking is not deactivated. The following errors may result in messages during tape processing:

- invalid volume serial number (VSN)
- invalid file name
- invalid label on tape
- invalid access method
- invalid file sequence number on tape
- tape mark instead of end-of-volume label on tape
- double tape mark instead of end-of-volume label on tape

**TAPE-ACCESS = \*BYPASS-LABEL**

Label checking and thus any data protection for tape files is deactivated for tapes processed in INPUT or REVERSE mode. This privilege implies the TAPE-ACCESS=\*READ function.

---

**TAPE-ACCESS = \*ALL**

All error messages which have "I" (ignore) as a possible response may be ignored. This privilege implies the TAPE-ACCESS=\*PRIVILEGED and TAPE-ACCESS=\*BYPASS-LABEL functions.

**FILE-AUDIT = \*UNCHANGED / \*NO / \*ALLOWED**

Defines whether the user is authorized to activate the AUDIT mode. This mode serves to monitor DMS accesses to files and file generations via system exit routines or, if the SECOS software product is used, by the SAT component.

**MAILING-ADDRESS = \*UNCHANGED / <c-string 1..64 with-low> / <x-string 1..128>**

Mailing address for spoolout lists.

**EMAIL-ADDRESS = \*UNCHANGED / \*NONE / <composed-name 1..1800> / <c-string 1..1800 with-low> / <x-string 1..3600>**

Specifies an email address or a list of email addresses for the users of this user ID. The addresses must be entered in the format '<local-part>@<domain>[, ...]'. Optionally an address can also be prefixed by an address name in parentheses (see [Example in chapter "Volume 2: ACTIVATE-SNAPSHOT - DECRYPT-FILE" in section "ADD-USER"](#)). A list consists of multiple addresses separated by a comma and can only be specified as a string (c or x string).

The address or address list entered is evaluated when a file is sent by email (see the MAIL-FILE command).

**PUBLIC-SPACE-LIMIT = \*UNCHANGED / \*STD / \*MAXIMUM / <integer 0..2147483647 2Kbyte>**

Assigns the maximum storage space the user may occupy for his files on public volumes on the pubset allocated with the PUBSET operand.

**PUBLIC-SPACE-LIMIT = \*STD**

Allocates the user 16,777,215 PAM pages.

**PUBLIC-SPACE-LIMIT = \*MAXIMUM**

Allocates the user 2,147,483,647 PAM pages.

**PUBLIC-SPACE-EXCESS = \*UNCHANGED / \*NO / \*TEMPORARILY-ALLOWED / \*ALLOWED**

Defines whether the user may exceed the limit defined by the PUBLIC-SPACE-LIMIT operand for the storage space on the allocated pubset. This authorization is restricted to user jobs started before this limit was reached.

**PUBLIC-SPACE-EXCESS = \*TEMPORARILY-ALLOWED**

The storage space limit may be exceeded, provided that the upper limit had not been reached at the time of the SET-LOGON-PARAMETERS command.

**ADDRESS-SPACE-LIMIT = \*UNCHANGED / \*STD / <integer 1..2147483647 Mbyte>**

Defines how much user memory a task can request under this user ID. The user memory comprises both conventional class-6 memory (program space) and (data spaces). The maximum user memory depends on the size of the virtual memory and can be less than the value specified here.

**ADDRESS-SPACE-LIMIT = \*STD**

The value of the system parameter SYSGJASL is assigned (the system parameter SYSGJASL has the default value 16 MB).

**MAX-ACCOUNT-RECORDS = \*UNCHANGED / \*NO-LIMIT / <integer 0..32767>**

Defines how many user-specific accounting records for each job or program are allowed to be written into the accounting file of the system.

---

**MAX-ACCOUNT-RECORDS = \*NO-LIMIT**

The user is authorized to write any number of user-specific accounting records and accounting records of his own in the accounting file.

**MAX-ACCOUNT-RECORDS = <integer 0..32767>**

Defines how many user-specific accounting records can be written in the system accounting file for each job or program. The user is not authorized to add accounting records of his own.

**PROFILE-ID = \*UNCHANGED / \*NONE / <structured-name 1..30>**

Determines whether the user ID is assigned an SDF-PROFILE-ID. This PROFILE-ID characterizes a (SDF) group of user IDs which use a common group syntax file. Systems support can effect direct assignment of a user ID to a group syntax file by means of a suitable entry in the SDF parameter file.

**PROFILE-ID = \*NONE**

The user is not assigned a PROFILE-ID and thus no group syntax file.

**PROFILE-ID = <structured-name 1..30>**

Defines the name of the PROFILE-ID which can be assigned to a group syntax file in the SDF parameter file.

**PUBSET =**

Defines the pubset whose user catalog is to accept the entry.

**PUBSET = \*HOME**

The entry is made in the user catalog of the home pubset.  
As a result, system access authorizations are redefined.

**PUBSET = <cat-id 1..4>**

Catalog identifier of the pubset whose user catalog is to accept the entry.

**RESIDENT-PAGES = \*UNCHANGED / \*STD / \*MAXIMUM / <integer 0..2147483647 4Kbyte>**

Defines the maximum number of resident main memory pages available to the user ID.

**RESIDENT-PAGES = \*STD**

The user may use 32,767 resident main memory pages.

**RESIDENT-PAGES = \*MAXIMUM**

The user may use 2,147,483,647 resident main memory pages.

**CSTMP-MACRO-ALLOWED = \*UNCHANGED / \*NO / \*YES**

Determines whether the user may use the CSTMP macro in his programs. The user can use the CSTMP macro to write-protect a memory pool (in class 6 memory) that can be shared by multiple users or explicitly cancel this protection. The macro is described in detail in the "Executive Macros" manual [22].

**DEFAULT-PUBSET = \*UNCHANGED / \*HOME / <cat-id 1..4>**

Assigns the user ID a default pubset on which the user can store his files and request storage space. Systems support can change the DEFAULT-PUBSET operand in any user catalog of an imported pubset. However, the user default pubset is determined only with the aid of the user catalog of the home pubset. For the TSOS user ID, the value of DEFAULT-PUBSET must be identical to the value of PUBSET.

User jobs which have the status HELD-BY-PUBSET due to the nonavailability of a default pubset are released for restart once the newly defined default pubset is available.

**DEFAULT-PUBSET = \*HOME**

Defines the home pubset to be the user default pubset.

---

**DEFAULT-PUBSET = <cat-id 1..4>**

Catalog identifier of the pubset to be used as the user default pubset of the user ID.

**TEST-OPTIONS = \*UNCHANGED / \*PARAMETERS(...)**

Defines the maximum possible privilege for testing and diagnostic analysis of programs. The test privilege is interpreted by the software products AID and DAMP (access method ANITA).

**TEST-OPTIONS = \*PARAMETERS(...)**

Defines the maximum permitted privilege levels for read and write access. Even at privilege level 2 the user has access to task-specific, sensitive data (system tables and control blocks). Higher values should be allocated only on request and for a limit period to selected user IDs. The values possible for this and a description can be found in [section "Overview of test privileges"](#).

**READ-PRIVILEGE = \*UNCHANGED / <integer 1..9>**

Defines the maximum read privilege.

**WRITE-PRIVILEGE = \*UNCHANGED / <integer 1..9>**

Defines the maximum write privilege.

**MODIFICATION = \*UNCHANGED / \*UNCONTROLLED / \*CONTROLLED**

Specifies whether the user requires the operator's permission to modify his/her current test privilege.

**MODIFICATION = \*UNCONTROLLED**

The user does not require the operator's permission.

**MODIFICATION = \*CONTROLLED**

The user requires the operator's permission.

**AUDIT = \*PARAMETERS(...)**

Defines user-specific audit authorization. Authorization may be assigned to users separately for hardware audit and linkage audit. System-wide availability of the audit function is defined via the AUDALLOW system parameter.

*Note*

Hardware audit is only supported on /390 architecture (SUs /390 and S servers).

**HARDWARE-AUDIT = \*UNCHANGED / \*ALLOWED / \*NOT-ALLOWED**

Specifies whether a user is authorized to control the hardware audit mode. The audit mode can be controlled by means of the START-, STOP-, HOLD- and RESUME-HARDWARE-AUDIT commands and via the AUDIT macro for the function states

TU (task unprivileged) and TPR (task privileged). Modifications only affect the user ID's new tasks.

**HARDWARE-AUDIT = \*ALLOWED**

The user is allowed to control the hardware audit mode, provided the audit function is available throughout the system.

**HARDWARE-AUDIT = \*NOT-ALLOWED**

The user is not allowed to control the hardware audit mode.

**LINKAGE-AUDIT = \*UNCHANGED / \*ALLOWED / \*NOT-ALLOWED**

Specifies whether a user is authorized to control the linkage audit mode. The audit mode can be controlled by means of the START-, STOP-, HOLD- and RESUME-LINKAGE-AUDIT commands and via the AUDIT macro for the function states TU (task unprivileged), TPR (task privileged) and SIH (system interrupt handling).

Modifications only affect the user ID's new tasks.

---

**LINKAGE-AUDIT = \*ALLOWED**

The user is allowed to control the linkage audit mode, provided the audit function is available throughout the system.

**LINKAGE-AUDIT = \*NOT-ALLOWED**

The user is not allowed to control the linkage audit mode.

**DEFAULT-MSG-LANGUAGE = \*UNCHANGED / \*STD / <name 1..1>**

Specifies the language in which messages are output by default.

**DEFAULT-MSG-LANGUAGE = \*STD**

The language defined using the MSGLPRI system parameter is used.

**FILE-NUMBER-LIMIT =**

Specifies the maximum number of files that may be created. This upper limit, or any lower value, may be assigned to subgroups or group members.

**FILE-NUMBER-LIMIT = \*MAXIMUM**

The maximum number of files is 16,777,215.

**FILE-NUMBER-LIMIT = <integer 0..16777215>**

Specifies the maximum possible number of catalog entries as an exact number.

**JV-NUMBER-LIMIT =**

Specifies the maximum number of job variables that may be created. This upper limit, or any lower value, may be assigned to subgroups or group members.

**JV-NUMBER-LIMIT = \*MAXIMUM**

The maximum number of job variables is 16,777,215.

**JV-NUMBER-LIMIT = <integer 0..16777215>**

Specifies the maximum possible number of job variables as an exact number.

**TEMP-SPACE-LIMIT =**

Specifies the maximum amount of temporary storage space which may be occupied on the shared volumes specified in the PUBSET operand.

**TEMP-SPACE-LIMIT = \*MAXIMUM**

The maximum amount of storage space is 2,147,483,647 PAM pages.

**TEMP-SPACE-LIMIT = <integer 0..2147483647 2Kbyte>**

Specifies exactly the amount of temporary storage space.

**DMS-TUNING-RESOURCES =**

Specifies which performance measures may be utilized, and the form in which they may be used.

**DMS-TUNING-RESOURCES = \*NONE**

No tuning measures may be utilized.

**DMS-TUNING-RESOURCES = \*CONCURRENT-USE**

The user may reserve preferred resources, but in doing so competes with all other users who have the same authorization.

**DMS-TUNING-RESOURCES = \*EXCLUSIVE-USE**

The user may make exclusive reservations of preferred resources.

**Permitted performance measures for the home and data subsets**

<b>PUBSET = *HOME</b>				
<b>DMS-TUNING-RESOURCES=</b>	<b>Resident ISAM pools</b>	<b>Resident FASTPAM environment</b>	<b>File attribute PERFORMANCE</b>	
			<b>= HIGH</b>	<b>=*VERY-HIGH</b>
NONE:	no	no	no	-
*CONCURRENT-USE	yes	no	-	-
*EXCLUSIVE-USE	yes	yes	-	-

<b>PUBSET = &lt;data subset&gt;</b>				
<b>DMS-TUNING-RESOURCES=</b>	<b>Resident ISAM pools</b>	<b>Resident FASTPAM environment</b>	<b>File attribute PERFORMANCE</b>	
			<b>= HIGH</b>	<b>=*VERY-HIGH</b>
NONE:	-	-	no	no
*CONCURRENT-USE	-	-	yes	no
*EXCLUSIVE-USE	-	-	yes	yes

Home pubset	Data pubset	Permitted performance measures
NONE:	NONE:	<ul style="list-style-type: none"> <li>• None</li> </ul>
*CONCURRENT-USE	NONE:	<ul style="list-style-type: none"> <li>• Resident ISAM pools</li> </ul>
*EXCLUSIVE-USE	NONE:	<ul style="list-style-type: none"> <li>• Resident ISAM pools</li> <li>• Resident FASTPAM environment</li> </ul>
NONE:	*CONCURRENT-USE	<ul style="list-style-type: none"> <li>• File attribute PERFORMANCE = HIGH on data pubset</li> </ul>
NONE:	*EXCLUSIVE-USE	<ul style="list-style-type: none"> <li>• File attribute PERFORMANCE = HIGH on data pubset</li> <li>• File attribute PERFORMANCE = VERY-HIGH on data pubset</li> </ul>
*CONCURRENT-USE	*CONCURRENT-USE	<ul style="list-style-type: none"> <li>• Resident ISAM pools</li> </ul>
*CONCURRENT-USE	*EXCLUSIVE-USE	<ul style="list-style-type: none"> <li>• Resident ISAM pools</li> <li>• File attribute PERFORMANCE = VERY-HIGH on data pubset</li> </ul>
*EXCLUSIVE-USE	*CONCURRENT-USE	<ul style="list-style-type: none"> <li>• Resident ISAM pools</li> <li>• Resident FASTPAM environment</li> </ul>
*EXCLUSIVE-USE	*EXCLUSIVE-USE	<ul style="list-style-type: none"> <li>• Resident ISAM pools</li> <li>• Resident FASTPAM environment</li> <li>• File attribute PERFORMANCE = VERY-HIGH on data pubset</li> </ul>

Table 73: Permitted performance measures (ADD-USER command)

---

**CODED-CHARACTER-SET = \*UNCHANGED / \*STD / <name 1..8>**

Specifies which CODED-CHARACTER-SET (CCS) is to be used. A name should only be specified here if the one required differs from the one preset by the system (\*STD). The specified CCS should be an EBCDIC character set.

**PHYSICAL-ALLOCATION = \*UNCHANGED / \*NOT-ALLOWED / \*ALLOWED**

Governs whether the user is allowed to perform physical space allocation (direct allocation) for the pubset.

**PHYSICAL-ALLOCATION = \*UNCHANGED**

The current status is to be retained.

**PHYSICAL-ALLOCATION = \*NOT-ALLOWED**

The user is no longer allowed to perform physical space allocation for the pubset.

**PHYSICAL-ALLOCATION = \*ALLOWED**

The user is now allowed to perform physical space allocation for the pubset.

**CRYPTO-SESSION-LIMIT = \*UNCHANGED / \*STD / \*MAXIMUM / <integer 0..32767>**

Defines the maximum number of openCRYPT sessions within a BS2000 session. The number of openCRYPT sessions already used is set to 0 at the start of a BS2000. The values \*STD and \*MAXIMUM define the maximum number of 128 or 32767 openCRYPT sessions.

**NET-STORAGE-USAGE = \*UNCHANGED / \*NOT-ALLOWED / \*ALLOWED**

Specifies whether the user may occupy space on Net-Storage volumes.

**NET-STORAGE-USAGE = \*UNCHANGED**

The current status is to be retained.

**NET-STORAGE-USAGE = \*NOT-ALLOWED**

The user is not permitted to use Net-Storage volumes.

**NET-STORAGE-USAGE = \*ALLOWED**

The user is permitted to use Net-Storage volumes. The space occupied on the Net-Storage volume is not counted toward the user's PUBLIC-SPACE-LIMIT.

**NET-CODED-CHAR-SET = \*UNCHANGED / \*STD / \*ISO / \*NO-CONVERSION / <name 1..8>**

Defines which Net-Storage-Coded-Character-Set (NETCCSN) is to be used for node files on Net-Storage. A character set conversion is only performed for SAM node files.

**NET-CODED-CHAR-SET = \*STD**

The setting of the NETCODE system parameter applies.

**NET-CODED-CHAR-SET = \*ISO**

A suitable ISO character set is used. For details on character set conversion see the CREATE-FILE command or the "Introductory Guide to DVS" manual [13].

**NET-CODED-CHAR-SET = \*NO-CONVERSION**

There is no code conversion for SAM node files.

**NET-CODED-CHAR-SET = <name 1..8>**

Name of the character set to be used. It should be an ASCII character set.

**ACCOUNT-ATTRIBUTES = \*UNCHANGED / \*ADD(...) / \*MODIFY(...) / \*REMOVE(...)**

Specifies whether an account number is to be added, changed or deleted.

---

**ACCOUNT-ATTRIBUTES = \*ADD(...)**

A new account number and specific attributes for the user ID is to be added.

**ACCOUNT = <alphanum-name 1..8>**

Account number of the user ID which is to be entered in the user catalog and to which the following data relate:

**CPU-LIMIT = \*STD / \*MAXIMUM / <integer 0..2147483647 seconds>**

Total CPU time available for user jobs under the account number.

**CPU-LIMIT = \*STD**

The default value specified in the SYSGJCPU system parameter is available.

**CPU-LIMIT = \*MAXIMUM**

2,147,483,647 CPU seconds are available to the user ID.

**SPOOLOUT-CLASS = Q / <integer 0..255> / \*STD**

Spoolout class for the account number of the user ID.

**SPOOLOUT-CLASS = \*STD**

The default value specified in the SYSGJCLA system parameter is available.

**MAXIMUM-RUN-PRIORITY = \*STD / <integer 30..255>**

Defines the highest priority that may be assigned to jobs of the user ID (see Note on [section "MODIFY-USER-ATTRIBUTES"](#)).

**MAXIMUM-RUN-PRIORITY = \*STD**

The default value specified in the SYSGJPRI system parameter is available.

**MAX-ALLOWED-CATEGORY =**

This operand defines which task attributes user jobs are allowed to attain. If the user employs the TINF macro in his/her programs, a check is made in both the job class used by the job concerned and in the user catalog to see whether the right to use the task attribute TP was assigned to the user under the specified account number.

**MAX-ALLOWED-CATEGORY = \*STD**

The tasks of the user can attain the task attributes BATCH and DIALOG.

**MAX-ALLOWED-CATEGORY = \*TP**

The user jobs may attain the task attributes BATCH, DIALOG and TP.

**MAX-ALLOWED-CATEGORY = \*SYSTEM**

All task attributes are permitted for the tasks of the user.

**PRIVILEGE = \*NO / \*PARAMETERS(...) / list-poss(3): \*NO-CPU-LIMIT / \*START-IMMEDIATE / \*INHIBIT-DEACTIVATION**

Defines privileges of job management.

**PRIVILEGE = \*NO**

The user ID does not receive any job management privileges.

**PRIVILEGE = \*PARAMETERS(...)**

Defines a sequence of job management privileges.

**NO-CPU-LIMIT = \*NO / \*YES**

Defines whether the user is allowed to run batch jobs without a time limitation.

---

**NO-CPU-LIMIT = \*YES**

The user is authorized to run batch jobs without time limitation under the specified account number. This applies even if the job class assigned to the job does not permit this start attribute. If the user specified the CPU-LIMIT=\*NO operand in the SET-LOGON-PARAMETERS or ENTER-JOB command and this function is authorized neither in the user catalog nor in the job class assigned to the job, the batch job is rejected with an error message.

In the case of tasks without a time limit, the user's CPU account is not debited.

**START-IMMEDIATE = \*NO / \*YES**

Defines whether the use is authorized to use the job express function.

**START-IMMEDIATE = \*YES**

The user is authorized to use the job express function. With this authorization batch jobs are started immediately, even if the class limit of the job class in which the job concerned is to be started has been reached. This applies even if the definition of the job class does not permit this start attribute. If the EXPRESS function is not permitted either in the user catalog or in the job class definition, the batch job is accepted, but it is not started as an EXPRESS job.

**INHIBIT-DEACTIVATION = \*NO / \*YES**

Defines whether the user is authorized to inhibit deactivation.

**INHIBIT-DEACTIVATION = \*YES**

The user ID is authorized to inhibit deactivation. The user's jobs are thus independent of the PRIOR function, by means of which jobs are placed in subordinate queues according to their system service requirements (macro time slice).

**PRIVILEGE = \*NO-CPU-LIMIT**

The user is authorized to run batch jobs without time limitation under the specified account number.

**PRIVILEGE = \*START-IMMEDIATE**

The user is authorized to use the job express function.

**PRIVILEGE = \*INHIBIT-DEACTIVATION**

The user ID is authorized to inhibit deactivation.

**POSIX-RLOGIN-DEFAULT = \*NO / \*YES**

Defines whether the account number being added is to be used for accounting of a POSIX remote login session. The POSIX remote login account number is unique within a user ID. The user administration system automatically performs a comparison with existing account numbers, and the declaration of a different account number as the POSIX account number overrides any earlier declaration. The old account number can from then on be used for BS2000 sessions only.

**LOGON-DEFAULT = \*NO / \*YES**

Defines whether the designated account number is to be used as the default account number for BS2000 timesharing mode if no account number is specified in the case of dialog or batch access.

**ACCOUNT-ATTRIBUTES = \*MODIFY(...)**

An existing account number or the corresponding attributes are to be modified. The account number is recreated if necessary.

**ACCOUNT = <alphanum-name 1..8>**

Account number of the user ID for which the following values are to be modified in the user catalog.

**CPU-LIMIT = \*UNCHANGED / \*STD / \*MAXIMUM / <integer 0..2147483647 seconds>**

Total CPU time available for user jobs under an existing account number.

---

**CPU-LIMIT = \*STD**

The default value specified in the SYSGJCPU system parameter is available.

**CPU-LIMIT = \*MAXIMUM**

The CPU time for the existing accounting number is changed to the value of 2,147,483,647 seconds.

**SPOOLOUT-CLASS = \*UNCHANGED / <integer 0..255> / \*STD**

Spoolout class for the account number of the user ID.

**SPOOLOUT-CLASS = \*STD**

The default value specified in the SYSGJCLA system parameter is available.

**MAXIMUM-RUN-PRIORITY = \*UNCHANGED / <integer 30..255>**

Defines the highest priority that may be assigned to jobs of the user ID (see note on [section "MODIFY-USER-ATTRIBUTES"](#)).

**MAX-ALLOWED-CATEGORY = \*UNCHANGED / \*STD / \*TP / \*SYSTEM**

This operand defines which task attributes user jobs are allowed to attain. If the user employs the TINF macro in his /her programs, a check is made in both the job class used by the job concerned and in the user catalog to see whether the right to use the task attribute TP was assigned to the user under the specified account number.

**MAX-ALLOWED-CATEGORY = \*STD**

The tasks of the user can attain the task attributes BATCH and DIALOG.

**MAX-ALLOWED-CATEGORY = \*TP**

The user jobs may attain the task attributes BATCH, DIALOG and TP.

**MAX-ALLOWED-CATEGORY = \*SYSTEM**

All task attributes are permitted for the tasks of the user.

**PRIVILEGE = \*UNCHANGED / \*PARAMETERS(...) / list-poss(3): \*NO-CPU-LIMIT / \*START-IMMEDIATE / \*INHIBIT-DEACTIVATION**

Defines privileges of job management.

**PRIVILEGE = \*PARAMETERS(...)**

Defines a sequence of job management privileges.

**NO-CPU-LIMIT = \*UNCHANGED / \*NO / \*YES**

Defines whether the user is allowed to run batch jobs without a time limitation.

**NO-CPU-LIMIT = \*YES**

The user is authorized to run batch jobs without time limitation under the specified account number. This applies even if the job class assigned to the job does not permit this start attribute. If the user specified the CPU-LIMIT=\*NO operand in the SET-LOGON-PARAMETERS or ENTER-JOB command and this function is authorized neither in the user catalog nor in the job class assigned to the job, the batch job is rejected with an error message.

In the case of tasks without a time limit, the user's CPU account is not debited.

**START-IMMEDIATE = \*UNCHANGED / \*NO / \*YES**

Defines whether the use is authorized to use the job express function.

**START-IMMEDIATE = \*YES**

The user is authorized to use the job express function. With this authorization batch jobs are started immediately, even if the class limit of the job class in which the job concerned is to be started has been reached. This applies even if the definition of the job class does not permit this start attribute. If the EXPRESS

---

function is not permitted either in the user catalog or in the job class definition, the batch job is accepted, but it is not started as an EXPRESS job.

**INHIBIT-DEACTIVATION = \*UNCHANGED / \*NO / \*YES**

Defines whether the user is authorized to inhibit deactivation.

**INHIBIT-DEACTIVATION = \*YES**

The user ID is authorized to inhibit deactivation. The user's jobs are thus independent of the PRIOR function, by means of which jobs are placed in subordinate queues according to their system service requirements (macro time slice).

**PRIVILEGE = \*NO-CPU-LIMIT**

The user is authorized to run batch jobs without time limitation under the specified account number. This applies even if the job class assigned to the job does not permit this start attribute. If the user specified the CPU-LIMIT=\*NO operand in the SET-LOGON-PARAMETERS or ENTER-JOB command and this function is authorized neither in the user catalog nor in the job class assigned to the job, the batch job is rejected with an error message. In the case of tasks without a time limit, the user's CPU account is not debited.

**PRIVILEGE = \*START-IMMEDIATE**

The user is authorized to use the job express function. With this authorization batch jobs are started immediately, even if the class limit of the job class in which the job concerned is to be started has been reached. This applies even if the definition of the job class does not permit this start attribute. If the EXPRESS function is not permitted either in the user catalog or in the job class definition, the batch job is accepted, but it is not started as an EXPRESS job.

**PRIVILEGE = \*INHIBIT-DEACTIVATION**

The user ID is authorized to inhibit deactivation. The user's jobs are thus independent of the PRIOR function, by means of which jobs are placed in subordinate queues according to their system service requirements (macro time slice).

**POSIX-RLOGIN-DEFAULT = \*UNCHANGED / \*NO / \*YES**

Defines whether the account number to be changed is to be used for accounting of a POSIX remote login session. The POSIX remote login account number is unique within a user ID. The user administration system automatically performs a comparison with existing account numbers, and the declaration of a different account number as the POSIX account number overrides any earlier declaration. The old account number can from then on be used for BS2000 sessions only.

**LOGON-DEFAULT = \*UNCHANGED / \*NO / \*YES**

Defines whether the designated account number is to be used as the default account number for BS2000 timesharing mode if no account number is specified in the case of dialog or batch access.

**ACCOUNT-ATTRIBUTES = \*REMOVE(...)**

An account number is to be removed from the user ID.

**ACCOUNT = list-poss(10): <alphanum-name 1..8>**

Account number of the user ID to be deleted.

An account number must always be maintained for the user ID.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SRM6001	Command executed with a warning
	1	SRM6010	Syntax error
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error
	130	SRM6030	Command cannot temporarily be executed

## Note

The task scheduling priorities (30-255) for job control are defined:

- in the user catalog (ADD-USER command, MAXIMUM-RUN-PRIORITY operand)
- in the job class definition (JMU statement DEFINE-JOB-CLASS, RUN-PRIORITY operand; in addition to the default priority, a maximum priority can be defined)

If the user specifies a task scheduling priority in the SET-LOGON-PARAMETERS or ENTER-JOB command, this priority is checked both in the user catalog and in the job class assigned to the job (for an example see the ADD-USER command).

If the priority specified by the user in the SET-LOGON-PARAMETERS or ENTER-JOB command is **worse** than the best priority of the job class and in the user catalog (i.e. allowed either in the job class or in the user catalog), the job is started with the priority specified by the user. If the priority specified by the user in the SET-LOGON-PARAMETERS or ENTER-JOB command is **better** than the priorities of the job class and in the user catalog (i.e. not allowed either in the job class or in the user catalog), the job is given whichever is worse, the default priority of the job class or the priority in the user catalog.

If the user does not specify any priority in the SET-LOGON-PARAMETERS or ENTER-JOB command, the job is started with the default priority.

---

## 4.67 MODIFY-USER-PROTECTION

Modify password for user ID

<b>Component:</b>	SRPMNUC
<b>Functional area:</b>	User management
<b>Domain:</b>	USER-ADMINISTRATION
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE OPERATING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	@

### Function

With the MODIFY-USER-PROTECTION command, users can define a password for their user ID, change this password or delete it. The password for a user ID is part of the user entry in the user catalog. The MODIFY-USER-PROTECTION command will only be executed if the user entry contains an appropriate authorization for the user ID (see output field *PASSWORD-MGMT*, SHOW-USER-ATTRIBUTES command).

#### *Long passwords*

In BS2000/OSD-BC V2.0 and above, users can define a “long password” to protect their user IDs. A long password is at least 9 and at most 32 characters long. The long password mechanism allows users to select passwords which are easy to remember while satisfying data protection requirements because of the large range of possible combinations.

When a 9 to 32-character password is entered, a hash algorithm converts the long password to an 8-byte password. The converted 8-byte password is stored in the system (encrypted as appropriate) for password checking purposes.

The following commands support the long password mechanism:

- ENTER-JOB and ENTER-PROCEDURE
- PRINT-DOCUMENT
- SET-LOGON-PARAMETERS
- SET-RFA-CONNECTION
- TRANSFER-FILE (openFT V9.0 and higher)

In cases where the long password mechanism is not supported, e.g. for program interfaces, for TRANSFER-FILE (openFT < V9.0) or in inhomogeneous computer networks, the user must find out and enter the converted 8-byte password.

There are various ways to do this:

- The SDF-P subsystem is available on the local system: The converted password can be ascertained with the HASH-STRING builtin function. The function is called with the parameters `STRING='<long_password>'` and

LENGTH=8 (see also the “SDF-P” manual [34]). As the STRING parameter, unlike the password interface, is case-sensitive, the long password must be entered in upper case. With commands and statements (SDF interface), expression substitution can be used, i.e. the password operand can, for example, be specified as follows (see also the example on [section "MODIFY-USER-PROTECTION"](#)):

```
PASSWORD= ' & ( TO-C-LIT ( HASH-STRING ( STRING= ' lomg_password ' , LENGTH=8 ) ) ) '
```

If the SDF interface is not being used, an S variable is assigned the result of the builtin function and SHOW-VARIABLE is used to output the variable value as an X literal (as the converted string can also contain nonenterable characters). This variable value is entered as password (<x-string>) at the input interface.

- The SDF-P subsystem is not available on the local system:
  - If the local system has access to another system on which SDF-P is available, the converted 8-byte password can be ascertained with HASH-STRING as described above.
  - The converted 8-byte password can be requested from systems support staff (unless encryption is in force on the system).
  - The user ID in question can temporarily be assigned a “short” password.
- Whether SDF-P is present or not, with TRANSFER-FILE the name of an FT profile (FTAC authorization profile) can be specified instead of the LOGON authorization.

If the SECOS software product is installed, additional user-specific security checks can be set up for passwords. The default values for the minimum length and complexity of a password are set to \*NONE (attributes not checked). If these attributes are changed to maximum values, in some cases it may be that the 8-byte password converted from a “long” password will fail to comply with security requirements. For that reason the minimum length should not be set to more than 6, and the minimum complexity should not be set to more than 2.

### *Restrictions*

The following functions of the MODIFY-USER-PROTECTION command are only available if SECOS is used:

- A new password specified in the NEW-LOGON-PASSWORD operand can be specified a second time for verification purposes in the CONFIRM-NEW-PASSWORD operand (SECOS >= V3.0).
- In the USER-IDENTIFICATION operand, it is possible to specify that password changes should be performed for the personal logon (SECOS >= V4.0).

If SECOS is not available then only the default value can be specified for these operands.

## Format

### MODIFY-USER-PROTECTION

```
LOGON-PASSWORD = *NONE / <c-string 1..8> / <c-string 9..32> / <x-string 1..16> / *SECRET
,NEW-LOGON-PASSWORD = *NONE / <c-string 1..8> / <c-string 9..32> / <x-string 1..16> / *SECRET
,CONFIRM-NEW-PASSWORD = *NOT-SPECIFIED / *NONE / <c-string 1..8> / <c-string 9..32> /
<x-string 1..16> / *SECRET
,PUBSET = *HOME / <cat-id 1..4>
,USER-IDENTIFICATION = *STD / *PERSONAL-USER-ID
```

---

## Operands

**LOGON-PASSWORD = \*NONE / <c-string 1..8> / <c-string 9..32> / <x-string 1..16> / \*SECRET**

Old password for the user ID.

The long password mechanism is supported (<c-string 9..32>). A hash algorithm converts the long password to an 8-byte password which is used for password checking. See Function above for details of the long password mechanism.

The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**NEW-LOGON-PASSWORD = \*NONE / <c-string 1..8> / <c-string 9..32> / <x-string 1..16> / \*SECRET**

New password for the user ID. The new password must not be the same as the previous password.

The long password mechanism is supported (<c-string 9..32>). A hash algorithm converts the long password to an 8-byte password which is used for password checking. See Function above for details of the long password mechanism.

The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password .

**CONFIRM-NEW-PASSWORD = \*NOT-SPECIFIED / \*NONE / <c-string 1..8> / <c-string 9..32 / <x-string 1..16> / \*SECRET**

*The operand is only available in conjunction with SECOS versions as of V3.0.*

Allows a new password specified using the NEW-LOGON-PASSWORD operand to be checked. Entering the password twice is to avoid a password containing a typing error being assigned when password entry is nondisplaying.

If a value other than the default \*NOT-SPECIFIED is entered, then it must be identical with the entry made for NEW-LOGON-PASSWORD, otherwise the command is rejected.

The CONFIRM-NEW-PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**PUBSET =**

Defines the catalog ID of the public volume set whose user catalog contains the entry for the user ID.

**PUBSET = \*HOME**

Catalog ID of the home public volume set.

**PUBSET = cat-id 1..4>**

Catalog ID of a local public volume set whose user catalog contains an entry for the user ID.

---

**USER-IDENTIFICATION = \*STD / \*PERSONAL-USER-ID**

*This operand is only available if SECOS >= V4.0 is in use.*

Specifies whether the password of the logon user ID or the password corresponding to the personal user ID (personal logon) is to be changed.

**USER-IDENTIFICATION = \*STD**

The password corresponding to the logon user ID is changed.

If the command is called during the updating of the logon password then \*STD designates the following user ID:

- following the output of message SRM3204, the logon user ID
- following the output of message SRM3207, the personal user ID

**USER-IDENTIFICATION = \*PERSONAL-USER-ID**

The password corresponding to the personal user ID is modified. If no personal logon has been performed then the password corresponding to the logon ID is modified.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command terminated without errors
	1	SRM6010	Syntax error in command
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error during command processing
	130	SRM6030	Command cannot temporarily be executed

**Notes**

- In the log (SYSOUT), passwords are overwritten with the letter P.
- For a nonexistent password (equivalent to the default value \*NONE) the system uses binary zeros (X'00 00 00 00 00 00 00 00'). Binary zeros used as passwords are not encrypted, however.
- If the system parameter ENCRYPT=Y is set, the system encrypts all passwords except for those consisting of binary zeros (if the default value \*NONE is specified).

---

## Example

Allocating a long password:

```
/mod-user-prot logon-pass='short#12',new='special password of $rudi!'
```

Finding out the converted, 8-byte password for use at an interface which does not support the long password mechanism. SET-VARIABLE (alias = STV) copies the password to variable A, and then SHOW-VARIABLE (alias = SHV) displays the variable in the form of an X literal (as it may include nontypable characters):

```
/stv a=hash-string(string='SPECIAL PASSWORD OF $RUDI!',LENGTH=8)
/shv a,inf=*par(value=*x-lit)
```

```
A = X'E611BB422CDB4FA5
```

When using the builtin TO-X-LITERAL function, the password can also be transferred into a variable as an X literal (in the example: PASS):

```
/stv pass=to-x-lit(string=
    hash-string(string='SPECIAL PASSWORD OF $RUDI!',length=8))
/shv pass
```

```
PASS = X'E611BB422CDB4FA5'
```

The converted, 8-byte password typically needs to be specified in TRANSFER-FILE commands. Here are various ways of specifying it:

```
/transfer-file ... password=x'e611bb422cdb4fa5'....._____ (1)
/transfer-file ... password=&(pass)..... _____ (2)
/transfer-file ... password=&(to-x-lit(string=a))....._____ (3)
/transfer-file ... password=&(to-x-lit(string=hash-string(
    string='SPECIAL PASSWORD OF $RUDI!',length=8)))....._____ (4)
```

- (1) Entering the converted password directly as an X string.
- (2) Entering the password by means of the variable substitution mechanism (contents of variable PASS).
- (3) Entering the password by means of the variable substitution mechanism (X literal of the A variable).
- (4) Entering the password directly by means of the variable substitution mechanism, which is first used to copy the password into the PASS variable in the form of an X literal. In this case, there is no need to ascertain the password by assigning it to a variable.

---

## 4.68 MODIFY-USER-PUBSET-ATTRIBUTES

Modify pubset-specific user attributes of user ID

<b>Component:</b>	SRPMNUC
<b>Functional area:</b>	User management Pubset and MRSCAT management
<b>Domain:</b>	USER-ADMINISTRATION
<b>Privileges:</b>	STD-PROCESSING USER-ADMINISTRATION
<b>Routing code:</b>	\$

### Function

This command modifies the pubset-specific user attributes of a user ID in the user catalog of the specified pubset. It is primarily intended for SM pubsets, but with various restrictions can also be used for SF pubsets.

Every user ID set up with the ADD-USER command from the beginning has pubset-specific user attributes. These are mostly default resource management attributes.

If an entry is created in a user catalog of an imported pubset, pubset-specific information must be stored. Systems support must define an upper limit for the user up to which the user may occupy storage space on this pubset. In addition, it can grant the user permission to exceed this limit. These new declarations, however, take effect only after the user logs on again, not for current tasks.

The default value \*UNCHANGED in the corresponding operands means that the previously valid definition still applies. The term “hierarchical quota differentials” as used in this description refers to the fact that a given value must be included within the value above it in the hierarchy. Thus, for example, the value for VERY-HIGH-PERF-SPACE must always be <= the value in HIGH-PERF-SPACE, which in turn must be <= the value in S0-LEVEL-SPACE, and this must be <= the value in TOTAL-SPACE. If quota differentials are not maintained, command processing is aborted.

### *Restriction*

The only nonprivileged users (STD-PROCESSING privilege) authorized to issue this command are those designated as group administrators. The actions a group administrator can take are defined by systems support. For information on setting up and managing user groups see the “SECOS” manual [35].

## Format

### MODIFY-USER-PUBSET-ATTRIBUTES

**USER-IDENTIFICATION** = <name 1..8>

| <integer 0..2147483647 2Kbyte>

## Operands

**USER-IDENTIFICATION** = <name 1..8>

Defines the name of the user ID for which the pubset-specific user attributes are to be modified.

**PUBSET** = **\*HOME** / <cat-id 1..4>

Identifies the pubset in whose user catalog pubset-specific user attributes are to be modified. This will typically be an SM pubset.

**PUBSET** = **\*HOME**

The entry is made in the user catalog of the home pubset.

**PUBSET** = <cat-id 1..4>

Catalog ID of the pubset in whose user catalog the entry is to be made.

**FILE-NUMBER-LIMIT** = **\*UNCHANGED** / **\*MAXIMUM** / <integer 0..16777215>

Defines the maximum number of files allowed for a user ID.

**FILE-NUMBER-LIMIT** = **\*MAXIMUM**

The number of files allowed for the user ID is set at 16,777,215.

**FILE-NUMBER-LIMIT** = <integer 0..16777215>

Specifies the exact number of files for the user ID's file number limit.

**JV-NUMBER-LIMIT** = **\*UNCHANGED** / **\*MAXIMUM** / <integer 0..16777215>

Specifies the maximum number of job variables that may be created.

**JV-NUMBER-LIMIT** = **\*MAXIMUM**

The number of job variables allowed for the user ID is set at 16,777,215.

---

**JV-NUMBER-LIMIT = <integer 0..16777215>**

Specifies the exact number of job variables for the user ID's JV number limit.

**DEF-STORAGE-CLASS = \*UNCHANGED / \*NONE / <structured-name 1..8>**

Defines the default storage class for files on SM pubsets.

**DEF-STORAGE-CLASS = \*NONE**

No default storage class is defined.

**DEF-STORAGE-CLASS = <structured-name 1..8>**

Specifies the name of the default storage class.

**CODED-CHARACTER-SET = \*UNCHANGED / \*STD / <name 1..8>**

Specifies which CODED-CHARACTER-SET (CCS) is to be used. A name should only be specified here if the one required differs from the one preset by the system (\*STD). The specified CCS should be an EBCDIC character set.

**NET-CODED-CHAR-SET = \*UNCHANGED / \*STD / \*ISO / \*NO-CONVERSION / <name 1..8>**

Defines which Net-Storage-Coded-Character-Set (NETCCSN) is to be used for node files on Net-Storage A character set conversion is only performed for SAM node files.

**NET-CODED-CHAR-SET = \*STD**

The setting of the SSMMILOG system parameter applies.

**NET-CODED-CHAR-SET = \*ISO**

A suitable ISO character set is used. For details on character set conversion see the CREATE-FILE command or the "Introductory Guide to DVS" manual [13].

**NET-CODED-CHAR-SET = \*NO-CONVERSION**

There is no code conversion for SAM node files.

**NET-CODED-CHAR-SET = <name 1..8>**

Name of the character set to be used. It should be an ASCII character set.

**RIGHTS = \*UNCHANGED / \*PARAMETERS(...)**

Defines the subset-specific rights of a user ID.

**RIGHTS = \*PARAMETERS(...)**

Specifies which subset-specific rights are to be modified.

**DMS-TUNING-RESOURCES = \*UNCHANGED / \*NONE / \*CONCURRENT-USE / \*EXCLUSIVE-USE**

Specifies which performance measures may be utilized, and the form in which they may be used.

**DMS-TUNING-RESOURCES = \*NONE**

No tuning measures may be utilized.

**DMS-TUNING-RESOURCES = \*CONCURRENT-USE**

The user is allowed to reserve preferred resources, but in doing so competes with all other users who have the same authorization.

**DMS-TUNING-RESOURCES = \*EXCLUSIVE-USE**

The user may make exclusive reservations of preferred resources.

## Permitted performance measures for the home and data pubsets

PUBSET = *HOME				
DMS-TUNING-RESOURCES=	Resident ISAM pools	Resident FASTPAM environment	File attribute PERFORMANCE	
			= HIGH	=*VERY-HIGH

*EXCLUSIVE-USE	*CONCURRENT-USE	<ul style="list-style-type: none"> <li>• Resident ISAM pools</li> <li>• Resident FASTPAM environment</li> </ul>
*EXCLUSIVE-USE	*EXCLUSIVE-USE	<ul style="list-style-type: none"> <li>• Resident ISAM pools</li> <li>• Resident FASTPAM environment</li> <li>• File attribute PERFORMANCE = VERY-HIGH on data pubset</li> </ul>

Table 74: Permitted performance measures (MODIFY-USER-PUBSET-ATTRIBUTES)

**NET-STORAGE-USAGE = \*UNCHANGED / \*NOT-ALLOWED / \*ALLOWED**

Specifies whether the user may occupy space on Net-Storage volumes.

**NET-STORAGE-USAGE = \*NOT-ALLOWED**

The user is not permitted to use a Net-Storage volume.

**NET-STORAGE-USAGE = \*ALLOWED**

The user is permitted to use a Net-Storage volume.

**PHYSICAL-ALLOCATION = \*UNCHANGED / \*NOT-ALLOWED / \*ALLOWED**

Governs whether the user is allowed to perform absolute space allocation (direct allocation).

**PHYSICAL-ALLOCATION = \*NOT-ALLOWED**

The user is no longer allowed to perform physical space allocation.

**PHYSICAL-ALLOCATION = \*ALLOWED**

The user is allowed to perform physical space allocation.

**PUBLIC-SPACE-EXCESS = \*UNCHANGED / \*NOT-ALLOWED / \*TEMPORARILY-ALLOWED / \*ALLOWED**

Defines whether the user may if necessary exceed the defined space limits on the pubset.

**PUBLIC-SPACE-EXCESS = \*NOT-ALLOWED**

The space limits may not be exceeded.

**PUBLIC-SPACE-EXCESS = \*TEMPORARILY-ALLOWED**

While a process is executing, the space limit imposed on the user may be exceeded temporarily.

**PUBLIC-SPACE-EXCESS = \*ALLOWED**

The space limits imposed on the user are removed.

**PERM-SPACE-LIMITS = \*UNCHANGED / \*PARAMETERS(...)**

Defines the permanent space granted to a user ID on a pubset. The operand is primarily intended for SM pubsets. If it is specified for an SF pubset, only the S0-LEVEL-SPACE value has any effect.

**PERM-SPACE-LIMITS = \*PARAMETERS(...)**

The permanent storage space available is to be defined.

---

**TOTAL-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM / \*UNLIMITED / <integer 0..2147483647 2Kbyte>**

Defines the maximum number of PAM pages for the user ID's permanent space. The specified value must be <= 2147483647.

**TOTAL-SPACE = \*AUTOMATIC-ADAPT**

The number of PAM pages in the user ID's permanent space is to adapt automatically. The hierarchical quota differentials are maintained.

**TOTAL-SPACE = \*MAXIMUM**

The number of PAM pages in the user ID's permanent space is to be set at 2,147,483,647.

**TOTAL-SPACE = \*UNLIMITED**

The number of PAM pages in the user ID's permanent space is unlimited.

**TOTAL-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as permanent storage space.

**S0-LEVEL-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM / <integer 0..2147483647 2Kbyte>**

Defines the maximum number of PAM pages for the user ID's S0-LEVEL-SPACE. The value specified must be <= the value specified for TOTAL-SPACE. On SF pubsets the value specified for this operand corresponds to that of the PUBLIC-SPACE-LIMIT operand.

**S0-LEVEL-SPACE = \*AUTOMATIC-ADAPT**

The number of PAM pages in the user ID's S0-LEVEL-SPACE is to adapt automatically. The hierarchical quota differentials are maintained.

**S0-LEVEL-SPACE = \*MAXIMUM**

The number of PAM pages in S0-LEVEL-SPACE is to be set at the highest possible logical value allowed by the value above it in the hierarchy (in this case TOTAL-SPACE).

**S0-LEVEL-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as S0-LEVEL-SPACE.

**HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM / <integer 0..2147483647 2Kbyte>**

Defines the maximum number of PAM pages for the user ID's permanent high-performance space. The value specified must be <= the value specified for TOTAL-SPACE.

**HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT**

The number of PAM pages in the user ID's HIGH-PERF-SPACE is to adapt automatically. The hierarchical quota differentials are maintained.

**HIGH-PERF-SPACE = \*MAXIMUM**

The number of PAM pages in HIGH-PERF-SPACE is to be set at the highest possible logical value allowed by the value above it in the hierarchy (in this case S0-LEVEL-SPACE).

**HIGH-PERF-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as HIGH-PERF-SPACE.

**VERY-HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM / <integer 0..2147483647 2Kbyte>**

Defines the maximum number of PAM pages for the user ID's permanent very-highperformance space. The value specified must be <= the value specified for TOTAL-SPACE.

---

**VERY-HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT**

The number of PAM pages in the user ID's VERY-HIGH-PERF-SPACE is to adapt automatically. The hierarchical quota differentials are maintained.

**VERY-HIGH-PERF-SPACE = \*MAXIMUM**

The number of PAM pages in VERY-HIGH-PERF-SPACE is to be set at the highest possible logical value allowed by the value above it in the hierarchy (in this case HIGH-PERF-SPACE).

**VERY-HIGH-PERF-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as VERY-HIGH-PERF-SPACE.

**HIGH-AVAILABLE-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM / <integer 0..2147483647 2Kbyte>**

Defines the maximum number of PAM pages for the user ID's permanent high-availability space. The value specified must be <= the value specified for TOTAL-SPACE.

**HIGH-AVAILABLE-SPACE = \*AUTOMATIC-ADAPT**

The number of PAM pages in the user ID's HIGH-AVAILABLE-SPACE is to adapt automatically. The hierarchical quota differentials are maintained.

**HIGH-AVAILABLE-SPACE = \*MAXIMUM**

The number of PAM pages in HIGH-AVAILABLE-SPACE is to be set at the highest possible logical value allowed by the value above it in the hierarchy (in this case S0-LEVEL-SPACE).

**HIGH-AVAILABLE-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as HIGH-AVAILABLE-SPACE.

**TEMP-SPACE-LIMITS = \*UNCHANGED / \*PARAMETERS(...)**

Defines the temporary space granted to a user ID on a pubset. The operand is primarily intended for SM pubsets. If it is specified for an SF pubset, only the TOTAL-SPACE value has any effect.

**TEMP-SPACE-LIMITS = \*PARAMETERS(...)**

The temporary storage space available is to be defined.

**TOTAL-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM / \*UNLIMITED / <integer 0..2147483647 2Kbyte>**

Defines the total number of PAM pages for the user ID's temporary space. The specified value must be <= 2147483647.

**TOTAL-SPACE = \*AUTOMATIC-ADAPT**

The total number of PAM pages in the user ID's temporary space is to adapt automatically. The hierarchical quota differentials are maintained.

**TOTAL-SPACE = \*MAXIMUM**

The number of PAM pages in the user ID's total temporary space is to be set at 2,147,483,647.

**TOTAL-SPACE = \*UNLIMITED**

The number of PAM pages in the user ID's total temporary space is unlimited.

**TOTAL-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as total temporary storage space.

---

**HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM /**

**<integer 0..2147483647 2Kbyte>**

Defines the maximum number of PAM pages for the user ID's temporary high-performance space. The value specified must be <= the value specified for TOTAL-SPACE.

**HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT**

The number of PAM pages in the user ID's temporary high-performance space is to adapt automatically. The hierarchical quota differentials are maintained.

**HIGH-PERF-SPACE = \*MAXIMUM**

The number of PAM pages in HIGH-PERF-SPACE is to be set at the highest possible logical value allowed by the value above it in the hierarchy (in this case TOTAL-SPACE).

**HIGH-PERF-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as temporary high-performance space.

**VERY-HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM /**

**<integer 0..2147483647 2Kbyte>**

Defines the number of PAM pages for the user ID's temporary very-high-performance space. The value specified must be <= the value specified for TOTAL-SPACE.

**VERY-HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT**

The number of PAM pages in the user ID's temporary very-high-performance space is to adapt automatically. The hierarchical quota differentials are maintained.

**VERY-HIGH-PERF-SPACE = \*MAXIMUM**

The number of PAM pages in VERY-HIGH-PERF-SPACE is to be set at the highest possible logical value allowed by the value above it in the hierarchy (in this case HIGH-PERF-SPACE).

**VERY-HIGH-PERF-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as temporary very-high-performance space.

**WORK-SPACE-LIMITS = \*UNCHANGED / \*PARAMETERS(...)**

Defines the space for work files granted to a user ID on a pubset. The operand is intended for use with SM pubsets only.

**WORK-SPACE-LIMITS = \*PARAMETERS(...)**

The storage space available for work files is to be defined.

**TOTAL-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM / \*UNLIMITED /**

**<integer 0..2147483647 2Kbyte>**

Defines the total number of PAM pages for the user ID's work file space. The specified value must be <= 2147483647.

**TOTAL-SPACE = \*AUTOMATIC-ADAPT**

The total number of pages in the user ID's work file space is to adapt automatically. The hierarchical quota differentials are maintained.

**TOTAL-SPACE = \*MAXIMUM**

The number of PAM pages in the user ID's total work file space is to be set at 2,147,483,647.

**TOTAL-SPACE = \*UNLIMITED**

The number of PAM pages in the user ID's total work file space is unlimited.

**TOTAL-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as total work file space.

**HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM / <integer 0..2147483647 2Kbyte>**

Defines the proportion of high-performance work file space for the user ID (proportion of the total work file space).

The value specified must be <= the value specified for TOTAL-SPACE.

**HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT**

The number of pages in the user ID's high-performance work file space is to adapt automatically. The hierarchical quota differentials are maintained.

**HIGH-PERF-SPACE = \*MAXIMUM**

The number of PAM pages in HIGH-PERF-SPACE is to be set at the highest possible logical value allowed by the value above it in the hierarchy (in this case TOTAL-SPACE).

**HIGH-PERF-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as highperformance work file space.

**VERY-HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT / \*UNCHANGED / \*MAXIMUM / <integer 0..2147483647 2Kbyte>**

Defines the proportion of very-high-performance work file space for the user ID (proportion of the high-performance work file space). The value specified must be <= the value specified for HIGH-PERF-SPACE.

**VERY-HIGH-PERF-SPACE = \*AUTOMATIC-ADAPT**

The number of PAM pages in the user ID's very-high-performance work file space is to adapt automatically. The hierarchical quota differentials are maintained.

**VERY-HIGH-PERF-SPACE = \*MAXIMUM**

The number of PAM pages in VERY-HIGH-PERF-SPACE is to be set at the highest possible logical value allowed by the value above it in the hierarchy (in this case HIGH-PERF-SPACE).

**VERY-HIGH-PERF-SPACE = <integer 0..2147483647 2Kbyte>**

Defines the exact maximum number of PAM pages to be granted to the user ID as very high-performance work file space.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SRM6001	Command executed with a warning
	1	SRM6010	Syntax error
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error
	130	SRM6030	Command cannot temporarily be executed

---

## 4.69 MODIFY-USER-SWITCHES

Turn user switches on/off

**Component:** BS2000 OSD/BC  
**Functional area:** User management  
**Domain:** USER-ADMINISTRATION  
**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

With the MODIFY-USER-SWITCHES command, users can set their user switches (ON), clear them (OFF) or invert them (INVERT).

For each user ID there are 32 user switches available (numbered 0 to 31), whose settings can be changed by every job running under the user ID. If a new user ID is created by systems support or if the system is newly generated, all user switches are cleared (value OFF).

User switches are not cleared at the end of a job (job switches are cleared at the end of a job; see [section "Job switches" in chapter "Volume 1: General Part"](#)).

The current settings of the user switches can be queried using SHOW-USER-SWITCHES. It is also possible to query the user switches of other user IDs.

#### *Privileged functions*

Systems support staff working under the TSOS user ID can modify the user switches of any user ID (USER-IDENTIFICATION operand).

### Format

**MODIFY-USER-SWITCHES**

Alias: **MDUSW**

**USER-IDENTIFICATION** = **\*OWN** / <name 1..8>

,**ON** = **\*UNCHA NGED** / list-poss(32): <integer 0..31>

,**OFF** = **\*UNCHA NGED** / list-poss(32): <integer 0..31>

,**INVERT** = **\*UNCHA NGED** / list-poss(32): <integer 0..31>

---

## Operands

**USER-IDENTIFICATION = \*OWN / <name 1..8>**

User ID whose user switches are to be set according to the entries for the operands ON, OFF and INVERT.

The default value is \*OWN, i.e. the user ID of the calling task. Nonprivileged users can only explicitly specify their own user ID.

**ON = \*UNCHANGED / list-poss(32): <integer 0..31>**

User switches to be set to ON.

**OFF = \*UNCHANGED / list-poss(32): <integer 0..31>**

User switches to be set to OFF.

**INVERT = \*UNCHANGED / list-poss(32): <integer 0..31>**

User switches to be inverted.

The user switches specified are set from ON to OFF or from OFF to ON.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	CMD0002	Command executed; error in WHEN queue (error possible for tasks waiting for this event)
	1	CMD0202	Contradictory entries
	32	EXC0041	System error
	64	EXC0868	User ID not found
	130	CMD2382	User switches not available because the user ID is locked

## Note

A user switch can be modified explicitly only once in a MODIFY-USER-SWITCHES command, i.e. switched on or off or inverted.

---

## Example

**/show-user-sw** \_\_\_\_\_ (1)

```
% USER SWITCHES ON EQUAL-  
% 3, 4
```

**/mod-user-sw on=(1,4),off=3** \_\_\_\_\_ (2)

**/show-user-sw**

```
% USER SWITCHES ON EQUAL-  
% 1, 4
```

**/mod-user-sw invert=(2,3,4)** \_\_\_\_\_ (3)

**/show-user-sw**

```
% USER SWITCHES ON EQUAL-  
% 1, 2, 3
```

- (1) Switches 3 and 4 were already set to ON.
- (2) Switches 1 and 4 are set to ON (note that switch 4 is already ON), switch 3 is set to OFF.
- (3) Switches 2, 3 and 4 are inverted.

---

## 4.70 MODIFY-VOLUME-SET-LIST

Modify volume set list definition

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

The MODIFY-VOLUME-SET-LIST command enables systems support to modify a defined volume set list. Volume sets can be added and removed. A volume set list can hold a maximum of 255 volume sets. It is also possible to modify the brief explanatory text.

The SM pubset for which the volume set list definition is to be modified must have been imported to the local system (in exclusive or shared mode).

### Format

#### MODIFY-VOLUME-SET-LIST

```
VOLUME-SET-LIST-NAME = <composed-name 1..8>  
,PUBSET = <cat-id 1..4>  
,REMOVE-VOLUME-SET = *NO / *ALL / list-poss(255): <cat-id 1..4>  
,ADD-VOLUME-SET = *NO / list-poss(255): <cat-id 1..4>  
,VOLUME-SET-LIST-INFO = *UNCHANGED / *NONE / <c-string 1..720 with-low>
```

### Operands

**VOLUME-SET-LIST-NAME = <composed-name 1..8>**

Name of a defined volume set list which is to be modified.

**PUBSET = <cat-id 1..4>**

Identifies the SM pubset for which the volume set list now being modified is defined.

**REMOVE-VOLUME-SET = \*NO / \*ALL / list-poss(255): <cat-id 1..4>**

Indicates whether volume sets are to be removed from the volume set list.

**REMOVE-VOLUME-SET = \*NO**

No volume sets are to be removed.

**REMOVE-VOLUME-SET = \*ALL**

All the volume sets are to be removed from the volume set list.

**REMOVE-VOLUME-SET = list-poss(255): <cat-id 1..4>**

The specified volume sets are to be removed from the volume set list. Up to 255 volume sets can be listed.

---

**ADD-VOLUME-SET = \*NO / list-poss(255): <cat-id 1..4>**

Indicates whether volume sets are to be added to the volume set list.

**ADD-VOLUME-SET = \*NO**

No volume sets are to be added.

**ADD-VOLUME-SET = list-poss(255): <cat-id 1..4>**

The specified volume sets are to be added to the volume set list. Up to 255 volume sets can be listed. Up to 255 volume sets can be assigned to a volume set list. This ceiling must not be exceeded.

The command does not check that the specified volume sets really belong to the SM pubset. Volume sets specified both in REMOVE-VOLUME-SET and in ADD-VOLUME-SET will still be on the volume set list when the command has finished executing.

**VOLUME-SET-LIST-INFO = \*UNCHANGED / \*NONE / <c-string 1..720 with-low>**

Specifies whether the brief explanatory text about the volume set list is to be modified. The default is \*UNCHANGED, which means that any existing text is retained.

**VOLUME-SET-LIST-INFO = \*NONE**

Any existing explanatory text is to be deleted.

**VOLUME-SET-LIST-INFO = <c-string 1..720 with-low>**

The brief text entered here is incorporated as a description of the volume set list. Any existing text will be overwritten.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	1	CMD0202	Syntax error in command
	32	CMD0221	Internal system error
	64	CMD0216	No authorization to issue command
	64	DMS148B	Volume set list not defined
	64	DMS148C	Maximum number of volume set entries exceeded
	64	DMS1485	Pubset not known
	64	DMS1486	Pubset is not a system-managed pubset
	64	DMS1487	Pubset not available
	64	DMS1490	Storage class management not available for this pubset
	64	DMS1484	Volume set list catalog invalid
	64	DMS1482	Error accessing volume set list catalog
	129	DMS148D	Not enough class 4/5 memory
	129	DMS148E	Error on MSCF connection to master
	129	DMS148F	GCF subsystem not ready

---

## 4.71 MOUNT-NET-STORAGE

Connect Net-Storage

**Component:** BS2000 OSD/BC

**Functional area:** Net-Storage administration

**Domain:** DEVICE  
STORAGE-MANAGEMENT

**Privileges:** TSOS  
OPERATING

**Routing code:** G

### Function

The MOUNT-NET-STORAGE command connects a directory released on a Net-Server as storage space (Net-Storage) with BS2000.

In this case the connection to the net server and net client is set up. The Net-Storage is mounted on the net client as a file system and is consequently available to the BS2000 system. From the BS2000 viewpoint the Net-Storage is in the MOUNTED status.

Before a pubset with a Net-Storage volume is imported, the Net-Storage concerned should be connected. Only then files on the Net-Storage can be accessed immediately after the pubset has been imported.

Information on the mounted directories can be requested using the SHOW-NET-STORAGE command.

Fundamental information on the use of Net-Storage in BS2000 is provided in the "Introduction to System Administration" [14]. How to work with files on Net-Storage is described in the "Introductory Guide to DMS" [13].

### Format

#### MOUNT-NET-STORAGE

**DIRECTORY** = <c-string 1..64 with-low>

,**SERVER** = <composed-name 1..256 with-under> / <c-string 1..256 with-low> / \***IP-ADDRESS**(...)

\***IP-ADDRESS**(...)

| **IP-ADDRESS** = <composed-name 7..15> / <c-string 2..39>

,**CLIENT** = <composed-name 1..8 with-under> / <c-string 1..8> / \***DNS**(...) / \***IP-ADDRESS**(...)

\***DNS**(...)

| **DNS-NAME** = <c-string 1..256 with-low>

\***IP-ADDRESS**(...)

| **IP-ADDRESS** = <composed-name 7..15> / <c-string 2..39>

---

## Operands

**DIRECTORY = <c-string 1..64 with-low>**

Specifies the directory name of the Net-Storage released on the net server.

**SERVER =**

Specifies the net server which makes the Net-Storage available.

**SERVER = <composed-name 1..256 with-under> / <c-string 1..256 with-low>**

Host name or fully qualified domain name of the net server.

**SERVER = \*IP-ADDRESS**

Specifies the IP address of the net server in IPv4 or IPv6 format.

**SERVER = \*IP-ADDRESS(...)**

IP address of the net server.

**IP-ADDRESS = <composed-name 7..15> / <c-string 2..39>**

Specifies the IP address of the net server in IPv4 or IPv6 format.

**CLIENT =**

Specifies the net client on which the Net-Storage (more precisely: the released directory) is to be mounted. For SUs /390 and S servers this is an HNC. For SUs x86 X2000 performs this role.

**CLIENT = <composed-name 1..8 with-under> / <c-string 1..8>**

Internal BCAM name of the net client.

**CLIENT = \*DNS(...)**

Domain name of the net client.

**DNS-NAME = <c-string 1..256 with-low>**

Specifies the fully qualified domain name of the net client.

**CLIENT = \*IP-ADDRESS(...)**

IP address of the net client.

**IP-ADDRESS = <composed-name 7..15> / <c-string 2..39>**

Specifies the IP address of the net client in IPv4 or IPv6 format.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	0	NKAN005	Net-Storage already connected
	1	NKAN003	Syntax error in the input
	32	CMD0221	system error
	32	NKAN004	Error in command execution
	64	NKAN009	Leading slash in directory name missing

---

## 4.72 MOVE-JOBS

Import or export job descriptions

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** TSOS

### Function

The systems support staff can export or import job descriptions with the MOVE-JOBS command:

- Job descriptions may be exported from an active job pool into an interim file. Batch jobs whose data is being transferred into the destination file, are deleted from the active job pool, i.e. waiting jobs are not started and active jobs are canceled.
- Job descriptions may be imported again into an active job pool from a file or from an inactive job pool. Batch jobs whose data is being transferred into the active job pool, are deleted from the source file (interim file or inactive job pool).

#### *Method*

The command realizes the following two functions:

- extracts jobs from the job pool and places them in an interim file
- imports jobs from an interim file or an inactive job pool into an active job pool.

The interim file has the same format as a job pool file. Jobs may also be imported directly from an accessible inactive job pool file, without the use of an interim file. Either function may be started at any time in the course of a system run, provided that "Batch-System-Ready" has been reached during startup or system shutdown has not been initiated yet. No further instance of the MOVE-JOBS command is allowed while jobs are being exported.

When a batch job is exported it is always simultaneously eliminated from the active job pool (the user job is canceled) unless the job is currently being processed and \*NO has been specified in CANCEL-RUNNING-JOBS.

This implicit cancellation differs from a cancellation using the CANCEL-JOB command, however. Temporary files, for instance, that may have been created by the JMS (S.IN, S.E, S.PROC files) are not deleted. A job variable that may be monitoring the job, receives the status '\$M'. The jobs are exported one after another, according to the selection criteria specified, i.e. the job descriptions are removed from the job pool and written into the specified file one after another.

The active JMS job scheduling is not affected by a lengthy export process. Jobs accepted in the course of an export process will also be considered. The JMS shows the same behavior as in a warm start as regards the import function. In contrast to a warm start, however, the JMS may not be able to take over the original TSN of a batch job, because it has already been assigned in the current system run. A new TSN will then be assigned.

## Format

**MOVE-JOBS**

Alias: **MVJ**

**FROM-FILE** = **\*STD**(...) / <filename 1..54 without-gen> / **\*INACTIVE-SYSTEM-JOBPOOL**(...)

**\*STD**(...)

| **CANCEL-RUNNING-JOBS** = **\*YES** / **\*NO**

**\*INACTIVE-SYSTEM-JOBPOOL**(...)

| **PUBSET** = <alphanum-name 1..4>

**,TO-FILE** = **\*STD** / <filename 1..54 without-gen>(…)

<filename 1..54 without-gen>(…)

| **WRITE-MODE** = **\*CREATE** / **\*EXTEND**

**,SELECT** = **\*BY-ATTRIBUTES**(…) / **\*BY-TSN**(…) / **\*ALL**

**\*BY-ATTRIBUTES**(…)

| **JOB-STATE** = **\*ANY** / list-poss(3): **\*INACTIVE** / **\*EXECUTING** / **\*REPEAT**

| **,PUBSET** = **\*ANY** / list-poss(16): <alphanum-name 1..4>

| **,JOB-NAME** = **\*ANY** / list-poss(16): **\*NONE** / <alphanum-name 1.8>

| **,USER-IDENTIFICATION** = **\*ANY** / list-poss(16): <alphanum-name 1.8>

| **,JOB-CLASS** = **\*ANY** / list-poss(16): <alphanum-name 1.8>

**\*BY-TSN**(…)

| **TSN** = **\*ALL** / list-poss(28): <alphanum-name 1..4>

**,OUTPUT** = <filename 1..54 without-gen>(…) / **\*DUMMY**(…)

<filename 1..54 without-gen>(…)

| **SYSOUT** = **\*YES** / **\*NO**

| **,SYSLST** = **\*NO** / **\*YES**

**\*DUMMY**(…)

| **SYSOUT** = **\*YES** / **\*NO**

| **,SYSLST** = **\*NO** / **\*YES**

**,DIALOG-CONTROL** = **STD** / **\*YES** / **\*NO**

---

## Operands

**FROM-FILE = \*STD(...) / <filename 1..54 without-gen> / \*INACTIVE-SYSTEM-JOBPOOL(...)**

Source file from which the job descriptions are to be imported or exported.

**FROM-FILE = \*STD(...)**

The job descriptions are exported from the current job pool file (\$TSOS.SYSTEM.JOBPOOL on the home pubset).

**CANCEL-RUNNING-JOBS = \*YES / \*NO**

Specifies whether batch jobs that are to be moved and that are already being processed, are to be canceled or not.

**CANCEL-RUNNING-JOBS = \*YES**

Batch jobs that are already being moved, are canceled.

**CANCEL-RUNNING-JOBS = \*NO**

Batch jobs that are already being moved, continue as normal. They cannot be moved again.

In the case of repeat and calendar jobs, however, this only applies to the current instance of the job. Further repeats are not started.

**FROM-FILE = <filename 1..54 without-gen>**

The job descriptions are imported from the specified interim file (for inactive job pool files).

**FROM-FILE = \*INACTIVE-SYSTEM-JOBPOOL(...)**

The job descriptions are imported from the inactive job pool file of another imported pubset.

**PUBSET = <alphanum-name 1..4>**

Catalog ID of the imported pubset.

**TO-FILE = \*STD / <filename 1..54 without-gen-vers>(...)**

Name of the file into which the batch jobs are to be moved. This must be a file other than the file specified in the FROM-FILE operand.

**TO-FILE = \*STD**

The batch jobs are moved (imported) into the current job pool file (\$TSOS.SYSTEM.JOBPOOL on the home pubset).

**TO-FILE = <filename 1..54 without-gen-vers>(...)**

The batch jobs are moved into the specified destination file (export, e.g. into the job pool file of another pubset or into an interim file).

**WRITE-MODE = \*CREATE / \*EXTEND**

Specifies whether a new destination file is to be created or an existing one extended.

**WRITE-MODE = \*CREATE**

A new destination file is created. If the file already exists the command is canceled.

**WRITE-MODE = \*EXTEND**

The destination file is extended. If the file does not already exist, a warning is issued after which it is created.

**SELECT = \*BY-ATTRIBUTES(...) / \*ALL / \*BY-TSN(...) /**

Specifies whether the number of batch jobs to be moved is to be restricted.

---

*Note*

When exporting from the active job pool, it is also possible to select, export or delete jobs that are essential for the normal operation of the system. Job management merely stops the job scheduler and the task under which the command is currently running from being exported.

**SELECT = \*BY-ATTRIBUTES(...)**

Only jobs with the specified attributes may be moved.

**JOB-STATE = \*ANY / list-poss(3): \*INACTIVE / \*EXECUTING / \*REPEAT**

Specifies whether the job status may be a selection attribute. By default, only the inactive jobs may be selected.

**JOB-STATE = \*ANY**

Jobs may be selected regardless of their status.

**JOB-STATE = \*INACTIVE**

Inactive jobs that are not repeat jobs are selected.

**JOB-STATE = \*EXECUTING**

Active jobs that are not repeat jobs are selected.

**JOB-STATE = \*REPEAT**

All repeat jobs are selected.

**PUBSET = \*ANY / list-poss(16): <alphanum-name 1..4>**

Specifies whether the pubset on which the command file for the job is located is to be the selection attribute.

**PUBSET = \*ANY**

The pubset is not a selection attribute.

**PUBSET = list-poss(16): <alphanum-name 1..4>**

All jobs whose command files are on one of the specified pubsets are selected. As many as 16 pubsets can be specified in a list.

**JOB-NAME = \*ANY / list-poss(16): \*NONE / <alphanum-name 1.8>**

Specifies whether the job name is to be a selection attribute.

**JOB-NAME = \*ANY**

The job name is not a selection attribute.

**JOB-NAME = list-poss(16): \*NONE / <alphanum-name 1.8>**

The jobs with the specified names are all selected. Jobs without a job name are selected with \*NONE. As many as 16 job names can be specified in a list.

**USER-IDENTIFICATION = \*ANY / list-poss(16): <alphanum-name 1.8>**

Specifies whether the user ID under which a job is running is to be the selection attribute.

**USER-IDENTIFICATION = \*ANY**

The user ID is not a selection attribute.

**USER-IDENTIFICATION = list-poss(16): <alphanum-name 1.8>**

All jobs with one of the specified user IDs are selected. As many as 16 user IDs can be specified in a list.

---

**JOB-CLASS = \*ANY / list-poss(16): <alphanum-name 1.8>**

Specifies whether the job class is to be the selection attribute.

**JOB-CLASS = \*ANY**

The job class is not a selection attribute.

**JOB-CLASS = list-poss(16): <alphanum-name 1.8>**

All jobs that are to run in one of the specified job classes are selected. As many as 16 job classes can be specified in a list.

**SELECT = \*ALL**

All jobs are moved.

**SELECT = \*BY-TSN(...)**

Only jobs with the specified TSN are moved.

**TSN = list-poss(128): <alphanum-name 1..4>**

TSN of the job to be moved. The default is \*ALL, i.e. all jobs are moved.

**OUTPUT = <filename 1..54 without-gen>(…) / \*DUMMY(...)**

Specifies whether and to which destination the result of the command (import or export) is to be output.

**OUTPUT = <filename 1..54 without-gen>(…)**

The command result is to be logged in the specified file (see [section "MOVE-JOBS"](#) for output format).

**SYSOUT = \*YES / \*NO**

Specifies whether the output is also to be copied to SYSOUT.

The default value is \*YES, i.e. output is also copied to SYSOUT.

**SYSLST = \*YES / \*NO**

Specifies whether the output is also to be copied to SYSLST.

The default value is \*NO, i.e. output is not also copied to SYSLST.

**OUTPUT = \*DUMMY(...)**

The result of the command execution is not copied into a file. By default, the result is output only to SYSOUT.

**SYSOUT = \*YES / \*NO**

Specifies whether the log is to be output to SYSOUT.

The default is \*YES, i.e. output is directed to SYSOUT.

**SYSLST = \*YES / \*NO**

Specifies whether the log is to be output to SYSLST.

The default is \*NO, i.e. no output to SYSLST.

**DIALOG-CONTROL = \*STD / \*YES / \*NO**

Specifies whether a dialog should be conducted with the user for control purposes during execution of the command in order to permit step-by-step command processing. If command processing is interrupted with [K2] then the control dialog is started. A control dialog is only possible in dialog mode but, in this mode, may also be used in procedures. In batch mode, all operand values have the same effect as \*NO.

In the control dialog, the user is asked, following the successful processing of a batch job or interruption with [K2], by means of message JMS0523 whether command processing is to be continued. The SDF abbreviation rules apply to the entered response. To display the possible responses, enter a question mark. If the response contains a syntax error the query will be repeated up to 10 times.

*Syntax of the response to message JMS0523 (control dialog)*

*possible responses: \*NO / \*YES(...)*

*\*YES(...)*

| **DIALOG-CONTROL = \*UNCHANGED / \*YES / \*NO**

*Meaning of the responses*

**Response \*NO**

Processing of the MOVE-JOBS command is interrupted.

**Response \*YES(...)**

Processing of the MOVE-JOBS command is continued. The subordinate operand DIALOG-CONTROL corresponds to the operand of the same name in the command and makes it possible to modify the associated settings. The operand value \*UNCHANGED leaves the previous setting unchanged.

**DIALOG-CONTROL = \*STD**

In the interactive dialog (SYSCMD is assigned to the operator terminal), the default value STD corresponds to the value \*YES in procedures, and in batch mode to the value \*NO.

**DIALOG-CONTROL = \*NO**

The selected batch jobs are processed without any control query.

**DIALOG-CONTROL = \*YES**

Whenever a batch job has been terminated successfully, a query is issued to ask whether processing should be continued.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	CMD0002	Command executed with a warning
	32	CMD0221	System error
	64	JMS0630	Semantic error or privilege error (see SYSOUT message; e.g. processor or catalog ID unknown or MONJV not accessible)
	64	JMS0640	File defective or not accessible, e.g. empty, not a PAM file, no access authorization
	130	JMS0620	No storage space or no TSN available
	130	JMS0660	Function currently not executable

---

## Notes

1. When job description data is transferred into the active job pool, the availability of resources or the authorization of the job issuer is not checked (as is the case when a job is accepted). Basically, the behavior of the JMS is identical to that in the event of a warm start, here. It is up to the systems support staff to make sure that the system environment is identical at the time the task is started to that at the time the job was initially accepted (command file, user attributes, default catalog, etc.). Before the job is imported, the system merely checks whether the job class and the user ID under which the job is to run are available. If they are not available, the job is not imported. JMS cancels the job, if inconsistencies are encountered when it is underway. Before the MOVE-JOBS command is used in a network, the job environment needs to be checked carefully. If JMS cannot start a job because the necessary conditions are not met, this is regarded as an abnormal termination from the viewpoint of JMS, i.e. the job is deleted from the job pool.
2. JMS attempts to retain the TSN of a job. However, this cannot always be achieved, in particular when a job has been moved from another computer.
3. The "Current image" and the "Next image" of a repeat job are treated as pertaining to one single job, i.e. both will be deleted from the active job pool, but only the next image will be imported into the interim file. The entire repeat job is then reconstructed from the next image when it is imported (same as startup). If the current image was in the system at the time of export and was then selected in the import, the next image will be changed back into its predecessor.
4. After an export the S. files belonging to the jobs that were moved are released. During the import they will be locked again.
5. The interim file created when jobs were exported can be used as a job pool in a warm start. In addition to the name convention for system job pool files and Note 1, the following must be observed:
  - In the case of a warm start, jobs cannot be taken over into the system if their TSN is already occupied by SPOOL. This situation is avoided if start-up is performed with the same EQUISAMQ that was active at the time of the export.
  - The jobs' monitoring JVs are initially closed and have the status "\$M". Only when a job is terminated is the associated JV opened and the status reset to "\$R".

## Format of the log file

The log file that is generated is an SAM file with a variable record length. The events that are logged, are contained in a record and can be identified by means of a four-position record type code. A sample export log and import log with explanations follow below.

Example 1 (export log)

```

*HDR > MOVE-JOBS   Date: 2012-03-23   Time: 13:50   _____ (1)

*CMD > FROM-FILE = *STD   _____ (2)
*CMD >           ( CANCEL-RUNNING-JOBS = *YES )
*CMD > TO-FILE    = JOBPOOL.112
*CMD >           ( WRITE-MODE = *EXTEND )
*CMD > SELECT    = *BY-ATTRIBUTES (
*CMD >           JOB_STATE = *ANY
*CMD >           PUBSET   = *ANY
*CMD >           JOB-NAME = *ANY
*CMD >           USER-ID  = *ANY
*CMD >           JOB-CLASS = *ANY
*CMD >           )
*CMD > OUTPUT    = HEMUL
*CMD >           ( SYSOUT = *YES, SYSLST = *NO )
*CMD > DIA-CONTR = *NO

+KEY >  TSN   JSTATE   CAT   JNAME   UID   JCLASS   O-TSN   _____ (3)

EXT >  0AQS  *INACT   2V24  HEM11   TSOS   JCJS2XSB   _____ (4)

#SYS >           RC FROM PAM WRITE      5678   _____ (7)
*WAR >           SOME JOBS COULD NOT BE PROCESSED   _____ (8)
*WAR >  0APP

```

---

*Explanation*

- (1) Heading line (record type \*HDR)
- (2) Command entered (record type \*CMD)
- (3) Normally (import or export successful) the information per job is output to the following columns:
  - TSN: the job's TSN at the time of export or assigned at the time of import (see also O-TSN)
  - JSTATE: Job status
  - CAT: Catalog ID of the pubset where the job's command file is located
  - JNAME: Job name
  - UID: User ID under which the job runs
  - JCLSS: Job class
  - O-TSN: Only relevant for import. If a new TSN has to be assigned when the job is imported, because the TSN already exists in the system, the O-TSN (original TSN) column contains the job's original TSN.
- (4) The information lines that follow begin with a process identification (record type \*EXT for successful export or \*IMP for successful import).
- (5) Export of a repeat job. Repeat jobs may exist in two forms, namely current image and next image. The MOVE-JOBS command only exports the next image, in order to avoid job duplication. If a current image exists during the export process, that will be deleted and reconstructed again from the next image on import. If possible, the current image will retain its TSN.
- (6) A current image existed when the repeat jobs was exported and was deleted (see item 5).
- (7) Example of a system error during command execution; it was not possible to read a PAM page.
- (8) Comprehensive warning message on command conclusion.

### Example 2 (export log)

```
*HDR > MOVE-JOBS   Date: 2012-03-24   Time: 08:49           _____ (1)

*CMD > FROM-FILE = *STD
*CMD >                ( CANCEL-RUNNING-JOBS = *NO )
*CMD > TO-FILE     = JOBPOOL.1
*CMD >                ( WRITE-MODE = *EXTEND )
*CMD > SELECT      = *BY-TSN ( TSN =
*CMD >                0XXX,0YYY,0ZZZ,0APP,0APR,0APS
*CMD >                )
*CMD > OUTPUT      = HEMUL
*CMD >                ( SYSOUT = *YES, SYSLST = *NO )
*CMD > DIA-CONTR = *NO

+KEY >   TSN   JSTATE   CAT   JNAME   UID   JCLASS   O-TSN

#ERR >   0APS   IS CALLER TASK           _____ (2)
#ERR >   0APR   IS ALREADY EXTRACTED
#ERR >   0APP   IS JOB-SCHEDULER
*NFD >   0ZZZ   IN SYSTEM JOBPOOL           _____ (3)
*NFD >   0YYY   IN SYSTEM JOBPOOL
*NFD >   0XXX   IN SYSTEM JOBPOOL

#SYS >                RC FROM JOBP BOURSE   01234567
*WAR >                SOME JOBS COULD NOT BE PROCESSED
*WAR >   0XXX
*WAR >   0YYY
*WAR >   0ZZZ
*WAR >   0APP
*WAR >   0APR
*WAR >   0APS

EXT >   0APR *INACT   G                TSOS   JCJS2XSB
#ERR >   0APR RC FROM CANCEL           09
EXT >   0APQ *INACT   G                TSOS   JCJS2XSB
EXT >   0APP *INACT   G                TSOS   JCJS2XSB
```

### Explanation

- (1) This sample log shows a further export. A new log file is created for each execution of the MOVE-JOBS command.
- (2) The information lines are identified by IMP (for import). See item 3 above for details. Specific user jobs cannot be exported, because this would mean that they would be removed completely from the system and that is not desirable (e.g. the task under which the MOVE-JOBS command is currently running or the scheduler task of the JMS). The MOVE-JOBS command cannot, however, avoid all essential tasks from being exported. If the MOVE-JOBS command is not used with the utmost care, then important user-specific jobs may be canceled causing serious disruption to system operation.
- (3) The TSN of a job to be exported is not known to the JMS (record type \*NFD).

Example 3 (import log)

```

*HDR > MOVE-JOBS   Date: 2012-03-23   Time: 13:50

*CMD > FROM-FILE = JOBPOOL.GROSS
*CMD > TO-FILE   = *STD
*CMD > SELECT    = *BY-ATTRIBUTES (
*CMD >             JOB_STATE = ( *INACTIVE, *REPEAT )
*CMD >             PUBSET    = (
*CMD >                 A    ,G    ,L    ,2V24,2V27
*CMD >             )
*CMD >             JOB-NAME  = *ANY
*CMD >             USER-ID   = *ANY
*CMD >             JOB-CLASS = (
*CMD >                 JCJS2XSB,JCJS3XSB,J1    ,J2    ,
*CMD >                 J3    ,J4    ,J5
*CMD >             )
*CMD >             )
*CMD > OUTPUT     = HEMUL
*CMD >             ( SYSOUT = *YES, SYSLST = *NO )
*CMD > DIA-CONTR = *NO

+KEY >   TSN    JSTATE   CAT    JNAME    UID      JCLASS      O-TSN
IMP >   0AQS  *INACT   2V24  HEM11    TSOS     JCJS2XSB    _____ (1)
IMP >   0AQT  *INACT   2V24  HEM22    TSOS     JCJS2XSB

#SYS >   0AEG  RC FROM JMS JMJENQ   04    _____ (5)
#SYS >   0AEE  RC FROM TSN REASSIGN FFFF

```

---

```
#SYS >          RC FROM PAM READ          4567
#ERR >          WRONG VERSION ENTRY ON JOBPOOL PAGE 0005
#SYS >          RC FROM PAM WRITE         5678
```

### *Explanation*

- (1) Example of a successfully imported job. The information lines are identified by IMP (for import). For the meaning of output columns see item 3 of ["Example 1 \(export log\) in section "MOVE-JOBS"](#).
- (2) It was not possible to import the job because the user ID *HELMUL* was not defined in the system.
- (3) It was not possible to import the job because the job class *JCJS3XSB* was not defined in the system.
- (4) Example of a successfully imported repeat job whose current image has been reconstructed.
- (5) Example of another error situation reported in the log. It is not always possible to allocate an error to a specific job.

---

## 4.73 MOVE-PRINT-JOBS

Move print job from EQUISAMQ file

<b>Component:</b>	SPOOLSYS
<b>Functional area:</b>	Controlling spoolout job
<b>Domain:</b>	SPOOL-PRINT-ADMINISTRATION
<b>Privileges:</b>	PRINT-SERVICE-ADMINISTRATION

### Function

Systems support can use the MOVE-PRINT-JOBS command to extract print jobs from one EQUISAMQ file (job spool queue) and move them into another. This allows systems support to remove urgent print jobs from a system that has failed and place them in the EQUISAMQ file of a functioning system for them to be printed. The command can also be used to relieve the print load of a system.

The function is also available when the SPOOL subsystem is not loaded.

The print jobs from the EQUISAMQ file of one system can be moved directly into the EQUISAMQ file of another system, or they can be stored in a work file before being finally moved to the EQUISAMQ file of the destination system and vice versa.

The number of print jobs that were moved successfully is output in the SPA0114 message. Each print job that has been successfully transferred is deleted from the input file.

If the TSN of a transferred print job already exists on the target system the job is assigned a new TSN and a message is issued to the console. The access authorizations pertaining to the print job remain unchanged.

The number 0 means that either no print job has been chosen or that no selection was possible due to an error.

As a standard, all local print jobs may be transferred. However, it is also possible to transfer all the distributed print jobs. Additional the number of print jobs moved may also be restricted with the aid of selection attributes (SELECT=\*BY-ATTRIBUTES(...) operand):

- Selection via the pubset on which the required resources are located (RESOURCES-PUBSET operand).
- Selection via job status (JOB-TYPE operand); waiting, active or on-hold jobs can be selected.
- Selection via the job type (JOB-SCOPE operand); local or distributed print jobs may be selected.

The MOVE-PRINT-JOBS command supports all print jobs that are processed by the Dprint, SPOOL, RSO, SCSIPCL and SPS subsystems. Distributed print jobs can only be processed if the SPOOL subsystem is not loaded.

The following distributed printed jobs can be processed:

- Print jobs that were output by remote clusters (BS2000 or Xprint) and processed by the server located on the gateway host (gateway host = server host).
- Print jobs that were output by a BS2000 client host and processed on the associated home server (client host = server host).

The Dprint commands MODIFY-MULTIPLE-PRINT-JOBS and CANCEL-MULTIPLE-PRINT-JOBS can be used for other distributed print jobs (see the “Distributed Print Services” User Guide [10]).

## Format

### MOVE-PRINT-JOBS

```
FROM-FILE = *STD / <filename 1..54 without-gen-vers> / *INACTIVE-SYSTEM-PRINT-QUEUE(..)  
*INACTIVE-SYSTEM-PRINT-QUEUE(...)  
    | PUBSET= <catid 1..4>  
,TO-FILE = *STD / <filename 1..54 without-gen-vers>  
,SELECT = *LOCAL-PRINT-JOBS / *DISTRIBUTED-PRINT-JOBS / *BY-ATTRIBUTES(...)  
*BY-ATTRIBUTES(...)  
    | RESOURCES-PUBSET = *ANY / list-poss(128): <cat-id 1..4>  
    | ,JOB-TYPE = *ANY / list-poss(3): *WAIT / *ACTIVE / *KEEP  
    | ,JOB-SCOPE = *ANY / list-poss(2): *LOCAL-PRINT-JOBS / *DISTRIBUTED-PRINT-  
        JOBS
```

## Operands

**FROM-FILE = \*STD / <filename 1..54 without-gen-vers> \*INACTIVE- SYSTEM-PRINT-QUEUE(...)**

The name of the original file from which the print jobs are to be transferred. This can be the EQUISAMQ file on the local system (\$TSOS.EQUISAMQ on the home pubset), an EQUISAMQ file on an imported pubset or a work file generated with MOVE-PRINT-JOBS.

**FROM-FILE = \*STD**

The print jobs are transferred from the EQUISAMQ file on the local system (\$TSOS.EQUISAMQ on the home pubset).

**FROM-FILE = <filename 1..54 without-gen-vers>**

The print jobs are transferred from the file specified. The path name of an EQUISAMQ file (\$TSOS.EQUISAMQ) or of a work file may be specified. The specified file must be existent and it must have the file attributes of an EQUISAMQ file.

A work file contains print jobs that have already been “collected” with MOVE-PRINT-JOBS and that are now to be transferred into an EQUISAMQ file or into another work file.

**FROM-FILE = \*INACTIVE-SYSTEM-PRINT-QUEUE(...)**

The print jobs are transferred from the remote system’s EQUISAMQ file (\$TSOS.EQUISAMQ on a pubset imported in the local system).

**PUBSET= <cat-id 1..4>**

Catalog ID of the imported pubset.

**TO-FILE = \*STD / <filename 1..54 without-gen-vers>**

The name of the destination file into which the print jobs are to be transferred. The destination file can be an EQUISAMQ file on the local system (home pubset), an EQUISAMQ file on an imported pubset or a work file, however, it must not be the original file specified in the FROM-FILE operand.

---

**TO-FILE = \*STD**

The print jobs are transferred to the EQUISAMQ file on the local system (\$TSOS.EQUISAMQ on the home pubset). The file has to exist already (generated when the SPOOLSYS subsystem is started).

**TO-FILE = <filename 1..54 without-gen-vers>**

The print jobs are transferred into the specified destination file. The path name of an EQUISAMQ file (\$TSOS.EQUISAMQ) or of a work file may be specified. The specified file must have the file attributes of an EQUISAMQ file. If the file does not yet exist, it will be generated with the appropriate file attributes. An exception to this rule is the EQUISAMQ on the local system. This must already exist (it is generated when the SPOOLSYS subsystem is started).

Print jobs can be collected in a work file and then transferred to an EQUISAMQ file at some later stage.

**SELECT = \*LOCAL-PRINT-JOBS / \*DISTRIBUTED-PRINT-JOBS / \*BY-ATTRIBUTES(...)**

Specifies whether the number of print jobs to be transferred is to be restricted.

**SELECT = \*LOCAL-PRINT-JOBS**

All local print jobs are transferred (corresponds to the specification SELECT=\*ALL which is still supported for reasons of compatibility).

**SELECT = \*DISTRIBUTED-PRINT-JOBS**

All local print jobs are transferred (see the notes on usage below).

**SELECT = \*BY-ATTRIBUTES(...)**

Only the print jobs with the specified selection attributes are transferred.

**RESOURCES-PUBSET = \*ANY / list-poss(128): <cat-id 1..4>**

Specifies whether the pubset with the required resources is the selection attribute.

**RESOURCES-PUBSET = \*ANY**

The print jobs are selected regardless of the pubset on which the required resources are located. The following resources are considered when selecting local print jobs (specified with the PRINT-DOCUMENT command):

- file to be printed (FROM-FILE operand)
- job variable monitoring the job (MONJV operand, if specified)
- file with the user resources (USER-RESOURCES-FILE operand, if specified)
- translation table (TRANSLATION-TABLE operand, if specified)

In the case of distributed print jobs under BS2000 where client = server, the monitoring job variable and the user resource file are taken into account as resources (if specified).

**RESOURCES-PUBSET = list-poss(128): <cat-id 1..4>**

Only print jobs with the required resources on the specified pubset are selected. As many as 128 pubsets can be included in a list. If more than 128 pubsets are to be considered the MOVE-PRINT-JOBS command will have to be issued again for the remaining pubsets.

**JOB-TYPE = \*ANY / list-poss(3): \*WAIT / \*ACTIVE / \*KEEP**

Specifies whether the job status is to be a selection attribute. Several statuses may be given in a list (OR operation).

**JOB-TYPE = \*ANY**

The print jobs are selected regardless of their status.

### **JOB-TYPE = \*WAIT**

The jobs that are waiting for a printer are selected. Their status may be WT (wait) or WP (wait-pre-processing).

### **JOB-TYPE = \*ACTIVE**

The jobs which have had a printer assigned to them are selected. Their status may be ACT (active), TRT (before-apa-print), TRD (after-apa-print) or PRE (pre-processing).

Selecting active jobs makes sense when you want to move print jobs from an EQUISAMQ file of a system that has failed into the EQUISAMQ file of a functioning system. If there is no system failure, active jobs cannot be accessed.

### **JOB-TYPE = \*KEEP**

Jobs that were put on hold are selected (e.g. with the HOLD-PRINT-JOB command). Their status is KP (keep).

### **JOB-SCOPE = \*ANY / list-poss(2): \*LOCAL-PRINT-JOBS / \*DISTRIBUTED-PRINT-JOBS**

Specifies whether local (\*LOCAL-PRINT-JOBS) or distributed (\*DISTRIBUTED-PRINT-JOBS) print jobs are to be selected. The default value is \*ANY, i.e. both local and distributed print jobs are selected. Both types of print job can be specified in a list (OR operator).

## **Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	32	SPA0101	System error
	64	CMD0216	No authorization
	64	CMD2201	Parameter error
	64	SPA0102	Command execution terminated abnormally
	64	SPA0103	Command has already been executed by another task

## **Notes**

- The MOVE-PRINT-JOBS command is rejected if you try to access the current EQUISAMQ file if the SPOOL subsystem is in the status IN-CREATE, IN-HOLD, IN-RESUME or IN-DELETE. This behavior is preset in the initialization file of the SPOOLSYS subsystem:

```
MOVE . SPOOL . REQUEST=ABORT-REQUEST
```

If the parameter value is changed into WAIT-SPOOL, command execution will not begin until the SPOOL subsystem is in the state CREATED or NOT-CREATED.

- While a MOVE-PRINT-JOBS command which accesses the current EQUISAMQ file is being processed, the START-, HOLD-, RESUME- and STOP-SUBSYSTEM commands are rejected for the SPOOL subsystem. This behavior is preset in the initialization file of the SPOOL subsystem:

```
MOVE . SPOOL . REQUEST=ABORT-REQUEST
```

If the parameter value is changed into WAIT-MOVE, command execution will not begin until the MOVE-PRINT-JOBS command has been concluded.

- While a MOVE-PRINT-JOBS command is being executed any other MOVE-PRINT-JOBS command is rejected. This behavior is preset in the initialization file of the SPOOLSYS subsystem:

---

MOVE . COMMAND=ABORT-REQUEST

If the parameter value is changed into WAIT-REQUEST, command execution of a further MOVE-PRINT-JOBS command will be started, when the currently active command execution routine is concluded.

- If the print jobs are output independent of the pubset on which the required resources are located, it is also possible to select print jobs that require resources on the home pubset. They can only be printed in another system if the pubset has been imported on that system. If this is not the case, the print jobs are rejected (status KP).
- Print jobs that have been successfully transferred to the destination file are deleted from the original file.
- RSO print jobs that were transferred into the current EQUISAMQ file are only visible if the RSO subsystem has been loaded.
- Print jobs whose TSN is already in use in the destination file, are assigned a new TSN. The relevant information is issued to the console.
- When a print job has been transferred to the destination file the job variable that is monitoring the job will be updated. The new TSN and the status of the print job (as established on the output device) are entered. The other fields remain unchanged.
- Print jobs with the same TSN (one PRINT-DOCUMENT command for several files with FAMILY-PROCESSING=\*YES) are split up in the transfer process, i.e. n-1 elements of the job all receive a TSN of their own.
- Active print jobs that are transferred (after a system crash), are returned to the wait state. The other jobs retain their respective states.
- Print jobs that request a file lock ( LOCK-FILE operand in the PRINT-DOCUMENT or MODIFY-PRINT-JOB-ATTRIBUTES command) are ignored when jobs are being transferred from a work file into the current EQUISAMQ file, if the file lock cannot be set (e.g. the file no longer exists or the pubset cannot be accessed).

#### *Special characteristics of distributed print jobs*

- If the TSN of a print job already refers to another task or another print job on the remote system to which it was moved with the MOVE-PRINT-JOBS command, this print job is assigned a new TSN, and a console message (SPA0105) is issued. In addition, this second print job (on the target system) is set with message SPA0117 to “not schedulable”, i.e. stopped, in the following cases:
  1. if the print job to be moved is a distributed print job on different clusters, with gateway = server
  2. if the TSN of the print job matches the TSN of a distributed print job (not client = server) on the target system
  3. if the SPOOL subsystem is not loaded.

The assignment of a new TSN occurs only when print jobs are moved to the standard EQUISAMQ file of the system. If a new TSN was assigned, the order of the print jobs involved must be defined in accordance with the new TSN.

- The user ID of virtual printer server tasks should be defined under a (selectable or shared) pubset which is not the home pubset in order to facilitate the administration of the user ID within HIPLEX (provided that the HIPLEX function is available).

---

## 4.74 MOVE-TASK-TO-CATEGORY

Modify category assignment of a task

**Component:** BS2000 OSD/BC V10.0A

**Functional area:** Job processing

**Domain:** JOB  
SYSTEM-TUNING

**Privileges:** TSOS

### Function

The MOVE-TASK-TO-CATEGORY command enables systems support to modify the application of a task to a category if it is necessary to handle this task better or relieve the load on a category.

In addition to the four categories with the standard names TP, DIALOG, BATCH and SYS, the task management supports 12 other categories whose names are defined with the JMU utility routine. The job management system (JMS) notifies the task management of these JMS categories.

PCS (Performance Control System) enables further categories which are not known to JMS to be set up. However, these additional categories can only be successor categories of JMS categories. A JMS category can also be defined as a successor category of another JMS category.

The change in the chain of successor categories is initiated by PCS when a predefined quantity of added SERVICE-UNITS is exceeded (also referred to as DURATION RUNOUT).

The successor categories specified when PCS is used are displayed using the PCS command SHOW-PCS-OPTION.

The MOVE-TASK-TO-CATEGORY command assigns a task only to target categories which are JMS categories and not successor categories.

Task attributes assigned to the user (DIALOG, BATCH, TP) are defined by systems support in the user catalog and in the job classes. They can be modified via program interfaces (TINF macro).

A task can only be assigned to a target category if the task type which is assigned to the target category is the same as the current task type of the task (if required using a setting made with TINF).

The command is rejected in the event of a task with the task type "SYSTEM" and if the category SYS is specified.

---

## Format

**MOVE-TASK-TO-CATEGORY**

Alias: **MTTC**

**JOB-IDENTIFICATION** = \*TSN(...) / \*MONJV(...)

\*TSN(...)

| **TSN** = <alphanum-name 1..4>

\*MONJV(...)

| **MONJV** = <filename 1..54 without-gen-vers>

,**TO-CATEGORY** = <name 1..7> / \*DIALOG / \*BATCH / \*TP

## Operands

**JOB-IDENTIFICATION =**

Type of job identification.

Jobs can be identified by their task sequence number (TSN) or monitoring JV (MONJV). Jobs with the task type "SYSTEM" are not accepted.

**JOB-IDENTIFICATION = \*TSN(...)**

The job is identified by its task sequence number (TSN).

**TSN = <alphanum-name 1..4>**

TSN of the job whose category assignment is to be modified.

**JOB-IDENTIFICATION = \*MONJV(...)**

The job is identified by the JV which monitors it.

**MONJV = <filename 1..54 without-gen-vers>**

Name of the JV monitoring the job whose category assignment is to be modified.

**TO-CATEGORY = <name 1..7> / \*DIALOG / \*BATCH / \*TP**

Name of the target category to which the task is to be assigned. The category SYS is not accepted.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Without errors
1	0	CMD0001	Task is already assigned to the specified target category
	1	CMD0202	Syntactical error
	32	CMD0221	System-internal error
	64	CMD0216	Authorization missing
	64	EXC0200	Parameter error: TSN or MONJV unknown or MONJV belongs to another system in the MSCF network
	64	EXC0201	Parameter error: Target category unknown
	64	EXC0202	Parameter error: Task with system type SYSTEM is not allowed
	64	EXC0203	Parameter error: SYS is not allowed as the target category
	64	EXC0204	Target category is not a JMS category (but a category set up by PCS)
	64	EXC0205	Target category is a (PCS) successor category and not an "autonomous" JMS category or a (JMS) start category in a chain of PCS successor categories
	64	EXC0206	Task type of task and target category do not match

## Example

The task with TSN=0BMU is assigned to the category BATCHF and is now to be assigned to the category TP2:

```
/show-job-status job-id=*tsn(0bmu)
```

```
TSN:      0BMU      TYPE:      2 BATCHF      NOW: 2012-03-08.154540
...
```

```
/move-task-to-category tsn=0bmu, to-category=tp2
```

The command is rejected with the following message:

```
% EXC0205 TARGET-CATEGORY IS A CONSECUTION CATEGORY. COMMAND NOT PROCESSED.
```

When PCS is used the PCS command /SHOW-PCS-OPTION supplies the following information:

Category TP (=JMS/PCS start category)	- >	Category TP1 (=JMS/PCS successor category)	- >	Category TP2 (=Non-JMS/PCS successor category)
---	--------	--	--------	--

The task is therefore to be assigned to the ( JMS) start category, namely TP, in this sequence:

```
/move-task-to-category tsn=0bmu, to-category=tp
```

```
% EXC0208 TASK WITH TSN = '0BMU' ASSIGNED TO TARGET-CATEGORY 'TP'. COMMAND  
COMPLETED.
```

The SHOW-JOB-STATUS command now shows that the task is now assigned to the category TP:

```
/show-job-status job-id=*tsn(0bmu)
```

```
TSN:      0BMU      TYPE:      2 TP      NOW:      2012-03-08.154820
...
```

As the task is already assigned to the target category TP, only message EXC0207 is output when the MOVE-TASK-TO-CATEGORY command is issued again for the target category TP:

```
/move-task-to-category tsn=0bmu, to-category=tp
```

```
% EXC0207 TASK WITH TSN = '0BMU' ALREADY ASSIGNED TO TARGET-CATEGORY 'TP'.  
COMMAND COMPLETED.
```

---

## 5 OPEN-VARIABLE-CONTAINER - SHOW-DSSM-INFORMATION

The manual "Commands" is divided into the following chapters:

- General Part
- ACTIVATE-SNAPSHOT - DECRYPT-FILE
- DELETE-ALTERNATE-INDEX - LOGOFF
- MAIL-FILE - MOVE-TASK-TO-CATEGORY
- OPEN-VARIABLE-CONTAINER - SHOW-DSSM-INFORMATION
- SHOW-FILE - SHOW-PUBSET-SPACE-DEFAULTS
- SHOW-RESOURCE-ALLOCATION - WRITE-TEXT

---

## 5.1 OPEN-VARIABLE-CONTAINER

Open variable container

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

### Function

The OPEN-VARIABLE-CONTAINER command is used to open variable containers, which are stored as PLAM library elements. If such a variable container or element does not yet exist when the command is called, it is automatically created.

This makes it possible to create S variables which are permanently available, i.e. S variables whose existence is not dependent on the current task.

#### *Restrictions*

If the chargeable SDF-P subsystem is not available, the following restrictions apply:

- The scope can be defined with SCOPE=\*CURRENT only.
- If AUTOMATIC-DECLARE=\*ALL is specified, only simple S variables can be declared (TYPE=\*ANY and MULTIPLE-ELEMENTS=\*NO). All other declarations are rejected.

## Format

### OPEN-VARIABLE-CONTAINER

**CONTAINER-NAME** = <composed-name 1..64>

,**FROM-FILE** = \***LIBRARY-ELEMENT** (...)

\***LIBRARY-ELEMENT**(...)

|     **LIBRARY** = <filename 1..54 without-vers>

|     , **ELEMENT** = \***CONTAINER-NAME** / <composed-name 1..64>(…)

|             <composed-name 1..64>(…)

|             |     **VERSION** = \***HIGHEST-EXISTING** / <composed-name 1..24>

,**LOCK-ELEMENT** = \***NO** / \***YES**

,**SCOPE** = \***CURRENT** / \***PROCEDURE** / \***TASK**(…)

\***TASK**(…)

|     **SAVE-AT-TERMINATION** = \***NO** / \***YES**

,**AUTOMATIC-DECLARE** = \***ALL** / \***NONE** / <structured-name 1..20 with-wild(40)> /

list-poss(2000): <structured-name 1..20>

## Operands

**CONTAINER-NAME** = <composed-name 1..64>

Name of the variable container.

**FROM-FILE** = \***LIBRARY-ELEMENT**(…)

The library element which contains the variable container.

The element type is SYSVCONT.

**LIBRARY** = <filename 1..54 without-vers>

Name of the PLAM library.

**ELEMENT** =

Name of the element.

**ELEMENT** = \***CONTAINER-NAME**

The name of the element is identical with that of the variable container.

**ELEMENT** = <composed-name 1..64>(…)

The name of the element may differ from that of the variable container.

**VERSION** =

Designates the version of the element.

**VERSION** = \***HIGHEST-EXISTING**

Selects the highest existing version.

---

**VERSION = <composed-name1..24>**

Selects the specified version.

**LOCK-ELEMENT =**

Specifies whether the element is locked or not.

**LOCK-ELEMENT = \*NO**

The element is opened in input mode. The container variables are copied into the variable container from this element. The element is then locked.

**LOCK-ELEMENT = \*YES**

The element is opened in input and output mode. The container variables are copied from this element into the variable container. The element then remains open until the CLOSE-VARIABLE-CONTAINER command is issued. Any subsequent OPEN-VARIABLE-CONTAINER command which is issued in the same task or another task is rejected.

**SCOPE = \*CURRENT / \*PROCEDURE / \*TASK(...)**

Defines the scope of the variable container. This controls access to the variables held in the variable container. The scope of the container variable must not be greater than that of the variable container.

**SCOPE = \*CURRENT**

The scope of the variable container is procedure-local (for further details see “Scope of variables” in the “SDF-P” manual [34]).

The variable container can only be used in the local procedure and in any lower-level include procedures, but not in the calling procedure. The container is implicitly closed at the end of the current procedure.

**i** The operand values \*PROCEDURE and \*TASK(...) can only be specified if the chargeable SDF-P subsystem is loaded. The operand values are completely described in the “SDF-P” manual [34].

**AUTOMATIC-DECLARE =**

Specifies whether the container variables are to be automatically declared.

**AUTOMATIC-DECLARE = \*ALL**

The container variables are automatically declared, with the scope of the variable container.

**AUTOMATIC-DECLARE = \*NONE**

Container variables are not automatically declared.

**AUTOMATIC-DECLARE = list-poss(2000): <structured-name 1..20>**

The specified container variables are automatically declared with the scope of the variable container.

**AUTOMATIC-DECLARE = <structured-name 1..20 with-wild(40)>**

The container variables whose names match the specified pattern string are automatically declared with the scope of the variable container.

*Notes*

- Variables in a variable container can be created by means of the CONTAINER operand in the DECLARE-VARIABLE command.
- A reference to a variable container is not allowed until it has been created using OPEN-VARIABLE-CONTAINER.
- If variables are automatically created (using OPEN-VARIABLE-CONTAINER) and the variables already exist with different attributes, the declaration is rejected and error message SDP1018 is returned as a warning.

---

Notwithstanding this, the opening process continues.

The user can interrogate the rejected variables by means of the S variable stream SYSMMSG.

- If the variable container includes any variables that cannot be processed using SDF-P-BASYS, any declaration of such variables by means of AUTOMATIC-DECLARE will be rejected.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SDP00xx	Warning: Variable does not exist or is already declared with other attributes. Guaranteed messages: SDP1008, SDP1018
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	CMD0216	Do not have required privilege
	64	SDP0091	Semantic error
	130	SDP0099	No more address space available

## Example

See the DECLARE-VARIABLE command.

---

## 5.2 OPEN-VIRTUAL-DEVICE-DIALOG

Open dialog with virtual printer

**Component:** SPOOL  
**Functional area:** Controlling spoolout job  
**Domain:** SPOOL-PRINT-SERVICES  
**Privileges:** STD-PROCESSING  
PRINT-SERVICE-ADMINISTRATION

### Function

The OPEN-VIRTUAL-DEVICE-DIALOG command initializes the dialog between a virtual device and the user application procedure in which the call takes place. It is executed in batch mode only.

The command is part of a set of four commands which enable an application to be created in the form of an S procedure (see "[Sample application procedure](#)"). These commands manage the dialog between a virtual device and the application which was started in batch mode as an S procedure:

- OPEN-VIRTUAL-DEVICE-DIALOG
- GET-JOB-FROM-VIRTUAL-DEVICE
- RETURN-JOB-TO-VIRTUAL-DEVICE
- CLOSE-VIRTUAL-DEVICE-DIALOG

### Format

<b>OPEN-VIRTUAL-DEVICE-DIALOG</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error; command successfully processed
	32	SCP0974	Unexpected command
5	32	SCP0974	Memory request error

### Notes

1. This dialog with the virtual device need be initialized only once, at the beginning of the procedure.
2. If the dialog cannot be initialized, the command is rejected and a return code is set.
3. If initialization has already taken place, the command is rejected and a return code is set.
4. This command can only be used in batch mode.
5. Spin-off processing is activated each time an error is detected.

## Sample application procedure

```
/SET-PROC-OPTIONS DATA-ESCAPE-CHAR=*STD,LOGGING-ALLOWED=*YES
/ " ***** "
/ " * PARAMETERS DECLARATION * "
/ " ***** "
/BEGIN-PARAMETER-DECLARATION

## 5.3 PRINT-DOCUMENT

Output files/library members to printer

<b>Component:</b>	SPOOL
<b>Functional area:</b>	Controlling spoolout jobs
<b>Domain:</b>	SPOOL-PRINT-SERVICES
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	\$

### Function

The PRINT-DOCUMENT command enables you to output files on a printer. By specifying the relevant operands you can control the print job. If a print job contains nothing other than the name of the file to be printed, SPOOL uses default values.

The specifications in the PRINT-DOCUMENT command are entered into a spool control block (SCB) along with the default values for device selection. The SCB is placed in a spoolout queue (local spoolout, RSO) and managed as a separate job with a separate TSN.

You can monitor the processing of your spoolout jobs with the SHOW-PRINT-JOB-STATUS command, modify specific print control parameters with the MODIFY-PRINT-JOB-ATTRIBUTES command, change the priority of your jobs with the CHANGE-TASK-PRIORITY command or cancel them with the CANCEL-PRINT-JOB command.

**i** The PRINT-DOCUMENT command is an enhanced version of the PRINT-FILE command. The functional scope of PRINT-FILE meets the needs of SPOOL Version 2.7B, but only PRINT-DOCUMENT allows you to use the additional and enhanced features available in SPOOL V3.0A and above.

## Overview of control options

Control option	Operand to be specified
Specify the name of the print file or library element	FROM-FILE
Only output part of each record	DOCUMENT-PART
Set a common TSN for several jobs	FAMILY-PROCESSING
Only output part of a file	INPUT-PART
Define the start time for a print job	SCHEDULING-TIME
Lock a file until end of job	LOCK-FILE
Delete a file after printing	DELETE-AFTER-PRINT
Assign a job name for the SPOOL job	PRINT-JOB-NAME
Assign a priority for the SPOOL job	PRINT-JOB-PRIORITY
Print multiple copies of a file	ADDITIONAL-COPIES
Specify a form (paper)	FORM-NAME
Set print attributes	LAYOUT-CONTROL
Determine the printer for output	TO-PRINTER
Influence output of header and trailer pages	COVER-PAGES
Execute job under another user ID (only with PRINT-SERVICE-ADMINISTRATION privilege)	PROCESSING-ADMISSION
Control the failure processing	FAILURE-PROCESSING
Support handling of notifications	NOTIFICATION

Table 75: PRINT-DOCUMENT command, control options

---

## Controlling spoolout

### *Printer selection*

If a print job does not specify which printer to use, SPOOL assigns it to any available high-speed printer. The number of characters this printer prints per line depends on the form.

If the job is to be printed on a particular printer, you specify this printer in the TO-PRINTER operand structure (see the operand description [TO-PRINTER](#)).

The operands listed have minimum requirements with regard to the printer(s) used. Thus, if you specify one of these operands, you influence printer selection.

Operand	Printer required (minimum requirement)
PRINTER-TYPE=*LP65-PRINTER	LP65 printer
PRINTER-TYPE=*APA-PRINTER	APA printer
PRINTER-TYPE=*HP-PRINTER	HP printer or HP90 printer
USER-RESOURCES-FILE (corresponds to *STD)	HP, HP90 or APA printer
PAGE-COPIES (corresponds to *STD and to 0)	HP, HP90 or LP65 printer
FORM-DEFINITION= <name>	APA printer
TABLE-REFERENCE-CHAR = <name>	APA printer
PAGE-DEFINITION = <name>	APA printer
CHARACTER-SETS = *POOL	HP printer or HP90 printer
FORMS-OVERLAY-BUFFER	HP printer or HP90 printer
ROTATION	HP printer or HP90 printer
OVERLAY (<face>,<reverse>)	LP65 printer
PAGE-DEFINITION = n	LP65 printer

Table 76: PRINT-DOCUMENT command operands with implicit printer selection

If none of the operands in this table is specified, the default value in the SPOOL parameter file is used for printer selection.

### Specifying the form

If a print job does not specify which form to use, SPOOL uses the default form (STD) defined in the SPOOL parameter file.

The default STD form normally refers to:

- the default loop C1 with a line density of 6 lpi and the vertical tab “channel 1” (normally the beginning of the page) on line 3
- the default rotation loop R06 for HP printers and HP90 printers with a line density of 6 lpi and a form length of 13.5 inches

To use another form, enter the desired form using `RESOURCE-DESCRIPTION=*PARAMETERS(FORM-NAME=...)`.

### Controlling paper feed

Appropriate paper feed (loop) information is associated with each form. Unless you specify otherwise, the loop assigned to the form is used automatically. However, `RESOURCE-DESCRIPTION=*PARAMETERS(LOOP-NAME=...)` also lets you specify a different loop name. For all printers, this loop must be contained in the system PRFILE `$SYSSPOOL.PRFILE` or an appropriate user PRFILE.

**i** When explicitly specifying a loop, ensure that the length of the loop corresponds to the length of the form.

For printers with a loadable vertical format buffer, specifying a paper form (FORM-NAME operand) loads the loop associated with this form into the buffer. If the LOOP-NAME operand is specified in the same spoolout job, the feed is governed by the loop specified in LOOP-NAME. In all cases, the loop called must be available in a PRFILE.

If the paper form and font are not specified, SPOOL assumes that the vertical tab “channel 1” is set to the start of a new page in the loop (line 3).

The default loop “C1”, the default font “101” and other fonts intended for laser printers are normally contained in the system PRFILE.

### Defining loops yourself

You can use the PRM utility routine to define and administer your own loops. For more details, see the “PRM” manual [30].

## Feed control characters

EBCDIC feed control characters:

Feed control characters	Effect
X'40' through X'4F'	n line feeds before printing, 1 line feed after printing
X'00' through X'0F'	n line feeds after printing
X'C1' through X'CB'	Channel feed before printing
X'81' through X'8B'	Channel feed after printing

Table 77: EBCDIC feed control characters

EBCDIC and IBM printer control byte formats:

Value	Bit position and meaning (EBCDIC)							
	2 <sup>7</sup>	2 <sup>6</sup>	2 <sup>5</sup>	2 <sup>4</sup>	2 <sup>3</sup>	2 <sup>2</sup>	2 <sup>1</sup>	2 <sup>0</sup>
0	Line feed	after printing	always 0	always 0	Number of lines or V tab no. Value: 8	Number of lines or V tab no. Value: 4	Number of lines or V tab no. Value: 2	Number of lines or V tab no. Value: 1
1	Channel feed	before printing						

Value	Bit position and meaning (IBM)							
	2 <sup>7</sup>	2 <sup>6</sup>	2 <sup>5</sup>	2 <sup>4</sup>	2 <sup>3</sup>	2 <sup>2</sup>	2 <sup>1</sup>	2 <sup>0</sup>
0	Line feed	V tab number Value 8	V tab number Value 4	Number of lines or V tab no. Value: 2	Number of lines or V tab no. Value: 1	always 0	after printing	always 1
1	Channel feed						before printing	

\*) V tab is the vertical tab "channel n"

ASA feed control characters and corresponding EBCDIC feed control characters:

ASA feed	EBCDIC feed	Effect
C'+'	X'00'	No line feed after printing
C'-'	X'42'	2-line feed before printing
C'0'	X'40'	1-line feed before printing
C'1'	X'C1'	Jump to channel 1 before printing
...	...	...
C'A'	X'CA'	Jump to channel 10 before printing
C'B'	X'CB'	Jump to channel 11 before printing
others	X'40'	No line feed before printing

Any invalid control characters are corrected on laser printers.

**i** The vertical tab "channel 12" (X'CC') or (X'8C') is reserved for SPOOL.  
The differences in printer hardware mean that ASA and EBCDIC feed control characters are not completely identical: OPS printers advance not before but **after** printing a line - except in the case of X'00' (see above).

---

---

## Specifying fonts

Every form entered in the SPOOL parameter file is assigned a font. This assignment is entered in the SPOOL parameter file.

If no font is specified in the PRINT-DOCUMENT command, font “101” is used as the default. This font is assigned to the “STD” form in the SPOOL parameter file for all printers except types 3337, 3338 and 3339. Font “101” has the OCR-B character style and is defined for a line density of 6 lines per inch (lpi) and a character density of 10 characters per inch (cpi).

The operand RESOURCE-DESCRIPTION=\*PARAMETERS(CHARACTER-SETS=) enables you to specify a font from the system PRFILE for HP/HP90 printers. If the desired font is in a user PRFILE, you must specify this in the USER-RESOURCES-FILE operand.

For the operand RESOURCE-DESCRIPTION=\*PARAMETERS(CHARACTER-SETS=), specify

- either the names of up to four fonts (for HP/HP90 printers)
- or the name of a font pool containing up to 64 fonts (HP/HP90 printers)

to be used to print a file. The fonts are contained in the \$SYSSPOOL.PRFILE resource library. However, you can also create a private user PRFILE containing one or more of your own fonts that you have created using the PRM utility routine. You can also define a font pool yourself in a user PRFILE. To print a file with a user-defined font, you must specify the file name in the USER-RESOURCES-FILE operand.

You can also specify a font directly from the standard SPSLIB when printing in APA mode. If the desired font is contained in a user SPSLIB, this must be specified simultaneously with the USER-RESOURCES-FILE operand, in the same way as for HP/HP90 printers. In the case of the operand RESOURCE-DESCRIPTION=\*PARAMETERS (...), you can specify fonts in the PAGE-DEFINITION suboperand. The fonts are contained in the printer control file \$SYSSPOOL.SYSPRT.SPS.<version>. You can use the software product SPM to create your own fonts in a user SPSLIB. For details, see the “SPOOL” manual [43]. To print a file with a user-defined font, you must specify the file name in the USER-RESOURCES-FILE operand.

Before starting to print the file, the SPOOL system loads the specified fonts from the specified PRFILE into the character memory of the laser printer. If a file is printed with DOCUMENT-FORMAT=\*TEXT in the PRINT-DOCUMENT command / PRNTDOC macro - i.e. control characters in the text are not interpreted (except in printer type 3365, see the “SPOOL” manual [43]) - the first font specified in the CHARACTER-SETS operand of the PRINT-DOCUMENT command is used to print the whole file. It is thus preferable to specify just one font. Conversely, if the print file text contains control characters to be interpreted by SPOOL - i.e. CONTROL-MODE=\*PAGE-MODE must be specified in the PRINT-DOCUMENT command - the font to be used in each instance is selected from the fonts loaded as follows:

- The control information in the first record on each print page determines, among other things, which font should be used to start printing the page. Control characters within the print data enable the font to be changed anywhere on the page (for every character, if need be).
- The fonts specified for CHARACTER-SETS are loaded into the printer's character memory when the command is processed.
- The procedure for switching from one font to another by means of control characters is as follows:

All fonts you specify (either explicitly or by specifying a pool name) are loaded on the requested device during scheduling. Only the first font specified can be used if DOCUMENT-FORMAT=\*TEXT applies. The number of fonts (specified either explicitly in the PRINT-DOCUMENT command or implicitly by means of a pool) is compared with the upper limit defined as a global parameter at installation time. The scheduler checks whether the specified device has enough memory for all explicitly or implicitly specified fonts to be loaded.

---

Whenever possible, you should refer to the pools set up by systems support:

- either by specifying the pool name alone
- or by specifying a pool name and an index

The scheduler forms groups of jobs using the same font or the same pool, thus avoiding unnecessary font changing and reloading operations.

If the PRINT-DOCUMENT command contains references to fonts not yet loaded into the device's character buffer, and if there is no more space in the character buffer, the controller checks the loaded fonts for those which are called least frequently; these are then replaced with new ones.

If more than four fonts are requested in the PRINT-DOCUMENT command, it may happen that none of the available HP laser printers is able to load the requested number of fonts. In this case, the relevant job cannot be processed.

In the information you request with the SHOW-USER-STATUS command, all jobs requiring more than four fonts (or overlays or the page rotation module) are marked by an asterisk in the OPT field. The SHOW-PRINT-JOB-STATUS command allows you to display the number of requested fonts.

If you issue the PRINT-DOCUMENT command with the operands LOOP-NAME, CHARACTER-SETS and so on for laser printers, the \$SYSSPOOL.PRFILE resource library is checked to see whether the relevant entries are available. If not, the PRINT-DOCUMENT command is rejected.

If you issue the PRINT-DOCUMENT command with the FORM-NAME and/or LOOP-NAME operands for printers with a loadable VFB, the resource library is checked to see whether the relevant entry is available. If not, the PRINT-DOCUMENT command is rejected.

### *Example*

A file containing four different fonts is to be printed on a laser printer.

```
/PRINT-DOCUMENT FROM-FILE=dateiname,...,RESOURCE-DESCRIPTION=  
*PAR(CHARACTER-SETS=(100,360,370,#XY)),...
```

To switch to font 370 (the third font), for example, one of the following control characters should be selected, depending on the desired character density:

X'06'	Character density 10 characters/inch and font in MXM section 3.
X'0A'	Character density 12 characters/inch and font in MXM section 3.
X'0E'	Character density 15 characters/inch and font in MXM section 3.

The character density for which font 3 (370) was originally defined should of course be taken into account.

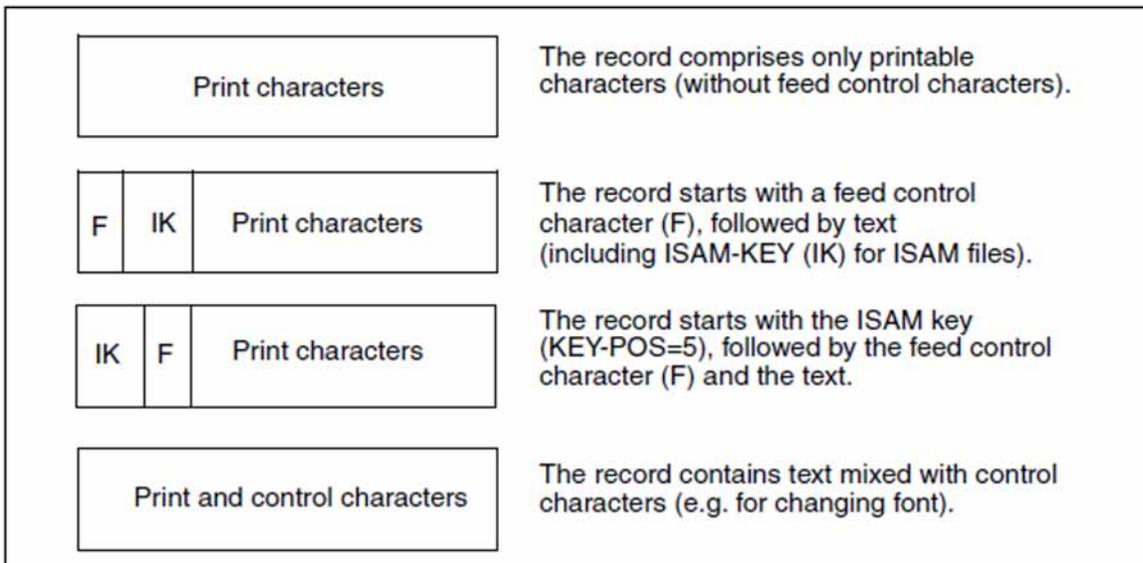

## Interpreting layout control characters

If you want to print a file containing layout control characters, when you create the job you can specify whether these control characters are to be interpreted by assigning the appropriate value to the operand `DOCUMENT-FORMAT=*PARAMETERS`. For further information on control characters, see the “SPOOL” manual [43].

SPOOL loads the font buffer and feed buffer as appropriate when processing the spoolout.

**i** The operator can use the `START-PRINTER-OUTPUT` command to ensure that the laser printer jobs specified with `DOCUMENT-FORMAT=*TEXT` may also be printed on an impact printer (line printer). In this case, the operands `LOOP-NAME`, `PAGE-COPIES`, `ADDITIONAL-COPIES`, `USER-RESOURCES-FILE`, `CHARACTER-SETS` and `OVERLAY-RESOURCES` are not interpreted.

## Examples of control characters in a file

## Defining your own forms, loops and fonts

*For HP/HP90 printers:*

Paper forms, loops, and fonts are generally defined by systems support. You can, however, also create loops and fonts yourself, store them in a user-specific resource library (PRFILE) and use them for SPOOL jobs. The loops and fonts must relate to a paper form already available in the SPOOL parameter file. You can use the `USER-RESOURCES-FILE` operand to cause SPOOL to use your resource library for this job. For further details, see the “PRM” manual [30].

*For APA printers:*

You can also create a private printer control file (SPSLIB) containing your own fonts etc. for printers that run in APA mode. You also specify this with the `USER-RESOURCES-FILE` operand. See also the “SPOOL” manual [43].

---

## Monitoring spoolout with job variables

SPOOL jobs can be monitored with job variables. Entering the name of a monitor variable (MONJV) in the PRINT-DOCUMENT command causes SPOOL to store a continuous stream of information on the processing of the job in the monitoring job variable.

For this purpose SPOOL uses the MONJV functions of the JV product. As a result, a job variable which is assigned to a spoolout job is protected against access by other jobs exactly like, for instance, the MONJV of an Enter job. This is regardless of whether the spoolout job is queued, has been canceled or is currently being processed.

Detailed information on managing job variables is provided in the “JV” manual [20].

SPOOL job variables can also be password-protected. Before a password-protected SPOOL job variable is interrogated, the password must first be entered into the password table by means of the ADD-PASSWORD command or in the PRINT-DOCUMENT command by means of the JV-PASSWORD operand.

## Error handling involving SPOOL job variables

If there are access problems involving SPOOL job variables, SPOOL can respond as follows:

- If the error occurs during syntax checking of the PRINT-DOCUMENT command, the command is rejected on account of the operand in which the error has occurred. In the case of shared processing of several jobs (FAMILY-PROCESSING operand), only the relevant file is rejected. Processing of the command then continues. If only one job is being processed, this is canceled.

If the operand START-PROCESSING=<integer.> or \*AT-FILE-CLOSING is specified in the PRINT-DOCUMENT command, SPOOL continues processing despite the problem with the variable, since otherwise part of the data would get lost. Instead, SPOOL gives a warning to the user and continues processing the job without monitoring job variables.

- If the error occurs during spoolout, SPOOL outputs the message SPS0450 on the trailer page but otherwise continues spoolout processing as normal.

## Contents of the SPOOL job variable

The job variable is structured as follows:

Sta	TSN	Proc.	Reserve	S	OTSN	E#	EC#	Device	ERCOD	ERMSG
1	4	9	17	38	40	45	49	53	62	71

The first three fields of the job variable are reserved for ENTER jobs. The subsequent fields are assigned to SPOOL and reflect the various processes involved in SPOOL job processing.

The fields “Status” and “Processor” are left-justified and are initially filled with blanks. The other fields are right-justified and are also initially filled with blanks.

If the job variable does not exist, it is created if necessary when the command is checked for validity.

You can use the SHOW-JV command to display the contents of a job variable.

Overview

Field	Contents	Meaning
Sta	\$S	(spooled-in) Job accepted and in wait status
	\$R	(running) Job active
	\$P	(pre-processing) Job for which a section is currently being preprocessed
	\$T	(terminated) Job successfully terminated
	\$A	(aborted) Job canceled or terminated abnormally
	\$K	(kept) Job was kept back
TSN	tsn	Contains the TSN of the job with the preceding filler character "0"; in the case of a replay job, tsn is always the current TSN. The original TSN is located in field OTSN;
Proc.	proc	Like ENTER-JOB jobs, contains the catalog ID of the system (home pubset) on which the job was issued or the tape is being played in;
Res.		Reserved
S		Specifies whether the job is connected with tape processing
	0	Job contains sections which have not been preprocessed
	1	General job processing
	2	Job is on tape or was saved there
	3	Job comes from a tape
OTSN	otsn	In the case of a replay job contains the original TSN;
E#	nnn	Number of copies to be printed
EC#	nnn	Number of copies already processed
Dev.	xxxxxx	For active jobs (\$R, \$T or \$A) specifies the device name, the abbreviated device name or "TP" for user tapes;
ERCOD	xxxxxxxx	Error code for RSO jobs
ERMSG	xxxxxx	Identification number of the error message in the case of RSO jobs

Table 78: Structure of the SPOOL job variable

## Notes

- The normal progression of job status is \$\$S, \$\$R and \$\$T (or \$\$A/\$\$K). A replay job receives the status \$\$T after the file has been transferred to tape. This tape can be played back on the same system. In this case, the job variable is checked as soon as the file is in the system. If the original job variable still exists, it is reinitialized and receives the status \$\$S.
- The job variable subsystem is optional. If it is not available during the PRINT-DOCUMENT command validity check and if a job variable is requested, SPOOL rejects the command.

## Brief description of the PRINT-DOCUMENT operands:

Level 1 operands	Substructure	Function
FROM-FILE		Name of the print file:
	*EAM(...)	Temporary EAM object module file
	<filename>	BS2000 file name
	<posix-pathname>	POSIX path name
	*LIBRARY-ELEMENT(...)	Member from a PLAM library
	*OMF	Object module file
	*SYSOUT/*SYSLST(...)	System file *SYSOUT/SYSLST
DOCUMENT-PART		File area which is to be output
	INPUT-SECTION(...)	Splitting the file into sections
	INPUT-PART(...)	First and last records to be output
	RECORD-PART(...)	First and last characters of each record to be output
	OUTPUT-PART(...)	Logical lines or pages of the file edited for printing
DOCUMENT-FORMAT		Type of document content or evaluation of control characters
	*TEXT(...)	No printer-specific control characters
	*PAGE-FORMAT(...)	Evaluation of specific control characters for laser printers
	*SPECIAL-FORMAT(...)	Use of a printer-specific language
PRINT-JOB-CONTROL		Control of print job processing
	START-PROCESSING	Time of printing

	FAMILY-PROCESSING	Assignment of a joint TSN for multiple spoolout jobs
	PRINT-JOB-NAME	Defining a job name
	PRINT-JOB-PRIORITY	Urgency of the spoolout job
	PRINT-JOB-CLASS	Job class of the spoolout job
	MONJV	Defining a job variable for saving information
	JV-PASSWORD	Password with which the SPOOL job variable is protected
	PROCESSING-ADMISSION	Only with the PRINT-SERVICE-ADMINISTRATION privilege: Execution of the job under a different user ID
	FAILURE-PROCESSING	Error handling in the case of files currently being processed
	SCHEDULING-TIME	Start time of the print job
	ENCRYPTION	Determines encryption of the print file
LAYOUT-CONTROL		Defines the parameters that control page layout.
	PAGE-COPIES	Page copies
	LEFT-MARGIN	Indentation of the output text
	TWO-SIDED	Single- or double-sided printing on LP65
	ROTATION	Use of the page rotation module
	COVER-PAGES	Tasks for printing header and trailer pages
	TABLE-REFERENCE-CHAR	Selection of fonts by means of control characters in the text <sup>3)</sup>
	INPUT-TRAY-NUMBER	Input paper tray number
	OUTPUT-TRAY-NUMBER	Output paper tray number
	TOP-OFFSET	Defines the vertical position of the text on the paper
	LEFT-OFFSET	Defines the horizontal position of the text on the paper
RESOURCE-DESCRIPTION		Specifies the print resources to be used for the printout.
	FORM-NAME	form name

	LOOP-NAME	Loop
	ROTATION-LOOP-NAME	Loop for pages to be rotated for printout (landscape format)
	CHARACTER-SETS	Fonts for output
	CHAR-SET-ATTRIBUTES	Support of specific font attributes <sup>1)</sup>
	OVERLAY-RESOURCES	Use of an overlay
	PAGE-DEFINITION	Page definitions for APA printers <sup>3)</sup>
	FORM-DEFINITION	Format definitions for APA printers <sup>1)</sup>
	USER-RESOURCES-FILE	Assignment of a user PROFILE, user SPSLIB or user RSOFILE
	TRANSLATION-TABLE	Use of a code translation table
	RESOURCES-LOCATION	Use of Dprint resources <sup>2)</sup>
TO-PRINTER		Printer type for the output
	PRINTER-NAME	Name of the requested printer or printer pool
	PRINTER-TYPE	Type of requested printer Any local printer Any printer from a device pool LP65 printer HP or HP90 printer APA printer <sup>3)</sup>
	REDIRECTION-ALLOWED	Redirection of spoolout jobs by the device manager <sup>1)</sup>
	CLUSTER-NAME	Specifies the cluster to which the print job is to be transferred <sup>2)</sup>
	VIRTUAL-PRINTER	Print output to an application
ADDITIONAL COPIES		Number of additional printouts of the file
LOCK-FILE		Protection of the file during processing
DELETE-AFTER-PRINT		Specifies whether the file is to be deleted after processing
NOTIFICATION		Processing of notifications for the assigned print job

Table 79 : Brief description of the operands of the PRINT-DOCUMENT command

1) allowed only for RSO operation (see the “RSO” manual [32])

- 2) only effective in a distributed system (see the “Dprint” manual [10]).
- 3) only for local SPOOL.

## Operands

### FROM-FILE =

Names of the files to be output. Up to 16 file names can be specified per command call.

### FROM-FILE = \*OMF

Outputs the temporary object module file of the current job.

### FROM-FILE = \*LIBRARY-ELEMENT(...)

The specified element is to be output from a PLAM library. An element is fully defined by its name, its type and its version. The records of an element are assigned to particular record types. There are 255 record types. A distinction is drawn between user record types (1 through 159) and special record types (160 through 255). Only the user record types of an element can be output with SPOOL.

#### **LIBRARY = <filename 1..54 without-vers>**

The name of the PLAM library from which an element is to be output.

#### **ELEMENT = <composed-name 1..64 with-under with-wild(80)>(…)**

Name of the element to be output from the specified PLAM.

#### **VERSION = \*HIGHEST-EXISTING / \*UPPER-LIMIT / <composed-name 1..24 with-under with-wild(40)>**

The version of the element which is to be output. If this operand is omitted, SPOOL selects \*HIGHEST-EXISTING, i.e. the last element in alphabetical order. \*UPPER-LIMIT stands for the highest possible version X'FF'. This version is represented by the character @ in screen displays, in messages and on the trailer page.

If the version is specified in wildcard format, and if there are library elements with the same names to which the wildcard specification applies, then all of these library elements are output.

#### **TYPE = <alphanum-name 1..8 with-wild (12)>**

The type of the library element to be output.

If specified in wildcard format, the name consists of a maximum of 12 alphanumeric characters.

#### *Note*

The records of LMS elements of type C, L or R belong to the special record types (160 through 255). No records from such elements may therefore be printed.

### FROM-FILE = <posix-pathname 1..1023 without-wild>

Path name or name of a POSIX file that is to be printed. If the argument contains no POSIX-specific characters it must be placed within single quotes (to distinguish it from a BS2000 file name). The file name *.profile*, for example, does not need to be quoted because it is not possible for a BS2000 file name to start with a period (dot).

### FROM-FILE = \*SYSLST(...)

Outputs the SYSLST system file.

#### **SYSLST-NUMBER = \*STD**

Outputs the SYSLST system file (which is automatically output on termination of an interactive task). If assigned to a cataloged file, the contents of this file are output. Unless otherwise specified, the following points apply to output:

- a maximum of 2048 bytes per output line (operand LAST-CHARACTER=2048)
- SYSLST is not locked (operand LOCK-FILE=\*NO)
- SYSLST is deleted at the end of output (operand DELETE-AFTER-PRINT=\*YES)
- feed control character handling: (operand DOCUMENT-FORMAT= \*TEXT(LINE-SPACING=\*BY-EBCDIC-CONTROL))

The \*SYSLST system file may be combined with the temporary EAM object module file \*OMF and the system file \*SYSOUT in any sequence in a PRINT-DOCUMENT command, e.g. PRINT-DOCUMENT (\*OMF,\*SYSLST,\*SYSOUT). However, it must not be combined with an EAM file number or a cataloged file.

**SYSLST-NUMBER = <integer 1..99>**

Two-digit number nn to be used to form the SYSLSTnn file name. A maximum of 16 different SYSLSTnn system files can be specified in a list (in parentheses and separated by commas). All the specified operand values then apply to each of these system files.

**FROM-FILE = \*EAM**

Outputs an EAM object module file.

**EAM-NUMBER = <integer 1..65535>**

Number of the EAM file to be output. There is a detailed description of EAM files in the “Introductory Guide to DMS” [13].

**FROM-FILE = \*SYSOUT**

The system file SYSOUT is output. If assigned to a cataloged file, the contents of this file are output. Unless otherwise specified, the following points apply to output:

- a maximum of 2048 bytes per output line (operand LAST-CHARACTER=2048)
- SYSOUT is deleted at the end of output (operand DELETE-AFTER-PRINT=\*YES)
- feed control character handling (operand DOCUMENT-FORMAT= \*TEXT(LINE-SPACING=\*BY-EBCDIC-CONTROL))

The SYSOUT system file may be combined with the temporary EAM object module file \*OMF and the system file SYSLST in any order in a PRINT-DOCUMENT command, e.g. PRINT-DOCUMENT (\*OMF,\*SYSLST,\*SYSOUT). However, it must not be combined with an EAM file number or a cataloged file.

**FROM-FILE = <filename 1..54 with-wild(80)>**

Name of file to be printed. PAM files must not be specified in batch mode.

The PRINT-DOCUMENT command is rejected if the specified file:

- is a newly cataloged file to which nothing has yet been written
- has already been opened in output mode
- is a “large” file (> 32 GB).

If the file does not belong to the user's own user ID, read access must be allowed (see the SHOW-FILE-ATTRIBUTES command).

The following points should be noted in connection with the output of cataloged files:

- A spoolout job is created even if the file to be output is reserved by a SECURE-RESOURCE-ALLOCATION command. This reservation must, however, be canceled before the spoolout job is processed; otherwise, the job is not executed. The file to be output is locked until the end of the session if the operand LOCK-FILE=\*YES was specified in the PRINT-DOCUMENT command and the job could not be executed because of the reservation.

- 
- The files \*OMF, \*SYSLST and \*SYSOUT cannot be specified together with a cataloged file in a spoolout job.

The following points apply to the output of temporary files:

- A PRINT-DOCUMENT command for a temporary file is always executed automatically with LOCK-FILE=\*YES and DELETE-AFTER-PRINT=\*YES. This ensures that a temporary file is not erased prematurely by EXIT-JOB but only after printing has been completed.
- The temporary file is also erased if the spoolout job is terminated abnormally (e.g. by means of the CANCEL-PRINT-JOB command).
- A detailed description of temporary files is given in the “Introductory Guide to DMS” [13].

#### **DOCUMENT-PART =**

Allows processing of the print file to be limited to only a part of it.

The file to be printed (the input file) consists of a sequence of records, each of which can be identified by SPOOL by means of its record number or a string it contains. SPOOL also allows you to structure the print file by using strings as file marks. These file marks divide the file up into sections. SPOOL takes into account all the options set by the user and converts the input file into a file edited for printing (an output file). This file consists of logical lines and pages. The delimitation of part or parts of a file can apply to either the input file or the output file. The following alternatives for defining parts of a file are available in the substructures of this operand:

- INPUT-SECTION: the input file can be subdivided into sections on the basis of a specified string, or the whole file can be processed.
- INPUT-PART: only a certain number of the input file’s records are processed. You can specify the first and last record by means of a record number, a section number or a string.
- RECORD-PART: of the records selected by means of the above operands, only a specified part of each record is processed.
- OUTPUT-PART: the whole input file is edited for printing, but output is limited to a subset of all logical print pages.

#### **DOCUMENT-PART = \*PARAMETERS(...)**

The part of the file to be processed can be specified in the following substructure.

##### **INPUT-SECTION =**

Specifies whether the file is structured by means of file marks.

##### **INPUT-SECTION = \*WHOLE-FILE**

The file is not structured. The whole input file is a single logical section.

##### **INPUT-SECTION = \*PARAMETERS(...)**

The file is structured by means of file marks that can be specified in the following substructure. You use the INPUT-PART operand to specify which sections of the structured print file are to be output.

##### **SECTION-IDENTIFIER = <c-string 1..60 with-low> / <x-string 1..120>**

Specifies the file marks by means of which the input file is to be structured. Any strings in the records can be used as file marks. These strings can be either in SECTION records, which are not printed, or in the print file’s normal records, which are printed. A string can be specified in the form of printable characters or hexadecimal characters. You use the INPUT-PART operand to specify which sections of the structured print file are to be output. The search for the start of the section to be printed is executed in a separate “pseudo controller” task. Neither the user task nor the printer is locked while this is being done. A pseudo

---

controller writes the address of the first record in the section to the SPOOL control block; the spoolout job can then be processed (PREPROCESSING). If the desired section is not found in the file, an error message appears on the trailer page (for the layout of this page see the “SPOOL” manual [43]).

**POSITION =**

Specifies the position at which the specified string begins in the SECTION record.

**POSITION = \*STD**

The relevant string begins by default at the start of the record, i.e.:

- in a SAM file: at the first byte after the record length field
- in an ISAM file with KEY-POS=5: at the first byte after the key
- in an ISAM file with KEY-POS > 5: at the first byte after the record length field.

**POSITION = <integer 1..2047>**

The relevant string begins at the specified byte (after the record length field).

**INPUT-PART =**

Specifies whether only a certain number of the input file's records are to be processed. You can specify the first and last record by means of a record number, a section number or a string.

**INPUT-PART = \*ALL**

All the file's records are to be processed.

**INPUT-PART = \*PARAMETERS(...)**

Only a certain number of the input file's records are to be processed. You can specify the first and last records.

**FIRST-RECORD =**

Specifies the record as of which the file is to be processed. You can specify the first record in the file, the number of a record or file mark, or a string in a record.

**FIRST-RECORD = \*BEGIN-OF-FILE**

Output begins with the file's first record, even if SECTION records are specified.

**FIRST-RECORD = <integer 1..2147483647>**

Number of the SECTION record or normal record as of which a section of the file is to be output.

**FIRST-RECORD = \*BY-STRING-ID(...)**

The record in which a specified string occurs is the first record to be output.

**STRING = <c-string 1..60 with-low> / <x-string 1..120>**

Output begins with the record in which the specified string of printable or hexadecimal characters is found at a specific position.

**POSITION = \*STD / <integer 1..2047>**

Position within the record at which the specified string of hexadecimal characters begins. By default, the FIRST-RECORD string begins at the start of the record, i.e.:

- in a SAM file: at the first byte after the record length field
- in an ISAM file with KEY-POS=5: at the first byte after the key
- in an ISAM file with KEY-POS > 5: at the first byte after the record length field.

**OCCURRENCE = 1 / <integer 1..32767>**

Specifies the record (containing the FIRST-RECORD string) as of which output is to start.

---

**LAST-RECORD =**

Specifies the last record in the part of the file to be output. You can specify the last record in the file, the number of a record or file mark, or any string in a record.

**LAST-RECORD = \*END-OF-FILE**

Output continues until the end of the file, even if SECTION records are specified.

**LAST-RECORD = <integer 1..2147483647>**

Number of the last record (SECTION record or normal record) in the part of the file to be output.

**LAST-RECORD = \*BY-STRING-ID(...)**

Specifies that the last record is to contain a specified string.

**STRING = <c-string 1..60 with-low> / <x-string 1..120>**

Output ends with the record in which the specified string of printable or hexadecimal characters is found at a specific position in the file.

**POSITION = \*STD / <integer 1..2047>**

Position within the record at which the specified string of hexadecimal characters begins. By default, the LAST-RECORD string begins at the start of the record, i.e.:

- in a SAM file: at the first byte after the record length field
- in an ISAM file with KEY-POS=5: at the first byte after the key
- in an ISAM file with KEY-POS > 5: at the first byte after the record length field.

**OCCURRENCE = 1 / <integer 1..32767>**

Specifies the occurrence of the record containing the LAST-RECORD string at which output is to stop.

*Note*

If the LAST-RECORD record is found before the FIRST-RECORD record, the PRINT-DOCUMENT command aborts.

**RECORD-PART =**

Specifies whether only a specific part of each of the records selected by means of the above operands is to be processed.

**RECORD-PART = \*ALL**

All of each selected record is to be processed.

**RECORD-PART = \*PARAMETERS(...)**

Only a specific part of each record is to be processed.

**FIRST-CHARACTER = 1 / <integer 2..32767>**

Allows a byte number (record column) to be specified indicating the point as of which the records of a file are to be output. (The bytes of a record are numbered consecutively from left to right starting with 1; ISAM keys and control characters are components of a record.) What happens depends on whether one of the values \*BY-EBCDIC-CONTROL, \*BY-IBM-CONTROL or \*BY-ASA-CONTROL is specified in the LINE-SPACING operand.

*If one of these values is specified.*

Output starts with the data byte following the specified byte number. The feed control character is interpreted irrespective of the entry for FIRST-CHARACTER, provided the value for FIRST-CHARACTER

---

is less than the length of the record. If the specified value is greater than the length of the record, it is ignored (i.e. printing does not take place, nor does line feed).

*If none of these values is specified.*

Output starts with the data byte corresponding to the specified byte number.

If the records are longer than the form definition allows, printing continues on the next line. If CONTROL-MODE=\*PAGE-MODE is specified, an entry for FIRST-CHARACTER is problematical because SPOOL takes no account of the number of control characters in a record.

**LAST-CHARACTER = \*STD / <integer 1..32767>**

Specifies the byte indicating the point at which printing of each record is to stop. What happens depends on whether one of the values \*BY-EBCDIC-CONTROL, \*BY-IBM-CONTROL or \*BY-ASA-CONTROL is specified in the LINE-SPACING operand.

*If one of these values is specified.*

Output ends with the data byte following the specified byte number (unless FIRST-CHARACTER is specified for an ISAM file with KEY-POSITION=5, in which case output ends with the data byte corresponding to the specified byte number).

*If none of these values is specified.*

Output ends with the data byte corresponding to the specified byte number. If the records are longer than the form definition allows, printing continues on the next line. If CONTROL-MODE=\*PAGE-MODE is specified, an entry for LAST-CHARACTER is problematical because SPOOL takes no account of the number of control characters in a record.

Default (\*STD):

- end of print line (136)
- 2048 for an EAM file, SYSLST or SYSOUT.

**OUTPUT-PART =**

Specifies that the whole input file is to be edited for printing, but that output is to be limited to a subset of all logical print pages.

**OUTPUT-PART = \*ALL**

All logical print pages of the edited file are to be output.

**OUTPUT-PART = \*RANGE(...)**

Part of the file is to be output.

**FROM = \*BEGIN-OF-FILE / <integer 1..2147483647>**

Allows a page or line number in the print file to be specified as of which output is to start, as specified by the DIMENSION operand. By default, output commences at the beginning of the file. The pages in a print file are defined as described for the LINE-PER-PAGE operand (unless a control character produces a premature page feed).

**TO = \*END-OF-FILE / <integer 1..2147483647>**

Allows a page or line number in the print file to be specified at which output is to end, as specified by the DIMENSION operand. By default, output terminates at the end of the file. Pages in a print file are defined by the LINE-PER-PAGE operand (unless a control character produces a premature page feed). The value specified here must be greater than that specified in the FROM operand.

---

**DIMENSION = \*PAGES / \*LINES**

Specifies whether the values in the FROM and TO operands are to be interpreted as page or line numbers.

**OUTPUT-PART = \*LAST(...)**

Only the last so many pages or lines of the print file are to be output.

**LAST = <integer 1..2147483647>**

Number of pages or lines to be output, calculated from the end of the file. The DIMENSION operand indicates whether the value is to be interpreted as a page or line number. Pages in a print file are defined by the LINE-PER-PAGE operand (unless a control character produces a premature page feed).

**DIMENSION = \*PAGES / \*LINES**

Specifies whether the value in the LAST operand is to be interpreted as a page or line number.

*Example of SECTION processing*

The following sections of an ISAM file are to be output.

```
01000000 Line 0
02000000 *SECTION0001
03000000 Line 1
04000000 *SECTION0002
05000000 Line 2
06000000 *SECTION0003
07000000 Line 4
```

Case: SECTION records in default positions.

```
PRINT-DOCUMENT datei, DOCUMENT-PART=*PAR(INPUT-SECTION = -
      *PAR(SECT-ID=C' *SECTION', POS=*STD), INPUT-PART= *PAR( -
      FIRST-RECORD=1, LAST-RECORD=3))
```

The following part of the file is printed:

```
03000000 Line 1
05000000 Line 2
```

**DOCUMENT-FORMAT =**

Specifies the type of the document contents, i.e. the format of the file to be printed as regards the interpretation of feed control characters, printer control characters, font identifiers, RENO commands and/or VTSU codes. You can specify the following operands and the corresponding substructures here:

- \*TEXT: the file has no printer-specific control characters except for feed control characters.
- \*PAGE-FORMAT: the file has laser printer-specific control characters.
- \*SPECIAL-FORMAT: the file has special printer-specific control characters.

---

**DOCUMENT-FORMAT = \*TEXT(...)**

Except for feed control characters, the file has no printer-specific control characters. The position of the feed control character in the record can be specified in the substructure of the LINE-SPACING operand.

The data is sent to the printer unchanged. Since only the data to be printed is sent to the printer, records can be truncated.

*The following applies to RSO:*

Records of type A-1 or A-2 are to be printed (no control characters in the data stream); in other words, except for feed control characters in the first column of the records, no control characters are interpreted. This is also the reason why a font change is not possible. The form's default font or the first font specified for CHARACTER-SETS, if specified, is used. Nonprinting characters, i.e. characters with a hexadecimal value less than X'40', are output as blanks. If the record length exceeds the maximum line length, the record is truncated in the printout. The maximum line length depends on the character spacing, which is defined by means of the font used (see the CHARACTER-SETS operand).

*Note*

RSO printers: If a list of fonts is specified in conjunction with DOCUMENT-FORMAT=\*TEXT (CHARACTER-SETS=... operand), the command interprets only the first element in the list.

**LINE-PER-PAGE = \*STD / <integer 1..32767>**

Specifies how many lines (including header and blank lines) are to be printed on a page.

**LINE-PER-PAGE = \*STD**

If the operand is omitted, the number of lines per print page is calculated using the following formula, regardless of what has been specified for the HEADER-LINE number of lines =  $P * Z - A - 6$

The name sections have the following meanings:

P = paper size in inches

Z = line density

A = number of line before the first channel

*Printers with a loadable vertical format buffer*

- The vertical tab "channel 1" controls the line on which printing is to start. Unless otherwise specified, 2 blank lines are set before printing starts; i.e. channel 1 (CHANNEL 01) is in the third line of the loop.
- If the value specified for the LINE-PER-PAGE operand is greater than the specified number of lines in the loop, the value in the loop is used.
- A value specified here must be at least three times as large as the line feed specified for LINE-SPACING=1 /2/3 if the LINE-PER-PAGE operand is specified together with the HEADER-LINE and LINE-SPACING operands.

**LINE-SPACING =**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING= 1 / 2 / 3**

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an EBCDIC feed control character.

**CONTROL-CHAR-POS = \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**LINE-SPACING = \*BY-IBM-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**CONTROL-CHAR-POS = \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**LINE-SPACING = \*BY-ASA-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**CONTROL-CHAR-POS = \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**HEADER-LINE =**

Specifies whether a header line is to be printed on every page (except the header and trailer pages).

**HEADER-LINE = \*NO**

No header line is printed.

**HEADER-LINE = \*STD**

The header has the following format:

Header	DATE yyyy-mm-dd	userid	nnnn	PAGE nnnn
Column	1	41(11,11)	60(21,67)	124 (77)

The first value in parentheses applies in the case of a form definition with a line length < 132 and >= 80 characters (with differing values). The second value in parentheses applies in the case of a form definition with a line length < 80 and >= 70 characters (with differing values).

jjjj-mm-tt	Year-Month-Day
userid	user ID
datei	file name
nnnn	Page number

Unless otherwise specified, the header line is followed by a blank line. The header is shifted in accordance with the LEFT-MARGIN operand, but the header line will be truncated at column 132.

DATE and PAGE are only present in the header line if the line size >= 032.

**HEADER-LINE = list-poss(3): \*DATE / \*FIRST-RECORD / \*PAGE-NUMBER**

The header has the following format:

HEADER-LINE=	DATE	FIRST-RECORD	PAGE-NUMBER
Header	DATE yyyy-mm-dd (yyyy-mm-dd)	First record	PAGE nnnn (nnnn, nnnn)
Column	1	21	124 (77.67)

**\*DATE:**

The value in parentheses applies in the case of a form definition with a line length < 132 and >= 70 characters (with differing values). \*PAGE-NUMBER: The first value in parentheses applies in the case of a form definition with a line length < 132 and >= 80 characters (with differing values). The second value in parentheses applies in the case of a form definition with a line length < 80 and >= 70 characters (with differing values).

yyyy-mm-dd	Year-Month-Day
First record	First logical record of the file
nnnn	Page number

If \*DATE, \*FIRST-RECORD or \*PAGE-NUMBER is omitted, the appropriate section is filled with blanks.

Unless otherwise specified, the header line is followed by a blank line.

The header is shifted in accordance with the LEFT-MARGIN operand, but the header line will be truncated at column 132.

\*DATE and \*PAGE are only present in the header line if the line size >= 032.

If \*FIRST-RECORD is specified, the first record is regarded as not belonging to the date.

**OUTPUT-FORMAT =**

Indicates whether the output format is character format only or character format and hexadecimal format.

**OUTPUT-FORMAT = \*CHARACTER**

Outputs in character format only. Records which exceed the length of a print line are truncated.

**OUTPUT-FORMAT = \*HEXADECIMAL**

Outputs the data records in character format and in hexadecimal format.

**Output format**

Each output line starts with an 8-byte prefix followed by data 50 bytes in length. Each output line is first printed using the appropriate font and then repeated in hexadecimal format.

**Format of the output line**

Column	Contents
1-4	Column number from which the data of the output record begins
5-8	blank
From 9	Characters of the input record according to font; the individual characters are separated by a blank. The characters are repeated in hexadecimal format in the next line.

**DOCUMENT-FORMAT = \*PAGE-FORMAT(...)**

The file has specific laser printer control characters.

**FORMAT-NAME =**

Format in which the output data is transferred to the printer.

---

**FORMAT-NAME = \*STD**

The default value is automatically determined from the value of the CONTROL-MODE operand. This leads to the following results:

CONTROL-MODE = *PAGE-MODE(...)	FORMAT-NAME = HP
CONTROL-MODE = *APA(...)	FORMAT-NAME = SPDS
CONTROL-MODE = *LOGICAL / *PHYSICAL / *LINEMODE	Content of the file to be printed not relevant

**FORMAT-NAME = <c-string 1..63 with-low>**

Optional string naming a specific file format.

**CONTROL-MODE =**

Specifies how the control characters are to be interpreted.

**CONTROL-MODE = \*PAGE-MODE(...)**

The control characters are interpreted as page printer-specific control characters.

**PAGE-CONTROL-CHAR = \*YES / \*NO**

Specifies whether the control character list must be at the beginning of each page (i.e. always after branching to the vertical tab "channel 1" in the loop).

**PAGE-CONTROL-CHAR = \*YES**

The control character list must be there.

**PAGE-CONTROL-CHAR = \*NO**

No control character list at the beginning of the page. However, this means that the following functions cannot be controlled in the case of output to HP printers:

- Film overlays on individual pages in the file; specified in the PRINT-DOCUMENT command, a film overlay is used on each page of the print file of the spoolout job.
- Page copies for individual pages in the file; all the pages of the print file are output with as many copies as specified in the PRINT-DOCUMENT command.
- Column-oriented indentation on individual pages; the value specified in the PRINT-DOCUMENT command is valid for all the pages in the print file.
- FOB data overlay on individual pages in the file; specified in the PRINT-DOCUMENT command, a FOB data overlay is used on each page in the print file of the spoolout job.
- A copy reference number cannot be specified.
- Page rotation control for individual pages in the print file; all the pages are output in either portrait or landscape format, as specified in the PRINT-DOCUMENT command.

**CONTROL-TYPE =**

Specifies whether the control characters are suitable for processing on HP or HP90 printers or whether they have to be converted.

**CONTROL-TYPE = \*COMPATIBLE**

The file does not contain HP or HP90 printer-specific control characters.SPOOL must convert the control characters.

---

**CONTROL-TYPE = \*HP**

The file contains HP or HP90 printer-specific control characters that can only be processed by these printers.

**LINE-SPACING =**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING = \*BY-EBCDIC-CONTROL**

The contents of the first byte of each record are to be interpreted as an EBCDIC feed control character.

**LINE-SPACING = \*BY-IBM-CONTROL**

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**LINE-SPACING = \*BY-ASA-CONTROL**

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**CONTROL-MODE = \*LINE-MODE**

*Only for RSO.*

Records of type C (see the “SPOOL” manual [43]) are printed out. The records may contain data mixed with LINE-MODE control characters. LINE-MODE control characters are (in any combination):

- printer control characters (i.e. physical control character beginning with X'27' or X'3C')
- RENO commands
- VTSU codes

Control over record and file formats (including page and line feed with LINE-MODE control characters) rests solely with the user. With the 9025/9026 RENO page printer, users must also ensure that the printer is set to the correct start position on the paper. A loop is not interpreted. Nonprinting characters, i.e. characters with a hexadecimal value < X'40' are output as blanks.

The spoolout job is executed with the default font of the form used until you change the font in the file with the aid of LINE-MODE control characters.

**CONTROL-MODE = \*LOGICAL(...)**

*Only for RSO printers.*

Specifies that records of type B-1 or B-2 are to be printed out, i.e. records which, in addition to a feed control character in the first byte, may contain data mixed with font identifiers, printer control characters, RENO commands and VTSU codes (see the “RSO” manual [32], section “Record type B-1/B-2”). With the exception of the VTSU codes VPA, NP, VT, NL, and CR, which are output as blanks, the above-mentioned control characters are interpreted. A font identifier, a VTSU code or a RENO command remains valid until a new control character is specified. If the font identifier is omitted, the default font for the form is used.

Since page feed is implemented via a loop or constant line feed when CONTROL-MODE=\*LOGICAL is specified, the file should not contain the RENO commands \LF, \FF and \CR. Setting the form height is likewise not permitted.

**LINE-PER-PAGE = \*STD / <integer 1..32767>**

Specifies how many lines (including header and blank lines) are to be printed on a page.

**LINE-PER-PAGE = \*STD**

If no value is specified, the number of lines per print page is calculated according to the following formula, regardless of the value in the HEADER-LINE operand:

Number of lines = P \* Z - A - 6

---

The name sections have the following meanings:

P = paper size in inches

Z = line density

A = number of line before the first channel 1

If the value specified for the LINE-PER-PAGE operand is greater than the specified number of lines in the loop, the value in the loop is used. A value specified here must be at least three times as large as the line feed specified for LINE-SPACING=1/2/3 if the LINE-PER-PAGE operand is specified together with the HEADER-LINE and LINE-SPACING operands.

**HEADER-LINE = \*NO / \*STD / list-poss(3): \*DATE / \*FIRST-RECORD / \*PAGE-NUMBER**

Specifies whether a header line is to be printed on every page (except the header and trailer pages). See also the description of the HEADER-LINE operand at [DOCUMENT-FORMAT=\\*TEXT\(...\)](#).

**LINE-SPACING =**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING= 1 / 2 / 3**

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an EBCDIC feed control character.

**CONTROL-CHAR-POS = \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**LINE-SPACING = \*BY-IBM-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**CONTROL-CHAR-POS = \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**LINE-SPACING = \*BY-ASA-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**CONTROL-CHAR-POS = \*STD / <integer 1..2040>**

Number of the data byte in which SPOOL finds the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**CONTROL-MODE = \*PHYSICAL(...)**

*Only for RSO.*

LINE-SPACING=\*NO is set automatically, which means that you must implement page and line feeds with LINE-MODE control characters (i.e. VTSU codes, printer control characters, and RENO commands) in the file itself. If you specify LINE-SPACING=\*BY-EBCDIC-CONTROL for records of type D-2, the feed control character in the first byte is interpreted as a line or page feed control character. Nonprinting characters are also transferred to the printer (in contrast to CONTROL-MODE=\*LINE-MODE). The user is responsible for inserting the correct control characters in the file (including line spacing characters).

**LINE-SPACING =**

Specifies the number of line feeds and the way in which control characters are interpreted.

---

**LINE-SPACING = \*NO**

The contents of the first byte of each record are not interpreted as a control character.

**LINE-SPACING = 1 / 2 / 3**

*Permitted only for RSO.*

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL**

The contents of the first byte of each record are to be interpreted as an EBCDIC feed control character.

**LINE-SPACING = \*BY-IBM-CONTROL**

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**LINE-SPACING = \*BY-ASA-CONTROL**

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**CONTROL-MODE = \*APA(...)**

Specifies that the file to be printed out contains APA feed control characters which are to be interpreted.

**LINE-SPACING = \*BY-EBCDIC-CONTROL / \*BY-IBM-CONTROL / \*BY-ASA-CONTROL**

Specifies the type of the printer control characters (E, I or A).

**DOCUMENT-FORMAT = \*SPECIAL-FORMAT(...)**

A printer-specific language is used in the document. In this case, the SPOOL and Distributed Print Services (Dprint) subsystems provide transparent control for the document. In other words, the file is transferred to an RSO printer, an Xprint printer or to filter processing without interpretation.

**FORMAT-NAME =**

Specification of the format to be processed. The document is either processed by RSO in transparent mode or sent to Xprint without a special format.

**FORMAT-NAME = \*NONE**

*Only for RSO.* No format is specified; the document is processed by RSO in transparent mode. Records of type E-1 or E-2 are printed out (see the "SPOOL" [43] manual). With the exception of VTSU codes for RSO, the data records can contain optional characters. All characters of a data record are transferred by RSO to the printer without interpretation, with the exception of the line spacing control character in the first byte of the type E-2 data record.

The user is responsible for inserting the correct control characters in the file (including line spacing characters). If the LINE-SPACING operand is not specified, the default setting LINE-SPACING=\*NO applies and you have to include page feeds and line feeds in the file yourself using LINE-MODE control characters. If LINE-SPACING=\*BY-EBCDIC-CONTROL is specified for type E-2 data records, the feed control character in the first byte is interpreted as a line feed or a page feed control character. If the LEFT-MARGIN operand is specified at the same time, blanks are included at the beginning of each data record and these indent the text by the desired number of columns when it is printed.

**FORMAT-NAME = \*PCL**

This value is only still available for reasons of compatibility.

**FORMAT-NAME = <c-string 1..63 with-low>**

This operand specifies that the contents of the document to be processed are of a specific type (e.g. HP LASERJET). The document to be processed is in PCL format. The operand value is determined by the document format attribute transferred to the cluster. It is interpreted by Xprint or the foreign print system as the "content type" attribute of the print job (xpad -job -ct...). For this reason the specification of <alphanum-name 1..63> for FORMAT-NAME is permitted only if no BS2000 cluster is specified with the operand value for

---

CLUSTER-NAME. This document content type fulfills the relevant requirements of ISO DPA class 1, which is required for interoperability between the BS2000 SPOOL & PRINT subsystems and remote SPOOL and PRINT subsystems.

Jobs to RSO are printed by an RSO printer if it supports the format name specified or if a filter is available which will convert the format name into a format name supported by the printer.

If the value of CLUSTER-NAME refers to a BS2000 cluster or if none was specified, the length of the format name may not exceed 8 characters. If the FORMAT-NAME value is longer, the command is rejected. The file is printed by a printer that supports the specified format name.

### *Examples*

1. A document containing only text records is transferred to the local SPOOL:

```
/PRINT-DOCUMENT FROM-FILE=myfile,DOC-FORMAT=*TEXT
```

2. A document containing only text records is transferred to a Xprint server:

```
/PRINT-DOCUMENT FROM-FILE=myfile,DOC-FORMAT=*TEXT,  
RES-DESCRIPTION(FORM-NAME=x-form),  
TO-PRINTER(PRINTER-NAME=xxxxxxxxx,  
CLUSTER-NAME=x-cluster)
```

3. A document containing text records whose tenth data byte is interpreted as EBCDIC-PCC is transferred to a Xprint server:

```
/PRINT-DOCUMENT FROM-FILE=myfile,DOC-FORMAT=*TEXT(  
LINE-SPACING=*BY-EBCDIC-CONTROL,CONTROL-CHAR-POS=10),  
RES-DESCRIPTION(FORM-NAME=x-form),  
TO-PRINTER(PRINTER-NAME=xxxxxxxxx,  
CLUSTER-NAME=x-cluster)
```

4. An HP PCL4 document is transferred to a Xprint server:

```
/PRINT-DOCUMENT FROM-FILE=myfile,DOC-FORMAT=*SPECIAL-FORMAT(  
FORMAT-NAME=HP-LASERJET oder *NONE),  
RES-DESCRIPTION(FORM-NAME=x-form),  
TO-PRINTER(PRINTER-NAME=xxxxxxxxx,  
CLUSTER-NAME=x-cluster)
```

You will find further detailed examples in the “Distributed Print Services” manual [10]

5. A PCL5 document is transferred to the local SPOOL in transparent mode:

```
/PRINT-DOCUMENT FROM-FILE=myfile,DOC-FORMAT=*SPECIAL-FORMAT(  
FORMAT-NAME=PCL5),  
RES-DESCRIPTION(FORM-NAME=FRM001)
```

Please note that FORM FRM001 has to be defined in the SPOOL parameters for a 2050 PCL or 2090 PCL.

6. A PCL5 document is transferred to RSO in transparent mode:

```
/PRINT-DOCUMENT FROM-FILE=myfile,DOC-FORMAT=*SPECIAL-FORMAT(  
FORMAT-NAME=*NONE oder PCL5),  
RES-DESCRIPTION(FORM-NAME=FRM001),  
TO-PRINTER=*PARAMETERS(PRINTER-NAME=PRNPCL)
```

You will find further detailed examples in the “Spool & Print commands” manual [42].

7. An HP job is transferred to a UNIX-based server:

```
/PRINT-DOCUMENT FROM-FILE=myfile,DOC-FORMAT=*PAGE-FORMAT(  
CONTROL-MODE=*PAGE-MODE),  
TO-PRINTER=*PARAM(PRINTER-NAME=xxxxxxxxx,  
CLUSTER-NAME=x-cluster,OUTPUT-FORMAT='HP-LASERJET')
```

The SPCONV product is required in this case. You will find further information in the “SPCONV” manual [41].

**LINE-SPACING =**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING = \*NO**

The contents of the first byte of each record are not interpreted as a control character.

**LINE-SPACING = 1 / 2 / 3**

*Permitted only for RSO.*

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL**

*Permitted only for RSO.*

The contents of the first byte of each record are to be interpreted as an EBCDIC feed control character.

**LINE-SPACING = \*BY-IBM-CONTROL**

*Permitted only for RSO.*

The contents of the first byte of each record are to be interpreted as an IBM feed control character.

**LINE-SPACING = \*BY-ASA-CONTROL**

*Permitted only for RSO.*

The contents of the first byte of each record are to be interpreted as an ASA feed control character.

**PRINT-JOB-CONTROL = \*PARAMETERS(...)**

Specifies all the parameters for controlling print job processing.

**START-PROCESSING =**

Time of printout for the system file prior to termination of the job.

**START-PROCESSING = \*IMMEDIATE**

The spoolout job is to be generated and processed immediately after the command is entered.

**START-PROCESSING = \*AT-FILE-CLOSING**

The spoolout job is to be processed immediately after the system file is closed. A system file is closed:

1. for primary assignment: by means of the EXIT-JOB (or LOGOFF) or CANCEL-JOB command (from a different identifier), i.e. after the end of the job
2. for a file assigned to a cataloged file:
  - by an EXIT-JOB (or LOGOFF) command or by CANCEL-JOB (from another ID), i.e. at the end of the job
  - by another ASSIGN-SYSFILE command (change of assignment) issued for the same system file
  - during a procedure run whenever procedure level 0 has been reached

**START-PROCESSING = <integer 1..2147483639>**

Number of logical pages after which printing is started. The remainder of the relevant file (<= <integer> pages) is printed out after the system file has been closed (see the operand value \*AT-FILE-CLOSING). The minimum

---

value for <integer> can be displayed using the SHOW-SPOOL-PARAMETERS command or SPSEIVE statement; the information is available in the output field SPOOL-OUT-OPTIONS:...ST-SP-LOW-VAL=...

*Note*

- All the operand values from a PRINT-DOCUMENT command with START-PROCESSING= <integer> or START-PROCESSING=\*AT-FILE-CLOSING are recorded for each addressed system file.
- Each spoolout job is given its own TSN.

**FAMILY-PROCESSING =**

Specifies whether a common TSN is allocated if two or more file or library elements are specified in a PRINT-DOCUMENT command (in order to ensure that these files are output sequentially on the same printer).

**FAMILY-PROCESSING = \*STD**

For spoolout jobs to local printers and RSO devices, the default value from the SPOOL parameter file is to apply. This can be defined separately (and hence differently) for local and RSO printers in the SPSEIVE statement MODIFY-SPOOL-PARAMETERS. You can query the value with the command or SPSEIVE statement SHOW-SPOOL-PARAMETERS (FAMILY-PROCESS field).

**FAMILY-PROCESSING = \*YES**

A common TSN (FAMILY-PRINT) is to be allocated if two or more files or library elements are specified in a spoolout job. The individual files or library elements cannot be processed in parallel.

**FAMILY-PROCESSING = \*NO**

The files or library elements specified at the same time in a PRINT-DOCUMENT command are to be processed under separate TSNs. This means that parallel processing is possible.

**CHECKPOINT =**

This operand is only still available for reasons of compatibility.

**PRINT-JOB-NAME =**

Job name for the spoolout job.

The job name can be formed from a maximum of 8 characters from the set (A,...Z,0,...9,@, #,\$,..,-) but must not start with a hyphen or end with a period. It may only start with a period if this is followed by an alpha character; in this case, the period itself as part of the job name is not printed on the header page. The special character string period and hyphen (.-) may only be specified in quotes.

The job name is printed on the header page in the third uppercase line and also appears in the output of the SHOW-PRINT-JOB-STATUS command. If this operand is omitted the job name from the SET-LOGON-PARAMETERS command is used instead.

**PRINT-JOB-NAME = \*JOB-NAME**

No separate job name for the spoolout job.

If a job name has been assigned (in the SET-LOGON-PARAMETERS command) to the job issuing the command, this name is printed in the third uppercase line on the header page.

**PRINT-JOB-NAME = <alphanum-name 1..8> / <c-string 1..8 with-low>**

Job name which is to be assigned to the spoolout job (and which will overwrite any job name already assigned to the job issuing the command).

**PRINT-JOB-PRIORITY =**

Defines the urgency with which this spoolout job is started relative to other spoolout jobs.

---

**PRINT-JOB-PRIORITY = \*JOB-PRIORITY**

The spoolout job is to have the same priority as the job issuing the command (this is the default).

**PRINT-JOB-PRIORITY = <integer 30..255>**

Priority to be assigned to the spoolout job. The highest priority you can assign is defined in the user catalog and can be displayed by means of the SHOW-USER-ATTRIBUTES command. If an invalid priority is entered (or no priority at all), the spoolout job is given the same priority as the job issuing the command.

**PRINT-JOB-CLASS =**

Defines the job class for the spoolout job.

**PRINT-JOB-CLASS = \*BY-USER-ATTRIBUTES**

The preset value for the print job class is copied from the user catalog.

**PRINT-JOB-CLASS = <integer 1..255>**

*Only the SPOOL administrator is allowed to select this value.* The specified job class is assigned to the spoolout job.

**MONJV =**

Specifies the job variable in which information on job processing is to be stored. See also "[Contents of the SPOOL job variable](#)".

**i** The command is rejected if the specified variable name is the name of a temporary job variable.

**MONJV = \*NONE**

No job variable is to be linked to the job.

**MONJV = \*STD**

The job variable will be given the name of the file to be printed (without catalog ID and without user ID). It is created under the user ID and catalog ID of the caller.

**i** The PRINT-DOCUMENT command MONJV=\*STD is rejected if:

- a file generation is specified
- a temporary file is specified
- an OMF or EAM file is specified
- a PLAM element is specified

The command PRINT-DOCUMENT (XX,XX),MONJV=\*STD is rejected. The reason for this is that if the job variable XX has been created for the first job, it is no longer available for a second job.

**MONJV = <filename 1..54 without-gen>**

The job variable should contain the specified name. If the job contains several files, the following suffix is added to the name of the job variable:

- a consecutive number <1..9999> if FAMILY-PROCESSING=\*YES is also specified
- the TSN of the spoolout job if FAMILY-PROCESSING=\*NO or START-PROCESSING=<integer 1..2147483639> is also specified

---

**JV-PASSWORD = \*NONE / \*SECRET / <c-string 1..4> / <x-string 1..8>**

Specifies the password with which the job variable is protected. \*SECRET or ^ enables a blanked input field to be requested for protected input in unguided dialog and foreground procedures.

See also "[Contents of the SPOOL job variable](#)".

**PROCESSING-ADMISSION =**

Only for spoolout jobs under the user ID with the privilege PRINT-SERVICE-ADMINISTRATION.

This allows the user to specify whether the spoolout job is to be executed under the user's own ID or another specified user ID and account number.

**PROCESSING-ADMISSION = \*SAME**

The spoolout job is to be executed under the user's own ID.

**PROCESSING-ADMISSION = \*PARAMETERS(...)**

The spoolout job is to be executed under another user ID.

**USER-IDENTIFICATION = <name 1..8>**

User ID under which the spoolout job is to be executed.

**ACCOUNT = \*NONE / <alphanum-name 1..8>**

Account number under which the spoolout job is to be executed.

**PASSWORD = \*NONE / \*SECRET / <c-string 1..8> / <c-string 9..32> / <x-string 1..16>**

Password for the user ID. The long password mechanism is supported (<c-string 9..32>). See the MODIFY-USER-PROTECTION command for details of the long password mechanism. The PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**FAILURE-PROCESSING =**

Specifies whether a specific message page is to be created when an error occurs during current processing on an APA printer.

**FAILURE-PROCESSING = \*PARAMETERS(...)**

Specifies what happens in the event of an error.

**MSG-PAGE = \*YES / \*NO**

Specifies whether the APA message page is to be printed. The APA message page contains error messages and warnings. If an APA printer is not being used, this parameter is ignored.

**SCHEDULING-TIME = \*STD / \*EARLIEST(...)**

Determines the scheduling time, i.e. the start time of the print job. The default setting is \*STD, i.e. the print job is started on the basis of printer availability and the processing rules for print jobs.

**SCHEDULING-TIME = \*EARLIEST(...)**

The job is started at the earliest at the specified time on the specified date.

**DATE = \*TODAY / <date with-compl>**

Day on which the print job is started.

**TIME = <time>**

Time at which the print job is started.

**ENCRYPTION = \*NO / \*YES**

Specifies whether the print file is to be encrypted.

**LAYOUT-CONTROL = \*PARAMETERS(...)**

Specifies all the parameters that control page layout.

**PAGE-COPIES = \*STD / <integer 0..255>**

In local SPOOL mode, only for the printer types HP, HP90 and LP65.

Number of page copies.

In RSO operation, this only applies to the following printer types: 2030-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9021, 9022, 9022-200, 9025, 9026-RENO, 9026-PCL, DJET, 9000-PCL.

This specifies how many times each individual page is to be repeated. The ADDITIONAL-COPIES operand allows additional printouts of the whole file to be requested.

A PRINT-DOCUMENT command with the PAGE-COPIES operand is rejected if the line number specified in the LINE-PER-PAGE operand is greater than the number of lines in the loop record minus the number of lines before the line on which the vertical tab "channel 1" is defined.

On an HP or HP90 printer a maximum of 255 copies of a page can be printed in succession. PAGE-COPIES=255 has the same effect as PAGE-COPIES=254: one original and 254 copies are printed.

**PAGE-COPIES = \*STD**

*For LP65 printers:*

the number of page copies is as specified in the PCL file. For all other printer types:

PAGE-COPIES=0.

**LEFT-MARGIN = \*STD / <integer 0..31>**

*For all printers with the exception of RSO printers:* The output text is to be indented by the specified number of columns. *For all RSO printers:* The output text is to be indented by the specified number \* 1/10 inch. The default value can be displayed by means of the command or SPSEIVE statement SHOW-SPOOL-PARAMETERS; the information is given in the PRINT-CMD-DEFAULTS:...LEFT-MARGIN = ... output field.

The LEFT-MARGIN operand is ignored if the operand CONTROL-MODE=\*PHYSICAL is specified at the same time.

**TWO-SIDED =**

Specifies whether the LP65 or RSO printer is to print the paper on one side or two. In conjunction with the ROTATION operand, the TWO-SIDED operand defines the exact type of printing on both sides.

TWO-SIDED=	ROTATION=	Type of double-sided printing
*NO	freely selectable	Single-sided printing (SIMPLEX)
*YES	*NO, 0, 180	Portrait format, aligned to the long edge
*YES	90, 270	Landscape format, aligned to the short edge
*TUMBLE	*NO, 0, 180	Portrait format, aligned to the short edge
*TUMBLE	90, 270	Landscape format, aligned to the long edge

---

## Notes

- For LP65 printers (and for these only) the TWO-SIDED, ELECTRONIC-OVERLAY and PAGE-COPIES functions are linked with one another and form part of one single print command. If only one of the operands is defined, default values will be generated for the others.
- Only the operand TWO-SIDED=\*STD can be used in conjunction with DOCUMENT-FORMAT=\*SPECIAL-FORMAT.

### **TWO-SIDED = \*STD**

The paper is printed on one side (simplex mode) or two (duplex mode), as defined in the PCL file.

### **TWO-SIDED = \*NO**

The paper is printed on one side (simplex mode).

### **TWO-SIDED = \*YES**

The paper is printed on two sides (duplex mode).

### **TWO-SIDED = \*TUMBLE**

The paper is printed on two sides (duplex mode), and the pages are turned over from top to bottom rather than left to right. The sheets are bound along a horizontal edge. Beside LP65 printers with single sheet processing, this job can also be printed on 2030-PCL, 9026-PCL, 9026-RENO, 4822-PCL, 4825-PCL, 4824-PCL and 9000-PCL printers.

### **ROTATION =**

Specifies whether the pages to be printed from the spoolout job are to be rotated, and if so by how many degrees. The print page set up in the printer is rotated (clockwise) by a certain number of degrees and printed on the form; for example, paper inserted in the printer in portrait format can be printed in landscape format. A separate loop is needed for pages rotated through 90<sup>0</sup>/270<sup>0</sup> (see the LOOP-NAME operand). Unless ROTATION=\*NO is specified, output is directed (automatically) to HP and HP90 printers. SHOW-SPOOL-PARAMETERS indicates whether or not an HP or HP90 printer with a page rotation module is available in the current SPOOL configuration: output field DEVICE-TYPE:..., ROT=YES/NO.

Spoolout jobs with page rotation are displayed in the outputs for the commands SHOW-USER-STATUS and SHOW-PRINT-JOB-STATUS JOB-IDENTIFICATION= TSN(TSN=...).

The feed for rotated pages is generally controlled via a separate loop (ROTATION-LOOP-NAME). If you have specified neither a ROTATION-LOOP-NAME for PRINT-DOCUMENT nor a form with a defined ROTATION-LOOP (see ADD-SPOOL-FORM), the default rotation loop R06 in the default form takes on feed control for the rotated pages. Header and trailer pages are not printed out in rotated format.

### **ROTATION = \*NO**

Page rotation is not performed. Any control characters for page rotation in the file are not interpreted.

### **ROTATION = \*BY-CONTROL-CODES**

Control characters for page rotation in the file are interpreted.

### **ROTATION = 0 / 90 / 180 / 270 / 0-180 / 180-0 / 90-270 / 270-90**

Each print page is rotated by 90<sup>0</sup> / 180<sup>0</sup> / 270<sup>0</sup> (clockwise) and printed out. Control characters for page rotation contained in the file are not interpreted. A separate loop is needed for pages rotated through 90<sup>0</sup> / 270<sup>0</sup>. You must check that output with the specified loop does not lead to errors. If an error occurs, the job is rejected.

### **ROTATION = 0-180 / 180-0 / 90-270 / 270-90**

The odd pages (number before the hyphen) and even pages (number after the hyphen) are to be printed at different angles. This function is not supported by RSO.

---

## **COVER-PAGES = PARAMETERS(...)**

Parameters for system exit routines relating to the printing of header and trailer pages.

### **HEADER-PAGE-TEXT = \*NONE / <c-string 1..32>**

The specified information (maximum of 32 characters) is stored in the SCB for processing the system exits. The first 8 characters are printed on the header page as an uppercase line under the mailing box. Only alpha characters, digits and a number of special characters are printed on the header page (in outsize type). All other character codes are automatically replaced by the printable character '?'.  
*Format of the header page:*

- User ID in outsize letters (10 lines + 2 blank lines)
- Account number in outsize letters (10 lines + 2 blank lines)
- Job name in outsize letters (10 lines + 2 blank lines)
- Mailing box (address and identification field: 12 lines + 2 blank lines)
- 'text' in outsize letters (10 lines + 2 blank lines)

### *Priority sequence:*

- Mailing box (address and identification field: 12 lines + 2 blank lines)
- 'text' in outsize letters (10 lines + 2 blank lines)
- Job name in outsize letters (10 lines + 2 blank lines)
- User ID in outsize letters (10 lines + 2 blank lines)
- Account number in outsize letters (10 lines + 2 blank lines)

### **HEADER-EXIT-NUMBER = \*NO / <integer 1..2147483639>**

Number of header pages required.

The precise significance of this operand depends on the definitions made for the computer center. The default value is \*NO (equivalent to 0).

### **TRAILER-EXIT-NUMBER = \*NO / <integer 1..2147483639>**

Number of trailer pages required.

The precise significance of this operand depends on the definitions made for the computer center. The default value is \*NO (equivalent to 0). The layout of the trailer page for local SPOOL is illustrated in the "SPOOL" manual [43].

## **TABLE-REFERENCE-CHAR =**

Specifies whether users select fonts for print page layout by means of control characters in the text. The selection can be made with the aid of TRCs (table reference characters), which reference a list of fonts from within the records. The list can either be part of the page definition (PAGE-DEFINITION) or can be declared by means of the CHARACTER-SETS operand. For a detailed explanation of how to use the TRC, see the "SPOOL" manual [43].

### **TABLE-REFERENCE-CHAR = \*NO**

No font selection control characters (TRCs) are stored in the print file, or these characters are not to be evaluated.

### **TABLE-REFERENCE-CHAR = \*YES**

The print file contains font selection control characters (TRCs) that are to be evaluated by SPS. Each TRC value represents a specific font that is to be used to print out the relevant record. The individual values (from X'00' to X'0F') must either be linked to the entries in the font list in PAGE-DEFINITION, in the order in which

---

they occur or must be explicitly linked to the fonts specified in the CHARACTER-SETS operand in the order in which they occur. Regardless of the number of different TRC values in the file, up to four fonts, specified in the form of a list, can be used to print the records. TRC values greater than X'03' (corresponding to the fourth value in the list) automatically reference the first font in the list.

**LANGUAGE-EXTENSION =**

This operand is only still available for reasons of compatibility.

**INPUT-TRAY-NUMBER =**

Defines the paper input tray for the printer type LP65 or for the RSO printers 2030-PCL, 4011, 4812, 4813, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-EPLQ, 9000-EPSQ, 9000-PCL, 9004, 9011, 9012, 9013, 9014, 9015, 9021, 9022, 9022-200, 9025, 9026-PCL, 9026-RENO, 9097 and DJET. In the case of LP65 printers, the tray numbers 1 to 3 can be specified, whereas for RSO printers the tray numbers 1 to 99 can be specified.

*Only for LP65 printers:*

The paper input tray is to be selected by means of a PCL file or an entry at the printer control console. The PCL file can in turn select an input tray.

The order of priority for selecting an input tray is as follows:

1. the number of the input tray specified in PRINT-DOCUMENT
2. any selection via the PCL file specified in the PRINT-DOCUMENT command
3. any selection via the PCL file specified in the form definition in the SPOOL parameter file
4. the default values defined in the device record.

The following applies to all printers listed above:

- If a paper input tray is specified here, but is not applicable for the particular printer, the result is a printer error on most printer types.
- The PRINT-DOCUMENT command is rejected if the selected paper size is not available on the particular printer or if the paper size in the standard forms entries is larger than that for the selected paper.
- Printer resources such as prolog, epilog, DIA, member and font character files are sent before the paper input tray is selected.

**INPUT-TRAY-NUMBER = \*STD**

Paper is taken from the input tray defined in the device record of the printer in the SPOOL parameter file (DEFAULT-TRAY-NUMBER operand of the ADD-SPOOL-DEVICE statement. It is not possible to specify the paper size in this statement operand). The input tray selection is valid for the entire spoolout process, i.e. including processing of the header and trailer pages. If a standard paper size is specified, the printer selects the first input tray that contains this paper size. If this paper is not available, the printer switches to offline and the operator is prompted in the printer channel to insert the selected paper.

**INPUT-TRAY-NUMBER = \*IGNORE**

*Only for RSO printers:* Once this operand value is specified, RSO sends no further commands for input tray selection to the printer. The default setting of the printer is used.

**INPUT-TRAY-NUMBER = <integer 1..99>**

Number of the input tray from which the paper is taken for printing the file itself as well as the header page (HEADER-PAGE) and trailer page (TRAILER-PAGE). RSO does not check the specified value. Possible values: 1...99.

The following table shows the printer types and the corresponding maximum number of input trays (column headed "max.").

printer	Max.	printer	Max.	printer	Max.	printer	Max.
2030-PCL	2	9000	0	9002	0	9022	2
4011	2	9000-PCL	2	9003	0	9022-200	2
4812	2	9000-PRO	0	9004	3	9025	2
4813	2	9000-PS	0	9011	2	9026-PCL	4
4818-PCL	2	9000-EPFX	0	9012	2	9026-RENO	4
4821-PCL	2	9000-EPLQ	2	9013	3	9045-ANSI	0
4822-PCL	3	9000-EPSQ	2	9014	3	9046	0
4824-PCL	2	9001	0	9015	2	9645	0
4825-PCL	3	9001-31	0	9021	2	DJET	1
8121	0						

Table 80: Printer types and the corresponding maximum number of input trays

The following table indicates how RSO's response to certain operand values is governed by the device definition:

- INPUT-TRAY-NUMBER operand specified in the PRINT-DOCUMENT command
- device definition in the ADD-SPOOL-DEVICE statement with the operand FORM-FEED = \*SINGLE-SHEET(DEFAULT-TRAY-NUMBER = ... )

Default in the device definition	Value of the INPUT-TRAY-NUMBER operand		
	*STD	1..99	*IGNORE
1..99	Sets default value (1) or Sets *LISTING value (2)	Sets specified value (1) or Sets *LISTING value (2)	Last tray specified is used
*IGNORE	Last tray specified is used	Sets specified value (1) or Sets *LISTING value (2)	Last tray specified is used

(1) on single-sheet printers and printer type 9015 (list printer)

(2) on list printers other than printer type 9015

#### **INPUT-TRAY-NUMBER = \*BY-FORMAT(...)**

Defines the input tray by specifying the paper format.

**INPUT-TRAY-FORMAT = \*A3 / \*A4 / \*A5 / \*B4 / \*B5 / \*FOLIO / \*INVOICE / \*EXEC / \*LEGAL / \*LETTER / \*DOUBLE-LETTER / \*MONARCH / \*COMMERCIAL-10 / \*DL / \*C5 / \*MANUAL / \*A3-UNCUT / \*A4-UNCUT / \*LEDGER**

Apart from \*MANUAL, each operand value corresponds to a paper format. To ensure that the values for PAGE-SIZE and LINE-SIZE specified in the FORM operand do not exceed the permissible maximum values for the selected paper format, the values of the FORM operand are compared with the permissible maximum values for the paper format.

The table below contains the maximum permissible values for PAGE-SIZE and LINE-SIZE for each paper format and indicates which printers support the paper format. With all paper formats, the sheets are taken from the first input tray which contains sheets in the given format.

Paper format	Maximum PAGE-SIZE	Maximum LINE-SIZE	Applicable to printers of type:
A3	165	116	9026-PCL and 9026-RENO
A4	116	82	9021, 9000-PCL, 9026-PCL, 9026-RENO, 2030-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
A5	82	58	4818-PCL, 4822-PCL, 4825-PCL, 9026-PCL and 9026-RENO
B4	143	101	2030-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4825-PCL, 9000-PCL, 9026-RENO
B5	101	71	9026-PCL and 9026-RENO
FOLIO	129	85	9026-RENO
INVOICE	85	55	9026-PCL and 9026-RENO
EXEC	105	72	9021, 9000-PCL, 9026-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
LEGAL	140	85	9021, 9000-PCL, 9026-PCL, 9026-RENO, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
LETTER	110	85	9021, 9000-PCL, 9026-PCL, 9026-RENO, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
DOUBLE-LETTER	150	117	9026-RENO
MONARCH	75	38	9021, 9000-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
COMMERCIAL-10	95	41	9021, 9000-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL

DL	86	43	9021, 9000-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL
C5	90	63	9021, 9000-PCL, 2030-PCL, 4821-PCL, 4822-PCL, 4824-PCL and 4825-PCL

Table 81: Paper formats

**INPUT-TRAY-FORMAT = \*MANUAL**

Form feed is manual. You should therefore insert a new sheet each time a new page is to be printed or the printer prompts you to do so.

The following printers support manual feed: 9004, 9014, 9015, 9021, 9022, 9022-200, 9026-Reno, 9026-PCL, 2030-PCL, 4812, DJET, 4814-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL and 9000-PCL.

**OUTPUT-TRAY-NUMBER =**

Specifies the paper output tray for LP65 printers and for the RSO printers 2030-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-PCL, 9014, 9015, 9026-PCL and 9026-RENO.

**OUTPUT-TRAY-NUMBER = \*STD**

Paper is output to the default tray defined in the device record (SPOOL parameter file). The output tray selection is valid for the entire spoolout process, i.e. including processing of header and trailer pages.

*Only for LP65 printers:*

Selection of the output tray by BS2000 can be prevented by a PCL file or by making an appropriate entry at the printer control console. In these cases, the entries for OUTPUT-TRAY-NUMBER have no effect. An output tray can also be defined in the PCL file.

The order of priority for selecting an output tray is as follows:

1. the output tray number specified in PRINT-DOCUMENT, provided this is not prevented by a PCL file or an entry at the printer console.
2. any selection via the PCL file specified in the PRINT-DOCUMENT command.
3. any selection via the PCL file specified in the form definition in the SPOOL parameter file.
4. the default values defined in the device record.

**OUTPUT-TRAY-NUMBER = \*IGNORE**

*Only for RSO printers.*

If this value is specified, the printer controller does not send an output tray selection code to the printer. This allows you to define the output tray in the prolog file.

**OUTPUT-TRAY-NUMBER = <integer 1..99>**

Specifies the output tray to be used for the current job. Only the values 1..3 are valid for LP65 printers.

RSO printer types	Output tray number	Output tray selection
2030-PCL, 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-PCL	1	Top output tray
	2	Bottom output tray
9014	1	Stacker
	2	Front output tray
9015	1	Uncut in rear output tray

	2	Cut in rear output tray
	3	Uncut in front output tray
	4	Cut in front output tray
9026-RENO	1..20	Appropriate output tray of the sort mechanism

**OUTPUT-TRAY-NUMBER = \*SORTER(...)**

*Only for RSO printers:*

Specifies that the sort mechanism is to be used for the current job. OUTPUT-TRAY-NUMBER = \*SORTER(...) is permissible for 9026-RENO, 4822-PCL and 4825-PCL printers. This sort mechanism can be used for up to 20 output trays. It cannot be controlled by the default values defined in the device record.

**SORT-MODE = \*NO**

All pages in the document are output to the sort trays from bottom to top. Exception 9026-RENO: here the pages are output to an output tray to provide optimum access.

**SORT-MODE = \*GROUP**

Each copy of a particular page - if multiple copies are specified in PAGE-COPIES - is output to a separate sort tray. The printer does not return to the first sort tray until it is ready to start outputting the next page in sequence. When the print job is completed, each sort tray used contains a complete copy of the printed document.

*Example*

There are three pages in the file, and PAGE-COPIES=1 is specified:

Page 3	Page 3	
Page 2	Page 2	
Page 1	Page 1	
<b>Tray 1</b>	<b>Tray 2</b>	<b>Tray 3</b>

**SORT-MODE = \*COLLATE**

All copies of a page - if multiple copies are specified in PAGE-COPIES - are collected in one sort tray. The copies of the next page are placed in the next sort tray. The sort trays are used from bottom to top.

*Example*

There are three pages in the file, and PAGE-COPIES=2 is specified:

Page 1	Page 2	Page 3
Page 1	Page 2	Page 3
Page 1	Page 2	Page 3
<b>Tray 1</b>	<b>Tray 2</b>	<b>Tray 3</b>

---

**SORT-MODE = \*STACKER**

*Cannot be used for the 9026 Printer.*

All printed pages are output to the stacker of the sort mechanism, to a maximum of 500 pages. This mode is suitable if a single copy of a very long document is to be printed.

All printed pages are output to the stacker of the sort mechanism, to a maximum of 500 pages. This mode is suitable if a single copy of a very long document is to be printed.

**SORT-MODE = \*AUTOMATIC**

Applicable to the 9026 printer only. The sort mode is selected automatically depending on the number of copies per page requested in PAGE-COPIES and the number of sort trays available. The printed pages are output unsorted, as with \*NO, if the number of copies specified in PAGE-COPIES is the same as the number of sort trays; they are grouped by document, as with \*GROUP, if the number of copies specified in PAGE-COPIES is less than the number of sort trays; and they are collected a page at a time, as with \*COLLATE, if the number of copies specified in PAGE-COPIES is greater than the number of sort trays.

*Note*

Header and trailer pages are printer resources such as prolog, epilog, DIA, member and font character file are sent before output tray selection and are therefore not included in sorting.

**TOP-OFFSET =**

Defines in millimeters the margin between the top of the physical sheet and the top of the print page. First the print page is positioned on the paper and only then is the lettering within the page rotated and positioned. This means that when the print page is moved with respect to the paper page the orientation of the text within the print page is ignored.

This operand is permissible only for 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-PCL, 9021, 9022-200 and 2030-PCL printers.

*Note*

Only TOP-OFFSET=\*IGNORE can be specified in conjunction with DOCUMENT-FORMAT=\*SPECIAL-FORMAT.

**TOP-OFFSET = \*IGNORE**

The printer controller does not set a margin between the first line and the top edge of the sheet. The preset printer value or the setting in the prolog file defines the margin that is effective when the document is printed.

**TOP-OFFSET = <integer -255..255>**

The permissible range of values is -255 to +255. Positive values move the first line down. Negative values move it up.

**LEFT-OFFSET =**

Defines in millimeters the margin between the left edge of the physical sheet and the left edge of the print page. First the print page is positioned on the paper and only then is the lettering within the page rotated and positioned. This means that when the print page is moved with respect to the paper page the orientation of the text within the print page is ignored.

This operand is permissible only for 4818-PCL, 4821-PCL, 4822-PCL, 4824-PCL, 4825-PCL, 9000-PCL, 9021, 9022-200, 9026-PCL and 2030-PCL printers.

*Note*

Only LEFT-OFFSET=\*IGNORE can be specified in conjunction with DOCUMENT-FORMAT=\*SPECIAL-FORMAT.

**LEFT-OFFSET = \*IGNORE**

The printer controller does not set a margin between the print page and the left edge of the sheet. The preset printer value or the setting in the prolog file defines the margin that is effective when the document is printed.

**LEFT-OFFSET = <integer -255..255>**

The permissible range of values is -255 to +255. Positive values move the print page to the right. Negative values move it to the left.

**RESOURCE-DESCRIPTION = \*PARAMETERS(...)**

Specifies the print resources to be used for the printout.

**FORM-NAME =**

Specifies the paper (form) to be used for output (e.g. STD, STDSF1, STDWA4). Default forms must be defined in the SPOOL parameter file for all printer types. With SHOW-SPOOL-FORMS you can output the entries to SYSOUT. The SPOOL parameter file also specifies whether header and trailer pages are to be printed.

**FORM-NAME = \*STD**

Default form.

**FORM-NAME = <alphanum-name 1..6>**

Name of the form with which the spoolout job is to be processed. A loop (or a page and format definition for APA printers) is implicitly named when the form is specified. The associated loop (or the PAGEDEF and FORMDEF) must be in a printer control file. The following table shows which printer control file must contain this loop (or the PAGEDEF and FORMDEF) for the relevant printer type:

Output device	Printer control file with the loop for specified form
Printers 3337, 3338, 3339, 3348, 3349, 3365, LP-EMULATED	\$SYSSPOOL.PRFILE
Printers: 3351, 3353, 2090, 2140, 2240	\$SYSSPOOL.PRFILE or the PRFILE user specified in the USER-RESOURCES-FILE operand
APA printer	\$SYSSPOOL.SYSPRT.SPS.<version> or the SPSLIB user specified in the USER-RESOURCES-FILE operand

The loop named implicitly via the FORM-NAME operand is ignored if the LOOP-NAME operand is specified at the same time. If the FORM-NAME and LOOP-NAME operands are omitted, the file is printed out using the default form entered for the printer type.

A loop explicitly specified in the LOOP-NAME operand must have the same length as the loop record assigned to the form used.

No loops can be specified for APA printers. If page and format specifications are made in the FORM-NAME operand, these are used for printing header, trailer and message pages, even if the PAGE-DEFINITION and FORM-DEFINITION operands are explicitly assigned.

See also "[Controlling spoolout](#)" and the section on APA printers in the "SPOOL" manual [43].

---

**LOOP-NAME =**

Name of the loop to be loaded into the feed information buffer (VFB/FCB). The loop name must not include the characters '\$', '&' or '@'.

**LOOP-NAME = \*STD**

Feed control for the spoolout job is to be implemented with the default loop of the form used.

**LOOP-NAME = <alphanum-name 1..3>**

Name of the loop which is to control line feed. The length of the specified loop must match the length of the default loop of the form used.

A loop for feed control is needed for the HP and HP90 printers (3351, 3353, 2090, 2140) and printers of types 3337, 3338, 3339, 3348, 3349 and 3365. Loops are stored in the PRFILE printer control file. If no loop is specified, the implicit entries in the FORM-NAME operand are used. If the FORM-NAME or LOOP-NAME operand is omitted, default values apply.

**ROTATION-LOOP-NAME =**

Only for HP and HP90 printers with a page rotation module.

Specifies the loop to control output in landscape format.

The loop name must not include the characters '\$', '&' or '@'.

**ROTATION-LOOP-NAME = \*STD**

Output of rotated pages is to be controlled by the default rotation loop of the specified form or the default rotation loop R06 of the default form (if no form was specified in the PRINT-DOCUMENT command).

**ROTATION-LOOP-NAME = <alphanum-name 1..3>**

Name of the loop with which line feed for the rotated pages is to be controlled.

**CHARACTER-SETS =**

Names of the fonts or font pools (only for HP and HP90 printers) to be used for output. Up to 4 fonts may be specified in the list for local SPOOL, up to 16 for RSO. For local SPOOL, the fonts must be contained in the \$SYSSPOOL.PRFILE resource library or in a user PRFILE (specified by means of the USER-RESOURCES-FILE operand).

If more than four fonts are to be used, a font pool must be specified.

If more than one font is to be used in a spoolout job, CONTROL-MODE=\*PAGE-MODE must be specified. For DOCUMENT-FORMAT=\*TEXT, only the first specified font is used for printing the (entire) file. The name of the first font and the number of specified fonts are shown in the output for the command SHOW-PRINT-JOB-STATUS JOB-ID= \*TSN(TSN=...).

If the HEADER-LINE operand is specified, the first font specified or the font pool specified with an index for CHARACTER-SETS=\*POOL is used for the header line. The default value for CHARACTER-SETS for the form used can be displayed using SHOW-SPOOL-FORMS; the information is given in the C-S output field. With HP printers the following must be borne in mind: Systems support can specify whether the header page is printed with the default font or with the font specified in CHARACTER-SETS. This default value can be displayed by means of the command or SPSEIVE statement SHOW-SPOOL-PARAMETERS; the information is given in the HEADER-PAGE: CHARACTER-SET=... output field.

**CHARACTER-SETS = \*STD**

The default font is selected for this printer type from the desired form. It can be displayed by means of SHOW-SPOOL-FORMS.

**CHARACTER-SETS = \*POOL(...)**

Only PRFILEs may contain descriptions of font pools. If a font pool is specified, the spoolout job will be processed on an HP or HP90 printer.

---

**POOL-NAME = <alphanum-name 1..4>**

Specifies a font pool (with a maximum of 64 fonts for an HP printer or 46 fonts for an HP90 printer) from which one or more fonts are to be used for output. All the fonts of this font pool are loaded into the font buffer when the spoolout job is executed.

**POOL-INDEX = 0 / <integer 0..64>**

Number of the font from the font pool with which the spoolout job is to be processed. The number of the font is determined by its position in the definition of the font pool. The specified font is used if POOL is specified together with CONTROL-MODE= \*PAGE-MODE.

**CHARACTER-SETS = \*BY-EXTENDED-NAME(...)**

Specifies the fonts to be interpreted by SPS when the TABLE-REFERENCE-CHAR operand is used.

**NAME = <alphanum-name 1..8>**

Names of the fonts to be linked with the TRC values in the print file (each TRC value represents a specific font). Regardless of the number of different TRC values in the file, up to four fonts, specified in the form of a list, can be used to print the records. TRC values greater than X'03' (corresponding to the fourth value in the list) automatically reference the first font in the list.

**CHARACTER-SETS = list-poss(16): <alphanum-name 1..3>**

Names of the fonts with which the spoolout job is to be processed. For DOCUMENT-FORMAT=\*TEXT (default), only the first specified font is used for printing.

For laser printers in local SPOOL mode, a maximum of four fonts may be specified. The printer control characters for changing fonts are only interpreted if CONTROL-MODE=\*PAGE-MODE is also specified. In the case of RSO printers, a maximum of 16 fonts may be specified. Font identifiers (CSIs) in the text are only interpreted if CONTROL-MODE=\*LOGICAL is specified at the same time. The command is rejected if a list of fonts is specified in conjunction with DOCUMENT-FORMAT=\*TEXT. See also "[Specifying fonts](#)".

**CHAR-SET-ATTRIBUTES =**

*Only for RSO.*

Specifies whether all or only selected font attributes are supported for the spoolout job. Such attributes are, for instance, character type, near letter quality (NLQ), color, etc. (see command or SPSEVE statement SHOW-SPOOL-CHARACTER-SETS). This operand does not apply to header and trailer pages.

**CHAR-SET-ATTRIBUTES = \*ALL**

All the attributes of the fonts used for printout are supported for the current spoolout job.

**CHAR-SET-ATTRIBUTES = \*RESTRICTED**

Only the following three attributes are supported:

- character type
- language
- NLQ (NEAR-LETTER-QUALITY)

**OVERLAY-RESOURCES = \*PARAMETERS(...)**

Specifies whether a film overlay - in the case of HP90 and 3365 printers an EFO data overlay - or a FOB data overlay is to be used for processing a spoolout job.

**ELECTRONIC-OVERLAY =**

Specifies whether a film overlay - in the case of HP90 and 3365 printers an EFO data overlay - is to be used for processing the spoolout job.

---

**ELECTRONIC-OVERLAY = \*NONE**

No film overlay (HP90 and 3365: no EFO data overlay) is used for output.

**ELECTRONIC-OVERLAY = <alphanum-name 2..2>**

Name of the film overlay (HP90 and 3365: EFO data overlay) to be used for processing the spoolout job (the name must be agreed with systems support).

**OVERLAY =**

*For local SPOOL only.*

Specifies for LP65 printers whether EFO data overlays are to be used on the recto and/or verso.

They must be stored in the printer memory. The OVERLAY, TWO-SIDED and PAGE-COPIES operands are part of one and the same LP65 printer command and are consequently linked to one another. If only the OVERLAY operand is specified, SPOOL will generate default values for the other two operands.

These default values are overwritten by each value specified in a PCL file or at the printer control console.

For a summary of the possible combinations of these three linked functions, see the description of the LP65 printer type in the "SPOOL" manual [43].

**OVERLAY = \*STD**

The EFO data overlays defined in the PCL file are used.

**OVERLAY = \*NONE**

No EFO data overlays are used for output.

**OVERLAY = \*PARAMETERS(...)**

The specified EFO data overlays are used for output.

**FACE-SIDE = \*NONE / <integer 1..127>**

Identification number of the overlay to be used on the recto.

**REVERSE-SIDE = \*NONE / <integer 1..127>**

Identification number of the overlay to be used on the verso.

**FORMS-OVERLAY-BUFFER =**

Specifies whether an FOB data overlay is to be used for processing the spoolout job (see the "SPOOL" manual [43] for a description of an overlay).

**FORMS-OVERLAY-BUFFER = \*NONE**

No FOB data overlay is used for output.

**FORMS-OVERLAY-BUFFER = <alphanum-name 1..4>**

Name of the overlay to be used for processing the spoolout job.

If an overlay is specified, the file is printed out on an HP or HP90 printer.

Use of an overlay for the spoolout job is indicated in the output of the command SHOW-PRINT-JOB-STATUS JOB-IDENTIFICATION=TSN(TSN=...).

**PAGE-DEFINITION =**

Specifies which page definition is to be used for output on LP65 or APA printers.

**PAGE-DEFINITION = \*STD**

The standard definition specified in the SPSLIB is to be used (see the table of SPSLIB standard definitions in the „SPOOL“ [43] manual).

**PAGE-DEFINITION = <integer 1..50000>**

This operand value is only still available for reasons of compatibility.

---

**PAGE-DEFINITION = <alphanum-name 1..8>**

The page definition with the specified name is to be used. This must be in the SPSLIB.

**i** The first two characters of the specified name must be “P1”. If they are not, the command is rejected.

**FORM-DEFINITION =**

Specifies which format definition is to be used for output on APA printers.

**FORM-DEFINITION = \*STD**

The default definition specified in the SPSLIB is to be used.

**FORM-DEFINITION = <alphanum-name 1..8>**

The format definition with the specified name is to be used. This must be in the SPSLIB.

**i** The first two characters of the specified name must be “P1”. If they are not, the command is rejected.

**USER-RESOURCES-FILE =**

Specifies a user file containing all the resources required for output on different printer types: user-defined loops, fonts, overlays, font pools, code translation tables, and SPS data stream definitions. The following can be specified:

- a user PRFILE containing loops, fonts, overlay entries (FORMS-OVERLAY-BUFFER operand), and font pool entries (CHARACTER-SETS operand)
- a user SPSLIB containing the PAGEDEFs (PAGE-DEFINITION operand), FORMDEFs (FORM-DEFINITION operand), fonts, page segments, overlays, and raster image data
- a user RSOFIL (only for RSO) containing loops

If no user PRFILE, SPSLIB or RSOFIL is specified, the information is taken from the following files: \$SYSSPOOL.PRFILE, \$SYSSPOOL.SYSPRT.SPS.<version> or \$SYSSPOOL.RSOFIL, respectively.

**USER-RESOURCES-FILE = \*STD**

The required resources are taken from \$SYSSPOOL.PRFILE, \$SYSSPOOL.SYSPRT.SPS.<version> or \$SYSSPOOL.RSOFIL.

**USER-RESOURCES-FILE = <filename 1..44 without-gen-vers>**

Name of a user PRFILE, SPSLIB or RSOFIL, which may contain a catalog ID and a user ID. SPOOL uses this file name with the suffix .PRFILE, .SPSLIB or .RSOFIL. The string can contain up to 28 characters without the catalog ID and user ID, to ensure that this user file can be called from any ID.

If the file name is specified without a user ID, the file is searched for under the user ID of the caller first, then under SYSSPOOL. If it is not found, the command is rejected. If a user ID is specified, the file is searched for under this ID only.

*Example 1*

```
PRINT-DOCUMENT DATEI , USER-RESOURCES-FILE=$XX.XX
```

A search is carried out for the \$XX.XX.PRFILE file. If the file is not found, the command is rejected.

---

### Example 2

If the catalog ID is specified, the search is limited to the specified pubset:

```
PRINT-DOCUMENT DATEI , USER-RESOURCES-FILE= : A : XXXXX
```

The file :A:\$userid.XXXXX.PRFIL is searched for. If the relevant file is not found, the search for the file : A:\$SYSSPOOL.XXXXX.PRFIL is continued. If this file is not found, the command is rejected.

### Example 3

```
PRINT-DOCUMENT DATEI , USER-RESOURCES-FILE= : A : $XX . XXXXX
```

The file :A:\$XX.XXXXX.PRFIL is searched for. If it is not found, the command is rejected.

If the file is on an exported PVS (EXPORT-PUBSET command), all spoolout jobs that require this PVS are placed in the KEEP queue. When the PVS becomes available again (IMPORT-PUBSET command), the spoolout jobs are restarted.

#### **TRANSLATION-TABLE =**

Specifies whether a code translation table is to be used for processing the spoolout job. The code translation table is necessary if the default escape character 'FF' is to be replaced by a random character.

#### **TRANSLATION-TABLE = \*NONE**

No code translation table is used.

#### **TRANSLATION-TABLE = \*PARAMETERS(...)**

A code translation table is used.

#### **NAME = <alphanum-name 1..8>**

Name of the code translation table to be used for processing the spoolout job.

#### **FILE = \*STD / \*SYSTEM / <filename 1..44 without-gen-vers>**

The code translation table from the specified file (if FILE=<filename..>) or from the standard \$TSOS.

RSOFILE resource file (if FILE=\*STD/\*SYSTEM) is used for RSO jobs.

Only FILE=\*STD applies for SPOOL jobs. Other values are ignored and reset to \*STD. Consequently, the code translation table is always taken from the user-specific resource file specified in USER-RESOURCE-FILE or from the standard \$SYSSPOOL.PRFIL resource file (if no user-specific resource file was specified).

#### **RESOURCES-LOCATION =**

Specifies, when the optional Distributed Print Services subsystem (Dprint) is used, whether the resources of the client or those of the server are to be used for printing the document.

#### **RESOURCES-LOCATION = \*STD**

The value from the GEN record of the SPOOL parameter file is to be used.

#### **RESOURCES-LOCATION = \*HOME**

The print job is to be executed using the print resources defined on the client system. In this case, an extract containing all the required print resources is taken from the resource file (i.e. a print resources container is created) and transferred to the selected server.

---

**RESOURCES-LOCATION = \*SERVER**

The print job is to be executed using the print resources defined on the server system. In this case, no print resources container is created and transferred.

**TO-PRINTER = \*PARAMETERS(...)**

Describes the requested target devices for the print job.

**PRINTER-NAME =**

Specifies the requested target printer of the print job. You can specify a distributed local printer pool, a nondistributed local printer pool, an RSO printer pool or an RSO printer.

*If you specify a printer pool:*

The job is output on any printer in the specified device pool. The pool must be defined in the SPOOL parameter file and can contain up to 16 RSO devices or 16 local SPOOL devices, but not both at the same time.

Device pools are managed by means of the SPSEVE statements ADD-, MODIFY-, REMOVE-, and SHOW-PRINTER-POOL (see the "SPSERVE" manual [44]).

The spoolout job is rejected if:

- no printer type from the device pool is assigned in the PRINT-DOCUMENT command (see the SHOW-SPOOL-FORMS command or SPSEVE statement)
- the ELECTRONIC-OVERLAY operand is specified.

Please bear in mind that the pool can contain various types of devices: if the file to be printed contains control characters that are only interpreted by a certain printer type, a printer of this type should be specified (implicitly) in the PRINT-DOCUMENT command. One possibility is to specify in the PRINT-DOCUMENT command a form that is defined only for the desired printer type (ADD-SPOOL-FORM).

**PRINTER-NAME = \*STD**

The spoolout job is to be processed on the default device type specified in the SPOOL parameters (PRINT-CMD-DEFAULTS).

**PRINTER-NAME = <alphanum-name 1..8>**

*Only for RSO.*

Symbolic name of the RSO device on which the spoolout job is to be processed.

**PRINTER-NAME = \*IPP(...)**

*Only for RSO.*

The spoolout job is to be processed on an IPP printer.

**URL = <c-string 1..1023 with-low>**

Specifies the Web address of the IPP printer.

**FQDN = \*NONE / <c-string 1..1023 with-low>**

Fully-qualified name of the domain to which the IPP printer is assigned.

**PRINTER-TYPE =**

Specifies which printer type is to process the print job. Only local printer types may be specified.

**PRINTER-TYPE = \*ANY**

A specific printer type is not requested. In this case, the SPOOL subsystem automatically determines the permitted printer types that can process the user request. \*ANY must be specified for output on RSO printers and printers on UNIX-based systems.

**PRINTER-TYPE = \*HP-PRINTER**

The spoolout job is to be processed on an HP or HP90 printer. \*HP-PRINTER includes the following printer types: 2090/2140/2240(HP90). The control characters for HP and HP90 laser printers are identical; a spoolout job for an HP printer can be processed on an HP90 printer and vice versa.

Selection of the printer type is affected by whether the CONTROL-MODE operand is specified at the same time:

Printer selection	CONTROL-MODE = *PAGE-MODE (default value)	CONTROL-MODE =*PAGE-MODE (CONTROL-TYPE=*HP)
<b>PRINTER-TYPE = *ANY</b>	Output can take place to all printer types	Output can be directed to HP or HP90 printers. Other control characters are converted to HP/HP90 control characters.
	The following also applies for HP-/HP90 printers: Conversion of the OVERPRINT functions to the LINE-MERGE function.	
<b>PRINTER-TYPE = *HP-PRINTER</b>	Output can only be processed on HP and HP90 printers. The OVERPRINT function is converted to the LINE-MERGE function.	
	Restrictions for PRFILE: The file may not contain the character X'FF'.	Support of the HP-specific control characters. Restriction: The file may only contain the character X'FF' as an escape character when control character evaluation is enabled (CHAR-SET-ATTRIBUTES = *ALL)

*Note for HP/HP90 printers*

If the entries in PRINT-DOCUMENT specify output to an HP or HP90 laser printer, a PRFILE must be available. If they are not, the command is rejected. If there is no HP/HP90 available in an installation, or only devices with insufficient configurations (not enough fonts, no graphics buffer for FOBs or no page rotation module, for example), the jobs can only be output to replay tape.

Systems support can run the SHOW-PRINT-JOB-STATUS command to obtain information on these jobs.

**PRINTER-TYPE = \*LP65-PRINTER**

The spoolout job is to be processed on an LP65 printer.

**PRINTER-TYPE = \*APA-PRINTER**

The spoolout job is to be processed on a 2050-APA-PRINTER, 2090-APA-PRINTER or 2090-TWIN-PRINTER.

**REDIRECTION-ALLOWED =**

Specifies whether a device administrator can redirect the spoolout job to a different printer. This does not affect the redirection of jobs by the user or by systems support.

**REDIRECTION-ALLOWED = \*STD**

Means YES for RSO print jobs, for SPOOL print jobs the operand is ignored.

**REDIRECTION-ALLOWED = \*YES / \*NO**

Can only be specified for RSO print jobs, not for SPOOL print jobs.

---

**CLUSTER-NAME = \*LOCAL-CLUSTER / <alphanum-name 1..8>**

Specifies the cluster to which the print job is to be transferred. \*LOCAL-CLUSTER means that the print job is to be processed in the local cluster.

*Only for Dprint.* To transfer the print job to a UNIX-based system, a cluster name defined in the Distributed Print Services (Dprint) configuration file must be specified. The remote clusters defined in the Distributed Print Services (Dprint) configuration file can be displayed by means of the SHOW-DPRINT-REMOTE-CLUSTER command (for a command description and detailed explanation, see the “Dprint” manual [10]).

**OUTPUT-FORMAT =**

*Only relevant for interoperability between BS2000- and UNIX-based systems.*

Specifies which printer language is to be used for the print job.

**OUTPUT-FORMAT = \*NONE**

No output format was specified. The document is transferred to the UNIX-based system without any modifications. It is assumed that the printer knows the format name specified in the DOCUMENT-FORMAT=\*SPECIAL-FORMAT(...) operand structure.

**OUTPUT-FORMAT = <c-string 1..63 with-low>**

The format name supported by the printer of the UNIX-based system specified in the PRINTER-NAME operand and known to this printer.

*Notes*

- In order to print out a document, its format name (defined implicitly with FORMAT-NAME=\*STD or explicitly through a freely selectable string) has to be compatible with one of the format names supported by the printer. The supported format names can be defined for each printer in the SPOOL parameter file (see “SPSERVE” manual [44]).
- As a standard, each printer supports the 'TEXT' format. 2050-APA, 2090-APA and 2090-TWIN printers also support the 'SPDS' format.
- If a printer does not support a document's format, it can only print the document if a filter is available which converts the format name into one supported by the printer.

*Example*

The print job issued with PRINT-DOCUMENT <datei>,...,FORMAT-NAME=xxx is printed out by a printer

- for which 'SUPP-FORMAT-NAME=xxx' was defined
- or for which 'SUPP-FORMAT-NAME=yyy' and a filter was defined which converts the input format 'xxx' into the output format 'yyy'

The filter is defined with the SPSEVER utility. You will find further information on filters in the “SPCONV” manual [41].

**VIRTUAL-PRINTER =**

This operand defines whether a print job is passed via a virtual printer to an application for processing.

**VIRTUAL-PRINTER = \*STD**

The virtual printer which is to receive the print job is determined through the SPOOL parameter file. Assignment of the print job to a virtual printer is given precedence. If no virtual printer is active when the print job is added to the list of print jobs, the print job is assigned to a real printer.

---

**VIRTUAL-PRINTER = \*ALLOWED**

Assignment of the print job to a virtual printer is given precedence. If no virtual device is active when the print job is added to the list of print jobs, the print job is assigned to a real device.

**VIRTUAL-PRINTER = \*NOT-ALLOWED**

This print job should not be transferred to an application program via a virtual device.

**VIRTUAL-PRINTER = \*MUST(...)**

This print job is transferred to the virtual printer specified by the parameters in the brackets. If the printer's supervisor task is inactive, the print job waits.

**NAME = <alphanum-name 1..8>**

Device name contained in the SPOOL parameter file.

**STRING = \*NONE / <c-string 1..32>**

Passes a character string on to the application program.

**ADDITIONAL-COPIES = 0 / <integer 1..255>**

Specifies how many additional times the file is to be printed.

The entry can also be made in parentheses. Each additional printout has its own header page. Default: 0 (no additional printouts).

**LOCK-FILE =**

Specifies whether the file is to be protected as long as the spoolout job is in the wait state (TYPE 4, see output of the SHOW-PRINT-JOB-STATUS command). During this time the file can only be read. As a rule, tape files are never locked. During processing of the spoolout job (TYPE 5, see output of the SHOW-PRINT-JOB-STATUS command), the file is protected irrespective of the setting of this operand.

A spoolout job is created even if the file to be output is reserved by a SECURE-RESOURCE-ALLOCATION command. This reservation must, however, be canceled by the time the spoolout job is processed; otherwise the job is not executed. The file to be output is locked until the end of the session if the LOCK-FILE=\*YES operand is specified in the PRINT-DOCUMENT command and the job cannot be executed owing to reservation.

**LOCK-FILE = \*STD**

The value defined in the SPOOL parameter file is valid (NO or YES).

**LOCK-FILE = \*YES**

The file is protected while the spoolout job is in the wait state. LOCK-FILE=\*YES is ignored if one of the values \*OMF, \*SYSLST or \*SYSOUT is specified for the FROM-FILE operand at the same time. A PRINT-DOCUMENT command for a library element with LOCK=\*YES is rejected. File protection offered by LOCK-FILE=\*YES remains in force even if the spoolout job is not processed until the next system run.

**LOCK-FILE = \*NO**

The file is not protected while the spoolout job is in the wait state. The file can be deleted or modified before processing of the spoolout job commences.

LOCK-FILE=\*NO is ignored for temporary files.

**DELETE-AFTER-PRINT =**

Specifies whether the file is to be deleted at the end of output and, if so, whether its data are to be overwritten with X'00..0'. Default: the file is not deleted after printing and not overwritten with binary zeros. The user must have write access to the file. If the file to be output belongs to a file generation group (see the FROM-FILE operand), the DELETE-AFTER-PRINT operand is ignored. If a spoolout job is used to print several elements of a PLAM library with INPUT-SECTION(...), the DELETE-AFTER-PRINT operand is set to \*NO (i.e. suppressed). The operand must not be specified together with \*SYSLST, \*EAM or \*SYSOUT.

---

**DELETE-AFTER-PRINT = \*NO**

The file is not to be deleted after printing (unless it is an EAM or system file).

**DELETE-AFTER-PRINT = \*YES(...)**

The file is to be deleted as soon as output has been completed.

**LINE-TRUNCATION =**

Specifies what happens if lines are truncated.

**LINE-TRUNCATION = \*STD**

The default value from the SPOOL parameter is valid. You can display this value by means of the SHOW-SPOOL-PARAMETERS command or SPSEIVE statement (field: ERROR-PR=(TRUNC=)).

**LINE-TRUNCATION = \*DELETE-FILE**

Processing of the spoolout job continues (i.e. DELETE-AFTER-PRINT=\*YES is executed). An appropriate warning is printed on the trailer page.

**LINE-TRUNCATION = \*KEEP-FILE**

Processing of the spoolout job is continued, but the file is not subsequently deleted.

**DELETE-AFTER-PRINT = \*DESTROY(...)**

Not for EAM and cataloged system files.

Specifies that once the file has been printed its data are to be overwritten with binary zeros.

**LINE-TRUNCATION =**

Specifies what happens if lines are truncated.

**LINE-TRUNCATION = \*STD**

The default value from the SPOOL parameter is valid. You can display this value by means of the SHOW-SPOOL-PARAMETERS command or SPSEIVE statement (field: ERROR-PR=(TRUNC=)).

**LINE-TRUNCATION = \*DELETE-FILE**

Processing of the spoolout job continues (i.e. DELETE-AFTER-PRINT=\*DESTROY is executed). An appropriate warning is printed on the trailer page.

**LINE-TRUNCATION = \*KEEP-FILE**

Processing of the spoolout job is continued, but the data of the file itself are overwritten with binary zeros.

**NOTIFICATION =**

Selects the notification processing for the associated print jobs. The permanent subscriptions are implemented asynchronously. At the print job submission the previous subscriptions can be discarded temporarily for the current print job by selecting NOTIFICATION=\*NO. It is also possible to temporarily associate another subscription to the current print job by giving the subscription attributes at the print job submission.

**NOTIFICATION = \*STD**

Notification delivery will be processed for the current print job if the owner of this print job has previously recorded permanent subscriptions in the notification resource file.

**NOTIFICATION = \*NO**

Notification processing is turned off for this print job. Notifications will not be generated even if there are valid subscriptions recorded in the notification resource file belonging to the owner of this print job. However, the notifications generated for subscriptions belonging to other privileged users is not turned off.

---

**NOTIFICATION = \*PARAMETERS(...)**

This operand creates one temporary subscription resource. This subscription exists as long as the current print job exists. It allows the user to associate subscription resource with a particular job.

**OBJECT-ATTRIBUTES =**

Specifies the object attributes associated to the notifications. Objects, e.g. a print job, for which notifications are sent may have attributes associated to them. The user may want to have one or more of these associated attributes returned with a particular notification. Generally, these may include any attribute associated to the object emitting the notification.

**OBJECT-ATTRIBUTES = \*NONE**

No attribute is selected.

**OBJECT-ATTRIBUTES = \*ALL**

All the attributes associated to the print job are selected.

**OBJECT-ATTRIBUTES = list-poss(20): <text 1..64>**

Some of the attributes are selected.

**EVENT-NAMES =**

List of subscribed events.

**EVENT-NAMES = \*ALL**

All the events associated to the print job are selected.

**EVENT-NAMES = list-poss(20): <alphanum 1..24>**

Some of the events are selected.

**USER-DATA =**

Specifies opaque data that some delivery methods include in each notification data; for example, for a notification by mail, the user data is included in the mail text.

**USER-DATA = \*NONE**

No user data is specified.

**USER-DATA = <text 1..63 with-low>**

Specifies the user data value.

**USER-DATA = <c-string 1..63 with-low>**

Specifies the user data value.

**RECIPIENT = \*PARAMETERS(...)**

According to the selected method the user has to specify the delivery address for the notifications.

**ADDRESS = <text 1..224 with-low> / <c-string 1..63 with-low>**

Specifies the delivery address.

**METHOD-NAME = <alphanum-name 1..8> / \*MAIL**

Specifies the notification delivery method. In case of print jobs addressed to a remote XPRINT cluster, the predefined \*MAIL keyword must be used. The notification then will be performed by the foreign cluster.

*Notes*

- When NOTIFICATION=\*PARAMETERS(...) is used, a new subscription is registered in the *notification.parameters* file. This subscription is associated to the current print job. This current print job is identified in the frame of the notification system by a 16-digit alphanumeric ID of the following form: *tttssshhhhhhhhh* where *tttt* is

the TSN of the print job, *sssss* is the sequence number of the print job (range in family processing) and *hhhhhhh* is the host name. The subscription is temporary and will be deleted after the processing of the SPOOLJOBABORTED or SPOOLJOB COMPLETED events. Those events are defined as terminal for that purpose.

- The object name of the created subscription is indicated with \*ANY in the notification manager display.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error Guaranteed messages: SCP0810, SCP1025, SCP1026, SCP1027
2	0	SCP0829	Command registered Guaranteed message: SCP0829
2	0	SCP0855	Tape file. LOCK-FILE ignored
2	0	SCP0862	Not file owner. DELETE ignored
2	0	SCP0863	FGG file. DELETE ignored Guaranteed message: SCP0863
2	0	SCP0864	File protected by ACCESS=READ. DELETE ignored Guaranteed message: SCP0864
2	0	SCP0865	File protected by write password. DELETE ignored Guaranteed message: SCP0865
2	0	SCP0866	File protected by EXDATE. DELETE ignored Guaranteed message: SCP0866
2	0	SCP0930	PRFILE not available
2	0	SCP0971	RECORD-CLASS 164 not accessible (PLAM) Guaranteed message: SCP0971
2	0	SCP0988	Print element with section. DELETE ignored
2	0	SCP1000	JV processing error. MONJV ignored Guaranteed message: SCP1000
2	0	SCP1004	PLAM error. DELETE/DESTROY ignored
2	0	SCP1076	No information available for the job
2	0	SCP1077	Job accepted but FAMILY not ready
2	0	SCP1078	LOCK error after job acceptance
	1	CMD0202	Syntax error
	1	SCP0973	Semantic error

	32	SCP0974	System error. Command rejected
	64	SCP0975	No authorization for command Guaranteed messages: SCP0860, SCP0925, SCP0972
	64	SCP0976	Invalid operand value Guaranteed messages: SCP0813, SCP0850, SCP0851, SCP0857, SCP0858, SCP0938, SCP0995, SCP0997
	128	SPS0266	SPOOL subsystem not available
	128	SCP0896	RSO/SPS/DPRINTCL/DPRINTSV/DPRINTCM subsystem not loaded/ready Guaranteed message: SCP0896
	128	SCP0996	JV subsystem not loaded/ready Guaranteed message: SCP0996
	128	SCP1087	POSIX subsystem not loaded/ready

### Incompatibilities between PRINT-DOCUMENT command operands

The PRINT-DOCUMENT command is rejected if one of the operands in the column on the left is specified at the same time as one of the corresponding operands in the column on the right.

Operand	Incompatible operands
CHARACTERS-SETS =chars-name	PRINTER-TYPE=*LP65-PRINTER / *APA-PRINTER, CONTROL-MODE=*APA

-------------------------	----------------------------

Table 82: Incompatibilities between PRINT-DOCUMENT command operands

## Notes

1. For reasons of compatibility, the “old” PRINT-FILE command continues to be supported. The new functionality can only be used explicitly with the new PRINT-DOCUMENT command.
2. Spoolout jobs for which the operand PAGE-COPIES, CONTROL-MODE, USER-RESOURCES-FILE or ELECTRONIC-OVERLAY has been specified in the PRINT-DOCUMENT command cannot be printed on impact printers. The operands automatically ensure that another type of printer is used (laser printers, RSO printers).
3. For printers with a loadable VFB, specifying the FORM operand causes the VFB to be loaded if nothing else is specified for the LOOP operand. This means that at least one loop must be available in the \$SYSSPOOL.PRFIL file.
4. POSIX path name  
The following operands are not supported for UFS files: LOCK-FILE=\*YES, DELETE-AFTER-PRINT=\*YES and MONJV=\*STD.

If a POSIX path name (up to 1024 characters) is specified, depending on the code type (ASCII or EBCDIC) of the UFS file, an automatic ASCII/EBCDIC conversion is carried out. The conversion is carried out for the whole UFS file (including metacharacters). The automatic ASCII/EBCDIC conversion is carried out by a preparatory server task that simultaneously creates a copy of the UFS file. This copy is given a name and stored in a DMS work file under the user ID \$SYSSPOOL. If the UFS file is in ASCII code and the print job is sent to RSO in transparent mode (DOC-FORMAT=\*SPECIAL-FORMAT), no ASCII/EBCDIC conversion is carried out. CCSNAME 88591 is set in the catalog entry of the DMS work file.

If a path name containing wildcards is specified, several UFS files can be processed. If FAMILY-PROCESSING=\*YES is specified, all the print jobs are created with the same TSN and cannot be distributed. If FAMILY-PROCESSING=\*NO is specified, the print jobs are created with different TSNs and can be distributed.

Print jobs for UFS files cannot be output to magnetic tape.

A POSIX extension allows the record structures of BS2000 files that are to be printed by the BS2000 SPOOL and PRINT subsystems to be preserved. The files can be copied from BS2000 to UFS by means of the RCOPY function with special operands. These files can then be processed only by BS2000 applications. If a print job is issued for them, an RCOPY function is executed in the opposite direction and the original BS2000 files (with the original record structures) restored.

The RCOPY function from UFS to BS2000 with the special operands for storing the BS2000 record structures can be carried out for all print jobs created by means of the PRINT-DOCUMENT command, except if the following operands were specified:

- DOC-FORMAT=\*TEXT(...)
- DOC-FORMAT=\*SPECIAL(LINE-SPACING=\*NO/1/2/3).

5. You will find information on outputting print data in a Dprint environment in the “Distributed Print Services” manual [10].

---

## Examples

### *Example 1*

A batch job contains the following commands:

```
/PRINT-DOCUMENT FROM-FILE=DAT,DELETE-AFTER-PRINT=*YES,ADDITIONAL-COPIES=3,  
/      DOCUMENT-FORMAT=*TEXT(LINE-SPACING=*BY-EBCDIC-CONTROL) _____ (1)  
  
/PRINT-DOCUMENT FROM-FILE=TEST.DAT.,DOCUMENT-FORMAT= -  
/      *TEXT(HEADER-LINE=*STD) _____ (2)  
  
/PRINT-DOCUMENT FROM-FILE=(FILE1,FILE2,FILE3),RESOURCES-DESCRIPTION= -  
/      *PARAMETERS(FORM-NAME=STDWA4) _____ (3)  
  
/PRINT-DOCUMENT FROM-FILE=(A,A),DELETE-AFTER-PRINT=*YES _____ (4)
```

- (1) The file DAT is to be printed four times in all, and then deleted. The file contains (EBCDIC) feed control characters.
- (2) All files whose names start with "TEST.DAT." are to be printed with a default header line.
- (3) The files FILE1, FILE2 and FILE3 are to be printed out on white paper (DIN A4).
- (4) The file A is to be printed once and then deleted. For printing in duplicate, the operand ADDITIONAL-COPIES=1 must be specified.

*Example 2*

```
/print-doc $rz4.sysrme.aid.023.,line-spacing=*by-ebcdic,  
print-job-control=*par(family-proc=*yes,print-job-name=aid023) —— (1)
```

```
% SCP0810 SPOOLOUT FOR FILE ':2ORZ:$RZ4.SYSRME.AID.023.D' ACCEPTED. TSN:  
'9W6B', SPOOLOUT-NAME: 'AID023', MONJV: '*NONE'  
% SCP0810 SPOOLOUT FOR FILE ':2ORZ:$RZ4.SYSRME.AID.023.E' ACCEPTED. TSN:  
'9W6B', SPOOLOUT-NAME: 'AID023', MONJV: '*NONE'
```

```
/show-print-job-sta —— (2)
```

```
TSN  SERVER  SP-NAME  RTSN  HOST      USER-ID  ACCOUNT  F-C  P-C  F-T  FCB-T  F-SIZE  
9W6B *HOME    AID023   9W5V  D016ZE07 QM211    89001    0   0  EAM  SAM     20  
9W6B *HOME    AID023   9W5V  D016ZE07 QM211    89001    0   0  EAM  SAM     20  
% SCP0947 2 JOBS FOUND WITH 40 PAM PAGES. COMMAND TERMINATED
```

- (1) All files pertaining to the user ID RZ4 that begin with SYSRMEAID.023. are to be printed out. The EBCDIC control characters contained in the first column are to be evaluated. The print jobs are to be given the job name AID023 and are to be given the same job number.
- (2) The SHOW-PRINT-JOB-STATUS command displays two print jobs (for each of the files found) under the TSN 64CS.

Example 3

The file FILE has been divided up by SPOOL into 3 print pages with a maximum of 64 lines per page:

Page 1		Page 2		Page 3	
Start	1	Line	65	Line	129
	2		.		.
	.		.		.
	.		.	End	150
	20		.		.
	.		.		.
	.	Line	128		.
Line	64		.		.

1. Print FILE, starting at line 20.

```
/PRINT-DOCUMENT FROM-FILE=DATEI,DOCUMENT-PART=*PARAMETERS(-  
OUTPUT-PART=*RANGE(FROM=20,DIMENSION=*LINES))
```

Page 1		Page 2		Page 3	
Line	20	Line	84	Line	148
	.		.		149
	.		.	End	150
	.		.		.
	.		.		.
	.		.		.
	.	Line	147		.
Line	83		.		.

The page feed is implemented after line 83 (=64+19) or 147 (=128+19).

2. Print pages 1 to 3 of FILE.

```
/PRINT-DOCUMENT FROM-FILE=DATEI,DOCUMENT-PART=*PARAMETERS(-  
OUTPUT-PART=*RANGE(FROM=1,TO=3))
```

The whole file is printed

3. Print the last page of FILE.

```
/PRINT-DOCUMENT FROM-FILE=DATEI,DOCUMENT-PART=*PARAMETERS(-  
OUTPUT-PART=*LAST(LAST=1))
```

Page 3	
Line	129
	.
	.
End	150

Only the last page (number 3) is printed, i.e. not the final 64 lines of FILE

## Notes on RSO

### *Valid character spacings (CPI)*

All PRINT-DOCUMENT commands requesting CPI values which are not actually supported by the destination printer are rejected. If the destination is a pool of printers, the selection will be restricted to printer types from the pool which actually support the requested CPI values.

### *Exceptions to the rule*

1. 8121, 9002 and 9645 printers are not provided with escape sequences that set character spacing (the hardware value is 10 cpi). Therefore, RSO only accepts a 10 cpi value on these printer types.
2. On 9000, 9025 and 9026 RENO printers, RSO cannot send any escape sequence setting the character spacing. However, the character spacing can be set by means of a 256-character string linked to the font (using the product RSOSERVE). RSO nevertheless permits certain CPI values for these printer types. The values 1 through 100 can be specified in the CHARACTERS-PER-INCH operand of the SPSERVE statement ADD-SPOOL-CHARACTER-SET.

This value is not set by RSO, however, but is used for computing the line size, i.e. the maximum number of characters per line used for the header and trailer pages and for detecting possibly truncated lines.

The following table indicates for each printer type the CPI operand values that are supported by RSO for the PRINT-DOCUMENT command and at the start of spoolout, and the CPI values that are translated by RSO into printer commands.

Printer types	CPI values checked for PRINT-DOCUMENT and at start of spoolout (1)	CPI values translated by RSO and sent to the printer (2)
2030-PCL	1..100	1..100
4011	10/12/15/17/20	10/12/15/17/20

9046	10/12/13/15/17	10/12/13/15/17
9097	10/12/15/17/20	10/12/15/17/20
9645	10	-
DJET	1..100	1..100

Table 83: CPI values supported by RSO in the PRINT-DOCUMENT command

- The table indicates for each printer type the CPI operand values for the font as supported by RSO V2.2A. This check is performed at PRINT-DOCUMENT command validation and print job scheduling time. The specification of other values leads to the following behavior.
  - For the PRINT-DOCUMENT command: The command is rejected.

- 
- At the start of spoolout: The print job is placed in the KEEP queue and the device is put into status “S”.
2. Some printer types do not support any printer commands that set the horizontal density ('-' in the table). This means that the requested horizontal density is never set by RSO, no matter what the CPI operand value of the font may be.

Nevertheless, on 9000, 9025 and 9026 RENO printers, character spacing can be set by means of a 256-character string linked to a font, using the RSOSERVE utility.

#### *Printing RSO files swapped out with HSMS*

In previous versions, when a controller task accessed a file swapped out with HSMS, other printers controlled by the task were blocked until the file was retrieved. RSO tries to prevent this situation arising for four types of RSO resource files (DIA, PROLOG, EPILOG and MEMBER files) by retrieving swapped out files when the PRINT-DOCUMENT command is checked and not only when the command is processed.

- *DIA file*

In the case of a swapped-out DIA file, retrieval of the file is initiated during checking of the PRINT-DOCUMENT command.

When command processing starts, a swapped-out DIA file is treated as a user error. The job is terminated with corresponding information on the trailer page, and a message is sent to the console.

- *PROLOG-/EPILOG file*

Nothing is done during checking of the PRINT-DOCUMENT command in the case of swapped-out PROLOG /EPILOG files.

When command processing starts, a swapped-out PROLOG/EPILOG file is regarded as a user error. The job is terminated with corresponding information on the trailer page, and a message is sent to the console.

- *MEMBER file*

Nothing is done during checking of the PRINT-DOCUMENT command in the case of swapped-out MEMBER files.

When command processing starts, a swapped-out MEMBER file is not taken into account.

#### *Validity check for /PRINT-DOCUMENT with USER-RESOURCES-FILE=xxxx*

A PRINT-DOCUMENT command with a loop entry in the FORM-NAME operand is also accepted if the file doesn't exist neither under the user ID of the caller nor under SYSSPOOL. If in this case a loop entry is specified in the operand LOOP-NAME the command will be rejected.

---

## Example 1

```
/show-spool-form form1
```

```
FORM-NAM DEV-TYPE  LI-S PA-S H-P T-P  VERT-CONTROL  ROT-CONTROL  OWNER
                                L-N/LPI/C-P/C-S L-N/LPI/C-P/C-S
FORM1     9001RP      80 120 YES INF      6   3 101          TSOS
```

```
/print-doc from-file=orion,to-printer=*par(printer-name=prn27272),
resources-description=*par(form-name=form1,user-resources-file=xxxx)
```

```
% SCP0810 SPOOLOUT FOR FILE ':C:$TSOS.ORION' ACCEPTED: TSN: '4FUN',-
SPOOLOUT-NAME: 'LUC', MONJV: '*NONE'
```

## Example 2

```
/show-spool-form form2
```

```
FORM-NAM DEV-TYPE  LI-S PA-S H-P T-P  VERT-CONTROL  ROT-CONTROL  OWNER
                                L-N/LPI/C-P/C-S L-N/LPI/C-P/C-S
FORM1     9001RP      80 120 YES INF C6      101          TSOS
```

```
/print-doc from-file=orion,to-printer=*par(printer-name=prn27272),
resources-description=*par(form-name=form2,user-resources-file=xxxx)
```

```
% SCP0810 SPOOLOUT FOR FILE ':C:$TSOS.ORION' ACCEPTED: TSN: '5FUN',-
SPOOLOUT-NAME: 'LUC', MONJV: '*NONE'
```

---

## 5.4 PROTECT-FITC-APPLICATION

Protect FITC application against unauthorized access

**Component:** BS2000 OSD/BC  
**Functional area:** Data communication control  
**Domain:** SECURITY-ADMINISTRATION  
**Privileges:** all privileges bar HARDWARE-MAINTENANCE

### Function

The PROTECT-FITC-APPLICATION command protects an FITC application against unauthorized access by means of guards. A support authorization to prevent unauthorized configuration and request authorization to prevent unauthorized use can be defined for the FITC port.

In addition, this command enables a standard connection ID to be reserved for a directly addressable FITC port. Senders of messages or jobs can address the port without the port name by using this short ID.

This command offers the same functions as the DEFPACC macro.

A support authorization (SUPPORT-GUARD operand) can only be assigned if the FITC port is not already protected. Assigning a support authorization also simultaneously defines the port owner (USER-ID operand). Only the port owner can assign or modify a request authorization (REQUEST-GUARD operand).

### Format

#### PROTECT-FITC-APPLICATION

**PORT-NAME** = <alphanum-name 1..54>

,**STD-CONNECTION-ID** = \*UNCHANGED / <x-string 1..4> / <integer 1..65535>

,**USER-ID** = \*UNCHANGED / <name 1..8>

,**SUPPORT-GUARD** = \*UNCHANGED / <filename 1..24 without-gen-vers>

,**REQUEST-GUARD** = \*UNCHANGED / <filename 1..24 without-gen-vers>

### Operands

**PORT-NAME** = <alphanum-name 1..54>

Port name of the FITC application which is to be protected or linked with a standard connection ID.

**STD-CONNECTION-ID** = \*UNCHANGED / <x-string 1..4> / <integer 1..65535>

Defines a standard connection ID for a directly addressable FITC port. This short ID is reserved for the specified port name and cannot be assigned again in the active session.

**USER-ID** = \*UNCHANGED / <name 1..8>

Defines the port owner's user ID. This operand is evaluated only if a support authorization is also specified (i.e. a guard is specified in the SUPPORT-GUARD operand).

---

**SUPPORT-GUARD = \*UNCHANGED / <filename 1..24 without-gen-vers>**

Defines a guard for configuring the FITC port. If a support authorization is already assigned, this specification is not accepted.

**REQUEST-GUARD = \*UNCHANGED / <filename 1..24 without-gen-vers>**

Defines a guard for using the FITC port. Only the port owner can assign the request authorization.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	1	NTF0404	Parameter combination not permissible.
	1	NTF0804	Specified application name (port name) not permissible.
	1	NTF0C04	Specified standard connection ID outside the permissible value range.
	32	NTF0018	FITC not accessible. Function cannot be executed.
	32	NTF0C10	Caller not authorized to modify the REQUEST profile.
	32	NTF1010	The SUPPORT profile already assigned to the port name cannot be accessed. Execution is therefore rejected because there is no way to perform a check.
	32	NTF1418	Function aborted on account of an internal FITC error.
	64	NTF040C	Specified port name already used.
	64	NTF080C	Specified standard connection ID already used elsewhere.
	64	NTF0C0C	Not possible to assign a valid user ID as the owner of the port.
	64	NTF100C	Specified guard name(s) cannot be completed.
	64	NTF140C	A REQUEST profile can only be assigned in conjunction with the SUPPORT profile or if the latter exists.
	64	NTF400C	Redefinition of the specified properties not permitted.
	130	NTF0418	Function cannot currently be executed due to memory shortage.

---

## 5.5 PURGE-ALIAS-CATALOG

Delete current alias catalog

**Component:** ACS

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The PURGE-ALIAS-CATALOG command deletes the alias catalog of the executing task. Entries in the alias catalog that have the PROTECTED attribute are also deleted in the process. If a HOLD-ALIAS-SUBSTITUTION command was issued to halt the alias substitution function, the effect of that command will be canceled on deleting the alias catalog.

The currently applicable ACS options are retained.

### Format

<b>PURGE-ALIAS-CATALOG</b>	Alias: <b>PGAC</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Normal execution of the commands
	32	CMD0221	Internal error
	128	ACS0018	ACS is not available

### Example

For an example, see the LOAD-ALIAS-CATALOG command.

---

## 5.6 READ-IOCF

Read IOCF

**Component:** IOFCOPY  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** TSOS

### Function

The systems support staff can read an IOCF from the hard disk of the service computer and write it into a PAM file on a BS2000 disk. A list of the IOCFs on the hard disk of the service computer can be obtained using the SHOW-IOCF command. An IOCF can be written from a PAM file onto the hard disk of the service computer using the WRITE-IOCF command.

### Format

<b>READ-IOCF</b>
<b>FILE-NAME</b> = <filename 1..54> , <b>LEVEL</b> = * <b>ACTIVE</b> / <integer 0..9>

### Operands

**FILE-NAME = <filename 1..54>**

Name of the BS2000 file into which the IOCF is to be written. An existing file of the same name will be overwritten.

**LEVEL = \*ACTIVE**

The current IOCF is being read.

**LEVEL = <integer 0..9>**

Level number of the IOCF which is to be read. The value range covers all existing levels. If the level number given is invalid, then the command is rejected.

The maximum number of levels is hardware-dependent.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD2201	Parameter error: At least one value from the command call is incorrect (e.g. file does not exist, incorrect format or incorrect file contents, level number does not exist, etc.). The exact cause of the error is contained in a preceding message.
	32	CMD0221	Internal error: A system interface which was called reports an error. The exact cause of the error is contained in a preceding message.
	64	CMD0216	No authorization

---

## 5.7 REDIRECT-PRINT-JOB

Redirect jobs to another printer

<b>Component:</b>	SPOOL
<b>Functional area:</b>	Controlling spoolout job
<b>Domain:</b>	SPOOL-PRINT-ADMINISTRATION
<b>Privileges:</b>	STD-PROCESSING OPERATING PRINT-SERVICE-ADMINISTRATION SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	N

### *Note*

The REDIRECT-PRINT-JOB command corresponds to the old REDIRECT-REMOTE-OUTPUT command; the command name REDIRECT-REMOTE-OUTPUT is still accepted as an alias.

### **Function**

The REDIRECT-PRINT-JOB command redirects spoolout jobs:

- from an RSO printer or pool to another RSO printer or pool
- from an RSO printer or pool to a local printer pool
- from a local printer pool to an RSO printer or pool
- from a local printer pool to a local printer pool
- from a local printer pool to a central printer pool
- from a Dprint printer pool to a Dprint printer pool

Nonprivileged users can only redirect their own jobs. RSO device administrators can redirect their own jobs and jobs started with the operand REDIRECTION-ALLOWED=\*YES in the PRINT-DOCUMENT command on a device for which they are entered as the RSO device administrator. Systems support can redirect any job.

Only jobs in the WAIT or KEEP status are redirected. All jobs can be redirected, or only some of them. In the latter case the jobs are selected by specifying the TSN, the job status (job type), the user ID and the name of the form or job. It is possible to specify a negative list.

As a check on the new destination, the jobs to be redirected are also submitted to PRINT-DOCUMENT command validation.

---

## Requirements for command execution

- The specifications for both printers must be different (different printer names or different printer pool names).
- The control character (ESCAPE character) must be defined the same for the specified printers.
- In family processing, **all** (sub)jobs must have the specified status (JOB-TYPE=...).
- The files to be printed must not be on an exported pubset.
- If the spoolout job is directed to a printer pool, the assigned printer must not be specified in the REDIRECT-PRINT-JOB command. The job always belongs to the pool, even if it is in the KEEP status for example.

### *Example*

A FAMILY-PRINT has been started for the pool POOL1. A job from this is in KEEP status on the device DVC1 which belongs to the pool POOL1.

```
/SHOW-PRINT-JOB-STATUS INF=*DESTINATION
```

```
TSN  SERVER  M STA R DEVICE  DESTIN  ERCOD  ERMSG  DEVICE TYPE
64CS *HOME   R KP   DVC1   POOL1
64CS *HOME   R WT   POOL1  POOL1
% SCP0947 2 JOBS FOUND WITH 40 PAM PAGES. COMMAND TERMINATED
```

The following commands have no effect on FAMILY with TSN 64CS:

```
/REDIRECT-PRINT-JOB JOB-ID=*DEVICE(DEV-NAME=DVC1),SELECT=*PAR( -
                        JOB-TYPE=*KEEP)
/REDIRECT-PRINT-JOB JOB-ID=*DEVICE(DEV-NAME=DVC1),SELECT=*PAR( -
                        JOB-TYPE=*ALL)
```

The following commands redirect FAMILY with TSN 64CS:

```
/REDIRECT-PRINT-JOB JOB-ID= *DEVICE(DEV-NAME=POOL1),SELECT=*PAR( -
                        JOB-TYPE=*ALL)JOB-TYPE=*ALL)
/REDIRECT-PRINT-JOB JOB-ID=*TSN(TSN=64CS),SELECT=*PAR(JOB-TYPE=*ALL)
```

---

### Restrictions

The following restrictions are applicable, depending on the direction of redirection.

*JOB-IDENTIFICATION = \*DEVICE-NAME*

FROM=	TO=				
	RSO printer	RSO pool	Local pool	*CENTRAL	Dprint pool
RSO printer	(1)	(2)	(3)	(3)	n.s.
RSO pool	(2)	(2)	(3)	(3)	n.s.
Local pool	(4)	(4)	(5)	n.s.	n.s.
*CENTRAL	n.s.	n.s.	n.s.	n.s.	n.s.
Dprint pool	n.s.	n.s.	n.s.	n.s.	(6)

n.s.= not supported (a pool must be set up for redirecting local printouts)

1. Rejected in the following cases:

- the CONTROL-MODE operand in the PRINT-DOCUMENT command is not set to \*PAGE, and device types concerned are different.
- escape characters are incompatible.

2. Rejected if CONTROL-MODE in the PRINT-DOCUMENT command was not set to \*PAGE.

3. Rejected if the following operands were specified in the PRINT-DOCUMENT command:

- INPUT-TRAY=...
- CHAR-SET-ATTRIBUTES=...
- FORMS-OVERLAY-BUFFER=...
- LINE-SPACING=\*NO
- CONTROL-MODE not equal \*PAGE

4. Rejected if following operands were specified in PRINT-DOCUMENT command:

- ROTATION-LOOP-NAME=...
- CHARACTER-SETS=\*POOL
- FORMS-OVERLAY-BUFFER=...
- CONTROL-MODE not equal \*PAGE
- ROTATION=...
- INPUT-TRAY=...

5. Local print jobs valid for a subset of device types in a printer pool can be redirected to another printer if the target printer belongs to that subset.

6. Dprint jobs can only be redirected if the command is entered on the server accepting the print job. If this is not the case, the print job must be redirected using the MODIFY-PRINT-JOB-ATTRIBUTES command. Distributed print jobs valid for a subset of device types in a Dprint pool can be redirected to another printer if the target printer belongs to that subset.

## *JOB-IDENTIFICATION= \*TSN*

If the TSN is used as the selection criterion, all operands of the PRINT-DOCUMENT command are permitted, albeit on the user's own responsibility.

### Information following command processing

On normal termination the number of redirected jobs is output.

On abnormal termination the reason is output:

- no output for the device
- device(s) not defined
- system error
- redirection mode not supported

For each “redirectable” job (see above) that was not redirected, a warning message indicating the reason is output.

### Format

#### REDIRECT-PRINT-JOB

**JOB-IDENTIFICATION** = **\*DEVICE-NAME** (...) / **\*TSN**(...)

**\*DEVICE-NAME**(...)

|     **DEVICE-NAME** = <alphanum-name 1..8>

|     ,**SPOOL-OUT-NAME** = **\*ALL** / list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>

,**EXCEPT** = **\*NONE** / **\*PARAMETERS**(...)

**\*PARAMETERS**(...)

|     **USER-IDENTIFICATION** = **\*NONE** / list-poss(16): <name 1..8>

|     ,**FORM-NAME** = **\*NONE** / list-poss(16): <alphanum-name 1..6>

|     ,**SPOOL-OUT-NAME** = **\*NONE** / list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>

---

## Operands

**JOB-IDENTIFICATION = \*DEVICE-NAME(...) / \*TSN(...)**

Identification of the spoolout jobs to be redirected.

**JOB-IDENTIFICATION = \*DEVICE-NAME(...)**

The spoolout jobs to be redirected are identified using the name of the printer on which the jobs are to be processed.

**DEVICE-NAME = <alphanumeric-name 1..8>**

Name of the printer or printer pool.

**JOB-IDENTIFICATION = \*TSN(...)**

Spoolout jobs designated by their TSN are redirected.

**TSN = list-poss(16): <alphanumeric-name 1..4>**

List of TSNs for the spoolout jobs.

**TO-DEVICE = \*CENTRAL / <alphanumeric-name 1..8>**

The spoolout jobs are redirected to the central computer center printer (\*CENTRAL) or the specified printer.

**SELECT = \*PARAMETERS(...) / \*ALL**

The spoolout jobs can be selected by specifying the user ID for the job, the status, the job name or the form name.

**SELECT = \*PARAMETERS(...)**

Selection of a subset of spoolout jobs. The spoolout jobs are redirected if they fulfill the specified criteria (AND operation).

**JOB-TYPE = \*WAIT / \*KEEP / \*ALL**

The selection criterion is whether the spoolout job is in the WAIT or KEEP status. If \*ALL is specified, no distinction is made.

**USER-IDENTIFICATION = \*ALL / list-poss(16): <name 1..8> / <c-string 1..8 with-low>**

The selection criterion is the user ID under which the spoolout job was created; it is possible to specify a list. If \*ALL is specified, the user ID is not used as a selection criterion.

**FORM-NAME = \*ALL / list-poss(16): <alphanumeric-name 1..6>**

The selection criterion is the name of the form to be used for printing; it is possible to specify a list. If \*ALL is specified, the form name is not used as a selection criterion.

**SPOOLOUT-NAME = \*ALL / list-poss(16): <alphanumeric-name 1..8> / <c-string 1..8 with-low>**

The selection criterion is the job name for the spoolout job; it is possible to specify a list. If \*ALL is specified, the job name is not used as a selection criterion.

**SELECT = \*ALL**

All spoolout jobs are redirected.

**EXCEPT = \*NONE / \*PARAMETERS(...)**

List of exceptions for spoolout jobs which are not to be redirected.

**EXCEPT = \*NONE**

No list of exceptions.

**EXCEPT = \*PARAMETERS(...)**

Specifies the jobs selected with SELECT=... which are to be excepted. Specifying \*NONE means that no exceptions are specified.

**USER-IDENTIFICATION = \*NONE / list-poss(16): <name 1..8>**

Spoolout jobs created by the specified user IDs are not redirected.

**FORM-NAME = \*NONE / list-poss(16): <alphanum-name 1..6>**

Spoolout jobs using the specified forms are not redirected.

**SPOOLOUT-NAME = \*NONE / list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

Spoolout jobs with the specified job names are not redirected.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error
2	0	SCP1036	Lock error
2	0	SCP1039	Device incompatibility Guaranteed message: SCP1039
2	0	SCP1040	No device definition Guaranteed message: SCP1040
2	0	SCP1041	No authorization for specified TSN Guaranteed message: SCP1041
2	0	SCP1042	EQUISAM file error for specified TSN Guaranteed message: SCP1042
2	0	SCP1043	Slot manager error for specified TSN Guaranteed message: SCP1043
2	0	SCP1044	Specified TSN not found Guaranteed message: SCP1044
2	0	SCP1045	Pubset exported Guaranteed message: SCP1045
2	0	SCP1047	Output not possible on specified device Guaranteed message: SCP1047
2	0	SCP1048	Invalid PRINT-DOCUMENT command
2	0	SCP1049	RSO subsystem not loaded
	1	CMD0202	Syntax error
	1	SCP0973	Semantic error
	32	SCP0974	System error. Command rejected
	64	SCP0975	No authorization for command
	64	SCP0976	Identification of device not possible Guaranteed message: SPS0306

---

## 5.8 REDUCE-PAGING-AREA

Reduce paging area

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	System control and optimization
<b>Domain:</b>	SYSTEM-TUNING SYSTEM-MANAGEMENT
<b>Privileges:</b>	TSOS OPERATING
<b>Routing code:</b>	R

### Function

This command removes one or more paging files from the paging area. A paging file can either be specified via the volume on which it is located or via the catalog ID of the pubset. The specification via pubset is only possible for SF pubsets. The specification refers to all paging files on the volumes of the respective SF pubset.

### Format

#### REDUCE-PAGING-AREA

**VOLUME** = \*NONE / \*PUBSET(...) / list-poss(256): <vsn 1..6>

\*PUBSET(...)

| **PUBSET** = list-poss(256): <cat-id 1..4>

### Operands

**VOLUME** = \*NONE / \*PUBSET(...) / list-poss(256): <vsn 1..6>

Specifies the paging files to be removed. The default value is \*NONE, i.e. no paging file is removed.

**VOLUME** = \*NONE / list-poss(256): <vsn 1..6>

Identifies by volume serial number (VSN) the disk on which the paging file to be removed is located. Up to 256 disks can be specified.

**VOLUME** = \*PUBSET(...)

Specifies one or more SD pubsets. All paging files on the volumes of the specified SF pubsets are removed.

**PUBSET** = list-poss(256): <cat-id 1..4>

Specifies the SF pubsets via their catalog number.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	32	EMM2800	The function cannot be continued owing to an internal error executing a particular object Guaranteed messages: EMM2818, EMM2828
	64	EMM2802	The specified pubset is unknown and cannot be identified in the given configuration. Guaranteed message: EM2841
	64	EMM2805	The MRSCAT entry of the pubset is missing. Guaranteed message: EMM2824
	128	EMM2807	The function cannot be continued due to lack of resources executing a particular object Guaranteed messages: EMM2819, EMM2829

**i** When lists are specified, command processing is aborted in the event of an error with a return code of EMM2800 or EMM2807.

## Notes

- Paging area reduction is rejected if it would cause virtual address space saturation.
- Processing of the command may take a number of minutes. For that reason, it is not executed in the calling task but is delegated to a server task created especially for the purpose. The job completion message is delivered to the calling task asynchronously. If the calling task terminates before the completion message is delivered, the message is sent to the console instead.
- If more than one volume is specified (explicitly or by specifying a pubset) when the command is issued, a separate job is started for each volume.

## Examples

Reducing the paging area by the paging file on the disk with the volume serial number 2OSW.0:

```
/REDUCE-PAGING-AREA VOLUME=2OSW.0
```

---

## 5.9 RELEASE-OPERATOR-ROLE

Release operator roles

**Component:** BS2000 OSD/BC  
**Functional area:** Operator function control  
**Domain:** CONSOLE-MANAGEMENT  
**Privileges:** OPERATING  
**Routing code:** @

### Function

The RELEASE-OPERATOR-ROLE command allows you to relinquish operator roles previously requested with the REQUEST-OPERATOR-ROLE command. By releasing an operator role you give up the right to enter commands protected by any of the relinquished routing codes or to receive messages distributed via one of the relinquished routing codes. You retain any other roles that were previously associated with your user ID, which means that you keep the right to enter commands that have routing codes which are included both in a role that you have relinquished and in a role that you have retained.

An operator role is a functional area and consists of a set of routing codes defined by the security administrator. This set may be any combination of the 40 routing codes available.

Once the command has been executed successfully, you are shown which operator roles are still assigned to you.

To continue receiving messages that are distributed via a routing code which you have relinquished by releasing an operator role, you must first have requested this right with the MODIFY-MSG-SUBSCRIPTION command.

The command can be issued by \$CONSOLE applications with dynamic authorization names and from user tasks with the OPERATING privilege.

If the "Operator LOGON" function is used (incompatible mode; system parameter NBCONOPI=Y), the command can also be issued at a physical operator terminal (console).

### Format

<b>RELEASE-OPERATOR-ROLE</b>
<b>OPERATOR-ROLE</b> = <u>*ALL</u> / list-poss(10): <name 1..8>

### Operands

**OPERATOR-ROLE =**

Specifies the operator roles to be relinquished by the operator's own user ID.

**OPERATOR-ROLE = \*ALL**

All operator roles that were associated with the operator's user ID up to now are relinquished.

**OPERATOR-ROLE = list-poss(10): <name 1..8>**

All operator roles specified via their names (up to 10) are relinquished by the operator's own user ID.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	NBR0986	Execution unnecessary
1	0	NBR0987	Operator ID currently has no role
2	0	NBR0990	Not all specified roles found
	1	CMD0202	Syntax error
	32	NBR0983	Internal error on command server
	64	CMD0216	No authorization
	64	NBR0981	Command cannot be issued from operator terminal in compatible mode (NBCONNOPI=N)
	64	NBR0982	Command issuer does not have an operator ID

---

## 5.10 RELEASE-SUBSYSTEM-SPACE

Release address space reserved for subsystems

**Component:** DSSM

**Functional area:** Subsystem management

**Domain:** SYSTEM-MANAGEMENT

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SUBSYSTEM-MANAGEMENT

### Function

With the RELEASE-SUBSYSTEM-SPACE command, users can dispense, for the duration of a task, with a subsystem group for which some class 5 memory was reserved using SCOPE=\*GLOBAL. As a result, the reservation of the corresponding address space is canceled and the address space can be used for other purposes.

### Format

<b>RELEASE-SUBSYSTEM-SPACE</b>
--------------------------------

<b>MEMORY-TYPE = *NON-PRIVILEGED / *BY-SLICE / *ALL</b>
---

### Operands

**MEMORY-TYPE = \*NON-PRIVILEGED / \*BY-SLICE / \*ALL**

Specifies the address space area in which the reservation of address space for subsystems is to be canceled.

**MEMORY-TYPE = \*NON-PRIVILEGED**

Cancels the reservation in the address space area below 16 MB.

**MEMORY-TYPE = \*BY-SLICE**

Cancels the reservation in the address space area above 16 MB.

**MEMORY-TYPE = \*ALL**

Cancels the reservation in the entire address space area.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	32	ESM0423	Storage space management problem
	32	ESM0424	Internal DSSM error

---

## 5.11 REMARK

Insert remarks in command file

<b>Component:</b>	SDF
<b>Functional area:</b>	Editing command files
<b>Domain:</b>	JOB PROCEDURE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SAT-FILE-MANAGEMENT SAT-FILE-EVALUATION SECURITY-ADMINISTRATION
<b>Routing code:</b>	@

### Function

The REMARK command allows remarks to be inserted in command files (ENTER or procedure files) in order to document the job or procedure run. The command is logged as entered; in interactive operation, it is only meaningful if job execution is logged on SYSLST.

The command can be issued from all operator terminals (consoles) and authorized user programs. It is also permitted for operator command files.

In programs with an SDF interface, REMARK is available as a standard statement with the same syntax and functionality.

### Format

<b>REMARK</b>
<b>TEXT</b> = <cmd-rest 0..1800>

### Operands

**TEXT = <command-rest 0..1800>**

Text of the remarks. The text can be up to 1800 characters in length.

An equals sign must not be the first significant character, as otherwise the command will be interpreted as a value assignment (SET-VARIABLE without command name). A semicolon outside parentheses is interpreted as a command separator, i.e. any subsequent characters are interpreted as the next command.

When the text is entered at the console, its length is limited to one screen line.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

---

## Example

A procedure file begins with the following commands:

```
/BEG-PROC LOG=*CMD  
/REMARK PROCEDURE FOR LINKING
```

```
...  
...
```

In the BEGIN-PROCEDURE command, the specification LOGGING=\*CMD enables output of the remark to SYSOUT. Then, when the procedure is executed, the remark is logged as follows:

```
% /REMARK PROCEDURE FOR LINKING
```

---

## 5.12 REMOVE-ACS-SYSTEM-FILE

Delete declaration of AC system file

**Component:** ACS  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** ACS-ADMINISTRATION

### Function

The REMOVE-ACS-SYSTEM-FILE command enables the ACS administrator (owner of the privilege of the same name) to delete an AC system file definition, previously made using ADD-ACS-SYSTEM-FILE. The associated real file, in which the entries are recorded, is unaffected by this action.

If the entry has the attribute SYSTEM-DEFAULT, it cannot be deleted.

### Format

<b>REMOVE-ACS-SYSTEM-FILE</b>
-------------------------------

<b>ALIAS-CATALOG-ID</b> = <composed-name 1..20>
---

### Operands

**ALIAS-CATALOG-ID = <composed-name 1..20>**

The symbolic name to be deleted, under which the AC system file is held, and which can be addressed using the LOAD-ALIAS-CATALOG command. The ACS administration can use SHOW-ACS-SYSTEM-FILES to request that a list of all the available AC system files is displayed.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed correctly
2	0	ACS0012	Warning: AC system file not found
	32	CMD0221	Internal error
	64	ACS0013	Error: AC system file with SYSTEM-DEFAULT attribute cannot be deleted

---

## 5.13 REMOVE-ALIAS-CATALOG-ENTRY

Delete entry from alias catalog

**Component:** ACS

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The REMOVE-ALIAS-CATALOG-ENTRY command allows the user to delete entries from the task-specific alias catalog. Protected entries cannot be deleted. If a HOLD-ALIAS-SUBSTITUTION command was issued to halt the alias substitution function, that command will remain in effect even if the last entry in the alias catalog is deleted with REMOVE-ALIAS-CATALOG-ENTRY.

### Format

<b>REMOVE-ALIAS-CATALOG-ENTRY</b>
<b>ALIAS-FILE-NAME</b> = *ALL / <filename 1..54 with-wild(80)>
, <b>SELECT</b> = *ALL / *USER-ENTRIES / *SYSTEM-ENTRIES

### Operands

**ALIAS-FILE-NAME** = \*ALL / <filename 1..54 with-wild(80)>

The aliases contained in the AC entries to be deleted.

**ALIAS-FILE-NAME** = \*ALL

Selects and deletes all AC entries matching the type specified in the SELECT operand.

**ALIAS-FILE-NAME** = <filename 1..54 with-wild(80)>

Selects and deletes all AC entries that have aliases which match the specified pattern string and the type specified in the SELECT operand.

**SELECT** = \*ALL / \*USER-ENTRIES / \*SYSTEM-ENTRIES

Selects AC entries for deletion on the basis of their type (user or system entries)

**SELECT** = \*ALL

Selects and deletes both user entries and system entries of the alias catalog.

**SELECT** = \*USER-ENTRIES

Selects and deletes only the user entries of the alias catalog.

**SELECT** = \*SYSTEM-ENTRIES

Selects only the system entries of the alias catalog for deletion.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed normally
1	0	CMD0001	No action (e.g. AC entry does not exist)
	32	CMD0221	Internal error
	64	ACS0017	Error: alias catalog not available
	64	ACS0029	Command not permitted
	128	ACS0018	ACS is not available
	130	ACS0036	Resource bottleneck

## Examples

For examples, see the ADD-ALIAS-CATALOG-ENTRY and LOAD-ALIAS-CATALOG commands.

---

## 5.14 REMOVE-ASE-ELEMENT

Delete ASE element

**Component:** ASE  
**Functional area:** Error logging  
**Domain:** ERROR-LOGGING  
**Privileges:** TSOS

### Function

This command can be used to delete either a particular ASE element or all defined ASE elements.

### Format

<b>REMOVE-ASE-ELEMENT</b>
<b>ELEMENT-ID</b> = <x-text 2..2> / *ALL

### Operands

**ELEMENT-ID = <x-text 2..2> / \*ALL**

Specifies the ASE element to be deleted. The ASE element is specified by means of its element ID, which is output when the element is declared. The element ID can, if required, also be ascertained in the output of the SHOW-ASE-ELEMENT command. \*ALL causes all ASE elements to be deleted.

### Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
	1	ASE0010	Syntax error
	32	CMD0221	System error
	64	ASE0011	Semantic error

---

## 5.15 REMOVE-CE-LOCK

Remove catalog entry lock

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
FILE-GENERATION  
**Privileges:** TSOS

### Function

The systems support staff can remove the catalog entry lock of a file or job variable using the REMOVE-CE-LOCK command.

The system determines whether a lock exists for the catalog entry (CE lock) of a file or a job variable, and if so, the lock holder's task is determined. If the task no longer exists or if it is pending indefinitely, the CE lock is hung up and cannot be released. This can be caused, for instance, by an error in system communication, in which case the CE lock is removed.

If the lock holder's task is in another state, the CE lock cannot be removed and the command is rejected. Systems staff will then have to check whether the task can be terminated (e.g. using CANCEL-JOB). The task's TID and the sysid of the system on which the task is processing can be obtained using the SHOW-CE-LOCK command.

For shared pubsets, the command can be issued from any system within the network.

### Format

<b>REMOVE-CE-LOCK</b>
<b>FILE-NAME</b> = <filename 1..54>
<b>,OBJECT</b> = * <u>FILE</u> / *JV

### Operands

**FILE-NAME = <filename 1..54>**

Name of the file or job variable for which a CE lock is to be removed. The path name has to be specified completely, i.e. including the catalog and the user ID. Specification of a file generation must not be relative.

**OBJECT = \*FILE / \*JV**

Specifies whether the command is to be executed for the catalog entry of a file or of a job variable.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	DMS1342	No catalog entry lock
	1	CMD0202	Syntax error
	32	CMD0221	Internal error
	64	CMD0216	No authorization
	64	CMD0501	Catalog not available
	64	DMS0505	Communication error
	64	DMS0512	Catalog unknown in system
	64	DMS1343	Master change underway for pubset
	64	DMS1344	Lock holder's task still active

## 5.16 REMOVE-CHANGE-DATE

Remove changeover time

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** TSOS

### Function

The REMOVE-CHANGE-DATE command removes the latest future changeover time from standard daylight time to daylight saving time (or vice versa).

The changeover time to be removed may not be within the next hour or the next hour but one. If it is in the next hour but one, it can be changed using the MODIFY-CHANGE-DATE command.

**i** The REMOVE-CHANGE-DATE command removes the changeover time for the current session. If required, also remove the changeover time in the GTIME parameter set of the startup parameter file (for future sessions).

### Format

**REMOVE-CHANGE-DATE**

**DATE = \*LATEST**

### Operands

**DATE = \*LATEST**

The latest future changeover time is to be removed.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CHD0010	Syntax error in the command
	32	CMD0221	System error in the command
	64	CHD0011	Semantic error in the command

---

## 5.17 REMOVE-CJC-ACTION

Cancel effect of CJC command sequence

**Component:** JV

**Functional area:** Job variables

**Domain:** JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

This function is available to the user only if the chargeable software product JV has been loaded as a subsystem.

### Function

The user can use the REMOVE-CJC-ACTION command to cancel any ADD-CJC-ACTION commands initiated during the currently executing job and still in effect.

An ADD-CJC-ACTION command can be identified either via the CJC name assigned by the user or via the internal identification assigned by the system.

The user can check with the SHOW-CJC-STATUS command whether there are any remaining ADD-CJC-ACTION commands still in effect under his or her user ID.

### Format

**REMOVE-CJC-ACTION**

**IDENTIFICATION = \*NAME(...) / \*NUMBER(...) / \*ALL**

**\*NAME(...)**

| **NAME** = <name 1..8>

**\*NUMBER(...)**

| **NUMBER** = <integer 1..9999>

### Operands

**IDENTIFICATION =**

Type of identification.

**IDENTIFICATION = \*NAME(...)**

**NAME = <name 1..8>**

Name defined in the ADD-CJC-ACTION command. Any ADD-CJC-ACTION commands with the same name are made ineffective.

---

**IDENTIFICATION = \*NUMBER(...)**

**NUMBER = <integer 1..9999>**

Identification allocated by the system for the CJC command sequence. An identification is output as soon as an ADD-CJC-ACTION command takes effect (i.e. following input of the END-CJC-ACTION command). The ADD-CJC-ACTION command to which the identification was assigned becomes ineffective.

**IDENTIFICATION = \*ALL**

All ADD-CJC-ACTION commands which are still in effect and were defined during the current job become ineffective.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed; specified ADD-CJC-ACTION name deleted or not found.
	1	CMD0202	Syntax error

---

## 5.18 REMOVE-CONSOLE-FILTER

Cancel filter settings

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** not allocated  
**Privileges:** OPERATING  
**Routing code:** @

### Function

The REMOVE-CONSOLE-FILTER command allows operators to cancel filter settings for some or all routing codes. If filter levels have been predefined in the OPR parameter service for the issuing console (operator terminal) or for the issuing authorized user program with generated authorization name, these filter levels are restored to the condition they were in following system initialization.

Note that issuing this command will result in an appreciable increase in the volume of message output. The command applies only to the console or authorized user program from which it was issued.

*Utilization in a user task with the OPERATING privilege*

Like any operator terminal, the user task can reset the filter levels purely for itself. The filter levels then apply only to event stream read operations.

When the user task terminates, all the filter levels that it has set are reset.

This function is available irrespective of system parameter settings.

### Format

#### REMOVE-CONSOLE-FILTER

**FILTER** = \*ALL / list-poss(5): <integer 1..5>

,**ROUTING-CODE** = \*ALL / list-poss(40): <alphanum-name 1..1> / \*

### Operands

**FILTER = \*ALL / list-poss(5): <integer 1..5>**

Defines which filter levels are to be cancelled or restored to the condition they were in following system initialization.

**FILTER = \*ALL**

Cancels all filter levels or restores them to the condition they were in following system initialization.

**FILTER = list-poss(5): <integer 1..5>**

Cancels the specified filter levels or restores them to the condition they were in following system initialization.

**ROUTING-CODE = \*ALL / list-poss(40): <alphanum-name 1..1> / \***

There are 40 routing codes. The filter levels specified in the FILTER operand are cancelled (or restored to the condition they were in following system initialization) for the routing codes specified here.

---

**ROUTING-CODE = \*ALL**

All 40 routing codes are affected by the change.

**ROUTING-CODE = list-poss(40): <alphanum-name 1..1> / \***

The routing codes explicitly specified here are affected by the change.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	1	CMD0202	Syntax error in command
	2	CMD0198	Shutdown in progress
	64	CMD0216	User does not have the necessary privilege
	130	NBR1042	Not enough class 5 memory; filter levels cannot be modified

**Note**

To reallocate a filter level to a routine code you use the ADD-CONSOLE-FILTER command.

For further information on routing codes and filter levels see the manual "Introduction to System Administration" [14].

---

## 5.19 REMOVE-CRYPTO-PASSWORD

Remove crypto password from the job's crypto password table

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION  
HARDWARE-MAINTENANCE

### Function

The REMOVE-CRYPTO-PASSWORD command removes one, several or all crypto passwords from the crypto password table of a job. All passwords which are not explicitly removed with the command are automatically deleted at the end of the job.

Each time a crypto password is removed without error the counter for the number of crypto passwords in the crypto password table is decremented.

Crypto passwords can be up to 8 characters long. Crypto passwords with less than 8 characters are stored left-justified within the system and filled with binary zeros. This means that the two crypto passwords C'ABCD' and C'ABCD'BLANK"BLANK"BLANK"BLANK" which are specified in the form of a C string are not identical, and owing to the different internal representation two different crypto passwords are calculated by the cryptographic algorithm:

<code>/rem-crypto-password c'ABCD'</code>	<b>internal:</b>	<code>X'C1C2C3C400000000'</code>
<code>/rem-crypto-password c'ABCD'</code>	<b>internal:</b>	<code>X'C1C2C3C440404040'</code>

The message DMS06DC notifies the caller that a specified crypto password could not be found in the crypto password table.

For information on encrypting files, see also the "Introductory Guide to DMS" [13].

### *REMOTE-FILE-ACCESS*

The REMOVE-CRYPTO-PASSWORD command is automatically forwarded to all RFA partner processes by the requesting job.

### Format

**REMOVE-CRYPTO-PASSWORD**

Alias: **RMCPW**

**PASSWORD** = \*ALL / \*SECRET / list-poss(20): <c-string 1..8> / <x-string 1..16>

---

## Operands

**PASSWORD = \*ALL / \*SECRET / list-poss(20): <c-string 1..8> / <x-string 1..16>**

Passwords which are to be removed from the crypto password table.

Up to 20 crypto passwords can be specified in a command. The specification is not case sensitive.

The PASSWORD operand has the following special features:

- The value entered is not logged.
- In guided dialog, the entry field is automatically blanked out.
- If \*SECRET or ^ is specified, in unguided dialog and in foreground procedures SDF provides a nondisplaying entry field for concealed entry of the password.

**PASSWORD = \*ALL**

All entries are removed from the job's crypto password table.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntactical or semantic error in the command
	32	DMS05C7	Unexpected error in DMS
	64	DMS066A	Specified crypto password cannot be used
	64	DMS0691	Crypto password table at maximum size
	64	DMS0692	Maximum number of crypto passwords per task reached
	64	DMS06FF	BCAM connection severed
	130	DMS0594	Not enough virtual memory available

---

## 5.20 REMOVE-DCAM-APPLICATION-LINK

Remove specifications for DCAM application from CLT

**Component:** DCAM

**Functional area:** Data communication control

**Domain:** NETWORK-MANAGEMENT

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE

### Function

The REMOVE-DCAM-APPLICATION-LINK command deletes specifications for a DCAM application from the CLT (communication link table) of the current job. Users can store specifications for a DCAM application in the CLT using the SET-DCAM-APPLICATION-LINK command.

### Format

<b>REMOVE-DCAM-APPLICATION-LINK</b>
-------------------------------------

<b>LINK-NAME</b> = <name 1..8>
--------------------------------

### Operands

**LINK-NAME = <name 1..8>**

Link name assigned to the CLT entry to be removed.

### Return codes

The command provides no command-specific command return codes (see [section "Return codes"](#)).

---

## 5.21 REMOVE-DCAM-CONNECTION-LINK

Remove virtual DCAM connection from CLT

**Component:** DCAM  
**Functional area:** Data communication control  
**Domain:** NETWORK-MANAGEMENT  
**Privileges:** STD-PROCESSING

### Function

The REMOVE-DCAM-CONNECTION-LINK command deletes specifications for a virtual DCAM connection from the CLT (communication link table) of the current job.

Users can store specifications for a virtual DCAM connection in the CLT using the SET-DCAM-CONNECTION-LINK command.

### Format

<b>REMOVE-DCAM-CONNECTION-LINK</b>
------------------------------------

<b>LINK-NAME</b> = <name 1..8>
--------------------------------

### Operands

**LINK-NAME = <name 1..8>**

Link name assigned to the CLT entry to be removed.

### Return codes

The command provides no command-specific command return codes (see [section "Return codes"](#)).

---

## 5.22 REMOVE-DEVICE-CONNECTION

Clear virtual connections

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Device management
<b>Domain:</b>	DEVICE
<b>Privileges:</b>	OPERATING
<b>Routing code:</b>	G

### Function

This command enables the operator to clear virtual connections between the hardware units (CHN, CTL, DVC) from the system, i.e. to prevent the system from using these connections.

Information on existing connections is displayed by the SHOW-DEVICE-CONFIGURATION command.

#### *Effect of the REMOVE-DEVICE-CONNECTION command*

1. If permitted, each of the specified connections changes to the status REMOVED EXPLICITLY. They cannot be used.
2. Every outer unit affected which does not have an inner connection in the status INCLUDED changes to the status DETACHED IMPLICITLY. None of these units can be used.
3. The connections of the outer hardware units which, as described in the preceding point, have the status DETACHED IMPLICITLY change to the status REMOVED IMPLICITLY. These connections cannot be used.
4. In the case of disk or tape devices which are able to form path groups, the path group is cleared.

## Format

### REMOVE-DEVICE-CONNECTION

**FROM** = \*CHANNEL(...) / \*CONTROLLER(...) / list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

\*CHANNEL(...)

|   **CHANNEL-PATH-ID** = list-poss(8): <x-text 2..2>

\*CONTROLLER(...)

|   **CONTROLLER-UNIT** = list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

,**TO** = \*CHANNEL(...) / \*CONTROLLER(...) / list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

\*CHANNEL(...)

|   **CHANNEL-PATH-ID** = list-poss(8): <x-text 2..2>

\*CONTROLLER(...)

|   **CONTROLLER-UNIT** = list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

,**SCOPE** = \*OWN-SYSTEM-ONLY / \*VM2000-GLOBAL

,**FORCE** = \*STD / \*YES / \*NO(...)

\*NO(...)

|   **WAIT** = \*NO / \*STD / <integer 1..32767>(...)

|                   <integer 1..32767>(...)

|                   |   **DIM** = \*STD / \*MIN / \*SEC

## Operands

### FROM =

Identifies the virtual connection to be cleared via one of the delimiting hardware units. The direction in which the virtual connection is removed is not predefined. FROM therefore does not have to be the inner and TO the outer unit.

### FROM = \*CHANNEL(...)

Defines the virtual connection to be cleared in terms of a specific channel.

#### **CHANNEL-PATH-ID** = list-poss(8): <x-text 2..2>

Specifies the channel path ID of the channel that delimits the virtual connection. A maximum of 8 channels can be specified.

### FROM = \*CONTROLLER(...)

Defines the virtual connection to be cleared in terms of a specific controller.

---

**CONTROLLER-UNIT = list-poss(8): <alphanum-name 2..2> / <x-text 4..4>**

Specifies the mnemonic device code (MN) of the controller that delimits the virtual connection. A maximum of 8 controllers can be specified.

**FROM = list-poss(8): <alphanum-name 2..2> / <x-text 4..4>**

Defines the virtual connection to be cleared in terms of a specific device. A maximum of 8 devices (mnemonic device codes) can be specified.

**TO = \*CHANNEL(...) / \*CONTROLLER(...) / list-poss(8): <alphanum-name 2..2> / <x-text 4..4>**

Defines the virtual connection to be cleared in terms of the other delimiting hardware unit. This unit, the second element of the pair (virtual connection), is specified according to the FROM operand.

**SCOPE =**

Specifies how the command is to be executed under VM2000.

**SCOPE = \*OWN-SYSTEM-ONLY**

The command is only executed in the local system.

**SCOPE = \*VM2000-GLOBAL**

If entered at the Monitor System (VM1), the command is executed at all guest systems running BS2000/OSD >= V5.0.

If entered at another guest system, the command is rejected with message NKR0178.

**FORCE =**

Specifies the execution mode for REMOVE-DEVICE-CONNECTION.

**FORCE = \*STD**

Immediate execution of the reconfiguration job is only required if the outer units involved are not being used. A wait time of up to 15 minutes may elapse for release of the units. During the wait time the connection is in the REMOVE-PENDING state. If the unit is released in under 15 minutes, the connection switches to the REMOVED state, otherwise it switches to the INCLUDED state.

**FORCE = \*YES**

The reconfiguration job is to be executed immediately.

**FORCE = \*NO(...)**

Immediate execution of the reconfiguration job is only required if the outer units involved are not being used. Otherwise, the time specified in the WAIT operand must elapse before the units are released, and the virtual connection then switches to the REMOVE-PENDING state. If the units are released within the specified period, the connection switches to the REMOVED state; if not, it switches to the INCLUDED state.

**WAIT =**

Specifies the maximum wait time for execution of the reconfiguration job in execution mode FORCE=\*NO.

**WAIT = \*NO**

No maximum wait time is specified for execution of the reconfiguration job.

**WAIT = \*STD**

The maximum wait time for execution of the reconfiguration job is set to 15 minutes.

**WAIT = <integer 1..32767>(…)**

Specifies the maximum wait time.

**DIM =**

Specifies whether the value defined for the wait time is to be interpreted in minutes or seconds.

**DIM = \*STD**

Wait time as for DIM=\*MIN.

**DIM = \*MIN**

Specifies the maximum wait time in minutes.

Possible values: 1 <= <integer> <= 546

**DIM = \*SEC**

Specifies the maximum wait time in seconds.

Possible values: 1 <= <integer> <= 32767

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
4	64	NKR0...	Path already detached
12	64	NKR0...	Internal check negative
16	64	NKR0...	Caller error
20	64	NKR0...	Software error

*Note*

If there is an error in command termination, the maincode contains the message code of the message output during command processing.

**Notes**

- If a reconfiguration job cannot be executed with FORCE=\*NO within the specified wait time, it is rejected with the following message:

```
NKR0037 mn MAY CURRENTLY NOT BE DETACHED
```

```
NKR0059 mn1/mn3 REMOVE REJECTED
```

In this case the operator should either:

- ask for more detailed information using the SHOW command, terminate tasks which have reserved the device, or assign other devices,
- or repeat the reconfiguration job in execution mode FORCE=\*YES.
- A reconfiguration job is not executed, regardless of the execution mode, if the last path to a unit absolutely essential for the system is affected (see DETACH-DEVICE, note 2).
- The status REMOVE PENDING can be terminated by means of the appropriate command  

```
INCLUDE-DEVICE-CONNECTION or REMOVE-DEVICE-CONNECTION . . . ,FORCE=*YES
```
- For magnetic tape controllers with two channel ports or for dual magnetic tape controllers, paths that are physically not available should also be logically removed. Otherwise, path handling by the system could cause an error.

---

## Examples

1. Detach the connections between devices Y1, Y2, Y3 and the controller Z4, if permissible (default wait time)

```
/REMOVE-DEVICE-CONNECTION FROM=(Y1,Y2,Y3),TO=*CONTROLLER(Z4),FORCE=*NO
```

or

```
/REM FROM=(Y1,Y2,Y3),TO=*CON(Z4)
```

2. Clear the connection between device D1 and controller Z5 immediately

```
/REMOVE-DEVICE-CONNECTION FROM=D1,TO=*CONTROLLER(Z5),FORCE=*YES
```

or

```
/REM FROM=D1,TO=*CON(Z5),FORCE=*Y
```

3. Clear the connections between devices L1 and L2 and channels 10 and 40.

```
/REMOVE-DEVICE-CONNECTION FROM=(L1,L2),TO=*CHANNEL((10,40)),FORCE=*YES
```

or

```
/REM FROM=(L1,L2),TO=*CH((10,40)),FORCE=*Y
```

---

## 5.23 REMOVE-DEVICE-DEPOT

Cancel assignments of tape devices to depots

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** T

### Function

The REMOVE-DEVICE-DEPOT command is used to cancel the assignment of tape devices to depots created by means of the ADD-DEVICE-DEPOT command. This command can only be processed successfully if the device is DETACHED or not used. Otherwise, message NKG0010 is issued. If UNIT-\*ALL is specified, no device with that depot may be allocated. Otherwise, message NKG0009 is issued.

### Format

**REMOVE-DEVICE-DEPOT**

**UNIT** = \*ALL / list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>

,**LOCATION** = \*ALL / <alphanum-name 1..8>

### Operands

#### **UNIT =**

Specifies one or more (up to 10) tape devices whose assignment to a depot is to be canceled.

As soon as the last device has been removed from a depot, all information on the depot involved is deleted implicitly.

#### **UNIT = \*ALL**

All device assignments to the specified depot are to be canceled.

#### **UNIT = list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>**

The assignment of the devices identified by their mnemonic names to the specified depot is to be canceled. A maximum of 10 devices may be specified.

#### **LOCATION =**

Specifies the depot for which the assignment of the specified devices (UNIT operand) is to be canceled.

#### **LOCATION = \*ALL**

The assignment of the specified devices (UNIT operand) is to be canceled for all known depots.

#### **LOCATION = <alphanum-name 1..8>**

Name of the depot for which the assignment of the specified devices (UNIT operand) is to be canceled.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	NKV0001	Syntax error
	64	NKV0004	Command partially processed
	64	NKV0005	Command not processed for an object
	64	NKV0006	Command not processed
	130	NKVT002	Tape monitor not available

---

## 5.24 REMOVE-FILE-ALLOCATION-LOCKS

Cancel file lock

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION  
TSOS

### Function

The command REMOVE-FILE-ALLOCATION-LOCKS enables files (and also file generations or file generation groups), which have been incorrectly closed due to a system crash or aborted job, to be made accessible again. The command enables the user to cancel any file lock imposed as a result of a system crash or the abortion of a job.

A file lock can be canceled with the REMOVE-FILE-ALLOCATION-LOCKS command only if the job which produced the lock was terminated by the system with the message "TASK PENDED INDEFINITELY" on the operator's console.

For tape files which were exclusively reserved by a SECURE-RESOURCE-ALLOCATION command, the user may request the removal of the lock; for disk files, only the system administrator is authorized to do so.

The REMOVE-FILE-ALLOCATION-LOCKS command does not reconstruct the files in question. This may be initiated with the REPAIR-DISK-FILES command if required. The CHECK-FILE-CONSISTENCY command removes a file lock and check the file for inconsistencies at the same time.

#### *Concurrent copy locks*

Concurrent copy locks must not be removed unless the concurrent copy session has been completed. There are two different cases to consider:

- If both file locks and concurrent copy locks exist, the return code depends on whether it was possible to reset the file locks.
- If there is only a concurrent copy lock, the return code depends on whether it was possible to reset the lock.

#### *Privileged functions*

Systems support (TSOS privilege) can, in addition to specifying any required file, also reset the NO-OPEN-ALLOWED bit in the TSOSCAT, which prevents the file from being opened.

---

## Format

**REMOVE-FILE-ALLOCATION-LOCKS**

**FILE-NAME** = <filename 1..54> / <partial-filename 2..53>

,**SELECT** = \*ANY-VOLUME / \*PRIVATE-DISK / \*PUBLIC-DISK / \*NET-STORAGE

,**OPEN-ALLOWED** = \*UNCHANGED / \*YES

## Operands

**FILE-NAME** = <filename 1..54> / <partial-filename 2..53>

The name of the file which is locked. This may be a permanent file or a temporary one, or a file generation group or a file generation. Write access is required for files which are not under the user's own user ID.

If a partially qualified file name is specified, only the files which are identified as open will be selected. If exactly one file is specified, the file is selected without taking this identifier into account.

*For tape input files:* If the locked file was opened in INPUT or REVERSE mode, the fully qualified file name must be specified; the file lock is removed.

The following actions are performed based on the access method with which the file was created:

**PAM files:** Only the file lock is removed. If the file is identified as open, it remains open, i.e. continues to be displayed by SHOW-FILE-ATTRIBUTES with STATUS=\*PAR(CLOSED-OUTPUT=\*YES); for REPAIR-DISK-FILES, the file is still regarded as a file that needs repair. This means that it will also be listed as a file that needs reconstruction in the output of the SHOW-FILE-ATTRIBUTES command (with the STATUS=\*PAR(REPAIR-NEEDED= \*YES) option).

**SAM files:** The file lock is removed. If the file is identified as open, no privileged close operation is performed, i.e. in the case of SHOW-FILE-ATTRIBUTES with STATUS=\*PAR( CLOSED-OUTPUT=\*YES) it is still displayed; for REPAIR-DISK-FILES it is regarded as a file to be repaired. This means that it will also be listed as a file that needs reconstruction in the output of the SHOW-FILE-ATTRIBUTES command (with the STATUS=\*PAR(REPAIR-NEEDED= \*YES) option).

**ISAM files:** The file lock is removed. If the file is identified as open, the last page pointer is set to the highest PAM page written. If the file is on a mirrored disk (see the "DRV" manual [11]), the consistency (contents) of file blocks is restored if required. Inconsistencies between the index and data sections and for secondary keys are **not** detected and are **not** removed. The file is no longer regarded as a file requiring repair, i.e. will not be shown by SHOW-FILE-ATTRIBUTES with STATUS=\*PAR(REPAIR-NEEDED=\*YES).

**SELECT = \*ANY-VOLUME / \*PRIVATE-DISK / \*PUBLIC-DISK**

Restricts the files selected for closing to the specified volume type. This operand is only meaningful if FILE-NAME was a partially qualified name, or the name of a file generation group.

**SELECT = \*ANY-VOLUME**

The specified files will be selected, irrespective of the volume on which they are held.

**SELECT = \*PRIVATE-DISK**

Of the specified files, those which are held on private disk will be selected.

**SELECT = \*PUBLIC-DISK**

Of the specified files, those which are held on public disk will be selected.

**SELECT = \*NET-STORAGE**

Of the specified files, those which are held on Net-Storage volume will be selected.

**OPEN-ALLOWED = \*UNCHANGED / \*YES**

This parameter enables systems support to specify that the NO-OPEN-ALLOWED bit in the catalog entry, which prevents a file from being opened, is reset for the specified file. The file can subsequently be opened again.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	CMD0001	No action required
2	0	DMS06E6	File specified in command is empty
2	0	DMS06E9	No valid record found during reconstruction of ISAM file
2	0	DMS06ED	Error on writing unrecoverable blocks to scratch file
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0533	Requested file not cataloged in pubset
	64	DMS0535	Specified file not shareable
	64	DMS055C	Catalog entry not found on assigned private disk
	64	DMS0583	An error occurred when reconstructing the file
	64	DMS0585	Error detected during catalog processing or multihost processing
	64	DMS0586	Currently not possible to access or reserve volume
	64	DMS0587	Use of specified command restricted by system administrator
	64	DMS0588	It was not possible to allocate disk space
	64	DMS05F8	It was not possible to allocate disk space Guaranteed message: DMS05F8
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0609	No access to system file
	64	DMS0609	No access to system file

	64	DMS06CC	No file corresponding to the specified operands
	64	DMS06E4	Reconstruction with specified command not possible for this file type
	64	DMS06FF	Reconstruction for this file type not possible with specified command
	64	DMS06FF	File created with WROUT=NO. Consistency check is not practical
	130	DMS0524	System address space full
	130	DMS053C	No space in pubset catalog file
	130	DMS0582	File is currently locked or in use and cannot be processed
	130	DMS0585	Error detected during catalog processing or multihost processing
	130	DMS0586	Currently not possible to access or reserve volume
	130	DMS0588	It was not possible to allocate disk space
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

---

## 5.25 REMOVE-FILE-LINK

Delete TFT entry

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT

### Function

The REMOVE-FILE-LINK command deletes the entry with the specified file link name from the Task File Table (TFT) and releases all the private volumes and devices linked to the name. The reservation is also canceled for any files which were exclusively reserved using the SECURE-RESOURCE-ALLOCATION command. The command will be ignored if the TFT entry referred to is still locked by a LOCK-FILE-LINK, and will only be executed when this lock is canceled by an UNLOCK-FILE-LINK command (or at LOGOFF time).

The user can specify whether:

- the task for tape devices is to retain an NDM-internal device type reservation (RELEASE-DEVICE),
- tapes which were reserved for the file are to be released (UNLOAD-RELEASED-TAPE).

Default: devices are released, but tapes remain reserved.

If the TFT entry which is to be canceled is linked to a TST entry, the file counter in the TST entry is decremented by 1. As soon as this reaches the value 0, the TST entry is deleted, and DMS releases all the devices linked to this TST entry. As long as the TST entry is still linked to at least one TFT entry (file counter > 0), DMS will only release those devices which were requested for the TFT entry named in the REMOVE-FILE-LINK command.

If the TFT entry which is to be canceled does not point to a TST entry, all the devices linked to the TFT entry will be released.

### Format

<b>REMOVE-FILE-LINK</b>	Alias: <b>RMFL</b>
<b>LINK-NAME</b> = * <u>FIRST-BLANK</u> / <filename 1..8 without-gen with-wild(80)>	
, <b>RELEASE-DEVICE</b> = * <u>YES</u> / * <b>NO</b>	
, <b>UNLOAD-RELEASED-TAPE</b> = * <u>NO</u> / * <b>YES</b>	
, <b>SUPPRESS-ERRORS</b> = * <u>NONE</u> / * <b>LINK-NAME-NOT-FOUND</b>	

---

## Operands

**LINK-NAME = \*FIRST-BLANK / <filename 1..8 without-gen with-wild(80)>**

The file link name of the TFT entry which is to be deleted.

**LINK-NAME = \*FIRST-BLANK**

If \*FIRST-BLANK is specified, the first TFT entry whose file link name consists of spaces will be processed.

**LINK-NAME = <filename 1..8 without-gen with-wild(80)>**

The file link name of the TFT entry which is to be deleted.

Use of wildcards allows more than one TFT entry to be specified. If the first character in a wildcard sequence is "\*", it must be followed by at least one other wildcard character.

**RELEASE-DEVICE = \*YES / \*NO**

Specifies whether an NDM-internal device type reservation is to be retained when tapes of the task are released. The reservation can then be used to request a device again. The reservation can be displayed using the SHOW-RESOURCE-ALLOCATION command and deleted with the SECURE-RESOURCE-ALLOCATION command.

**RELEASE-DEVICE = \*YES**

When a tape is released an NDM-internal device type reservation is not retained.

**RELEASE-DEVICE = \*NO**

When a tape is released an NDM-internal device type reservation is retained.

**UNLOAD-RELEASED-TAPE = \*NO / \*YES**

Specifies whether the tapes which were linked to this TFT entry are to be released.

**UNLOAD-RELEASED-TAPE = \*NO**

The tapes to be released will not be unloaded.

**UNLOAD-RELEASED-TAPE = \*YES**

The tapes to be released will be unloaded.

If the job requires to access these volumes again, they will have to be requested again.

### *Note*

If there are several active files on a tape which is being released, then this volume will not actually be released until a REMOVE-FILE-LINK command has been issued for each of the active files.

**SUPPRESS-ERRORS = \*NONE / \*LINK-NAME-NOT-FOUND**

Specifies which errors are to be suppressed.

**SUPPRESS-ERRORS = \*NONE**

All errors lead to the DMS error messages provided and, in non-S and ENTER procedures, trigger the spin-off mechanism, and, in S procedures, SDF-P error handling.

**SUPPRESS-ERRORS = \*LINK-NAME-NOT-FOUND**

If no TFT entry is found in the LINK-NAME operand, the command is executed as though no error had occurred: no error message is issued, and the spin-off mechanism and SDF-P error handling are not triggered.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	CMD0001	No action required
2	0	DMS059C	In conjunction with wildcards: not all the selected TFT entries can be deleted
	1	CMD0202	Syntactical or semantic error in command
	130	DMS0582	File is currently locked or being used and cannot be processed

## Example

See the LOCK-FILE-LINK command.

---

## 5.26 REMOVE-IO-UNIT

Remove input/output unit from configuration

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** G

### Function

Using the REMOVE-IO-UNIT command, systems support staff can dynamically remove input/output devices from a configuration. Input/output units (devices, controllers, channels) that are DETACHED can be removed from the configuration in this process. If an “internal” unit is removed (channel or controller), the system implicitly also removes the relevant “external” devices (controllers or devices), provided they are not allocated to some other “internal” unit. Input/output devices have to be removed in the order device -> controller -> channel.

The command is only accepted if the dynamic I/O configuration change was started successfully (see START-CONFIGURATION-UPDATE command).

### Format

#### REMOVE-IO-UNIT

**UNIT** = \*CHANNEL(...) / \*CONTROLLER(...) / \*DEVICE(...)

\*CHANNEL(...)

|     **NAME** = <alphanum-name 2..3>

\*CONTROLLER(...)

|     **NAME** = <alphanum-name 2..2> / <x-text 4..4>

\*DEVICE(...)

|     **NAME** = <alphanum-name 2..2> / <x-text 4..4>

### Operands

**UNIT** = \*CHANNEL(...) / \*CONTROLLER(...) / \*DEVICE(...)

Specifies the input/output units to be removed from the configuration.

**UNIT** = \*CHANNEL(...)

Specifies a channel to be removed from the configuration. Controllers and devices that can only be accessed through this channel are implicitly removed along with the channel.

**NAME** = <alphanum-name 2..3>

Mnemonic device code of a channel.

**UNIT = \*CONTROLLER(...)**

Specifies a controller to be removed from the configuration. Devices that can only be accessed via this controller are implicitly removed along with it.

**NAME = <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device code of a controller.

**UNIT = \*DEVICE(...)**

Name of the device to be removed from the configuration.

**NAME = <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device code.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	NKR0006	Syntax error
	64	CMD0216	No authorization
1	64	NKR0169	System error
2	64	NKR0169	Wrong parameter
3	64	NKR0169	Dynamic I/O configuration change was rejected
4	64	NKR0169	Dynamic I/O configuration change not supported
5	64	NKR0169	Input/output unit not removed
9	64	NKR0169	Input/output unit not defined
11	64	NKR0169	Path to input/output unit not removed
12	64	NKR0169	Dynamic I/O configuration change was not started
14	64	NKR0169	Configuration changes not completed in the guest system
16	64	NKR0169	Another guest system is being started
17	64	NKR0169	Another guest system is being terminated
18	64	NKR0169	Dynamic I/O configuration change not supported by one or several guest systems

---

## 5.27 REMOVE-ISAM-POOL-LINK

Delete pool link name

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING

### Function

The REMOVE-ISAM-POOL-LINK command enables the user to delete one particular pool link name, or all of them, from the pool table for the job. The command will only be executed fully if the files which were originally linked with these pool link names have been correctly closed; for any pool link names which are linked to open files, DMS will issue an error message.

The ADD-ISAM-POOL-LINK command enters a pool link name for an ISAM pool into the pool table of the task. Entries in the pool table can be displayed by using the SHOW-ISAM-POOL-LINK command.

For a full description of the ISAM pool see the “Introductory Guide to DMS” [13].

### Format

<b>REMOVE-ISAM-POOL-LINK</b>
------------------------------

<b>LINK-NAME</b> = <name 1..8> / *ALL
---------------------------------------

### Operands

**LINK-NAME = <name 1..8> / \*ALL**

Specifies which pool link name is to be deleted from the pool table.

**LINK-NAME = <name 1..8>**

The pool link name LINK-NAME, which was allocated to an ISAM pool using an ADD-ISAM-POOL-LINK command, will be deleted.

**LINK-NAME = \*ALL**

All the pool link names for the task are to be deleted. If any pool link name is still linked to a file which is open, a corresponding error message will be output, and the other pool link names will be deleted.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	64	DMS0A17	Internal system error
	64	DMS0A0E	Syntax error in ISAM pool command
	64	DMS0A11	Specified catalog ID does not exist
	64	DMS0A13	Specified pool name is syntactically invalid
	64	DMS0A1A	Pool links to ISAM pool still exist
	64	DMS0A1B	Specified pool link name does not exist
	130	DMS0A12	Specified catalog ID not available

## Example

See the ADD-ISAM-POOL-LINK command.

---

## 5.28 REMOVE-JV-LINK

Delete JV-LINK entries

**Component:** JV

**Functional area:** Job variables

**Domain:** JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** \$ (with NBCONOPI=N) or J (with NBCONOPI=Y)

This command is available only to users who have the chargeable software product JV loaded as a subsystem.

### Function

The REMOVE-JV-LINK command deletes one or all entries in the JV-LINK table. The user selects the entry to be deleted by specifying the link name. If all entries are to be deleted, the user is prompted in dialog mode by message JVS0457 to confirm this request.

The user can obtain information on existing JV-LINK entries by entering the SHOW-JV-LINK command

### Format

<b>REMOVE-JV-LINK</b>	Alias: <b>RMJVL</b>
-----------------------	---------------------

<b>LINK-NAME</b> = <b>*ALL</b> / <alphanum-name 1..7>
---

### Operands

**LINK-NAME** = **\*ALL** / <alphanum-name 1..7>

Link name of the JV whose JV-LINK entries are to be deleted. Specifying \*ALL causes all entries to be deleted. To delete all entries, the user must confirm his or her choice a second time in the dialog (by answering "Y" or "N" to message JVS0457).

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	CMD0001	No action necessary
2	0	CMD0001	Command executed with a warning
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JVS04E0	Command not executable in the call environment; if possible, remove cause of error (see SYSOUT message JVS04xx)
	130	JVS04E1	Command cannot be executed at this time; for cause see SYSOUT message JVS04xx
	130	CMD2282	Subsystem JV not available for indefinite time

---

## 5.29 REMOVE-MASTER-CATALOG-ENTRY

Delete entry from MRSCAT of home pubset

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS  
**Routing code:** \$

### Function

The relevant pubset must be set to “inaccessible”, otherwise the command is rejected.

Once the entry has been deleted, the pubset can no longer be identified. A new catalog ID can be entered by systems support using the ADD-MASTER-CATALOG-ENTRY command.

### Format

<b>REMOVE-MASTER-CATALOG-ENTRY</b>
<b>ENTRY-NAME</b> = <cat-id 1..4>
<b>,VOLUME-SET-ENTRIES</b> = <u>*REMOVE</u> / *KEEP

### Operands

**ENTRY-NAME = <cat-id 1..4>**

Identifies the MRSCAT entry which is to be deleted.

**VOLUME-SET-ENTRIES = \*REMOVE / \*KEEP**

Governs whether deletion of the MRSCAT entry for a system-managed pubset (SM pubset) also means deletion of the associated volume set entries.

**VOLUME-SET-ENTRIES = \*REMOVE**

When the MRSCAT entry for an SM pubset is deleted, the associated volume set entries are to be deleted as well.

**VOLUME-SET-ENTRIES = \*KEEP**

Only the MRSCAT entry for an SM pubset is to be deleted, not the associated volume set entries.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	CMS0312	MRSCAT entry not found
2	0	CMS0002	Disk error
	1	CMS0011	Syntax error
	1	CMS0314	Syntax error in entry name or error in wildcard specification
	32	CMS0001	Error in SLOT Manager
	32	CMD0221	Internal system error
	32	CMS031F	MRSCAT parameter error
	32	CMS0310	Error during privilege checking
	32	CMS0317	Locked MRSCAT entry cannot be released
	32	CMS0318	Synchronization error due to task lock manager problem
	64	CMS0010	Command reserved for systems support
	130	CMS0003	MRSCAT entry cannot be deleted because pubset is occupied

---

## 5.30 REMOVE-NET-STORAGE-VOLUME

Remove a Net-Storage volume from a local pubset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Net-Storage administration
<b>Domain:</b>	STORAGE-MANAGEMENT
<b>Privileges:</b>	TSOS

### Function

The REMOVE-NET-STORAGE-VOLUME removes a Net-Storage volume from a local pubset.

By default, the command is executed only if the directory concerned on the Net-Storage contains no (more) BS2000 files.

The following actions are performed here:

1. The management files (catalog and FSL files) in the directory are deleted.
2. Then the directory is deleted.

Optionally the command can also be executed if the directory still contains cataloged BS2000 files. The specification in the FILES-ON-VOLUME operand determines the procedure for the BS2000 files:

- **\*EXPORT:**  
The BS2000 files are exported (as with the EXPORT-FILE command). The directory and the files on the Net-Storage remain unchanged and can, if required, once again be added to a pubset as a Net-Storage volume.
- **\*DELETE:**  
If there are no inconsistencies, the existing BS2000 files, the management data and the directory are deleted. If there are inconsistencies, command execution can be forced with the FORCE=\*YES operand.

Information on the Net-Storage available in BS2000 can be requested using the SHOW-NET-STORAGE command. Information on the Net-Storage assigned to a pubset can be requested using the SHOW-PUBSET-NET-STORAGE command.

Fundamental information on the use of Net-Storage in BS2000 is provided in the “Introduction to System Administration” [14]. How to work with files on Net-Storage is described in the “Introductory Guide to DMS” [13].

---

## Format

### REMOVE-NET-STORAGE-VOLUME

```
VOLUME = *STD / <vsn 6..6>
,PUBSET = <cat-id 1..4>
,FILES-ON-VOLUME = *REJECT / *EXPORT / *DELETE(...)
    *DELETE(...)
        | FORCE = *NO / *YES
```

## Operands

### **VOLUME =**

Specifies the VSN of the Net-Storage volume.

On the Net-Storage the Net-Storage volume is implemented by a directory below the released directory with a name which corresponds to the VSN.

### **VOLUME = \*STD**

The VSN of the new Net-Storage volume was derived from the name of the pubset, see the “Introduction to System Administration” [14]. The VSN must be specified explicitly for a Net-Storage volume with a nonstandard name.

### **VOLUME = <vsn 6..6>**

Specifies the VSN of the Net-Storage volume explicitly. A default name cannot be specified explicitly. The VSN must consist of 6 characters and comply with the conventions for private volumes. Consequently it may not begin with the string PUB and may not contain a period, see the “Introduction to System Administration” [14].

### **PUBSET = <cat-id 1..4>**

Specifies the name of the pubset from which the Net-Storage volume is to be removed.

### **FILES-ON-VOLUME =**

Determines the procedure when the Net-Storage volume still contains cataloged BS2000 files.

### **FILES-ON-VOLUME = \*REJECT**

The command is executed only when the Net-Storage volume contains no cataloged BS2000 files.

### **FILES-ON-VOLUME = \*EXPORT**

The files' catalog entries are deleted only in the local pubset (as with the EXPORT-FILE command). The directory and the file on the Net-Storage are retained.

### **FILES-ON-VOLUME = \*DELETE(...)**

The BS2000 files on the Net-Storage volume are deleted. Subsequently, the directory concerned on the Net-Server is also deleted.

By default, (FORCE=\*NO) deletion takes place only when no inconsistencies are determined between the catalog entry on the local pubset and the catalog entry on the Net-Storage volume. Otherwise, the command will be rejected.

**FORCE = \*NO / \*YES**

Specifies whether the files should also be deleted if inconsistencies exist. The default \*NO causes the command to be rejected in this case. When FORCE = \*YES, the files are always deleted and inconsistencies are ignored. Files which are not cataloged in BS2000 (UNIX files) are also deleted.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	32	CMD0221	System error
	32	DMS1CFF	System error (see SERSLOG entry)
	64	DMS1C04	Error when calling the ONETSTOR subsystem
	64	DMS1C05	Catalog ID does not exist
	64	DMS1C06	Pubset not imported
	64	DMS1C07	Error when calling the allocation function
	64	DMS1C08	Error when calling a CMS function for the TSOSCAT
	64	DMS1C09	Error when calling a CMS function on the Net-Storage volume
	64	DMS1C0C	Net-Storage volume is not empty
	64	DMS1C0D	File system label on the net server does not match the pubset
	64	DMS1C0E	File catalog on the Net-Storage volume is not empty
	64	DMS1C10	The Net-Storage volume contains locked files
	64	DMS1C12	No Net-Storage volume can be created on the home pubset
	64	DMS1C13	Error when calling the multiprocessor system function
	64	DMS1C14	Error when calling the watchdog
	64	DMS1C15	Error when allocating on the slave system
	64	DMS1C18	Net-Storage volume cannot be accessed
	64	DMS1C20	Name of the Net-Storage volume is invalid

---

## 5.31 REMOVE-PASSWORD

Delete file or JV passwords from password table

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE  
FILE-GENERATION-GROUP  
JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** \$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

This command deletes file or JV passwords from the password table for the job (see the ADD-PASSWORD command).

### Format

<b>REMOVE-PASSWORD</b>	Alias: <b>RMPW</b>
<b>PASSWORD</b> = <b>*ALL</b> / <b>*SECRET</b> / list-poss(63): <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>	

### Operands

**PASSWORD = \*ALL / \*SECRET / list-poss(63): <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>**

Specifies that the passwords specified in the ADD-PASSWORD command are to be removed from the password table for the job, thus reinstating full password protection.

The PASSWORD operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.
- The password entered is not logged.

**PASSWORD = \*ALL**

All entries in password table for the job are to be deleted.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	DMS06FF	BCAM connection severed
	130	DMS0585	Error detected when processing catalog or multiprocessor system

## Example

See the ADD-PASSWORD command.

---

## 5.32 REMOVE-PUBSET-LOCK

Reset pubset lock

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Function

The REMOVE-PUBSET-LOCK command enables the system administrator to reset locks set by pubset management. The pubset concerned and an unambiguous description of the lock which is to be reset must be specified here. A lock is described unambiguously by the lock type, the system with the lock entry, the task ID and the sysid of the lock holder.

The command can be entered on any system in a shared pubset network (with BS2000/OSD  $\geq$  V8.0). If the lock which is to be released is not on the system on which the command was issued, the command is sent to the system containing the lock entry. Only locks whose lock entry is contained on a system with BS2000/OSD  $\geq$  V8.0 can be reset.

The command is rejected if the task which contains the lock still exists and is not in the "pended indefinitely" status.

Successful release of a lock is logged with the console message DMS13CD.

Information on existing locks can be obtained using the SHOW-PUBSET-LOCKS command.

## Format

### REMOVE-PUBSET-LOCK

**PUBSET** = <cat-id 1..4>

**,LOCK-IDENTIFICATION** = **\*PUBSET-RECONFIGURATION(...)** / **\*SHARED-EXCAT(...)** /  
**\*SHARED-IMCAT(...)** / **\*SHARED-MASTER-EXCAT(...)**

**\*PUBSET-RECONFIGURATION(...)**

| **TID-OF-LOCKHOLDER** = **X'FFFFFFFF'** / <x-string 1..8>

| **,LOCATION-OF-LOCK** = **\*OWN-SYSTEM** / <alphanum-name 1..3>

**\*SHARED-EXCAT(...)**

| **TID-OF-LOCKHOLDER** = **X'FFFFFFFF'** / <x-string 1..8>

| **,SYSTEM-OF-LOCKHOLDER** = **\*HOST-SYSTEM** / <alphanum-name 1..3>

| **,LOCATION-OF-LOCK** = **\*OWN-SYSTEM** / <alphanum-name 1..3>

**\*SHARED-IMCAT(...)**

| **TID-OF-LOCKHOLDER** = **X'FFFFFFFF'** / <x-string 1..8>

| **,SYSTEM-OF-LOCKHOLDER** = **\*HOST-SYSTEM** / <alphanum-name 1..3>

| **,LOCATION-OF-LOCK** = **\*OWN-SYSTEM** / <alphanum-name 1..3>

**\*SHARED-MASTER-EXCAT(...)**

| **TID-OF-LOCKHOLDER** = **X'FFFFFFFF'** / <x-string 1..8>

| **,LOCATION-OF-LOCK** = **\*OWN-SYSTEM** / <alphanum-name 1..3>

## Operands

**PUBSET** = <cat-id 1..4>

Catalog ID of the pubset for which the specified lock is to be reset.

**LOCK-IDENTIFICATION** = **\*PUBSET-RECONFIGURATION(...)** / **\*SHARED-EXCAT(...)** / **\*SHARED-IMCAT(...)** /  
**\*SHARED-MASTER-EXCAT(...)**

Unambiguous description of the lock which is to be reset.

**LOCK-IDENTIFICATION** = **\*PUBSET-RECONFIGURATION(...)**

The lock is of the type PUBSET-RECONFIGURATION. For this lock type the lock holder is contained on the system with the lock entry.

**TID-OF-LOCKHOLDER** = **X'FFFFFFFF'** / <x-string 1..8>

Task ID (TID) of the instance which holds the lock.

---

**LOCATION-OF-LOCK = \*OWN-SYSTEM / <alphanum-name 1..3>**

Sysid of the system with the lock entry. The default is \*OWN-SYSTEM, i.e. the local system.

**LOCK-IDENTIFICATION = \*SHARED-EXCAT(...)**

The lock is of the type SHARED-EXCAT. The lock holder's system can be specified for this lock type.

**TID-OF-LOCKHOLDER = X'FFFFFFFF' / <x-string 1..8>**

Task ID (TID) of the instance which holds the lock.

**SYSTEM-OF-LOCKHOLDER = \*OWN-SYSTEM / <alphanum-name 1..3>**

Sysid of the system on which the lock holder resides. The default is \*OWN-SYSTEM, i.e. the local system.

**LOCATION-OF-LOCK = \*OWN-SYSTEM / <alphanum-name 1..3>**

Sysid of the system with the lock entry. The default is \*OWN-SYSTEM, i.e. the local system.

**LOCK-IDENTIFICATION = \*SHARED-IMCAT(...)**

The lock is of the type SHARED-IMCAT. The lock holder's system can be specified for this lock type.

**TID-OF-LOCKHOLDER = X'FFFFFFFF' / <x-string 1..8>**

Task ID (TID) of the instance which holds the lock.

**SYSTEM-OF-LOCKHOLDER = \*OWN-SYSTEM / <alphanum-name 1..3>**

Sysid of the system on which the lock holder resides. The default is \*OWN-SYSTEM, i.e. the local system.

**LOCATION-OF-LOCK = \*OWN-SYSTEM / <alphanum-name 1..3>**

Sysid of the system with the lock entry. The default is \*OWN-SYSTEM, i.e. the local system.

**LOCK-IDENTIFICATION = \*SHARED-MASTER-EXCAT(...)**

The lock is of the type SHARED-MASTER-EXCAT. For this lock type the lock holder is contained on the system with the lock entry.

**TID-OF-LOCKHOLDER = X'FFFFFFFF' / <x-string 1..8>**

Task ID (TID) of the instance which holds the lock.

**LOCATION-OF-LOCK = \*OWN-SYSTEM / <alphanum-name 1..3>**

Sysid of the system with the lock entry. The default is \*OWN-SYSTEM, i.e. the local system.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	0	DMS13CE	No reconfiguration lock exists
	32	CMD0221	Internal error
	32	CMD2009	Error creating the presentation variables
	32	DMS138A	Internal error with Serslog entry
	64	CMD0216	Privileges error
	64	DMS138B	Pubset not found
	64	DMS138C	Pubset not accessible
	64	DMS1397	Partner host with illegal version
	128	CMD0217	Command not fully executed
	128	DMS1386	Error in the memory request
	128	DMS1389	Error in MSCF communication

---

## 5.33 REMOVE-RFA-CONNECTION

Clear down RFA connection and terminate partner task

<b>Component:</b>	RFA
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT

This command is available only to users who have the RFA software product (see also the “RFA” manual [31]).

### Function

The command REMOVE-RFA-CONNECTION clears down one or all RFA connections previously set up with the SET-RFA-CONNECTION command. When the last RFA connection to a remote processor is cleared down, the partner task on the remote processor is simultaneously terminated.

When the local user task is terminated (EXIT-JOB or LOGOFF), the system automatically clears down all RFA connections set up during the current task.

The REMOVE-RFA-CONNECTION command is rejected if a program is loaded.

The user can issue the SHOW-RFA-CONNECTIONS command to get information on still existing RFA connections.

#### *Note*

More than one SET-RFA-CONNECTION command can be issued for a single catalog ID. The same number of REMOVE-RFA-CONNECTION commands must be issued to clear down a connection as SET-RFA-CONNECTION commands were issued.

### Format

<b>REMOVE-RFA-CONNECTION</b>
<b>CATALOG-ID = &lt;cat-id 1..4&gt; / *ALL</b>

### Operands

**CATALOG-ID = <cat-id 1..4> / \*ALL**

Catalog ID to which the RFA connection is to be cleared down. Specifying \*ALL lets all RFA connections be cleared.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	RFA0002	Command executed
1	0	RFA0002	No RFA connection exists which can be cleared down
	64	RFA0025	Program loaded
	64	RFA0027	Configuration error

---

## 5.34 REMOVE-SUBSYSTEM

Remove inactive subsystem from dynamic catalog

**Component:** DSSM  
**Functional area:** Subsystem management  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** SUBSYSTEM-MANAGEMENT

### Function

This command allows system administrators to remove an inactive subsystem from the current dynamic subsystem catalog while the system is running. As the subsystem is only virtually removed, issuing this command does not change the number of subsystems and CALL entries that can subsequently be added to the current subsystem catalog using the ADD-SUBSYSTEM command.

The command is rejected if

- the designated subsystem is active
- another subsystem has cross-references to or dependency relations with the designated subsystem.

### Format

**REMOVE-SUBSYSTEM**

**SUBSYSTEM-NAME** = <structured-name 1..8>

, **VERSION** = <product-version mandatory-man-corr> / <product-version without-man-corr>

### Operands

**SUBSYSTEM-NAME** = <structured-name 1..8>

Name of the subsystem that is to be removed.

**VERSION** = <product-version mandatory-man-corr> / <product-version without-man-corr>

Identifies the version number.

If a version number is specified, the format specified here must be identical to the format used when the subsystem was defined (release and correction status mandatory or not allowed; cf. SDF metasyntax).

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	32	ESM0646	Command processing terminated abnormally; error occurred during initialization routine updating or calculation of the default version.
	64	ESM0642	Command not executed

---

## Notes

- Once a subsystem has been removed, its cross-references to and dependency relations with any other subsystem cease to exist.
- If the latest version of a nonprivileged subsystem is removed, any dependency relations operating on the subsystem are obsolete.
- Once at least one subsystem has been removed with REMOVE-SUBSYSTEM, it is no longer possible to dynamically extend the current subsystem catalog using the ADD-SUBSYSTEM command with TYPE=\*EXTENDED-ACTIVE-CONFIGURATION. However, dynamic extension is possible with ADD-SUBSYSTEM and TYPE=\*NEW-SUBSYSTEMS.

## Example

Removing Version 17.0 of the EDT subsystem:

```
/remove-subsystem subsystem-name=edt,version='17.0'
```

---

## 5.35 REMOVE-TASKLIB

Cancel TASKLIB assignment

**Component:** SYSFILE  
**Functional area:** Program control  
**Domain:** PROGRAM  
**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE

### Function

The REMOVE-TASKLIB command cancels the assignment of an object module library as a TASKLIB which was made with the SET-TASKLIB command.

### Format

<b>REMOVE-TASKLIB</b>	Alias: <b>RMTL</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	SSM2036	Operand invalid

---

## 5.36 REMOVE-USER

Delete user entry from user catalog

**Component:** SRPMNUC

**Functional area:** User management

**Domain:** USER-ADMINISTRATION

**Privileges:** STD-PROCESSING  
USER-ADMINISTRATION

**Routing code:** \$

### Function

The REMOVE-USER command enables the systems support staff to delete a user's entry from the user catalog of a pubset.

Execution of this command proceeds as follows:

If jobs are still active for the user when a data pubset is specified, execution of the command is discontinued and the message SRM2215 is issued. By entering 'Y' you confirm the deletion of the user ID and execution of the command is continued. Make sure that the pubset data cannot be accessed by active jobs, as this would lead to errors.

By entering 'N', you lock the user ID and the command is terminated.

First, the user's files and job variables (and, when SECOS is being used, the guards) are deleted from the pubset and after a confirmation they are deleted logically, also:

- If errors occur during deletion, the user ID is locked (not deleted). All necessary steps must be taken to enable the files to be deleted. The REMOVE-USER command must then be repeated.
- If the files have been deleted without problems, the user entry in the user catalog is also deleted.

The REMOVE-USER command is rejected

- for the standard user IDs allocated by the system except for the user SERVICE ID
- for a user ID to which at least one system-global privilege other than STD-PROCESSING is allocated (if SECOS is used)
- for a user ID which is the administrator of a user group (if SECOS is used).
- for the home pubset if the user ID still has active tasks
- for the data pubset if the user ID still has active tasks and the message SRM2215 was answered with 'N'

As a general rule, no user ID can be deleted if it has any system privilege other than STD-PROCESSING. However, if SECOS is being used, such a user ID can be deleted by first assigning to it the STD-PROCESSING privilege, and then withdrawing the other individual privilege from it.

#### *Restriction*

The only nonprivileged users (STD-PROCESSING privilege) authorized to issue this command are those designated as group administrators. The actions a group administrator can take are defined by systems support. For information on setting up and managing user groups see the "SECOS" manual [35].

---

## Format

**REMOVE-USER**

**USER-IDENTIFICATION** = <name 1..8>

,**PUBSET** = **\*HOME** / <cat-id 1..4>

## Operands

**USER-IDENTIFICATION** = <name 1..8>

Identifies the user whose entry is to be deleted.

**PUBSET** =

Deletes the entry in the user catalog of the specified pubset.

**PUBSET** = **\*HOME**

Deletes the entry in the user catalog of the home pubset.

As a result, the user ID no longer has access to the system.

**PUBSET** = <cat-id 1..4>

The user ID is deleted from the user catalog of the specified pubset.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SRM6001	Command executed with a warning
	1	SRM6010	Syntax error
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error
	130	SRM6030	Command cannot temporarily be executed

---

## 5.37 REPAIR-DISK-FILES

Reconstruct disk file

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The REPAIR-DISK-FILES command reconstructs a disk file which was incorrectly closed due to a system crash or a job being aborted. This involves: updating of the catalog entry, the implicit removal of any lock which may apply, and closing of the file (see the command REMOVE-FILE-ALLOCATION-LOCKS); ISAM files will be reconstructed using the available records. The files which need to be reconstructed can be displayed by using the SHOW-FILE-ATTRIBUTES command with the option STATUS=\*PAR(REPAIR-NEEDED=\*YES).

**i** If the file access was interrupted while there was still buffered data in main memory, the last changes which were made may be missing from the reconstructed file; this is because the contents of the buffer are not output to external storage until it becomes full.

The reconstruction of files is discussed in the general section of the “Introductory Guide to DMS” [13].

#### *Privileged functions*

If reconstruction is not possible because of a file lock, systems support receives the message DMS06F0 in interactive mode (in batch mode command processing is aborted without any message) and can then, if required, cancel the file lock and thus force reconstruction. In the event of forced reconstruction, it is essential to ensure that the file is not open for writing at this time.

## Format

### REPAIR-DISK-FILES

**FILE-STATUS** = **\*OPEN** (...) / **\*ANY**(...)

**\*OPEN**(...)

| **FILE-NAME** = <filename 1..54> / <partial-filename 2..53>

| **,SELECT** = **\*ANY-VOLUME** / **\*PRIVATE-DISK** / **\*PUBLIC-DISK** / **\*NET-STORAGE**

**\*ANY**(...)

| **FILE-NAME** = <filename 1..54>

| **,SELECT** = **\*ANY-VOLUME** / **\*PRIVATE-DISK** / **\*PUBLIC-DISK** / **\*NET-STORAGE**

**,ISAM-COPY-NAME** = **\*SAME** / <partial-filename 2..53> / <filename 1..54>

**,ISAM-REPAIR-INFO** = **\*NO** / [**\*YES**](...)

[**\*YES**](...)

| **OUTPUT** = **\*SYSOUT** / **\*SYSLST**

## Operands

**FILE-STATUS** = **\*OPEN**(...) / **\*ANY**(...)

Specifies whether the file is to be reconstructed only if it was not closed correctly, or in any case.

**FILE-STATUS** = **\*OPEN**(...)

The file is only to be reconstructed if it was not closed correctly.

**FILE-NAME** = <filename 1..54> / <partial-filename 2..53>

Identifies the permanent or temporary file, file generation group or file generation which is to be reconstructed.

If FILE-NAME is specified in partially qualified form, then:

- ISAM-COPY-NAME (if required) must also be specified in partially qualified form.
- ISAM-COPY-NAME will be ignored when generations are being reconstructed.

Only the user's own user ID may be specified.

The reconstruction of the file depends on the access method with which the file was created (see the output field *FILE-STRUC* in the output of the SHOW-FILE-ATTRIBUTES command):

**PAM:** The file lock is removed. If the file is identified as open, the system carries out a privileged close operation, and the last page pointer (LPP) is updated if required:

For a K-PAM file (*BLOCK-CONTR=PAMKEY*), the LLP will then point to the last reserved PAM page (corresponds to the file size). For an NK-PAM file (*BLOCK-CONTR=DATA/NO*), the LLP will contain a value which is determined by the file size, rounded down to a multiple of the number of PAM pages in the data block (see the blocking factor in the output field *BUF-LEN* of the SHOW-FILE-ATTRIBUTES command). If the file is on a disk that is operated in dual mode (see the "DRV" manual [11]), the contents of the data blocks will not be

---

updated. However, this can also be achieved with FILE-STATUS=\*ANY(...).

**SAM:** The file lock is removed. If the file is identified as open, the last page pointer is set to the highest used PAM page if required. After that, the file is closed. If the file is on disk that is operated in dual mode, the contents of data blocks are restored. “Dual mode” disks are explained in the “DRV” manual [11].

**ISAM:** The file lock is removed. The file is reconstructed from the repairable data blocks. Secondary keys which are identified as complete are also reconstructed.

Irrespective of the access method, concurrent copy locks are retained if the concurrent copy session is still in progress.

**SELECT = \*ANY-VOLUME / \*PRIVATE-DISK / \*PUBLIC-DISK**

The type of volume to which the reconstruction is to be restricted.

This operand is only meaningful if FILE-NAME was a partially qualified file name or the name of a file generation group.

**SELECT = \*ANY-VOLUME**

The specified files will be selected, irrespective of the volume on which they are held.

**SELECT = \*PRIVATE-DISK**

Of the specified files, those which are held on private disk will be selected.

**SELECT = \*PUBLIC-DISK**

Of the specified files, those which are held on public volumes (disk) will be selected.

**SELECT = \*NET-STORAGE**

Of the specified files, those which are held on Net-Storage volume will be selected.

**FILE-STATUS = \*ANY(...)**

The file is to be reconstructed irrespective of its status.

**FILE-NAME = <filename 1..54>**

Identifies the permanent or temporary file, file generation group or file generation which is to be reconstructed. Only the user's own user ID may be specified.

The reconstruction of the file depends on the access method with which the file was created (see the output field *FILE-STRUC* in the output of the SHOW-FILE-ATTRIBUTES command):

**PAM:** The file lock is removed. If the file is identified as open, the system carries out a privileged close operation, and the last page pointer (LPP) is updated if required: For a file that was created with BLOCK-CONTROL-INFO=\*WITHIN-DATA-BLOCK or \*PAMKEY, the last page pointer will point to the last PAM page which was written. For a file that was created with BLOCK-CONTROL-INFO=\*NO, the LLP will point to a value which is determined by the file size, rounded down to a multiple of the number of PAM pages in the data block (see the blocking factor in the output field *BUF-LEN* of the SHOW-FILE-ATTRIBUTES command). If the file is on a disk that is operated in dual mode (see reference below), the contents of its data blocks will be updated if required. “Dual mode” disks are explained in the “DRV” manual [11].

**SAM:** The file lock is removed. If the file is identified as open, the system carries out a privileged close operation, and the last page pointer (LPP) is set to the last PAM page that was written. If the file is on a disk that is operated in dual mode (see reference below), the contents of its data blocks will be updated if required. “Dual mode” disks are explained in the “DRV” manual [11].

**ISAM:** The file lock is removed. The file is reconstructed from the repairable data blocks. Secondary keys which are identified as complete are also reconstructed.

---

Irrespective of the access method, concurrent copy locks are retained if the concurrent copy session is still in progress.

**SELECT = \*ANY-VOLUME / \*PRIVATE-DISK / \*PUBLIC-DISK**

The type of volume to which the reconstruction is to be restricted.

This operand is only meaningful if FILE-NAME was a partially qualified file name or the name of a file generation group.

**SELECT = \*ANY-VOLUME**

The specified files will be selected, irrespective of the volume on which they are held.

**SELECT = \*PRIVATE-DISK**

Of the specified files, those which are held on private disk will be selected.

**SELECT = \*PUBLIC-DISK**

Of the specified files, those which are held on public volumes (disk) will be selected.

**SELECT = \*NET-STORAGE**

Of the specified files, those which are held on Net-Storage volume will be selected.

**ISAM-COPY-NAME = \*SAME / <partial-filename 2..53> / <filename 1..54>**

ISAM-COPY-NAME is only meaningful when ISAM files are being reconstructed, and identifies the file into which the reconstructed copy of the ISAM file ISAM-COPY-NAME is to be put. The file is assigned the encryption attributes of the file to be reconstructed. ISAM-COPY-NAME can be the name of a permanent file, temporary file or file generation, but may not be the name of file generation group.

Write access is required for files which are not under the user's own user ID. ISAM-COPY-NAME may not be the same as FILE-NAME.

If FILE-NAME is partially qualified, so must ISAM-COPY-NAME be.

If no ISAM-COPY-NAME is specified, the system will create a work file for use in reconstructing the ISAM file (default value \*SAME). If the reconstruction is to be carried out on a private disk, then the file must be cataloged. If the data and index sections of the file which is to be reconstructed are held on separate disks, corresponding storage space must also be requested for the reconstructed copy (using CREATE-FILE or MODIFY-FILE-ATTRIBUTES as appropriate). Only the user's own user ID may be specified.

**ISAM-COPY-NAME = \*SAME**

The reconstruction will be put into the file specified by FILE-NAME. This procedure will be mediated by a work file, created by the system. For ISAM files on private disks or under user IDs other than the user's, the work file will be copied into the file specified by FILE-NAME, and will then be deleted. Since copying can be very time-consuming, it is recommended that a fully qualified file name is specified. For ISAM files on PUBLIC disks under the user's own user ID, the work file will simply be recataloged and the original file will be deleted. If an ISAM file on PUBLIC disk is subject to a concurrent copy lock which cannot be reset, message DMS06EE is issued. The repaired ISAM file will then be in a file named **REPAIR.<tsn>.hhmss**, as it will not have been possible to delete the original file owing to the concurrent copy lock and then rename the work file under the name of the original file.

**ISAM-REPAIR-INFO = \*NO / \*YES(...)**

This operand is evaluated for ISAM files only: specifies whether file blocks which cannot be reconstructed are to be logged.

**ISAM-REPAIR-INFO = \*NO**

File blocks which cannot be reconstructed are not logged.

**ISAM-REPAIR-INFO = \*YES(...)**

The block numbers of file blocks which cannot be reconstructed are output. The output can be directed to SYSOUT (default) or SYSLST.

**OUTPUT = \*SYSOUT / \*SYSLST**

Specifies where the block numbers of the file blocks which cannot be reconstructed are to be output. SYSOUT is the default.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
1	0	CMD0001	No action required
2	0	DMS06E6	File specified in command is empty
2	0	DMS06E9	No valid record found during reconstruction of ISAM file
2	0	DMS06ED	Error on writing unrecoverable blocks to scratch file
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset Guaranteed message: DMS051B
	64	DMS051C	User not authorized to access pubset Guaranteed message: DMS051C
	64	DMS0533	Requested file not cataloged in pubset Guaranteed message: DMS0533
	64	DMS0535	Specified file not shareable
	64	DMS055C	Catalog entry not found on assigned private disk
	64	DMS0583	An error occurred when reconstructing the file
	64	DMS0585	Error detected during catalog processing or multihost processing Guaranteed message: DMS053C
	64	DMS0586	Currently not possible to access or reserve volume
	64	DMS0587	Use of specified command restricted by system administrator
	64	DMS0588	It was not possible to allocate disk space
	64	DMS05F8	It was not possible to allocate disk space Guaranteed message: DMS05F8

	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0609	No access to system file
	64	DMS06CC	No file corresponding to specified operands
	64	DMS06E4	Reconstruction with specified command not possible for this file type
	64	DMS06FF	Reconstruction for this file type not possible with specified command
	64	DMS06FF	File created with WROUT=NO. Consistency check is not practical
	130	DMS0524	System address space full
	130	DMS053C	No space in pubset catalog file
	130	DMS0582	File is currently locked or in use and cannot be processed
	130	DMS0585	Error detected during catalog processing or multihost processing
	130	DMS0586	Currently not possible to access or reserve volume
	130	DMS0588	It was not possible to allocate disk space
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

---

## Notes on reconstructing ISAM files

- For ISAM files, the data buffers are written back out to the disk as soon as a new data block has to be fetched into main memory. This means that the last changes which were made to the file may be missing from the reconstructed ISAM file (if WRITE-IMMEDIATE=\*YES was specified, then no more than one record can be missing).
- If no ISAM-COPY-NAME is specified for an ISAM file on public volumes, it will be reconstructed in a work file created by the system. The file FILE-NAME will then be deleted, even without an explicit DESTROY instruction (see the DESTROY-BY-DELETE operand in the CREATE-FILE and MODIFY-FILE-ATTRIBUTES commands), and the work file will be renamed as FILE-NAME.
- If no ISAM-COPY-NAME is specified for an ISAM file on private volumes, it will be reconstructed in a temporary work file on public data volumes. The work file will then be copied into the file FILE-NAME, and then deleted with an explicit DESTROY instruction (see the DESTROY-BY-DELETE operand in the CREATE-FILE and MODIFY-FILE-ATTRIBUTES commands). This procedure can be very time-consuming so that it is advantageous to specify an ISAM-COPY-NAME.
- If an ISAM-COPY-NAME is specified in the command REPAIR-DISK-FILES, that is where FILE-NAME will be reconstructed. FILE-NAME itself will remain unaltered. If ISAM-COPY-NAME is to be held on private volumes, or if FILE-NAME is a file on private volumes, then ISAM-COPY-NAME must be cataloged before the command REPAIR-DISK-FILES is input. If the data and index blocks are stored on separate volumes, then it is also necessary to reserve storage space for ISAM-COPY-NAME (see the CREATE-FILE and MODIFY-FILE-ATTRIBUTES commands).
- In the data blocks in the reconstructed file, no space will be kept free for later expansion of the file, equivalent to specifying PADDING-FACTOR=0 in the ADD-FILE-LINK command.
- ISAM files for which the data and index blocks are on separate private volumes can only be reconstructed if BUFFER-LENGTH=\*STD.
- If an ISAM data block contains data items which cannot be associated with any specific record, the whole block will be saved in the PAM file *S.filename1.REPAIR*. On completion of the REPAIR-DISK-FILES processing, this file is available for the user to make his own reconstruction attempts. If the new file name is too long, *filename1* will be correspondingly shortened.
- Since the recreation of an ISAM file involves the setting up of a copy of the file, which is within pubspace, the user must ensure that sufficient storage space is available.

---

## 5.38 REPAIR-FILE-LOCKS

Remove unauthorized file locks

**Component:** BS2000 OSD/BC  
**Functional area:** File processingg  
**Domain:** FILE  
**Privileges:** STD-PROCESSING  
TSOS

### Function

The owner of a file or the systems support staff (user ID TSOS) can remove an “unauthorized” file lock using the REPAIR-FILE-LOCKS command. This refers to file locks that are no longer required but that are not released automatically by the system for one of the following reasons:

- short connection failure in a network
- system error stopped the file lock from being removed

You can obtain information on the file locks currently in effect with the help of the SHOW-FILE-LOCKS command.

File access via RFA connections is not supported.

### Format

<b>REPAIR-FILE-LOCKS</b>
<b>FILE-NAME</b> = <filename 1..54>

### Operands

**FILE-NAME = <filename 1..54>**

Name of the file for which an unauthorized file lock is to be released. If the ACS software product is being used, the file name will be replaced according to the alias catalog.

---

## Return code

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	DMS13EE	File not locked
	1	CMD0221	Syntax error in command
	32	DMS13EA	Internal system error
	64	CMD2203	Error in syntax file
	64	DMS0301	Catalog not available
	64	DMS13EB	RFA connections not supported
	64	DMS13E1	File access not allowed
	64	DMS13E2	No access authorization for pubset
	64	DMS13E3	User ID does not exist
	128	DMS13E0	Resource bottleneck

---

## 5.39 REQUEST-MAIN-CONSOLE-FUNCTIONS

Request change of main operator terminal

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** not allocated  
**Privileges:** OPERATING  
**Routing code:** E

### Function

This command allows operators to request that the operator terminal (console) on which the command is issued should be defined as the main operator terminal (console). If the request is granted on the current main operator terminal ('Y' or 'YES' entered when message NBR1085 is issued there), the operator terminal is changed.

The command is allowed on physical operator terminals only.  
Moreover, it must **not** be issued

- from the current main operator terminal
- from teleservice

### Format

<b>REQUEST-MAIN-CONSOLE-FUNCTIONS</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
1	0	NBR1081	Operator terminal is already main operator terminal. Command ignored
	2	CMD0198	Shutdown in progress
	64	CMD0216	User does not have required privilege
	64	NBR0200	Function not yet unavailable
	64	NBR1080	Command is reserved for physical operator terminals
	64	NBR1082	Command rejected by main operator terminal
	129	NBR1083	Command already being processed. Try again later
	130	NBR1084	Command rejected owing to memory or task saturation

---

## Results

If the command is issued at a console, the following message appears on the main console:

```
NBR1085 ALLOW '(&00)' TO BECOME THE MAIN CONSOLE? REPLY (Y=YES; N=NO)
```

(&00) stands for the console on which the command was issued. This is the console which is to become the new main console.

If the message is answered in the affirmative, console (&00) is made the new main console, as indicated by the message

```
EXC0655 '(&00)' BECOMES MAIN CONSOLE
```

If the message is answered in the negative (any response other than 'Y' or 'YES'), the existing main console retains its function. The requested change is rejected. The following message is displayed on the console which requested the change:

```
NBR1082 '/REQUEST-MAIN-CONSOLE-FUNCTIONS' REJECTED BY MAIN CONSOLE
```

---

## 5.40 REQUEST-OPERATOR-ROLE

Request assignment of operator roles

**Component:** BS2000 OSD/BC  
**Functional area:** Operator function control  
**Domain:** CONSOLE-MANAGEMENT  
**Privileges:** OPERATING  
**Routing code:** @

### Function

By issuing the REQUEST-OPERATOR-ROLE command you ask to have one or more “operator roles” assigned to your own operator terminal (console) or user ID. An operator role is a group of system operation duties and consists of a set of routing codes defined by a security officer (SYSPRIV user ID or SECURITY-ADMINISTRATION privilege). This set may be any combination of the 40 BS2000 routing codes.

An operator role can be requested by \$CONSOLE applications with dynamic authorization names and by user tasks with the OPERATING privilege.

If the “Operator LOGON” function is used (incompatible mode; system parameter NBCONOPI=Y), an operator role can also be requested at a physical operator terminal. The request is granted only if the security officer has previously given the associated user ID permission to use the chosen operator role (MODIFY-OPERATOR-ATTRIBUTES command).

Once an operator role has been successfully assigned, the assignee is authorized to receive messages distributed via the operator role’s routing codes.

In a user task with the OPERATING privilege, successful assignment merely controls the receipt of these messages when a system event stream is displayed by the presentation function of the SHOW-SYSEVENT-LOG command, which can be issued irrespective of operator roles.

After successful assignment of an operator role, operator terminals and \$CONSOLE applications with dynamic authorization names can issue all commands which are protected by the operator role’s routing codes. Only commands which are protected by the @ routing code may always be entered.

If the command is repeated, the new operator roles specified are added to the existing ones. This has the same effect as issuing the command once with a list of operator roles. Once the command has been executed successfully, all operator role assignments are displayed.

Refer also to the section dealing with simplifying system operation in the “Introduction to System Administration” [14].

### Format

<b>REQUEST-OPERATOR-ROLE</b>
<b>OPERATOR-ROLE</b> = list-poss(10): <name 1..8>

---

## Operands

**OPERATOR-ROLE = list-poss(10): <name 1..8>**

All operator roles whose names are specified in the list are requested by the operator's own user ID. A maximum of 10 operator roles can be specified.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	NBR0985	Command execution unnecessary
2	0	NBR0989	Not all specified roles could be assigned
	1	CMD0202	Syntax error
	32	NBR0983	Internal error on command server
	64	CMD0216	No authorization
	64	NBR0981	Command cannot be issued from operator terminal in compatible mode (NBCONOP=I=N)
	64	NBR0982	Command issuer has no operator ID
	64	NBR0984	Operator role not permitted

---

## 5.41 RESET-DBL-DEFAULTS

Reset DBL call parameters to defaults

<b>Component:</b>	BLSSERV
<b>Functional area:</b>	Program control
<b>Domain:</b>	PROGRAM
<b>Privileges:</b>	STD-PROCESSING

### Function

The RESET-DBL-DEFAULTS command resets parameters altered with the MODIFY-DBL-DEFAULTS command to their original DBL default settings.

### Format

<b>RESET-DBL-DEFAULTS</b>
---------------------------

<b>SCOPE = <u>*ALL</u> / *CMD-CALLS / *PROGRAM-CALLS</b>
--

### Operands

#### **SCOPE =**

Determines whether all or only some of the parameters are to be returned to their default settings.

#### **SCOPE = \*ALL**

The settings that can be made with the command MODIFY-DBL-DEFAULTS SCOPE=\*ALL(...) are reset to their default values.

#### *Note*

A RESET-DBL-DEFAULTS command with SCOPE=\*ALL does not have the same effect as two RESET-DBL-DEFAULTS commands which are issued one after the other with SCOPE=\*CMD-CALLS and SCOPE=\*PROGRAM-CALLS.

#### **SCOPE = \*CMD-CALLS**

Resets only those defaults which can be configured using MODIFY-DBL-DEFAULTS SCOPE=\*CMD-CALLS(...).

#### **SCOPE = \*PROGRAM-CALLS**

Resets only those defaults which can be configured using MODIFY-DBL-DEFAULTS SCOPE=\*PROGRAM-CALLS (...).

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	32	BLS0152	System error
	64	CMD0216	User is not authorized to issue the command

---

## 5.42 RESET-INPUT-DEFAULTS

Delete task-specific default values

**Component:** SDF

**Functional area:** SDF control

**Domain:** SDF

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The RESET-INPUT-DEFAULTS command allows the user to delete task-specific default values. Within the task, default values can be defined for commands and statements. The user can either delete all default values or restrict deletion to default values of commands or of statements. If only defaults of commands/statements are to be deleted, deletion can be restricted to specific commands/statements.

The RESET-INPUT-DEFAULTS command can be applied to a task-specific default value with a particular input serial number. To facilitate this, the output of the SHOW-INPUT-DEFAULTS command can be requested with input serial numbers (operand INPUT-SERIAL-NUMBER=\*YES).

In programs with an SDF interface, RESET-INPUT-DEFAULTS is available as a standard statement with the same functionality.

### Format

RESET-INPUT-DEFAULTS	Alias: <b>RSID</b>
<b>OBJECT</b> = <b>*CMD</b> (...) / <b>*STMT</b> (...) / <b>*ALL</b> / <integer 1..9999>	
<b>*CMD</b> (...)	
<b>CMD</b> = <b>*ALL</b> / <structured-name 1..30 with-wild(50)>	
<b>*STMT</b> (...)	
<b>STMT</b> = <b>*ALL</b> / <structured-name 1..30 with-wild(50)>	
<b>,PROGRAM</b> = <b>*CURRENT</b> / <b>*ALL</b> / <structured-name 1..30>	

---

## Operands

**OBJECT = \*CMD(...) / \*ALL / \*STMT(...)** / <integer 1..9999>

Specifies the type of input for which the task-specific default values are to be deleted.

**OBJECT = \*CMD(...)**

Only the task-specific default values of commands are deleted. The defaults of all or only of selected commands can be deleted.

**CMD = \*ALL** / <structured-name 1..30 with-wild(50)>

Specifies whether the task-specific default values of all commands or only of selected commands are to be deleted.

**CMD = \*ALL**

All task-specific default values of commands are deleted.

**CMD = <structured-name 1..30 with-wild(50)>**

Name of the command whose task-specific default values are to be deleted. If wildcards are used, the defaults of all commands which match the search pattern entered will be deleted.

**OBJECT = \*STMT(...)**

Only the task-specific default values of statements are deleted. The defaults of all or only of selected statements of a program can be deleted.

**STMT = \*ALL** / <structured-name 1..30 with-wild(50)>

Specifies whether the task-specific default values of all statements or only of certain statements are to be deleted. In the PROGRAM operand, the user can specify whether the deletion is to apply to defaults of statements of a specific program or of all programs.

**STMT = \*ALL**

All task-specific default values of statements are deleted.

**STMT = <structured-name 1..30 with-wild(50)>**

Name of the statement whose task-specific default values are to be deleted. If wildcards are used, the defaults of all statements which match the search pattern entered will be deleted.

**PROGRAM = \*CURRENT** / \*ALL / <structured-name 1..30>

Specifies the program for whose statements specified in the STMT operand the task-specific default values are to be deleted.

**PROGRAM = \*CURRENT**

Only default values of statements of the program currently defined in the SDF options are deleted. The program name can be set using the MODIFY-SDF-OPTIONS command (DEFAULT-PROGRAM-NAME operand).

**PROGRAM = \*ALL**

The default values of all statements are deleted, regardless of the program name.

**PROGRAM = <structured-name 1..30>**

Program name, defined in a currently assigned syntax file.

Only default values of statements of the specified program are deleted.

**OBJECT = \*ALL**

All task-specific default values, i.e. from both commands and statements, are deleted.

---

**OBJECT = <integer 1..9999>**

Input serial number of the default value to be deleted.

The input serial number of a default value can be taken from the output of the SHOW-INPUT-DEFAULTS command (operand INPUT-SERIAL-NUMBER=\*YES).

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
1	0	CMD0001	No task-specific default value that matches the specifications exists. Guaranteed message: CMD0561
1	32	CMD0500	Syntax description in current syntax file invalid. Guaranteed message: CMD0500
1	64	CMD0561	Command execution not successful Guaranteed message: CMD0561

```

```
/reset-input-defaults 2 _____ (7)
/reset-input-defaults *cmd(cmd=create-file) _____ (8)
/show-input-defaults _____ (9)
```

```
#!/PRINT-DOC LINE-SPACING=*BY-EBCDIC-CONTROL
```

- (1) Evaluation of EBCDIC print control characters is set as the default value for the PRINT-DOCUMENT command. The LINE-SPACING operand is specified without a structure-initiator because in the syntax file \*TEXT-FORMAT the default value of the operand is DOCUMENT-FORMAT.
- (2) The private disk *WORK01* of device type *D3435* is set as the default value for the CREATE-FILE command. In this case, the structure-initiator must be specified, because the VSN and the device type refer to a private disk. To create a file on a public disk, SUPPORT=\*PUBLIC must now be specified (see item 6).

- 
- (3) Public disks are again set as the default for the CREATE-FILE command; but to create a file on the private disk *WORK01*, it is sufficient to specify SUPPORT=\*PRIVAT.
  - (4) For the CREATE-FILE command, the value set by default is a BASIC-ACL, which grants all access rights only to the owner, but allows the other users to read and execute the file. The protection attribute is set accordingly if the higher-ranking structure is activated with PROTECTION=\*PARAMETERS.
  - (5) All task-specific default values are output with their input serial numbers.
  - (6) The file *TEST.X.1* that was created with CREATE-FILE and SUPPORT=\*PRIVATE-DISK on the private disk *WORK01*, the file *TEST.X.2* was created without SUPPORT on a public disk.
  - (7) The definition with the input serial number 2 is deleted. In this case this is the definition with CREATE-FILE for the private disk.
  - (8) All definitions for the CREATE-FILE command are deleted.
  - (9) The output of the task-specific default values now shows only the definition for the PRINT-DOCUMENT command.

---

## 5.43 RESET-MSG-BUFFER

Suppress messages directed to console

**Component:** BS2000 OSD/BC

**Functional area:** Operator terminal control  
Message processing

**Domain:** not allocated

**Privileges:** OPERATING

**Routing code:** @

### Function

The command allows operators to suppress messages which are directed to a physical console (operator terminal) and are already queued for output. It is possible to suppress all messages or only those originating from a particular task.

Response messages and command termination messages cannot be suppressed.

The command operates only on messages which are currently queued for output. Messages generated subsequently are not suppressed.

### Format

<b>RESET-MSG-BUFFER</b>
<b>SENDER</b> = <u>*ANY</u> / <alphanum-name 1..4>

### Operands

**SENDER =**

Designates the source of the messages that are to be suppressed.

**SENDER = \*ANY**

All messages directed to the console are to be suppressed.

**SENDER = <alphanum-name 1..4>**

Only messages originating from a specific task are to be suppressed.

The task is identified by its TSN.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	1	CMD0202	Syntax error in command
	2	CMD0198	Shutdown in progress
	64	CMD0216	User does not have required privilege
	64	NBR0200	Command temporarily unavailable
2	64	NBR0898	Input from user task not permitted
	64	NBR1080	Command is reserved for physical consoles

---

## 5.44 RESET-MSG-SUPPRESSION

Cancel message suppression

**Component:** BS2000 OSD/BC

**Functional area:** Operator terminal control  
Message processing

**Domain:** CONSOLE-MANAGEMENT

**Privileges:** OPERATING

**Routing code:** @

### Function

This command cancels an arrangement made with the SET-MSG-SUPPRESSION command to suppress output of certain messages to operator terminals (consoles) or authorized user programs.

If the “Operator LOGON” function is used (system parameter NBCONOPI=Y), only the values \*NO and \*OWN are allowed for the CONSOLE-UNIT and APPLICATION-NAME operands, which means that the command cannot be issued for other operator terminals or authorized user programs.

If the “Operator LOGON” function is not used (compatible mode), the operator can issue the command at the main operator terminal with reference to other operator terminals or authorized user programs as well.

In a user task with OPERATING privilege, the command applies only when reading from the event stream of the user’s own task. In this case only the value \*NO is permissible for the CONSOLE-UNIT and APPLICATION-NAME operands.

The operator can use the SHOW-MSG-SUPPRESSION command to display a list of current message suppression arrangements.

### Format

**RESET-MSG-SUPPRESSION**

**MSG-ID** = \*ALL / list-poss(12): <alphanum-name 7..7>

,**CONSOLE-UNIT** = \*NO / \*OWN / \*ALL / list-poss(20): <name 2..2>

,**APPLICATION-NAME** = \*NO / \*OWN / \*ALL / list-poss(20): <name 4..4>

### Operands

**MSG-ID =**

Specifies the message numbers which are to be output again on the operator terminal.

**MSG-ID = \*ALL**

All suppressed messages can now be displayed again on the specified operator terminals.

**MSG-ID = list-poss(12): <alphanum-name 7..7>**

Specifies a seven-digit message number or a list of message numbers identifying messages which can now be output again on the operator terminal.

---

**CONSOLE-UNIT =**

Specifies the mnemonic device name of the operator terminal on which the specified messages can now be displayed again.

**CONSOLE-UNIT = \*NO**

The existing definition for the operator terminals is retained. However, when input is from an operator terminal, the change becomes effective for the operator terminal where the input is made.

**CONSOLE-UNIT = \*OWN**

*This operand value is only possible when input is made at an operator terminal.*

Message suppression is to be canceled for the operator terminal where the command input is made.

**CONSOLE-UNIT = \*ALL**

Message suppression is to be canceled for all operator terminals.

This operand may only be used in the mode without operator LOGON at the main operator terminal.

**CONSOLE-UNIT = list-poss(20): <name 2..2>**

Mnemonic device name of the main or standby operator terminal at which the specified messages are allowed to be displayed again.

In this operand remote consoles may only be specified in the mode without operator LOGON from the main operator terminal.

**APPLICATION-NAME =**

Specifies the authorized user program for which message suppression is to be canceled.

**APPLICATION-NAME = \*NO**

The existing definition for the authorized user programs is retained. However, when input is from an authorized user program, the change becomes effective for this user program.

**APPLICATION-NAME = \*OWN**

*This operand value is only permissible when input is from an authorized user program.*

Message suppression is canceled for the authorized user program in which the command was issued.

**APPLICATION-NAME = \*ALL**

Message suppression is canceled for all known authorized user programs.

This operand may only be used in the mode without operator LOGON at the main console.

**APPLICATION-NAME = list-poss(20): <name 4..4>**

Name of the authorized user program (4 alphanumeric characters) for which suppression of the specified messages is to be canceled.

Remote authorized user programs may only be specified in the mode without operator LOGON from the main operator terminal.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
1	0	NBR0874	Message not suppressed on the operator terminal or in the case of an authorized user program
2	0	NBR0884	Command partially executed
	1	CMD0202	Syntax error
	32	NBR0007	OPR task anchor not accessible
	64	NBR0200	Command not available
	64	NBR0865	Authorized application not found
	64	NBR0866	Operator terminal not found
	64	NBR0869	No message suppressed in the system
	64	NBR0883	Can only be issued from main operator terminal in this form
	64	NBR0870	No message
	130	NBR0877	Message suppression table locked

---

## 5.45 RESTART-PROGRAM

Start program from checkpoint (restart)

**Component:** CPR

**Functional area:** Program control

**Domain:** PROGRAM

**Privileges:** STD-PROCESSING  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The RESTART-PROGRAM command causes a program to be restarted at a recorded checkpoint. The program is loaded with the status it had when the checkpoint was written; files, volumes, and devices must be available. The RESTART-PROGRAM command can be used in interactive or batch mode. The checkpoint can be written, for example, using the Assembler macro WRCPT.

The tape devices linked to the program at the time the checkpoint was written are assigned, and the tapes are positioned to the appropriate blocks.

If the program writing the checkpoint is called in a procedure, the behavior of RESTART-PROGRAM is governed by whether the checkpoint was written in interactive mode or in batch mode. In interactive mode, both the program and the procedure itself are restarted. A procedure called with ENTER-PROCEDURE cannot be restarted, because the copy of the procedure is no longer available (see ENTER-PROCEDURE command, "Method of operation". In this case the RESTART-PROGRAM command is not executed).

## Format

### RESTART-PROGRAM

**FILE-NAME** = <filename 1..54 without-gen>

,**FILE-CHANGE** = **\*NOT-ALLOWED** / **\*ALLOWED**

,**DUMMY-FILES** = **\*NONE** / list-poss(2000): <partial-filename 2..53> / <filename 1..54 without-gen>

,**LOOSE-DEBUGGING** = **\*NO** / **\*YES**

,**RESTART-OPTIONS** = **\*START-PROGRAM(...)** / **\*LOAD-ONLY(...)**

**\*START-PROGRAM(...)**

|     **CHECKPOINT** = **\*LAST** / **\*NAME(...)** / **\*NUMBER(...)** / **\*VOLUME-SEQUENCE(...)**

|         **\*NAME(...)**

|             |     **NAME** = <name 1..6>

|         **\*NUMBER(...)**

|             |     **NUMBER** = <integer 1..16777215>

|         **\*VOLUME-SEQUENCE(...)**

|             |     **VOL-SEQUENCE-NUMBER** = **\*LAST** / <integer 1..255>

|         , **MONJV** = **\*NONE** / <filename 1..54 without-gen-vers>

**\*LOAD-ONLY(...)**

|     **CHECKPOINT** = **\*LAST** / **\*NAME(...)** / **\*NUMBER(...)**

|         **\*NAME(...)**

|             |     **NAME** = <name 1..6>

|         **\*NUMBER(...)**

|             |     **NUMBER** = <integer 1..16777215>

,**RECONSTRUCTION-LIMIT** = **\*NO** / <integer 1..255>

## Operands

**FILE-NAME** = <filename 1..54 without-gen>

The file name specified by FILE-NAME is the name of the checkpoint file created when the checkpoint was written, and which contains the program to be loaded. The file must be available locally.

**FILE-CHANGE** = **\*NOT-ALLOWED** / **\*ALLOWED**

DMS will check the file names, encoded internally by the system (CFID), of the required files. The user can specify whether the restart is to be aborted if any of these names has been changed since the checkpoint file was created.

---

**FILE-CHANGE = \*NOT-ALLOWED**

DMS will check the file names, encoded internally by the system (CFID), of the files required for the restart. If any of these names has changed since the checkpoint file was created the restart will be aborted.

**FILE-CHANGE = \*ALLOWED**

Changes to the CFID will be ignored.

**DUMMY-FILES = \*NONE / list-poss(2000): <partial-filename 2..53> / <filename 1..54 without-gen>**

The user files listed here will be treated as DUMMY files, i.e. they do not need to be available for the restart (see also the FILE-NAME=\*DUMMY operand in the ADD-FILE-LINK command). A maximum of 255 files are permitted. The logical system files (SYSLST etc.) cannot be declared as dummy files. A user files may only be declared as a DUMMY file if RECONSTRUCTION-LIMIT=\*NO was *not* specified.

**LOOSE-DEBUGGING = \*NO / \*YES**

Specifies whether it is permissible to deconstruct the debugging context of the calling task when the program is restarted.

**LOOSE-DEBUGGING = \*NO**

If the calling task has a debugging context, it should be retained. The RESTART-PROGRAM command is rejected with message EXC030B if the AID debugger was being used in the calling task before the command was issued.

**LOOSE-DEBUGGING = \*YES**

If the calling task has a debugging context, it may be deconstructed. The RESTART-PROGRAM command is executed even if the AID debugger was being used in the calling task before the restart; but any breakpoints set with AID will no longer be available after the restart.

**RESTART-OPTIONS= \*START-PROGRAM(...) / \*LOAD-ONLY(...)**

Specifies whether the program is to be started or only loaded.

**RESTART-OPTIONS = \*START-PROGRAM(...)**

The program is to be started (see START-EXECUTABLE-PROGRAM command).

**CHECKPOINT= \*LAST / \*NAME(...) / \*NUMBER(...) / \*VOLUME-SEQUENCE(...)**

The type of the checkpoint identifier.

**CHECKPOINT = \*LAST**

The program is to be started from the last checkpoint.

**CHECKPOINT = \*NAME(...)**

Checkpoint identification is based on the checkpoint name.

**NAME = <name 1..6>**

*Only for disk files:* <name> is a six-byte code which identifies the checkpoint on which the command will base the program restart. This code is output on SYSOUT together with a PAM page number (see CHECKPOINT=\*NUMBER) when the checkpoint is written.

If a user file has more than one checkpoint with identical codes, then <name> designates the last one which was written. Any previous checkpoint can then only be selected by specifying CHECKPOINT=\*NUMBER.

**CHECKPOINT = \*NUMBER(...)**

Checkpoint identification is based on the checkpoint number.

**NUMBER = <integer 1..16777215>**

The number of the PAM page on which the checkpoint begins; this number is output to SYSOUT when the checkpoint is written.

---

<number> must be specified if the program is to be started from a checkpoint other than the last one (see CHECKPOINT=\*NAME).

**CHECKPOINT = \*VOLUME-SEQUENCE(...)**

Checkpoint identification is based on the file section number.

**VOL-SEQUENCE-NUMBER = \*LAST / <integer 1..255>**

*Only for tape files* with standard labels which have been cataloged with FILE-SEQUENCE=1: designates the file section at which the restart is to begin.

**VOL-SEQUENCE-NUMBER = \*LAST**

The restart is to begin at the last file section.

**VOL-SEQUENCE-NUMBER = <integer 1..255>**

The restart is to begin at the specified file section number.

For an explanation of "file section number" and "file sequence number" see the "Introductory Guide to DMS" [13] or the START-POSITION and FILE-SEQUENCE operands in the ADD-FILE-LINK command.

**MONJV = \*NONE / <filename 1..54 without-gen-vers>**

*Only for users with the chargeable JV software package loaded as a subsystem.*

Specifies the name of a job variable which will monitor the restarted program.

During program execution, the operating system sets the job variable to the values \$R, \$T or \$A, corresponding to the program status so that the user can query the program status at any time by inspecting this job variable.

\$R The program is running

\$T The program has finished

\$A The program has terminated abnormally

Further details can be found in the "Job Variables" manual [20].

**RESTART-OPTIONS = \*LOAD-ONLY(...)**

The program will only be loaded, not started (see LOAD-EXECUTABLE-PROGRAM command).

**CHECKPOINT =**

The type of the checkpoint identifier.

**CHECKPOINT = \*LAST**

The program is to be started from the last checkpoint.

**CHECKPOINT = \*NAME(...)**

*Only for disk files:*

The program is restarted at the checkpoint with the ID specified in the associated NAME operand.

**NAME = <name 1..6>**

Designates a six-byte code which identifies the checkpoint on which the RESTART-PROGRAM command will base the program restart. This code is output together with a PAM page number (see CHECKPOINT=\*NUMBER(...)) when the checkpoint is written.

If a user file has more than one checkpoint with identical codes, then <name> designates the last one which was written. Any previous checkpoint can then only be selected by specifying CHECKPOINT=\*NUMBER(...).

---

**CHECKPOINT = \*NUMBER(...)**

The program is restarted at the checkpoint which begins on the PAM page specified in this NUMBER operand.

**NUMBER = <integer 1..16777215>**

The number of the PAM page on which the checkpoint begins; this number is output to SYSOUT when the checkpoint is written. <number> must be specified if the program is to be started from a checkpoint other than the last one (see CHECKPOINT=\*NAME).

**RECONSTRUCTION-LIMIT = \*NO / <integer 1..255>**

*Only for tape files:* Specifies the number of file sections to be reconstructed.

This operand permits the program to be restarted from a given checkpoint and to continue until the specified number of checkpoints has been passed. The checkpoint identifying codes are inserted again.

**RECONSTRUCTION-LIMIT = \*NO**

No limit is being set for the number of file sections to reconstruct.

**RECONSTRUCTION-LIMIT = <integer 1..255>**

Allows the user to specify the number of file sections to be repaired.

## Return codes

The RESTART-PROGRAM command is rejected by SDF within a procedure. But this is the only case in which the return code can also be evaluated. The general SDF return codes are described in [section "Return codes"](#).

## Notes

- The job causing a restart requests the same storage that was allocated to the interrupted job when the checkpoint was written. Also, this job determines whether the restarted job runs in interactive or noninteractive mode. Files open at the time of the checkpoint are opened when the program is restarted. The user is responsible for consistency. EAM files are not reconstructed.
- If file generations are affected by a checkpoint, the user should not change the base value, since the RESTART-PROGRAM command ignores any updates made to the file generation group between the checkpoint time and the restart time and uses the status which existed when the checkpoint was written. It is therefore advisable not to modify file generations used in a checkpoint before the RESTART-PROGRAM is executed.
- The RESTART-PROGRAM command may be used only if the system files SYSDTA, SYSCMD, SYSIPT, SYSLST and SYSOUT have their primary assignments.
- The WRCPT macro must have been issued under the same version of the BS2000 operating system and with the same version of SDF as the RESTART-PROGRAM command. Otherwise, the user receives an error message.
- After RESTART-PROGRAM the syntax file environment is reconstructed in the same way as when writing checkpoints, with the exception of the system syntax files (base system and subsystem syntax files), where the current assignment for the job continues to apply (this cannot be influenced by the user).
- If tape files are affected by a checkpoint, the checkpoint data contains the necessary information to permit the system to position the tapes to the appropriate block.
- The RESTART-PROGRAM command must not be issued in the following two cases:
  - If all assignments of system files (i.e. all opened procedures) that were saved in interactive mode through the WRCPT macro contain one or more procedures in interrupted status, the RESTART-PROGRAM command must not be used in batch mode.

- 
- If all ASSIGN-... assignments that were saved in batch mode by the WRCPT macro contain one or more assignments of SYSOUT to a cataloged file, the RESTART-PROGRAM command must not be used in interactive mode.

In either case, an error message is output and the job is aborted.

- While a CJC command sequence is active, no checkpoints can be written and no restart implemented.
- In the event of a class 5 memory shortage, restart processing is terminated with an error message.
- The maximum lifetime for a temporary file is until the end of the task. The user must therefore either reconstruct temporary files before issuing the RESTART-PROGRAM command, or must declare them as dummy files (in the FCB or in the ADD-FILE-LINK command, or with the DUMMY-FILES operand of the RESTART-PROGRAM command).

If during checkpoint writing it is determined that temporary files are being used, subcode 2 in the standard header is set to X'44' to warn the user, because branches to the checkpoint written are possible only to a limited extent due to the limited lifetime of the temporary files. In addition, a warning is sent to SYSOUT (EXC0302).

During execution of the RESTART-PROGRAM command, the system checks each temporary file in the checkpoint task to see whether it has been declared as a DUMMY file or whether the user has created a temporary file of the same name (and with the same file attributes) in the RESTART-PROGRAM task. If not, the error message "Temporary file not found" is issued. CHECKPOINT/RESTART-PROGRAM cannot be used to extend the lifetime of a temporary file.

- After a restart, the task can access only its own temporary files. Access to temporary files of the checkpoint task is thus possible only if the checkpoint task and the restart task are identical.
- All EAM files of the job are deleted.
- If the event "SVC interrupt" was active at the time of the checkpoint, is inactive after RESTART-PROGRAM and must be activated again by calling the STXIT macro.
- If, due to lack of space, the system file SYSLST has been moved from disk to tape in the period between the checkpoint and the restart, an initialized disk file must be made available for SYSLST before the RESTART-PROGRAM command is entered.

---

*Return codes/messages*

If processing of the RESTART-PROGRAM command is aborted with the following message:

```
EXC0305 I/O ERROR `(&00)' IN /RESTART-PROGRAM COMMAND. JOB STEP TERMINATED.  
REENTER COMMAND
```

the insert contains the following additional information in the form of the return code (hexadecimal):

<b>Insert</b>	<b>Meaning</b>
0C	Device cannot be reserved
04	\$REQM error
08	Catalog error (e.g. file not cataloged)
1C	VSN cannot be assigned, or error when reopening an ISAM file
10	A file has been opened as shareable
14	No extension for slot segment available or the slots could not be re-linked
18	An error occurred when writing the checkpoint file or 'T' has been entered in response to the previous message DMS0DEE
2C	Error when reopening a SAM file
20	Error in FCB
24	Number of tape devices for a file is smaller than that at the time of the checkpoint
28	Error in task-specific tables
30	Pubset on which a user file resides cannot be requested
34	A file no longer exists or a temporary file does not have the format name of a temporary file

Table 84: Return codes when restarting a program (RESTART-PROGRAM command)

---

*Program monitoring (see also the “Job Variables” manual [20])*

The status indicator in the job variable monitoring the program is set to “R” at the time the program is restarted.

If the JV cannot be accessed at the time the command is processed, an error message is issued to SYSOUT and processing is continued.

## **Example**

The checkpoint with the identifier FIX003 in the checkpoint file FPT.FILE is to be restarted. The file OUT.FILE is to be treated as a DUMMY file after the restart.

```
/rest-prog f-name=fpt.file,  
          dummy-files=out.file,  
          rest-opt=*start-prog(checkpoint=*name(fix003))
```

The third tape of a volume set has been destroyed. It is to be reconstructed using the RESTART-PROGRAM command, starting at the previous checkpoint:

```
/restart-prog f-name=tape.save,  
             check-point=*vol-seq(vol-seq=2),reconstruct=1
```

The program is terminated after the first checkpoint has been written. The catalog is not updated.

---

## 5.46 RESTORE-FILE-FROM-SNAPSET

Restore files on the basis of a Snapset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE SNAPSET
<b>Privileges:</b>	STD-PROCESSING TSOS

### Function

The RESTORE-FILE-FROM-SNAPSET command restores files of a pubset from a pubset copy which was created on an associated Snapset. During the restore operation, single files are copied from the Snapsets onto the active pubset. The process is comparable to an HSMS restore from a backup archive.

The Snapset operand enables a specific backup status (the default is the latest Snapset backup) to be specified, or the user can specify that each file should be restored from the Snapset with the latest file status. Before restoration takes place, the user can issue the LIST-FILE-FROM-SNAPSET command to obtain information on files which were saved to a Snapset.

All file attributes of a restored file are taken over from the original file unchanged (including the creation date, date of modification and the protection attributes). Only the allocation may differ from the original file, even in the case of files with physical allocation. Files on SM pubsets are restored to the "most suitable" volume set. This need not be the original volume set.

Individual file generations can only be restored with the entire file generation group. Files on private disk or on Net-Storage are ignored. In the case of migrated files and tape files, only the catalog entries are restored (without checking the availability of the associated tapes). When renaming takes place, these files are also ignored.

Nonprivileged users can only restore a file of a foreign user if they are the co-owner. In this case, they can also restore a file of their own under the foreign user ID.

Overwriting by the restore must be explicitly permitted for existing files (REPLACE operand). For files which are protected against unauthorized overwriting by means of a password, the required password must be entered into the caller's password table (see ADD-PASSWORD).

Files can also be restored under a new name (NEW-FILE-NAME operand). They are renamed by specifying either another user ID or a file name prefix.

Optionally, files which were open in write mode at the time the Snapset was created can be restored (RESTORE-OPEN-FILES operand). A file restored in this way has the same status as after a system crash. It may be necessary to call the REPAIR-DISK-FILE command for ISAM files. Files with the ONLINE-SAVE attribute which are opened in write mode are restored regardless of this option.

If required, the caller can have a log of restore processing output to SYSOUT or SYSLST (OUTPUT operand). This log can cover either all files or only the files which, for particular reasons, could not be restored (REPORTING operand).

The Snapsets are temporarily not available if the SHC-OSD subsystem was not active when the pubset was imported. In this case the command is aborted with DMS0622. As soon as SHC-OSD is active, the Snapsets are subsequently activated when the SHOW-SNAPSET-CONFIGURATION command is called.

File restoration is not an explicit SAT event. The SECOS component SAT can only log the DELETE-FILE (for overwriting) and CREATE-FILE calls which are used internally.

### *Privileged functions*

Systems support (TSOS privilege), as co-owner, can restore a file under its original user ID or under a foreign user ID.

When a file which still exists is overwritten, systems support can explicitly bypass the file protection by means of the IGNORE-PROTECTION operand.

## Format

### RESTORE-FILE-FROM-SNAPSET

**FILE-NAME** = <filename 1..54 without-gen with-wild(80)>

,**SNAPSET** = **\*LATEST** / **\*ALL** / <name 1..1 with-low> / <integer -52..-1> / **\*INTERVAL(...)**

**\*INTERVAL(...)**

| **OLDEST** = **-52** / <integer -52..-1>

| **,NEWEST** = **-1** / <integer -52..-1>

,**REPLACE** = **\*NO** / **\*YES(...)**

**\*YES(...)**

| **IGNORE-PROTECTION** = **\*NO** / **\*YES**

,**NEW-FILE-NAME** = **\*SAME** / **\*BY-USER-ID(...)** / **\*BY-PREFIX(...)**

**\*BY-USER-ID(...)**

| **NEW-USER-ID** = **\*SAME** / <name 1..8>

**\*BY-PREFIX(...)**

| **NEW-PREFIX** = **\*NONE** / <filename 1..8 without-cat-gen-user-vers>

,**RESTORE-OPEN-FILES** = **\*NO** / **\*YES**

,**REPORTING** = **\*ERROR** / **\*FULL**

,**OUTPUT** = **\*NONE** / list-poss(2): **\*SYSOUT** / **\*SYSLST**

---

## Operands

### **FILE-NAME = <filename 1..54 without-gen with-wild(80)>**

Selects the files which are to be restored. The files must satisfy the following requirements:

- They must have been cataloged when the Snapset is created.
- The pubset on which they are cataloged must be imported locally.
- They may not reside on private disk or on a Net-Storage volume.

The catalog and user IDs specified must be unique (i.e. contain no wildcards). Aliases (also partially-qualified aliases) may be specified. The name of a file generation group may be specified (individual file generations can only be restored within the group).

### **SNAPSET = \*LATEST / \*ALL / <name 1..1 with-low> / <integer -52..-1> / \*INTERVAL(...)**

Specifies the Snapset from which the files are to be restored. Information about all existing Snapsets for a pubset can be obtained using the SHOW-SNAPSET-CONFIGURATION command.

### **SNAPSET = \*LATEST**

The files are to be restored from the latest Snapset (i.e. from the most up-to-date pubset backup).

### **SNAPSET = \*ALL**

All Snapsets of the pubset concerned are used as a basis for restoration. Each file is restored from the Snapset with the latest file status, in other words with the latest backup of the file.

### **SNAPSET = <name 1..1 with-low>**

Specifies a particular Snapset explicitly by means of the Snapset ID. The maximum of 52 pubsets are distinguished by means of Snapset IDs specified which comprise letters from the 26 lowercase letters a to z and the 26 uppercase letters A to Z.

### **SNAPSET = <integer -52..-1>**

Specifies a particular Snapset explicitly by means of the relative age. The value -1 specifies the latest Snapset.

### **SNAPSET = \*INTERVAL(...)**

Restoration takes place as with SNAPSET=\*ALL. However, only Snapsets which lie in the specified age range are used as a basis:

#### **OLDEST = -52 / <integer -52..-1>**

Specifies the oldest Snapset; the range begins with this Snapset.

#### **NEWEST = -1 / <integer -52..-1>**

Specifies the newest Snapset; the range ends with this Snapset.

### **REPLACE = \*NO / \*YES(...)**

Specifies whether the files to be restored may overwrite existing files.

### **REPLACE = \*NO**

Existing files are not overwritten. This means that files with the names of existing files are not restored.

### **REPLACE = \*YES(...)**

Existing files may be overwritten by files which are to be restored provided the protection attributes permit this. For files which are protected against unauthorized overwriting by means of a password, the required password must be entered into the caller's password table (see the ADD-PASSWORD command).

---

**IGNORE-PROTECTION = \*NO / \*YES**

*This operand is only available to privileged users (TSOS privilege).*

Specifies whether files are to be overwritten without taking into account any write protection which exists.

**NEW-FILE-NAME = \*SAME / \*BY-USER-ID(...) / \*BY-PREFIX(...)**

Specifies whether the files are to be renamed when they are restored. When they are renamed, either a different ID or a file name prefix can be specified.

**NEW-FILE-NAME = \*SAME**

Each file is restored under the name of the original file.

**NEW-FILE-NAME = \*BY-USER-ID(...)**

Each file is to be restored under the user ID specified.

Only the co-owner (or TSOS) is able to restore the file under a user ID other than the original one.

**NEW-USER-ID = \*SAME / <name 1..8>**

New user ID. The default is \*SAME, i.e. the user ID of the original file is retained.

**NEW-FILE-NAME = \*BY-PREFIX(...)**

Each file is to be restored under a new name. The name consists of the specified prefix and the original name, separated by a period.

**NEW-PREFIX = \*NONE / <filename 1..8 without-cat-gen-user-vers>**

File name prefix (up to 8 characters). The default is \*NONE, i.e. the original file name is retained.

**RESTORE-OPEN-FILES = \*NO / \*YES**

Specifies whether files which were open in write mode when they were saved to the Snapset and for which the ONLINE-SAVE file attribute was not set are also to be saved.

**RESTORE-OPEN-FILES = \*NO**

These files are not restored.

**RESTORE-OPEN-FILES = \*YES**

These files are restored. The consistency is the same as after a system crash (write accesses in the correct order). ISAM files may need to be verified (REPAIR-DISK-FILE command).

**REPORTING = \*ERROR / \*FULL**

Determines the scope of the log if a processing log was requested in the OUTPUT operand.

**REPORTING = \*ERROR**

Only files which could not be restored are listed. The reason is displayed by means of a message code.

**REPORTING = \*FULL**

All files are listed. For files which could not be restored, the reason is displayed by means of a message code.

**OUTPUT = \*NONE / list-poss(2): \*SYSOUT / \*SYSLST**

Specifies whether a processing log is to be output to SYSOUT and/or SYSLST. The default is \*NONE, i.e. no log is output.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	1	CMD0202	Syntactical or semantic error in the command
	32	DMS0584	A status occurred which prevents processing from continuing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0102	Command aborted after interruption with K2
	64	CMD0216	Required authorization not available
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0535	Specified file not shareable
	64	DMS057F	Migrated file cannot be renamed
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS05FC	Specified user ID not in home pubset
	64	DMS0610	Action with wildcards: Error executing a function for one of the selected file names
	64	DMS0616	Volume set in SM pubset cannot be accessed
	64	DMS0620	No restorable file found
	64	DMS0621	File already cataloged, restoration not performed
	64	DMS0622	Snapset not available
	64	DMS0681	DMS error when executing job
	64	DMS0684	File does not exist
	64	DMS06CC	No file name matches the specified wildcards
	130	DMS053C	No space in the pubset's catalog
	130	DMS0582	The file is currently locked or in use and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system
	130	DMS0588	The disk storage assignment could not be executed

	130	DMS0594	Not enough virtual memory available
	64	DMS0616	Volume set not accessible in SM pubset
	64	DMS0620	No restorable file found
	64	DMS0621	File already cataloged, restoration not performed
	64	DMS0622	Snapset not available

## Examples

The two examples below show Snapset use from the viewpoint of a nonprivileged user.

### *Example 1: Restoring deleted files*

On 21 December 2011 the nonprivileged user is working in interactive mode under the user ID ARCHIVE8 and with the default pubset 2OS6.

**/show-file-attr d\*** \_\_\_\_\_ (1)

```

% ACC-COUNT = 211 S-ALLO-NUM = 0
%:20S6: PUBLIC: 1 FILE RES= 30 FRE= 5 REL= 3 PAGES
```

- (1) The user has all files listed whose names begin with “D”, and in doing so notices that no file with the prefix “DU” exists. As the files were still there a week ago, somebody must have accidentally deleted them!
- (2) The SHOW-SNAPSET-CONFIGURATION command provides information on all the available Snapset backups of the pubset 20S6: There are 15 Snapsets with backups from 12:00 and 18:00 hours on the days concerned. The oldest backup was made at 18:00 on 11 December.
- (3) As the user does not know exactly when the missing files were deleted, he/she specifies SNAPSET=\*ALL in order to restore each of the files from the latest Snapset.
- (4) As all the files were restored from Snapset f, they must have been deleted between 18:00 on 19 December and 12:00 on 20 December. The restored files contain the original time stamps, just as if they had not been deleted.
- (5) The user checks the time stamps in the catalog entry of the last file.

*Example 2: Resetting the processing state of a file*

Under the user ID ARCHIV8B (with the same standard pubset), the user now wants to reset the processing state of the M.SS.ARCHIVE.V08.0B03.SRCLIB file because (faulty) changes were made in the past few days. The user checks the backed-up file statuses as follows:

```
/list-file-from-snapset f-name=sm.ss.archive.v08.0b03.srclib,
inf=*all,snapset=*all _____ (1)
```

```
%-----SNAPSET g-----%

```

- (1) The user displays information about the backed-up file statuses using LIST-FILE-FROM-SNAPSET.
- (2) From the output the user sees that the file was created on 14 December and was modified on 19 and 20 December. In order to undo changes on 19 December or later, the file must consequently be restored from Snapset d.
- (3) For safety's sake, the user checks the time stamps in the restored file's catalog entry: it now has the status of 14 December 12 once more, i.e. the processing state from before the changes which were made on or after 19 December.

---

## 5.47 RESTORE-JV-FROM-SNAPSET

Restore job variables on the basis of a Snapset

**Component:** BS2000 OSD/BC

**Functional area:** Job variables

**Domain:** JOB-VARIABLES  
SNAPSET

**Privileges:** STD-  
PROCESSING  
TSOS

### Function

The RESTORE-JV-FROM-SNAPSET command restores job variables of a pubset from a pubset copy which was created on an associated Snapset. During the restore operation, single job variables are copied from the Snapsets onto the active pubset. The process is comparable to an HSMS restore from a backup archive.

The Snapset operand enables a specific backup status (the default is the latest Snapset backup) to be specified, or the user can specify that each job variable should be restored from the Snapset with the latest job variable status. Before restoration takes place, the user can issue the LIST-JV-FROM-SNAPSET command to obtain information on job variables which were saved to a Snapset.

All attributes of a restored job variable are taken over from the original job variable unchanged (including the creation date, date of modification and the protection attributes).

Nonprivileged users can only restore a job variable of a foreign user if they are the co-owner.

Overwriting by the restore must be explicitly permitted for existing job variables (REPLACE operand). For job variables which are protected against unauthorized overwriting by means of a password, the required password must be entered into the caller's password table (see ADD-PASSWORD).

Job variables can also be restored under a new name (NEW-JV-NAME operand). They are renamed by specifying either another user ID or a name prefix.

If required, the caller can have a log of the restore processing output to SYSOUT or SYSLST (OUTPUT operand). This log can cover either all job variables or only the job variables which, for particular reasons, could not be restored (REPORTING operand).

The Snapsets are temporarily not available if the SHC-OSD subsystem was not active when the pubset was imported. In this case the command is aborted with DMS0622. As soon as SHC-OSD is active, the snapsets are subsequently activated when the SHOW-SNAPSET-CONFIGURATION command is called.

The restoration of job variables is not an explicit SAT event. The SECOS component SAT can only log the DELETE-JV (for overwriting) and CREATE-JV calls which are used internally.

---

### Privileged functions

Systems support (TSOS privilege), as co-owner, can restore a job variable under its original user ID or under a foreign user ID.

When a job variable which still exists is overwritten, systems support can explicitly bypass the protection by means of the IGNORE-PROTECTION operand.

### Format

#### RESTORE-JV-FROM-SNAPSET

**JV-NAME** = <filename 1..54 without-gen-vers with-wild(80)>

,**SNAPSET** = **\*LATEST** / **\*ALL** / <name 1..1 with-low> / <integer -52..-1> / **\*INTERVAL(...)**

**\*INTERVAL(...)**

| **OLDEST** = **-52** / <integer -52..-1>

| **,NEWEST** = **-1** / <integer -52..-1>

,**REPLACE** = **\*NO** / **\*YES(...)**

**\*YES(...)**

| **IGNORE-PROTECTION** = **\*NO** / **\*YES**

,**NEW-JV-NAME** = **\*SAME** / **\*BY-USER-ID(...)** / **\*BY-PREFIX(...)**

**\*BY-USER-ID(...)**

| **NEW-USER-ID** = **\*SAME** / <name 1..8>

**\*BY-PREFIX(...)**

| **NEW-PREFIX** = **\*NONE** / <filename 1..8 without-cat-gen-user-vers>

,**REPORTING** = **\*ERROR** / **\*FULL**

,**OUTPUT** = **\*NONE** / list-poss(2): **\*SYSOUT** / **\*SYSLST**

---

## Operands

### **JV-NAME = <filename 1..54 without-gen-vers with-wild(80)>**

Selects the job variables which are to be restored. The job variables must satisfy the following requirements:

- They must have been cataloged when the Snapset is created.
- The pubset on which they are cataloged must be imported locally.

The catalog and user IDs specified must be unique (i.e. contain no wildcards). Aliases (also partially-qualified aliases) may be specified.

### **SNAPSET = \*LATEST / \*ALL / <name 1..1 with-low> / <integer -52..-1> / \*INTERVAL(...)**

Specifies the Snapset from which the job variables are to be restored. Information about all existing Snapsets for a pubset can be obtained using the SHOW-SNAPSET-CONFIGURATION command.

### **SNAPSET = \*LATEST**

The job variables are to be restored from the latest Snapset (i.e. from the most up-to-date pubset backup).

### **SNAPSET = \*ALL**

All Snapsets of the pubset concerned are used as a basis for restoration. Each job variable is restored from the Snapset with the latest job variable status, in other words with the latest backup of the job variable.

### **SNAPSET = <name 1..1 with-low>**

Specifies a particular Snapset explicitly by means of the Snapset ID. The maximum of 52 pubsets are distinguished by means of Snapset IDs specified which comprise letters from the 26 lowercase letters a to z and the 26 uppercase letters A to Z.

### **SNAPSET = <integer -52..-1>**

Specifies a particular Snapset explicitly by means of the relative age. The value -1 specifies the latest Snapset.

### **SNAPSET = \*INTERVAL(...)**

Restoration takes place as with SNAPSET=\*ALL. However, only Snapsets which lie in the specified age range are used as a basis:

#### **OLDEST = -52 / <integer -52..-1>**

Specifies the oldest Snapset; the range begins with this Snapset.

#### **NEWEST = -1 / <integer -52..-1>**

Specifies the newest Snapset; the range ends with this Snapset.

### **REPLACE = \*NO / \*YES(...)**

Specifies whether the job variables to be restored may overwrite existing job variables.

### **REPLACE = \*NO**

Existing job variables are not overwritten. This means that job variables with the names of existing job variables are not restored.

### **REPLACE = \*YES(...)**

Existing job variables may be overwritten by job variables which are to be restored provided the protection attributes permit this. For job variables which are protected against unauthorized overwriting by means of a password, the required password must be entered into the caller's password table (see the ADD-PASSWORD command).

---

**IGNORE-PROTECTION = \*NO / \*YES**

*This operand is only available to privileged users (TSOS privilege).*

Specifies whether job variables are to be overwritten without taking into account any write protection which exists.

**NEW-JV-NAME = \*SAME / \*BY-USER-ID(...) / \*BY-PREFIX(...)**

Specifies whether the job variables are to be renamed when they are restored. When they are renamed, either a different ID or a name prefix can be specified.

**NEW-JV-NAME = \*SAME**

Each job variable is restored under the name of the original job variable.

**NEW-JV-NAME = \*BY-USER-ID(...)**

Each job variable is to be restored under the user ID specified.

Only the co-owner (or TSOS) is able to restore the job variable under a user ID other than the original one.

**NEW-USER-ID = \*SAME / <name 1..8>**

New user ID. The default is \*SAME, i.e. the user ID of the original job variable is retained.

**NEW-JV-NAME = \*BY-PREFIX(...)**

Each job variable is to be restored under a new name. The name consists of the specified prefix and the original name, separated by a period.

**NEW-PREFIX = \*NONE / <filename 1..8 without-cat-gen-user-vers>**

Name prefix (up to 8 characters). The default is \*NONE, i.e. the original job variable name is retained.

**REPORTING = \*ERROR / \*FULL**

Determines the scope of the log if a processing log was requested in the OUTPUT operand.

**REPORTING = \*ERROR**

Only job variables which could not be restored are listed. The reason is displayed by means of a message code.

**REPORTING = \*FULL**

All job variables are listed. For job variables which could not be restored, the reason is displayed by means of a message code.

**OUTPUT = \*NONE / list-poss(2): \*SYSOUT / \*SYSLST**

Specifies whether a processing log is to be output to SYSOUT and/or SYSLST. The default is \*NONE, i.e. no log is output.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	1	CMD0202	Syntactical or semantic error in the command
	32	DMS0584	A status occurred which prevents processing from continuing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0102	Command aborted after interruption with K2
	64	CMD0216	Required authorization not available
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS05FC	Specified file not in home pubset
	64	DMS0610	Action with wildcards: Error executing a function for one of the selected job variable names
	64	DMS0616	Volume set in SM pubset cannot be accessed
	64	DMS0620	No restorable job variable found
	64	DMS0621	Job variable already cataloged, restoration not performed
	64	DMS0622	Snapset not available
	64	DMS0682	JVS error when executing job
	130	DMS053C	No space in the pubset's catalog
	130	DMS0585	Error detected when processing catalog or multiprocessor system
	130	DMS0594	Not enough virtual memory available

---

## 5.48 RESTORE-PUBSET-FROM-SNAPSET

Restore a pubset on the basis of a Snapset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT SNAPSET
<b>Privileges:</b>	TSOS HSMS-ADMINISTRATION

### Function

The RESTORE-PUBSET-FROM-SNAPSET command resets a pubset which is in the INACCESSIBLE state to the status of a Snapset.

This command is executed only if the pubset has not been reduced by one or more volumes since the Snapset to be used for restoration was created.

If the system run aborts while this command is being executed, the pubset can remain in an intermediate state which corresponds to partial execution of the command. In this case restoration can be completed by calling the command again. The pubset is locked until the command has been executed fully.

When remote mirroring is being used and snap copies are also generated in the remote storage system, the pubset is restored using the snap units of the original units which are directly attached. These are identified automatically by the Snapset management.

#### *Note on the disk storage systems*

- For EMC with TimeFinder/Snap  
Reconstruction of a pubset can only be executed from the **most recent** of the Snapsets which exist for this pubset.  
The Snapset used for reconstruction can then not be used anymore, and is automatically deleted after the reconstruction process has been completed. Older Snapsets, however, are retained, and can then still be used. When a pubset is to be reset to the status of an older Snapset, this can only be done by means of repeated reconstruction, each time based on the most recent Snapset, through to the required Snapset.
- For ETERNUS and EMC with TimeFinder/SnapVX  
Reconstruction of a pubset can be executed on any Snapset version in one step. All Snapset versions, also the version used for reconstruction, are retained and can still be used, e.g. also for another reconstruction.

### Format

<b>RESTORE-PUBSET-FROM-SNAPSET</b>
<b>PUBSET</b> = <cat-id 1..4>
<b>,SNAPSET</b> = * <b>LATEST</b> / <name 1..1 with-low> / <integer -52..-1>

---

## Operands

**PUBSET = <cat-id 1..4>**

Catalog ID of the pubset which is to be restored.

**SNAPSET =**

Specifies the Snapset from which the pubset is to be restored.

**SNAPSET = \*LATEST**

The pubset is restored on the basis of the latest Snapset.

**i** The pubset concerned does not have to be importable for the reconstruction. The F5 label reconstruction takes place when the reconstructed pubset is imported.

**SNAPSET = <name 1..1 with-low> / <integer -52..-1>**

*Not permitted for Symmetrix systems.*

The pubset is restored on the basis of the explicitly specified Snapset (specification of the Snapset ID or of the relative age).

**i** While the function is being executed, the pubset is implicitly imported, and it is exported when the function ends. Implicit F5 label reconstruction also takes place.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	32	CMD0216	Required authorization not available
	64	DMS13D5	The Snapset specified does not exist on the pubset
	64	DMS3001	Internal error
	64	DMS3002	Error in message output
	64	DMS3003	Error when requesting more space
	64	DMS3006	DMS error
	64	DMS340D	Error while reserving the disk
	64	DMS3405	Existing pubset type does not match MRSCAT entry
	64	DMS3406	No MRSCAT entry for specified catalog ID
	64	DMS3410	Pubset not in INACCESSIBLE state
	64	DMS3411	VSN not unique
	64	DMS3412	Device management reports volume inconsistency
	64	DMS3414	Pubset does not contain a Snapset catalog
	64	DMS3415	While ascertaining the volumes of the SM pubset, an error occurred when an SVL was accessed
	64	DMS3416	Pubset contains fewer volumes than the Snapset
	64	DMS3417	Error while restoring the snap unit
	64	DMS3418	Error while terminating the snap unit
	64	DMS3419	Snap device is not assigned to the device
	64	DMS341A	Device could not be attached
	64	DMS341B	No Snapset was found for a volume of the pubset
	64	DMS341C	Pubset will be processed by PVSREN
	64	DMS341F	Pubset no longer contains specific volume
	64	DMS3423	Only SNAPSET=*LATEST is permitted for the storage system available
	64	DMS3500	SHC-OSD subsystem is not available
	64	DMS3503	Error while calling the reported interface

---

## Notes

- The pubset which is to be restored must be exported. Until the restore operation has been completed, it is protected against being placed in service by /IMPORT-PUBSET (the PVSREN indicator is set in the SVL). During this period, import attempts are rejected with the message DMS0351 and insert 03. If the data from the snap units is already being copied back, the rejection is indicated by the messages DMS0381 and DMS038F.
- During the restore operation, a temporary copy of the Snapset catalog of the pubset which is to be restored is created on the home pubset and given the file name \$TSOS.SYSWRK.SNAPSET.<catid>. This file is only required for restoration and is deleted again once the operation has been completed. During the restore operation it is protected against being deleted because it is used to restart any interrupted restore operation (the command must be called again if the operation is interrupted). If the pubset is restored in a different way, the pubset is deleted when the next pubset import takes place.
- An interrupted restore operation can only be restarted in the same runtime environment, i.e. with the same home pubset, because the copy of the Snapset catalog which is stored there is required for this purpose.

---

## 5.49 RESTORE-SDF-INPUT

Restore previous input

<b>Component:</b>	SDF
<b>Functional area:</b>	SDF control
<b>Domain:</b>	SDF
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The RESTORE-SDF-INPUT command redisplay an input which has already been made and stored in the input buffer. The user can then use the displayed command or statement again as it is or in modified form without having to retype it. For an input to be reused, however, at least one character in the input string must be changed (e.g. you can overwrite a character with the same character).

The INPUT operand is used to select the input to be displayed. The default \*LAST-CMD recalls the last saved command. Earlier inputs can be selected using the relative or absolute input serial number. The SHOW-INPUT-HISTORY command (or standard statement) provides information on all saved (and therefore available) inputs.

The output produced by RESTORE-SDF-INPUT depends on the current guidance mode (see SHOW-SDF-OPTIONS command, output field *GUIDANCE*):

- In guided dialog a temporarily guided dialog is initiated for the command or statement that is to be output. The operand form contains all user inputs.  
A guided dialog is not possible for commands or statements without operands. Therefore, only the help text and the error message CMD0070 are displayed. If you select an AID command, the warning CMD0559 is output because AID commands are not supported in guided dialog.
- In unguided dialog the saved input string is displayed. To use dialog guidance for making modifications, the user can initiate a temporarily guided dialog by entering a question mark directly after the command/statement name.

The input buffer is controlled (activated/deactivated and deleted) via the MODIFY-SDF-OPTIONS command (or standard statement). Inputs in guided dialog are saved in ACCEPTED form, while inputs in unguided dialog are saved in INPUT form.

The RESTORE-SDF-INPUT command or statement is not saved.

Values specified for “secret” operands which match neither the default value nor a value defined via SECRET=\*NO are saved in the input buffer with “^”.

If these values are displayed again via RESTORE-SDF-INPUT in unguided dialog, the user can do one of the following:

- send off the command/statement unchanged. In this case, SDF displays a blanked input field for each secret operand for the user to enter the desired value.
- delete the “^” and insert the desired value directly before sending off the command/statement.

In programs with an SDF interface, RESTORE-SDF-INPUT is available as a standard statement with approximately the same syntax and functionality.

## Format

**RESTORE-SDF-INPUT**

Alias: **RRSDFI**

**INPUT** = **\*LAST-CMD** / <integer -100..-1> / <integer 1..9999>

## Operands

**INPUT = \*LAST-CMD / <integer -100..-1> / <integer 1..9999>**

Determines which input from the input buffer is to be redisplayed.

**INPUT = \*LAST-CMD**

The last saved command is displayed.

**INPUT = <integer -100..-1>**

Identifies the desired input relative to the current input.

**INPUT = <integer 1..9999>**

Identifies the desired input absolutely via its input serial number, which is automatically assigned by SDF when it is saved. The contents of the input buffer can be displayed with input serial numbers (see SHOW-INPUT-HISTORY command, operand INPUT-SERIAL-NUMBER=\*YES).

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
1	0	CMD0001	Output is not possible since the input buffer is empty. Guaranteed message: CMD0558
2	0	CMD0559	AID command not supported in guided dialog. Guaranteed message: CMD0559
1	32	CMD0500	Syntax description in current syntax file invalid. Guaranteed message: CMD0500
1	64	CMD0558	Command execution not successful

-----

```

```

NEXT = *down(basic-acl)
      *EXECUTE"F3" / + / Next-cmd / *CONTINUE / *EXIT"K1" / *EXIT-ALL"F1" /
      *TEST"F2"

```

```

COMMAND : MODIFY-FILE-ATTRIBUTES
STRUCTURE: BASIC-ACL=
OPERANDS : ...AME=TEST, PROTECTION=*PARAMETERS ( BASIC-ACL=*PARAMETERS ( OWNER=*PARAMETERS ( READ=*YES, WRITE=*YES, EXEC=*YES ), GROUP=*PARAMETERS ( READ=*YES, WRITE=*YES, EXEC=*NO ), OTHERS=*PARAMETERS ( READ=*YES, WRITE=*YES, EXEC=...
-----

```

```

OWNER          = ( READ=Y, WRITE=Y, EXEC=Y)
GROUP          = ( READ=Y, WRITE=N, EXEC=Y)
OTHERS         = ( READ=Y, WRITE=N, EXEC=Y)
-----

```

```

NEXT = *CONTINUE
      *EXECUTE"F3" / + / - / Next-cmd / *CONTINUE / *EXIT"K1" / *EXIT-ALL"F1"
      / *TEST"F2"

```

- (1) BASIC-ACL protection is recorded in the catalog entry for the *SF.DUMMY* file (owners have unrestricted rights, groups and others have only read access).
- (2) The SHOW-JOB-STATUS command is supposed to display information on the task with the TSN *00AS*, but no such task exists.
- (3) The RESTORE-SDF-INPUT command has to redisplay the last input.
- (4) The SHOW-JOB-STATUS command (see step 2) is output. In the character string which is output, the TSN is corrected to *00AD* and sent off with [DUE]. Information on this TSN is displayed.
- (5) The TEST file is cataloged. The protection rights are then output in abbreviated form via SHOW-FILE-ATTRIBUTES.
- (6) SHOW-INPUT-HISTORY outputs the contents of the input buffer with input serial numbers (INPUT-SERIAL-NUMBER=\*YES).
- (7) RESTORE-SDF-INPUT redisplayes the command with the serial number 45.
- (8) In the displayed MODIFY-FILE-ATTRIBUTES, the file name is changed to *TEST* and sent off with [DUE]. The TEST file thus receives the same BASIC-ACL protection as the *SF.DUMMY* file did previously.
- (9) The user wants to change the protection attributes of the TEST file again. RESTORE-SDF-INPUT displays the last command entered (see step 8). A question mark is inserted after the command name and the line is sent off with [DUE].
- (10) SDF switches to temporarily guided dialog and displays the operand form of the MODIFY-FILE-ATTRIBUTES command with the explicitly set specifications for BASIC-ACL. For an overview of the input, the user requests the subform for BASIC-ACL (\*PARAMETERS structure) by entering “\*down(basic-acl)” in the NEXT line.

- 
- (11) The user enters the desired values (groups and others receive execution rights with EXEC=\*YES) in the subform and sends it off with [DUE].

*Note*

The BASIC-ACL access rights can be changed to the shortest possible form by editing the command line output by RESTORE-SDF-INPUT (or by editing the corresponding command line in the output of the SHOW-INPUT-HISTORY command).

## 5.50 RESTORE-SOFTWARE-INVENTORY

Copy current SCI

**Component:** IMON-GPN  
**Functional area:** System control and optimization  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** SUBSYSTEM-MANAGEMENT

### Function

The RESTORE-SOFTWARE-INVENTORY command can be used to restore the current SCI from a backup copy. When this is done, both physical SCI files (IMON-SCI and IMON-GPN-SCI) are restored.

The command is not executed if the IMON subsystem is currently loaded.

A backup copy of the current SCI can be explicitly created using the SAVE-SOFTWARE-INVENTORY command. Backup copies are also created automatically on system start and during software installation (see the “IMON” User Guide [19]).

### Format

**RESTORE-SOFTWARE-INVENTORY**

**FROM-SCI = \*STD / <filename 1..50>**

### Operands

#### FROM-SCI =

Name of the source file (backup copy) from which the current SCI is to be restored.

#### FROM-SCI = \*STD

Uses the SCI backup that was automatically created under the name \$TSOS.SYS.IMON.SCI.[GPN.]SAV on the last system start.

#### FROM-SCI = <filename 1..50>

Explicit specification of the name of the source file.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	32	IMO9101	Command terminated abnormally (system error in external call; internal error in IMON-GPN)
	64	CMD0216	Privileges error
	64	IMO9100	IMON subsystem started, error during the restore operation, DMS error

---

## 5.51 RESUME-ALIAS-SUBSTITUTION

Cancel effect of HOLD-ALIAS-SUBSTITUTION

**Component:** ACS

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The RESUME-ALIAS-SUBSTITUTION command cancels the effect of the HOLD-ALIAS-SUBSTITUTION command and resumes the interrupted alias substitution function.

One RESUME-ALIAS-SUBSTITUTION command must be entered for each HOLD-ALIAS-SUBSTITUTION command.

### Format

<b>RESUME-ALIAS-SUBSTITUTION</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed normally
2	0	ACS0041	Alias substitution still inactive
1	0	CMD0001	No action, since the ACS substitution function was not interrupted by HOLD-ALIAS-SUBSTITUTION
	128	ACS0018	ACS not available

### Examples

For examples, see the HOLD-ALIAS-SUBSTITUTION and SET-FILE-NAME-PREFIX commands.

---

## 5.52 RESUME-HARDWARE-AUDIT

Resume suspended AUDIT mode

**Component:** BS2000 OSD/BC  
**Functional area:** AUDIT mode control  
**Domain:** PROGRAM  
**Privileges:** STD-PROCESSING  
TSOS

### Function

The RESUME-HARDWARE-AUDIT command resumes AUDIT mode after it has been suspended with HOLD-HARDWARE-AUDIT. The command acts like START-HARDWARE-AUDIT with SCOPE=\*OWN-JOB, but differs from it in that any existing AUDIT backup table continues to be used to back up the AUDIT table.

The command is rejected if AUDIT mode has been activated but has not been suspended. If AUDIT mode has not been activated, the command activates it (like START-HARDWARE-AUDIT with SCOPE=\*OWN-JOB).

The RESUME-HARDWARE-AUDIT command can only relate to the user's own task.

#### *Privileged functions*

Systems support (TSOS privilege) can resume hardware AUDIT mode for the privileged processor state TPR (STATE=\*SYSTEM).

### Format

<b>RESUME-HARDWARE-AUDIT</b>
------------------------------

<b>STATE = *USER / *SYSTEM</b>
--------------------------------

### Operands

#### **STATE =**

Processor state for which the AUDIT mode is to be reactivated. If the hardware AUDIT mode is to be activated at the same time for both processor states, the command must be issued twice.

#### **STATE = \*USER**

The hardware AUDIT mode is to be resumed for the nonprivileged processor state TU.

#### **STATE = \*SYSTEM**

*This operand value is reserved for privileged users.*

The hardware AUDIT mode is to be reactivated for the privileged processor state TPR.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	64	CMD0216	User does not have authorization
	64	IDA0001	Hardware AUDIT not activated
	64	IDA0011	Privilege error
	64	IDA0023	Hardware AUDIT not available due to missing authorization in user entry
	64	IDA0024	Hardware AUDIT not available because of current test option settings for the active task

---

## 5.53 RESUME-JOB

Take user job off hold

**Component:** BS2000 OSD/BC  
**Functional area:** Job processing  
**Domain:** JOB  
**Privileges:** TSOS  
OPERATING  
**Routing code:** J

### Function

The RESUME-JOB command enables systems support staff to take a user job suspended with the HOLD-JOB command off hold (wait state HELD-BY-COMMAND). The job can then be considered once again by job management and can be processed in accordance with its attributes.

If the user job is in the wait state due to a lack of system resources then the availability of the resources is checked and, if they are unavailable, a warning is issued. This wait state can only be cleared by providing the missing resources (by importing the corresponding pubset or releasing the TSN).

The RESUME-TASK command is used to resume tasks that have already been started.

As soon as the user job has been released, a message is displayed on the operator terminal (console).

### Format

#### RESUME-JOB

**JOB-IDENTIFICATION** = \*TSN(...) / \*MONJV(...) / <alphanum-name 1..4>

\*TSN(...)

| **TSN** = <alphanum-name 1..4>

\*MONJV(...)

| **MONJV** = <filename 1..54 without-gen-vers>

### Operands

**JOB-IDENTIFICATION =**

Type of job identification.

The command may refer to the TSN or to a monitoring job variable.

**JOB-IDENTIFICATION = \*TSN(...)**

The job to be taken off hold is identified by its TSN.

**TSN = <alphanum-name 1..4>**

TSN of the job in the wait state.

---

**JOB-IDENTIFICATION = \*MONJV(...)**

The job to be released is identified via a monitoring job variable.

**MONJV = <filename 1..54 without gen>**

Job variable specified for the job that was suspended.

**JOB-IDENTIFICATION = <alphanum-name 1..4>**

Job number of the suspended job.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	CMD0002	Warning: wait state due to lack of resources
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JMS0630	Semantic error
	64	JMS0640	Command cannot be executed

---

## 5.54 RESUME-JOB-CLASS

Take job class off hold

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** TSOS  
OPERATING

**Routing code:** J

### Function

The RESUME-JOB-CLASS command enables systems support staff to take a job class suspended with the HOLD-JOB-CLASS command off hold. The batch jobs which were temporarily forced to wait in the job class queue can then be released for starting. Execution of the command is acknowledged by a message displayed on the console.

Systems support staff can obtain an overview of the states of the various job classes using the SHOW-SYSTEM-STATUS command.

### Format

<b>RESUME-JOB-CLASS</b>
<b>CLASS-NAME</b> = <name 1..8>

### Operands

**CLASS-NAME** = <name 1..8>

Name of the job class to be released.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JMS0630	Semantic error
	64	JMS0640	Command cannot be executed

---

## 5.55 RESUME-JOB-STREAM

Take job stream off hold

**Component:** BS2000 OSD/BC  
**Functional area:** Job processing  
**Domain:** JOB  
**Privileges:** TSOS  
OPERATING  
**Routing code:** J

### Function

The RESUME-JOB-STREAM command enables systems support staff to take a job stream suspended with the HOLD-JOB-STREAM command off hold. The job scheduler is reactivated and begins selecting the jobs to be started from its assigned number of job classes and passing them to the class scheduler.

The RESUME-JOB-STREAM command is also permitted for the system job stream \$SYSJS.

A message is displayed on the console to indicate that scheduling has been resumed.

### Format

<b>RESUME-JOB-STREAM</b>
--------------------------

<b>STREAM-NAME</b> = <name 1..8>
----------------------------------

### Operands

**STREAM-NAME = <name 1..8>**

Name of the job stream to be released.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JMS0630	Semantic error
	64	JMS0640	Command cannot be executed

## Example

```
/show-system-status inf=*job-stream
```

%JSTREAM	STATE	DORM	ANCD	WAIT	STRT	HOLD	START	STOP	LIFETIME
\$\$SYSJS	ACT	0	0	0	4	0	ATLOAD	ATSHUTD	
%JSSTD	ACT	0	0	0	0	0	ATLOAD	ATSHUTD	
%JSSTD1	ACT	0	0	0	6	0	ATLOAD	ATSHUTD	
%JSSTD2	HOLD	0	0	0	0	0	ATLOAD	ATSHUTD	
%JSTSOS	ACT	0	0	0	10	0	ATLOAD	ATSHUTD	

```
/resume-job-stream jsstd2
```

```
% JMS0022 '/RESUME-JOB-STREAM' COMMAND PROCESSED
```

```
/show-system-status inf=*job-stream
```

%JSTREAM	STATE	DORM	ANCD	WAIT	STRT	HOLD	START	STOP	LIFETIME
\$\$SYSJS	ACT	0	0	0	4	0	ATLOAD	ATSHUTD	
%JSSTD	ACT	0	0	0	0	0	ATLOAD	ATSHUTD	
%JSSTD1	ACT	0	0	0	6	0	ATLOAD	ATSHUTD	
%JSSTD2	ACT	0	0	0	0	0	ATLOAD	ATSHUTD	
%JSTSOS	ACT	0	0	0	10	0	ATLOAD	ATSHUTD	

Job stream JSTD2, which is currently on hold (as indicated by the *STATE* output field of the first SHOW-SYSTEM-STATUS command), is reactivated by the RESUME-JOB-STREAM command.

---

## 5.56 RESUME-LINKAGE-AUDIT

Resume suspended linkage AUDIT mode

**Component:** BS2000 OSD/BC  
**Functional area:** AUDIT mode control  
**Domain:** PROGRAM  
**Privileges:** STD-PROCESSING  
TSOS

### Function

The RESUME-LINKAGE-AUDIT command resumes linkage AUDIT mode after it has been suspended with HOLD-LINKAGE-AUDIT. Any existing AUDIT backup table continues to be used to back up the linkage AUDIT table. The command is rejected if linkage AUDIT mode has been activated but has not been suspended. If linkage AUDIT mode has not been activated, the command activates it.

#### *Privileged functions*

Systems support (TSOS privilege) can continue linkage AUDIT mode for the privileged processor state TPR (STATE=\*SYSTEM).

### Format

<b>RESUME-LINKAGE-AUDIT</b>
<b>STATE = *USER / *SYSTEM</b>

### Operands

#### **STATE =**

Processor state for which the linkage AUDIT mode is to be resumed. If the linkage AUDIT mode is to be activated at the same time for both processor states, the command must be issued twice.

#### **STATE = \*USER**

Linkage AUDIT mode is to be resumed for the nonprivileged processor state TU.

#### **STATE = \*SYSTEM**

*This operand value is reserved for privileged users.*

Linkage AUDIT mode is to be resumed for the privileged processor state TPR.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	64	CMD0216	User does not have authorization
	64	IDA0052	Linkage AUDIT not available due to missing authorization in user entry
	64	IDA0053	Linkage AUDIT not available because of current test option settings for the active task
	64	IDA0060	No AUDIT functions throughout the system in this session

---

## 5.57 RESUME-PRINT-JOB

Resume print job

**Component:** SPOOL

**Functional area:** Controlling spoolout job

**Domain:** SPOOL-PRINT-ADMINISTRATION

**Privileges:** STD-PROCESSING  
OPERATING  
PRINT-SERVICE-ADMINISTRATION  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** O

### *Note*

The RESUME-PRINT-JOB command corresponds to the RESUME-SPOOLOUT command; the command name RESUME-SPOOLOUT is still accepted as an alias.

### **Function**

The RESUME-PRINT-JOB command resumes processing of a suspended print job in the local cluster. The print job is identified by its TSN or MONJV. The cluster administrator can address a print job by means of the server name and the TSN on the server on which it is processed.

**i** Starting with BS2000 OSD/BC V11.0, printers that are connectable to the channel are no longer supported. However, print jobs for “local” printers defined in SPOOL are still accepted and can be forwarded to real, LAN-connected high performance printers by using a SPOOL add-on product (e.g. ROUTER by Océ).

This forwarding cannot be continued by /RESUME-PRINT-JOB. The command may therefore now only be used for RSO printers and virtual devices.

### *Privileged functions*

RSO device administrators and spool and cluster administrators can resume any print job scheduled for printing on any device that they manage.

For more information on these user groups see the manuals “RSO” [32], “SPOOL” [43] and “Dprint” [10].

## Format

### RESUME-PRINT-JOB

**JOB-IDENTIFICATION** = \*TSN(...) / \*SERVER-TSN(...) / \*MONJV(...)

\*TSN(...)

|     **TSN** = <alphanum-name 1..4>

\*SERVER-TSN(...)

|     **TSN** = <alphanum-name 1..4>

|     , **SERVER-NAME** = <alphanum-name 1..8>

\*MONJV(...)

|     **MONJV** = <filename 1..54 without-gen>

, **PRIORITY** = \*UNCHANGED / <integer 30..255>

, **RESTART-POSITION** = \*UNCHANGED / \***BEGIN-OF-SPOOL**OUT / \***PAGE**(...) / \***BACK**(...)

\***PAGE**(...)

|     **PAGE-NUMBER** = <integer 1..10000000>

\***BACK**(...)

|     **PAGES** = <integer 1..10000000>

## Operands

**JOB-IDENTIFICATION** = \*TSN(...) / \*SERVER-TSN(...) / \*MONJV(...)

Specifies how the job is identified.

**JOB-IDENTIFICATION** = \*TSN(...)

The job is identified by its local TSN.

**TSN** = <alphanum-name 1..4>

TSN of the job.

**JOB-IDENTIFICATION** = \*SERVER-TSN(...)

The print job is identified by its TSN on the server. Print jobs in the local cluster can be addressed in this way by the cluster administrator.

**TSN** = <alphanum-name 1..4>

TSN of the job on the server

**SERVER-NAME** = <name 1..8>

Name of the server on which the print job can be addressed by its TSN.

**JOB-IDENTIFICATION** = \*MONJV(...)

The print job is identified by its monitoring job variable.

**MONJV = <filename 1..54 without-gen-vers>**

This operand allows print jobs to be addressed by their monitoring job variables, provided the specified MONJV is accessible on the host at which the command is issued.

**PRIORITY = \*UNCHANGED / <integer 30..255>**

Priority for the released spoolout job.

**PRIORITY = \*UNCHANGED**

The priority that the spoolout job previously had remains in force.

**RESTART-POSITION =**

Defines the point from which the spoolout file is to be output again.

**i** If there are control characters in the data, they are only interpreted if the value X'A3' is contained in byte 6 of the control character list for the first page to be printed (see the "SPOOL" manual [43]).

**RESTART-POSITION = \*UNCHANGED**

The spoolout job should be repeated from the place specified in the HOLD-PRINT-JOB command.

**RESTART-POSITION = \*BEGIN-OF-SPOOLOUT**

Repeat from the start of the file.

**RESTART-POSITION = \*PAGE(...)**

The spoolout job is to be repeated from a particular page.

**PAGE-NUMBER = <integer 1..1000000>**

Repeat output from the specified page; all preceding pages are skipped.

**RESTART-POSITION = \*BACK(...)**

The SPOOLOUT job is to be restarted on the page that is before current page by the number of pages specified. All pages before that are ignored.

**PAGES = <integer 1..1000000>**

Number of pages to leaf back to reach the starting point for repeating output.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SCP0973	Semantic error
	32	SCP0974	System error. Command rejected
	64	SCP0975	No authorization for command
	64	SCP0976	Invalid operand value Guaranteed message: SPS0968
	128	SCP1051	Subsystem required for operand

---

## 5.58 RESUME-PROCEDURE

Resume suspended procedure run

**Component:** SYSFILE

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The RESUME-PROCEDURE command ends ESCAPE mode (see the HOLD-PROCEDURE command) and resumes execution of an interrupted procedure.

### Format

RESUME-PROCEDURE	Alias: RUP
MODE = *ACTUAL / *CMD / *PROGRAM	

### Operands

#### MODE =

Mode in which procedure execution is to be continued.

#### MODE = \*ACTUAL

Procedure execution is continued in the mode in effect at the time it was interrupted. Command mode: Control returns to the next command in the procedure file.

Program mode: The interrupted program is resumed at the address at which it was interrupted.

#### MODE = \*CMD

The procedure is to be continued in command mode. If the procedure was interrupted in program mode, the interrupted program remains loaded until a RESUME-PROCEDURE command with MODE=\*PROGRAM is given.

#### MODE = \*PROGRAM

The procedure is to be continued in program mode. If no program is loaded, an error message is issued and control is returned to the terminal. The user can then enter the RESUME-PROCEDURE command with MODE=\*CMD to continue the procedure run in command mode.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	64	SSM2018	Command not permitted in batch mode in a noninterruptible procedure
	64	SSM2019	No interrupted procedure exists
	64	SSM2020	MODE=*PROGRAM and no program loaded
	64	SSM2013	No program loaded

## Notes

- An interrupted procedure can be continued only by means of the RESUME-PROCEDURE command.
- The RESUME-PROCEDURE command must always be entered in dialog. If it is part of a procedure or part of a batch job, an appropriate error message is issued and the spinoff mechanism is activated.
- If a procedure interrupted in command mode is to be continued in program mode, this can only be done by explicitly specifying the operand MODE=\*PROGRAM. The program itself can have been loaded at any desired level and may be continued at any desired level. The program is, however, tied to the system file assignments (ASSIGN command) applicable to whichever is the current level.
- The EXIT-PROCEDURE command causes a direct switch from the ESCAPE mode of the current procedure to the ESCAPE mode of the next lower procedure level. This procedure can then be continued in the current mode by means of the RESUME-PROCEDURE command (without operands). It is also possible to continue the procedure in a different mode by specifying the operand MODE=\*PROGRAM/\*CMD.

## Example

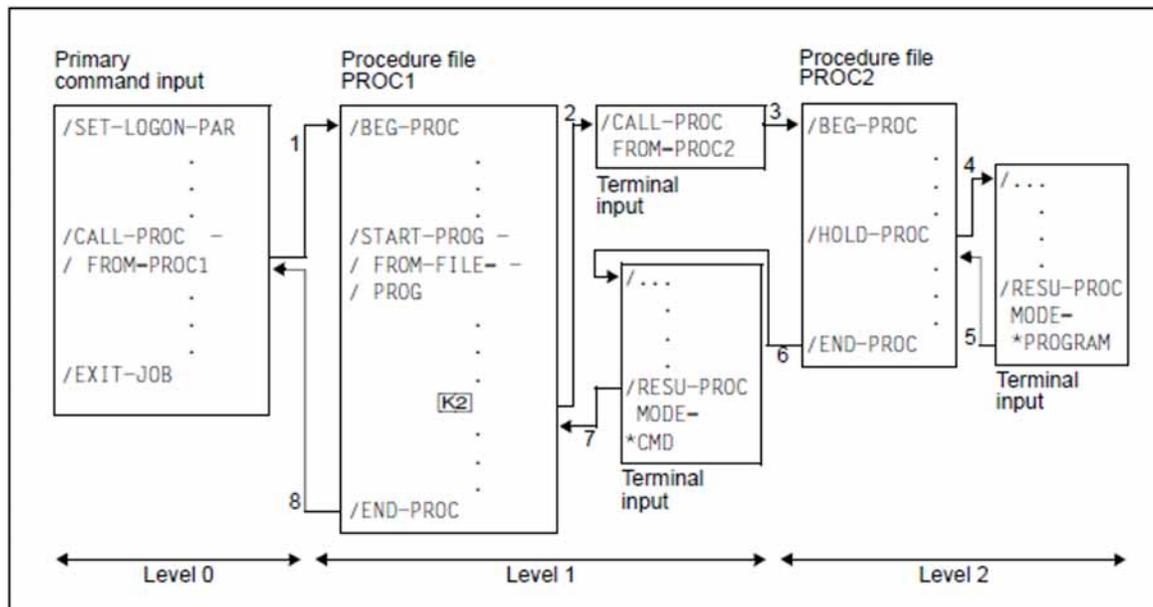

Figure 9: Program execution in different areas

---

The arrows indicate the sequence in which commands are processed (SYSCMD).

1. With the command `/CALL-PROC FROM=PROC1`, the procedure PROC1 is started and SYSCMD is assigned to the procedure file PROC1.
2. In the procedure the program PROG is loaded and started. The logical system files of procedure level 1 are assigned to the program. The procedure PROC1 is interrupted by pressing [K2] in program mode, i.e. the interruption occurs during execution of the program PROG. SYSCMD is assigned to the terminal (ESCAPE mode).
3. With the command `/CALL-PROC FROM=PROC2`, the procedure PROC2 is started and SYSCMD is assigned to the procedure file PROC2.
4. The procedure PROC2 is interrupted in command mode by a HOLD-PROCEDURE command. SYSCMD is assigned to the terminal (ESCAPE mode).
5. The program PROG interrupted by [K2] is continued at procedure level 2. The logical system files of procedure level 2 are now assigned to the program. If the program run terminates at this procedure level (last instruction executed), control is passed to the procedure PROC2. Processing is continued with the command following the HOLD-PROCEDURE command.
6. Procedure PROC2 is terminated by `/END-PROC`, and SYSCMD is again assigned to the terminal (level-1 ESCAPE mode; level 1 is still in program mode).
7. The RESUME-PROCEDURE command cancels the level-1 ESCAPE mode. Since at this time the program PROG is no longer loaded, the user must specify the operand "MODE=\*CMD" in order to switch from program mode to command mode.
8. SYSCMD is again assigned to the primary command input.

---

## 5.59 RESUME-PROGRAM

Start loaded program or resume suspended program

**Component:** AIDSYSA  
**Functional area:** Program control  
**Domain:** PROGRAM  
**Privileges:** all privileges

### Function

The RESUME-PROGRAM command starts a loaded program (see LOAD-EXECUTABLE-PROGRAM command) or resumes it after it has been suspended (e.g. interrupted with the [K2] key).

This command has no operands and is executed immediately. If no program is loaded, the message "IDA0C11 USER PROGRAM NOT LOADED" is displayed.

### Format

<b>RESUME-PROGRAM</b>	Alias: <b>RU / RUPG</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	1	CMD2201	Error in function call: function invalid
	3	CMD2203	Error in function call: version invalid
	64	IDA0C11	Error: no program loaded

---

## 5.60 RESUME-PUBSET-RECONFIGURATION

Terminate pubset reconfiguration job normally

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

The RESUME-PUBSET-RECONFIGURATION command enables systems support to gracefully terminate reconfiguration jobs which have been abnormally terminated as a result of job cancellation or a change of master. Reconfiguration jobs may have been initiated by a START-/STOP-PUBSET-CACHING, MODIFY-PUBSET-DEFINITION-FILE, MODIFY-PUBSET-PROCESSING, MODIFY-PUBSET-RESTRICTIONS or CREATE-SNAPSET command.

If applied to the pubset of a slave system, the RESUME-PUBSET-RECONFIGURATION command updates the associated MRS catalog entries on the basis of the information in the pubset configuration file.

### Format

<b>RESUME-PUBSET-RECONFIGURATION</b>
--------------------------------------

<b>PUBSET</b> = <cat-id 1..4>
-------------------------------

### Operands

**PUBSET = <cat-id 1..4>**

Identifies the pubset for which reconfiguration jobs are to be gracefully terminated.

### Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No errors
	32	CMD0221	Internal system error
	32	DMS138A	Internal parameter error
	64	CMD0216	No authorization to issue command
	64	DMS138B	Pubset does not exist
	64	DMS138C	Pubset not accessible
	64	DMS1391	SM pubset has no reconfiguration file
	128	DMS1386	Not enough class 4/5 memory

---

Return codes of the command which initiated the reconfiguration job may also be issued: START-/STOP-PUBSET-CACHING, MODIFY-PUBSET-DEFINITION-FILE, MODIFY-PUBSET-PROCESSING, MODIFY-PUBSET-RESTRICTIONS or CREATE-SNAPSET.

---

## 5.61 RESUME-SUBSYSTEM

Take suspended subsystem off hold

**Component:** DSSM

**Functional area:** Subsystem management

**Domain:** SYSTEM-MANAGEMENT

**Privileges:** OPERATING  
SUBSYSTEM-MANAGEMENT

**Routing code:** R

### Function

The RESUME-SUBSYSTEM command enables systems support staff to take a suspended subsystem off hold. Once this command has been executed successfully, connections can be set up once again to the specified subsystem, provided that the subsystem was previously placed in a defined hold state by means of a HOLD-SUBSYSTEM command. This ensures that all the necessary resources (holder task, address space) are still available and the initialization routine can be executed.

### Format

**RESUME-SUBSYSTEM**

**SUBSYSTEM-NAME** = <structured-name 1..8>

,**VERSION** = **\*STD** / <product-version mandatory-man-corr> / <product-version without-man-corr> / **\*HIGHEST**

,**SUBSYSTEM-PARAMETER** = **\*NONE** / <c-string 1..254>

,**RESET** = **\*NO** / **\*YES**

,**SYNCHRONOUS** = **\*NO** / **\*YES**

### Operands

**SUBSYSTEM-NAME** = <structured-name 1..8>

Name of the subsystem which is to be taken off hold.

**VERSION** = **\*STD** / <product-version mandatory-man-corr> / <product-version without-man-corr> / **\*HIGHEST**

Identifies the version number.

If a version number is specified, the format specified here must be identical to the format used when the subsystem was defined (release and correction status mandatory or not allowed; see description of the data type "[product-version](#)" (SDF syntax representation)).

**VERSION** = **\*STD**

If there is only **one** version of the subsystem that is on hold, the default value applies for this version.

If there are **several** suitable versions, the version must be specified.

**VERSION** = **\*HIGHEST**

The highest version of the subsystem entered in the static subsystem catalog is selected.

---

**SUBSYSTEM-PARAMETER = \*NONE / <c-string 1..254>**

Specifies whether special parameters that can only be evaluated by the specified subsystem are to be processed.

**RESET =**

Determines the mode and urgency of command processing.

**RESET = \*NO**

If the relevant system is not yet in a defined hold state, the command is rejected until this is achieved.

**RESET = \*YES**

The command is accepted irrespective of any clear-down process still outstanding and the subsystem or some components are immediately initialized (see notes).

**SYNCHRONOUS =**

Enables synchronous or asynchronous processing to be selected.

**SYNCHRONOUS = \*NO**

The command is to be processed asynchronously, i.e. there is no need to wait for it to execute before making another input. No error messages relating to the execution of the command will be output.

**SYNCHRONOUS = \*YES**

The command must be executed before another entry can be made. Any messages relevant to its execution are output.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	CMD0001	No action necessary; subsystem already on hold
	1	ESM0414	Syntax error: an invalid version was specified
	32	ESM0224	Command not processed
	32	ESM0228	Command terminated abnormally

**Notes**

- To ensure a high degree of parallelism and data integrity, time-consuming management functions are not performed under the control of the calling task; instead they are transferred to a DSSM task. As a rule, the requested function is checked **synchronously** (i.e. involving a wait state for the calling task). The actual processing, however, is performed by DSSM **asynchronously** and independently of the calling task.
- After the HOLD-SUBSYSTEM command, RESUME-SUBSYSTEM is rejected if DSSM has not yet fully suspended the subsystem. The RESET=\*YES operand, however, enables systems support to cancel the hold state for the subsystem unconditionally, without waiting for completion of a HOLD-SUBSYSTEM command. In this case, the initialization routine is initiated. The subsystem involved, which is informed of the RESET, can determine the scope of the initialization routine itself (full initialization, partial initialization, no initialization).

---

## 5.62 RESUME-TASK

Release suspended batch task

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** SYSTEM-TUNING

**Privileges:** TSOS  
OPERATING

**Routing code:** J

### Function

A batch task previously placed on hold with the HOLD-TASK command is released with RESUME-TASK. Only after this release can the job be canceled, if required, with the CANCEL-JOB command. In the case of a task which is waiting for an operator response, if a RESUME-TASK command is issued after a HOLD-TASK command, the following message will appear:

```
EXC0712 TASK NOT PENDED BY HOLD-TASK COMMAND. /RESUME-TASK REJECTED
```

Not until the operator response is entered will the task be put on hold. A second RESUME-TASK command will be required to cancel the hold state for the task.

### Format

#### RESUME-TASK

**JOB-IDENTIFICATION** = **\*TSN** (...) / **\*MONJV**(...)

**\*TSN**(...)

| **TSN** = <alphanum-name 1..4>

**\*MONJV**(...)

| **MONJV** = <filename 1..54 without-gen-ver>

### Operands

#### **JOB-IDENTIFICATION** =

The batch job for which the wait state is to be canceled can be identified either by its task sequence number (TSN) or by a declared monitoring job variable (MONJV).

#### **JOB-IDENTIFICATION** = **\*TSN**(...)

Preset value: the job is identified by its TSN.

**TSN** = <alphanum-name 1..4>

TSN of the batch job to be resumed.

---

**JOB-IDENTIFICATION = \*MONJV(...)**

Preset value: the job is identified by its monitoring job variable.

**MONJV = <filename 1..54 without-gen-ver>**

Specifies the monitoring job variable of the batch task for which the wait state is to be canceled.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
12	64	EXC0711	Specified task sequence number (TSN) not found
12	64	EXC0712	Task is not on hold
12	64	EXC0715	Command is not allowed for this task type

---

## 5.63 RETURN-JOB-TO-VIRTUAL-DEVICE

Return print job to virtual printer

<b>Component:</b>	SPOOL
<b>Functional area:</b>	Controlling spoolout job
<b>Domain:</b>	SPOOL-PRINT-SERVICES
<b>Privileges:</b>	STD-PROCESSING PRINT-SERVICE-ADMINISTRATION

### Function

The RETURN-JOB-TO-VIRTUAL-DEVICE command returns the current print job to the virtual device. It is executed in batch mode only.

The POST-ACTION operand determines whether the print job is canceled as a result of being returned or the status which it is assigned when it remains in the Spool&Print queues. This specification ultimately decides whether the application retains control over this print job.

When the print job remains in the keep or wait status, the ERROR-MSG operand can be used to specify that an error message is also output.

The command is part of a set of four commands which enable an application to be created in the form of an S procedure (for an example, see the OPEN-VIRTUAL-DEVICE-DIALOG command). These commands manage the dialog between a virtual device and the application which was started in batch mode as an S procedure:

- OPEN-VIRTUAL-DEVICE-DIALOG
- GET-JOB-FROM-VIRTUAL-DEVICE
- RETURN-JOB-TO-VIRTUAL-DEVICE
- CLOSE-VIRTUAL-DEVICE-DIALOG

### Format

**RETURN-JOB-TO-VIRTUAL-DEVICE**

**POST-ACTION** = \*WAIT / \*KEEP / \*CANCEL-JOB / \*TERMINATE-JOB / \*ERROR

,**ERROR-MSG** = \*NONE / <alphanum-name 7..7>

### Operands

**POST-ACTION** = \*WAIT / \*KEEP / \*CANCEL-JOB / \*TERMINATE-JOB / \*ERROR

Specifies which action must be performed on the returned print job.

**POST-ACTION** = \*WAIT

The current print job is set to wait status in the Spool&Print queues.

---

**POST-ACTION = \*KEEP**

The current print job is set to keep status in the Spool&Print queues. If a message number is specified in the ERROR-MSG operand, this message is displayed on the console and in the output of the SHOW-PRINT-JOB-STATUS command.

**POST-ACTION = \*CANCEL-JOB**

The current print job is no longer displayed in the Spool&Print queues. The status display of any MONJV which is assigned is set to "\$A". The associated file is not deleted (irrespective of the DELETE-AFTER-PRINT option for the print job). In the case of a family job, all the family's jobs are canceled.

**POST-ACTION = \*TERMINATE-JOB**

The current print job is no longer displayed in the Spool&Print queues. The status display of any MONJV which is assigned is set to "\$T". Whether the associated file is deleted is determined by the DELETE-AFTER-PRINT option for the print job.

**POST-ACTION = \*ERROR**

\*ERROR means that the current print job is set to wait status in the Spool&Print queues and the application task is deleted. An error message (ERROR-MSG operand) may be sent to the console.

**ERROR-MSG = \*NONE / <alphanum-name 7..7>**

Specifies whether or which error message is to be displayed on the console. An error message is output only if \*KEEP or \*ERROR was specified in the POST-ACTION operand.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error; command successfully processed
	32	SCP0974	Unexpected command
5	32	SCP0974	Memory request error

**Notes**

1. If the dialog cannot be initialized, the command is rejected and a return code is set.
2. If no initialization took place (OPEN-VIRTUAL-DEVICE-DIALOG command), the command is rejected and a return code is set.
3. If no print job was requested (GET-JOB-FROM-VIRTUAL-DEVICE command), the command is rejected and a return code is set.
4. This command can only be used in batch mode.
5. Spin-off processing is activated each time an error is detected.

---

## 5.64 RUN

Start command file

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Editing command files
<b>Domain:</b>	not allocated
<b>Privileges:</b>	OPERATING
<b>Routing code:</b>	E

### Function

This command starts the execution of a command file. The command is acknowledged with console message NBR1000, which specifies a RUN ID. This message specifies a RUN ID, which is also displayed in subsequent event messages during RUN processing. The processing of a command file can be canceled by specifying the CANCEL-RUN-PROCESS command together with the RUN ID.

Command file usage is described in “Command files for the operator” in the “Introduction to System Administration” [14].

#### *Restrictions when using the “Operator LOGON” function*

When using the “Operator LOGON” function (system parameter NBCONOPI=Y), note the following:

- Explicit issuing of a RUN command prior to “SYSTEM READY” is rejected.
- After “SYSTEM READY”, unrestricted use of the RUN command is possible only for authorized user programs with generated authorization names.
- After “SYSTEM READY”, the operator cannot issue a RUN command until the operator LOGON has been completed (SET-LOGON-PARAMETERS command). The commands in the RUN file are then processed with the file access rights (permissions) and command privileges of the operator ID. Please note the following:
  - If the user ID is not specified explicitly in the name of the RUN file, it defaults to the operator ID. If the specified file does not exist under the operator ID, the system attempts to run the file under the user ID defined in the NBRUNUID system parameter. If the file does not exist under that user ID, or if no user ID is defined in the system parameter, the system makes a third and last attempt to run the file under the TSOS ID. Searching among the various user IDs ends once the specified file is found in one of them. If the file still cannot be executed (no execute permission or invalid content), the RUN command terminates and the call may have to be corrected and repeated. If the catalog ID is not specified, it defaults to the catalog ID defined in the user catalog as the default for the user ID which is established as described above.
  - The RUN file name completion algorithm also applies to RUN command sequences generated when the RUN file is executed.
  - If RUN files under IDs other than the user’s own are accessed, the file protection attributes are evaluated (access control and passwords). This is of particular significance if the operator ID does not have TSOS privilege.
  - RUN command sequences cannot be processed correctly unless the operator ID is authorized to issue the RUN command and all the commands which are invoked within the RUN command sequence (including commands in follow-up sequences).

- The loss of routing codes as the result of an EXIT-JOB command or the failure of the operator terminal takes immediate effect, which means that any commands still awaiting processing which require a routing code other than @ will be rejected. The same applies if operator LOGON has been repeated in the meantime. RUN commands from a physical operator terminal which has become inactive are always rejected, even if @ is the assigned routing code (message NBR1014).
- The SET-LOGON-PARAMETERS and REQUEST- and RELEASE-OPERATOR-ROLE commands are rejected within a RUN command sequence.

## Format

### RUN

**FROM-FILE** = <filename 1..54 without-gen-vers> / \***LIBRARY-ELEMENT**(...)

\***LIBRARY-ELEMENT**(...)

|     **LIBRARY** = <filename 1..54 without-gen-vers>

|     , **ELEMENT** = <composed-name 1..64>

, **FILE-PASSWORD** = \***NONE** / <c-string 1..4> / <x-string 2..8> / <integer -2147483648..2147483647>

**i** With the support of libraries the command syntax has been brought into line with SDF. For reasons of compatibility, the earlier syntax is also accepted for command files which are not contained in a library (FPASS=\*STD corresponds to FILE-PASSWORD=\*NONE in this case).

## Operands

**FROM-FILE** = <filename 1..54 without-gen-vers> / \***LIBRARY-ELEMENT**(...)

Name of command file (SAM or ISAM) to be executed.

**FROM-FILE** = \***LIBRARY-ELEMENT**(...)

The command file is stored in a PLAM library member.

**LIBRARY** = <filename 1..54 without-gen-vers>

Name of the PLAM library which contains the command file as a member (type J).

**ELEMENT** = <composed-name 1..64>

Name of the member.

Only records with format "A" and record type 1 are processed.

**FILE-PASSWORD** = \***NONE** / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>

Execute password of the command file or read password of the PLAM library.

## Notes

- The system processes the SHOW-PENDING-MSG command with a higher priority than other commands. If this command is specified in a command file, it can overtake other commands which are ahead of it in the command file.
- Reading of the RUN file can be interrupted by means of an ASTOP command within the file. Commands that have already been read can be processed before reading of the RUN file has been completed. ASTOP wait

states can be canceled by means of AGOGO commands. If not enough AGOGO commands are entered during the ASTOP wait states, reading of the RUN file is resumed after 3 minutes. The system parameter NBRUNWT can be used to set a different wait time.

- An ASTOP command should be included in the RUN file after every 30 commands or so.
- Only one RUN command can be processed at a time. RUN commands in RUN files are not processed until all other commands in the RUN file have been read.
- Processing of a RUN file is aborted if a record is more than 201 bytes long.
- If the content of a record cannot be interpreted or if a record contains an incorrect command, the record is rejected, but processing of the RUN command continues.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
1	0	NBR1018	RUN file empty; command ignored
1	0	NBR1303	RUN library member is empty or contains only unsuitable records (type or format). Command ignored.
2	0	NBR0746	Command revoked
2	0	NBR1005	At least one timeout in ASTOP wait state
	1	CMD0202	Syntax error
	64	NBR0796	Password in command is missing or wrong
	64	NBR0826	Record in RUN file too long
	64	NBR1002	Specified file is missing or contains errors
	64	NBR1003	Read error during command file processing
	64	NBR1015	RUN file on foreign ID and not shareable or protected against execution by GUARDS
	64	NBR1305	RUN library does not exist
	64	NBR1306	RUN library is not a library
	64	NBR1307	RUN library member not found or has incorrect type
	64	NBR1308	Password for RUN library missing or incorrect
	64	NBR1310	RUN file on foreign ID and not shareable or protected against reading by GUARDS
	129	NBR1014	Command rejected because issued from inactive operator terminal
	130	NBR0921	Memory shortage
	130	NBR1017	Catalog not available

---

	130	NBR1301	General PLAM error, take note of message inserts
	130	NBR1304	Library or library member locked in RUN command
	130	NBR1309	PLAM not available

---

## 5.65 SAVE-RETURNCODE

Save current command return code

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The SAVE-RETURNCODE command can only be used within S procedures and in dialog blocks.

The SAVE-RETURNCODE command allows the user saves the current command return code in a nonerror situation. The SAVE-RETURNCODE command must directly follow the command concerned. This code can subsequently be queried using the builtin functions SUBCODE1, SUBCODE2 and MAINCODE (see [section "SDF-P-BASYS"](#) and "SDF-P" [34]).

#### Note

When the chargeable SDF-P subsystem is used, the current command return code for a command is implicitly saved by an immediately following IF-CMD-ERROR command. The command return code can then be evaluated in the ELSE branch in a nonerror situation (see the "SDF-P" manual [34]).

### Format

SAVE-RETURNCODE

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	130	SDP0099	No further address space available

---

## 5.66 SAVE-SOFTWARE-INVENTORY

Copy current SCI

<b>Component:</b>	IMON-GPN
<b>Functional area:</b>	System control and optimization
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	SUBSYSTEM-MANAGEMENT

### Function

The SAVE-SOFTWARE-INVENTORY command is used to back up the current SCI. When this is done, consistent backup copies are created for the two physical files (IMON-SCI and IMON-GPN-SCI).

The name of the backup copy can be specified explicitly. The corresponding IMON-GPN-SCI is backed up under the same file name but with the suffix .GPN. If the length of the SCI name including the catalog ID and the user ID exceeds 50 characters then the command is aborted with an error message.

The command is not executed if the IMON subsystem is not loaded.

Backup copies of the SCI are also automatically created on system start and on software installation (see the “IMON” User Guide [19]).

The RESTORE-SOFTWARE-INVENTORY command can be used to restore the current SCI from a backup copy.

### Format

<b>SAVE-SOFTWARE-INVENTORY</b>
<b>TO-SCI = *STD / &lt;filename 1..50&gt;</b>

### Operands

**TO-SCI =**

Name of the target file (backup copy).

**TO-SCI = \*STD**

The file name of the currently open SCI is used together with the timestamp (date and time) in the form <yyyymmddhhmmss> as the suffix.

**TO-SCI = <filename 1..50>**

Explicit specification of the target file name.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	32	IMO9101	Command terminated abnormally (system error in external call; internal error in IMON-GPN)
	64	CMD0216	Privileges error
	64	IMO9100	IMON subsystem started, DMS error

---

## 5.67 SAVE-SUBSYSTEM-CATALOG

Save changes to dynamic subsystem catalog

**Component:** DSSM  
**Functional area:** Subsystem management  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** SUBSYSTEM-MANAGEMENT

### Function

This command allows users with the SUBSYSTEM-MANAGEMENT privilege to save changes to the dynamic subsystem catalog in a static subsystem catalog.

Changes made with the ADD-SUBSYSTEM, REMOVE-SUBSYSTEM and MODIFY-SUBSYSTEM-PARAMETER commands as a rule affect only the dynamic subsystem catalog, not the static catalog.

Consequently, any such changes are lost the next time the system is started up unless they are saved in a static catalog with the aid of the SAVE-SUBSYSTEM-CATALOG command. Note, however, that changes which are useful for the current session may be pointless or even counter-productive after the next startup. (For example: a message file is assigned to a subsystem which has BEFORE-DSSM-LOAD as its activation point. If the subsystem is restarted during the current session, this may well be a useful change to make; but it cannot be implemented the next time the system is started up.)

### Format

**SAVE-SUBSYSTEM-CATALOG**

**CATALOG-NAME** = \*STD / \*STARTUP-CATALOG / <filename 1..54 without-gen-vers>

,**FORCED** = \*NO / \*YES

### Operands

**CATALOG-NAME** = \*STD / \*STARTUP-CATALOG / <filename 1..54 without-gen-vers>

Designates the file in which the dynamic catalog is to be saved.

**CATALOG-NAME** = \*STD

The dynamic catalog is saved under the default file name '*\$.SYS.SSD.CAT.X*'.

**CATALOG-NAME** = \*STARTUP-CATALOG

The dynamic catalog is stored under the name of the catalog used at startup time.

**CATALOG-NAME** = <filename 1..54 without-gen-vers>

The file named here is used as the static catalog.

**FORCED** = \*NO / \*YES

Defines whether, despite errors, the dynamic catalog is saved to the static catalog.

**FORCED** = \*NO

A dynamic catalog which contains errors will not be saved in the static catalog.

---

**FORCED = \*YES**

The dynamic catalog will be saved in the static catalog even if it contains errors.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	32	ESM0288	DSSM bourse not available
	32	ESM0296	Request for memory space (REQM) not executed
	32	ESM0350	Internal DSSM error; DSSM task restarted
	32	ESM0360	Error due to insufficient memory
	32	ESM0409	DSSM not initialized
	32	ESM0643	Internal error during save operation
	64	ESM0648	Command not executed

**Notes**

- The dynamic catalog to be saved may be inconsistent for a number of reasons. For example, the catalog required by DSSM may have been saved using the operand `FORCED=*YES`, in which case there will be inconsistencies between the subsystems. Another possibility is that changes made by means of `/MODIFY-SUBSYSTEM-PARAMETER` will be unacceptable at the next BS2000 startup, although they will be accepted in the current BS2000 session. Because of the danger of such inconsistencies, the catalog must first be subjected to a variety of checks before it can be saved. Any errors detected in the course of these checks are reported, and a corresponding message is output via `SYSOUT`.
- Even if the dynamic catalog was saved without inconsistencies being detected, it cannot be taken for granted that the next startup carried out with this catalog will be successful. For example, if the start time (`CREATION-TIME`) of a subsystem has been changed by means of an earlier `/MODIFY-SUBSYSTEM-PARAMETER` so that it is no longer started automatically during BS2000 system startup, this may lead to serious problems for other subsystems.
- If a DMS error relating to the catalog file occurs during saving of the catalog, message ESM1806 is output. The result of the save operation must be checked accordingly. If the same message is output in relation to one of the subsystems involved, it should merely be interpreted as a warning; it has no influence on the result of `/SAVE-SUBSYSTEM-CATALOG`.
- If the specified catalog name is the same as the name of an existing file, a message is displayed inquiring whether the user wishes to overwrite this file.
- If certain functions cannot be correctly processed, appropriate messages are output via `SYSOUT`.

## Example

Provided that it contains no errors, the dynamic catalog is to be saved as a static catalog under the file name *COPY.DSSMCAT*:

```
/save-subsystem-catalog catalog-name=copy.dssmcat,forced=*no
```

## 5.68 SAVE-VARIABLE-CONTAINER

Save variable container

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
OPERATING  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION  
SECURITY-ADMINISTRATION

### Function

The SAVE-VARIABLE-CONTAINER command is used to save variable containers.

### Format

#### SAVE-VARIABLE-CONTAINER

```
CONTAINER-NAME = <composed-name 1..64 with-wild(80)>(…) /  
list-poss(2000):<composed-name 1..64>(…)  
  
<composed-name 1..64 with-wild(80)>(…)  
| ELEMENT-VERSION = *SAME / *INCREMENT  
  
<composed-name 1..64>(…)  
| ELEMENT-VERSION = *SAME / *INCREMENT
```

### Operands

#### **CONTAINER-NAME =**

Name of the variable container.

#### **CONTAINER-NAME = <composed-name 1..64 with-wild(80)>(…)**

Variable container with name matching the specified pattern string.

#### **ELEMENT-VERSION =**

Designates the version of the library element (member).

#### **ELEMENT-VERSION = \*SAME**

The element version remains unchanged. If the element does not yet exist, it is assigned the version \*UPPER-LIMIT.

#### **ELEMENT-VERSION = \***INCREMENT****

The element version is incremented. If the element does not yet exist, it is assigned the version 001.

---

LOCK-ELEMENT = \*NO must have been specified in OPEN-VARIABLE-CONTAINER and the element version must end with a digit.

**CONTAINER-NAME = list-poss(2000): <composed-name 1..64>(…)**

Name of the variable container. A (large) number of variable containers can be named in a list.

**ELEMENT-VERSION =**

Designates the version of the library element (member).

**ELEMENT-VERSION = \*SAME**

The element version remains unchanged. If the element does not yet exist, it is assigned the version \*UPPER-LIMIT.

**ELEMENT-VERSION = \*INCREMENT**

The element version is incremented. If the element does not yet exist, it is assigned the version 001.

LOCK-ELEMENT = \*NO must have been specified in OPEN-VARIABLE-CONTAINER and the element version must end with a digit.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	CMD0216	Do not have required privilege
	64	SDP0091	Semantic error
	130	SDP0099	No more address space available

**Example**

See the DECLARE-VARIABLE command.

---

## 5.69 SECURE-RESOURCE-ALLOCATION

Request resources

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT

### Function

The SECURE-RESOURCE-ALLOCATION command reserves resources required by the job for execution. This reservation guarantees that subsequent accesses to resources will not be rejected by the system.

Within an interactive or batch job the following resources can be reserved by means of the SECURE-RESOURCE-ALLOCATION command:

- private volumes (disks, tapes)
- devices for private volumes (disk devices, tape devices)
- files, file generations and file generation groups on private and public volumes.

Reservation of a file also results in the reservation of the disk or tape containing it and, in turn, the reservation of the respective device.

*Explicit* reservations can be made for

- devices, by means of the DEVICE or UNIT operand
- volumes, by means of the DISK or TAPE operand
- files, by means of the FILE operand.

*Implicitly* reserved are devices or volumes which are required for an explicitly reserved file or volume.

If a device type is both implicitly and explicitly reserved in a command at the same time, the system will attempt to provide the sum of the implicitly and explicitly reserved devices.

A resource is *exclusively* reserved if no other job can use it while it is reserved. It is termed *shareable* if the system ensures free access during the reservation period, although other jobs can use the resource as well.

An existing reservation is canceled:

- with every SECURE-RESOURCE-ALLOCATION command (even without operands). All previously reserved private resources are released (even those reserved only implicitly)
- with the REMOVE-FILE-LINK command.

REMOVE-FILE-LINK cancels the reservation of a file and of the associated disk/tape as required. The reservation of devices is retained if this is requested in the REMOVE-FILE-LINK command with RELEASE-DEVICE=\*NO.

If disks/tapes or devices assigned to the file are also implicitly reserved by other files or disks/tapes, these disks /tapes and devices are not released until all system references have been cleared.

- 
- with the WAIT-EVENT command (UNTIL=\*USER-SWITCHES(...) operand).
  - at job end (EXIT-JOB, LOGOFF, CANCEL-JOB).

The SECURE-RESOURCE-ALLOCATION command is rejected if:

- a program is loaded and assignments with USE=SPECIAL exist.
- a tape file to be reserved is open.
- the TFT entry of a tape file to be reserved is locked with /LOCK-FILE-LINK.
- a public volume is supposed to be reserved explicitly.
- one of the requested resources cannot be made available (see WAIT operand).
- implicitly requested devices do not exist or not in adequate numbers
- a nonprivileged user tries to reserve a file under the TSOS user ID or the standard system user ID exclusively.
- the job has opened files on volumes which were to be reserved exclusively This is possible if SECURE-RESOURCE-ALLOCATION is issued within a procedure file and the file was previously allocated to a private volume of a logical system file (e.g. ASSIGN-SYSLST).

Each SECURE-RESOURCE-ALLOCATION command (even one without operands) first releases all private resources which were previously reserved (implicit RELEASE). TFT entries will not be deleted, and do not need to be recreated. However, the device reservations linked to the existing TFT entries are canceled.

If a volume which is not yet mounted is reserved, for tapes by default a PREMOUNT message (for tapes) is sent to the operator terminal (can be changed with MODIFY-MOUNT-PARAMETER). Private disk must be online or be made available during the execution of the command.

If any of the requested resources cannot be reserved, no reservation at all is made. Depending on the job type and what is specified for the WAIT operand, the system either issues a message or places the job in the Secure queue until all requested resources are available or until the specified wait time elapses. Note, however, that the system branches to the next SET-JOB-STEP, EXIT-JOB or LOGOFF command if implicitly requested devices or the necessary number of devices do not exist.

If the operator rejects a resource request (MOUNT message on the console), no reservation is made and the system branches, in batch mode, to the next SET-JOB-STEP, EXIT-JOB or LOGOFF command.

If the command is rejected (e.g. resources not available), all volumes previously made available to the job are released again.

Whether a private disk can be reserved depends on the setting of the parameters "USER-ALLOCATION", "SYSTEM-ALLOCATION" and "OPERATOR-CONTROL". The user can query these via the SHOW-DISK-STATUS command.

#### *Notes on tape processing*

For any tape volume reserved by /SECURE-RESOURCE-ALLOCATION VOLUME (explicit reservation) or by /SECURE-RESOURCE-ALLOCATION FILE (implicit reservation), the VOLUME-PHASE will be set to PREMOUNT (see the command SHOW-TAPE-STATUS, SHOW-RESOURCE-ALLOCATION). In other words, this tape is pre-reserved solely to prevent the use of the same volume by another job. However, no input/output operations have yet taken place on the volume. There is an implicit device reservation. Between the time of OPEN and CLOSE, the PHASE for the tape is IN-USE (i.e. the tape is being processed). Following the CLOSE, the PHASE is set back to PREMOUNT.

*Remote file access (see also the “RFA” manual[31])*

Files may also be reserved in a remote system via RFA. However, only files may be specified in this command and these must all belong to the same system.

The local TFT contains entries for all remote files which are being processed. Exclusively reserved remote files are not included; the same applies to remote files after input of the REMOVE-FILE-LINK command.

In order to avoid a deadlock situation, a SECURE-RESOURCE-ALLOCATION command without operands is sent to all RFA partner tasks during the disconnection phase at the start of command execution (unless the task is itself an RFA partner task).

*Access to migrated files (for details see the “HSMS” manual[18])*

Files migrated by means of HSMS to one of the hierarchical storage levels S1 or S2 can be implicitly recalled via /SECURE-RESOURCE-ALLOCATION, FILE=\*PAR(filename) (implicit recall). HSMS outputs a summary report in this case.

## Format

### SECURE-RESOURCE-ALLOCATION

**DEVICE** = **\*NO** / list-poss(11): [**\*PARAMETERS**](...)

[**\*PARAMETERS**](...)

|     **TYPE** = <device> / <structured-name 1..8> / <alphanum-name 1..8>

|     **,NUMBER** = **1** / <integer 0..255>

|     **,LOCATION** = **\*USER-DEFAULT** / **\*NONE** / <alphanum-name 1..8> / **\*BY-FILENAME**(...)

|             **\*BY-FILENAME**(...)

|             |     **NAME** = <filename 1..54>

**,UNIT** = **\*NO** / list-poss(48): <alphanum-name 2..2> / <alphanum-name 4..4>

**,DISK** = **\*NO** / list-poss(48): [**\*PARAMETERS**](...)

[**\*PARAMETERS**](...)

|     **VOLUME** = <alphanum-name 1..6>

|     **,TYPE** = <device>

|     **,ALLOCATION** = **\*SHARED** / **\*EXCLUSIVE**

**,TAPE** = **\*NO** / list-poss(48): [**\*PARAMETERS**](...)

[**\*PARAMETERS**](...)

|     **VOLUME** = <alphanum-name 1..6>

|     **,TYPE** = **\*BY-VOLUME-CATALOG** / <device>

|     **,ACCESS** = **\*READ** / **\*WRITE**

```

|      ,MOUNT = *YES / *NO
,FILE = *NO / list-poss(48): [*PARAMETERS](...)
[*PARAMETERS](...)
|      NAME = <filename 1..54>
|      ,ACCESS = *READ / *WRITE
|      ,MOUNT = 1 / <integer 0..255>
|      ,ALLOCATION = *SHARED / *EXCLUSIVE
,WAIT = [*PARAMETERS] (...)
[*PARAMETERS](...)
|      TIME = *TASK-STD / <integer 1..2097152 seconds>
|      ,EVENT = *ALL-MOUNT / *DISK-MOUNT

```

## Operands

**DEVICE = \*NO / list-poss(11): \*PARAMETERS(...)**

Specifies whether devices are to be reserved.

**DEVICE = \*NO**

No devices will be reserved by their device type.

**DEVICE = list-poss(11): \*PARAMETERS(...)**

Specifies the number and type of devices to be reserved. No more than eleven different types of devices may be reserved.

**TYPE = <device> / <structured-name 1..8> / <alphanum-name 1..8>**

Specifies which device type is to be reserved.

A disk device should not be reserved using the TYPE operand because the associated disk can be used by privileged applications (such as FDDRL or VOLIN) in usage mode SPECIAL only.

Tape and cartridge tape devices are reserved by specifying a valid volume type (see also [section "Device types for DMS tape processing"](#)). Volume types WORK and TAPE can be used only for applications for which WORK and TAPE respectively have also been specified as volume type (in the CREATE-FILE command, for example).

The available device types can be determined from the output from the SHOW-DEVICE-CONFIGURATION command with UNIT=\*SELECT(CLASS=\*DEVICE, ATTRIBUTE=\*ATTACHED) (see also the device table in [section "Device type table"](#) (device type column)).

See also the TYPE operand for reserving disks (DISK) and tapes (TAPE).

**NUMBER = 1 / <integer 0..255>**

Number of devices of the specified type that are to be reserved.

**LOCATION = \*USER-DEFAULT / \*NONE / <alphanum-name 1..8> / \*BY-FILENAME(...)**

*Only for reservation of tape devices*

Either describes the way in which the location is determined or designates the location itself.

**LOCATION = \*USER-DEFAULT**

The device administration should select suitable device groups. If the chargeable MAREN subsystem is

---

loaded, the device administration should use MAREN (MAREN Exit) to obtain the appropriate device depot information.

**LOCATION = \*NONE**

The devices to be reserved should be taken from the device group which is not assigned to a device depot (the RESTPOOL; see ADD-DEVICE-DEPOT command).

**LOCATION = <alphanum-name 1..8>**

Designates the storage location (device depot) from whose assigned device group the tape devices to be reserved are to be selected. Assignments of tape devices to device depots are defined by system support staff using the ADD-DEVICE-DEPOT command. These assignments can be listed with the SHOW-DEVICE-DEPOT command.

**LOCATION = \*BY-FILENAME(...)**

The device administration must use the chargeable MAREN subsystem to find out where the tape is located. The specified file name is passed to MAREN. In conjunction with MAREN Exit, MAREN uses this name to find out where the relevant tape is stored. The procedure for obtaining depot information on MARENLM or MAREN-Exits is described in the "MAREN" manual [23].

If the location returned by MAREN is not one of the depots declared with ADD-DEVICE-DEPOT, processing continues without a depot specification. In this respect note the following:

1. If all tape devices are assigned to depots, the command is rejected with a return code of NKS0015, and any other device reservation (e.g. using a FILE or OPEN macro) is rejected with an appropriate return code.
2. If suitable devices with no depot assignment are available (from the RESTPOOL), the device request is implemented from this pool.

If the "devices" in this pool are ones which have simply been generated to allow for future additions but are not physically present, tasks may end up waiting permanently on the device queue. Any such tasks can be listed with the SHOW-RESOURCE-REQUESTS command (the *RESOURCES REQUESTED* output contains a device type designation with no depot specification).

**NAME = <filename 1..54>**

The location of the tape on which the specified file is archived is ascertained.

**UNIT = \*NO / list-poss(48): <alphanum-name 2..2> / <alphanum-name 4..4>**

Mnemonic (two- or four-character) device name of the device to be reserved. The device is reserved exclusively for this job.

A disk device should not be reserved using the UNIT operand because the associated disk can be used by privileged applications (such as FDDRL or VOLIN) in usage mode SPECIAL only.

**UNIT = \*NO**

No device is being reserved by specifying its UNIT.

**UNIT = list-poss(48): <alphanum-name 2..2>**

Mnemonic device name (2 characters) of the tape device which is to be reserved; the device will be exclusively reserved, and can also be used in non-DMS mode.

**UNIT = list-poss(48): <alphanum-name 4..4>**

Mnemonic device name (4 characters) of the tape device which is to be reserved; the device will be exclusively reserved, and can also be used in non-DMS mode.

**DISK = \*NO / list-poss(48): \*PARAMETERS(...)**

Specifies whether a private disk is to be reserved.

---

**DISK = list-poss(48): \*PARAMETERS(...)**

For each private disk which is to be reserved, the volume serial number (VSN), the disk device type and the type of reservation must be specified. A maximum of 48 private disks can be reserved.

The “DMS” usage mode is implicitly defined for the volumes.

Whether a device can be reserved or not depends on the values of the “USER-ALLOCATION”, “SYSTEM-ALLOCATION” and “OPERATOR-CONTROL” settings defined by system support staff using the SET-DISK-DEFAULTS and SET-DISK-PARAMETER commands. Users can request information about these values using the SHOW-DISK-DEFAULTS and SHOW-DISK-STATUS commands.

**VOLUME = <alphanum-name 1..6>**

Specifies the volume serial number(s) of the disk(s) to be reserved.

**TYPE = <device>**

Specifies the type of device on which the disk is to be mounted.

Only device types known within the system are accepted. In interactive mode, the possible device types are displayed with DEVICE-TYPE=?.

The available device types are shown in the output of the SHOW-DEVICE-CONFIGURATION command with UNIT=\*SELECT(CLASS=\*DEVICE,ATTRIBUTE= \*ATTACHED) (see also the device table in [section "Device type table"](#) (device type column)).

**ALLOCATION = \*SHARED / \*EXCLUSIVE**

Specifies the reservation mode for the disk to be reserved.

**ALLOCATION = \*SHARED**

Disk access by other jobs is permitted.

**ALLOCATION = \*EXCLUSIVE**

Exclusive reservation: this means that the resource may not be used by any other jobs.

**TAPE = \*NO / list-poss(48): \*PARAMETERS(...)**

Specifies whether a tape is to be reserved. This reservation is always exclusive.

**TAPE = list-poss(48): \*PARAMETERS(...)**

Specifies the volume serial number, device type and desired type of access for each tape to be reserved. A maximum of 48 tapes may be reserved.

The \*DMS\* usage mode is implicitly defined for the volumes. Reservations for the “SPECIAL” or “WORK” usage modes are possible only in explicit device reservations.

*Points to note when using storage locations (MAREN subsystem)*

When reserving a volume and the implicit device reservation linked to it, the device administration uses the chargeable MAREN subsystem to determine the storage location of the volume.

If the volume identifier is entered in the MAREN catalog, the storage location indicated there is used for the device reservation. Otherwise, the default storage location supplied by MAREN or the storage location determined by using the MARENLM or MAREN-EXITS routine is used (see the “MAREN, Volume 1” manual [23]).

**VOLUME = <alphanum-name 1..6>**

Specifies the volume serial number of the volume to be reserved.

**TYPE = \*BY-VOLUME-CATALOG / <device>**

Identifies the type of device on which the volume is to be mounted.

Only device types or volume types known within the system are accepted. In interactive mode, the possible

---

device and volume types are displayed with DEVICE-TYPE=?. Volume types WORK and TAPE can be used only for applications for which WORK and TAPE respectively have also been specified as volume type (in the CREATE-FILE command, for example).

**TYPE = \*BY-VOLUME-CATALOG**

The device type is determined via MAREN device substitution. If this function is not available, the command is rejected.

**ACCESS = \*READ / \*WRITE**

Specifies the type of accesses for which the tape must be mounted. The purpose of this operand is to inform the operator in the mount or premount request whether the tape should be mounted with the write protection lock activated or deactivated.

**ACCESS = \*READ**

The tape is only to be read. The write protection lock must not be disabled.

Tapes are *not* write-protected by default. If a write access is attempted to a tape which was requested without a write-enable ring, the processing will merely be interrupted and the system will request the operator to remount the tape with the write protection lock disabled.

**ACCESS = \*WRITE**

The tape is to be written. The operator will be asked in the mount request to disable the write protection lock.

**MOUNT = \*YES / \*NO**

Specifies whether the implicit device reservation is to be executed immediately when the SEC-RES command is executed.

**MOUNT = \*YES**

The system reserves the volume and device and issues the premount message on the operator terminal.

**MOUNT = \*NO**

The system will reserve the volume but not the required device; no premount message will be output. The device will be reserved offline; this reservation will not be output if the command SHOW-RESOURCE-ALLOCATION is issued.

**FILE = \*NO / list-poss(48): \*PARAMETERS(...)**

Specifies whether a file, file generation or file generation group is to be reserved. Access to the file must be permitted (see SHOW-FILE-ATTRIBUTES command).

**FILE = \*NO**

No file/file generation is to be reserved.

**FILE = list-poss(48): \*PARAMETERS(...)**

The name must be specified for each file which is to be reserved; for tape files, the reservation details must also be specified (ACCESS, MOUNT), and for disk files the type of reservation. A maximum of 48 files can be reserved. For tape files, the reservation is always exclusive; for disk files, it depends on the ALLOCATION operand.

**NAME = <filename 1..54>**

Identifies a cataloged file, file generation or system file. If the file/FGG specified by NAME is not cataloged, the job will not be put into the SECURE queue. In interactive mode, an error message will be output, in batch mode spin-off will be initiated.

If the file specified by NAME is cataloged under another user's ID, the file/FGG must be shareable. All the disks belonging to it will be reserved as shareable and mounted.

For files on SPDs (shareable private disks), the reservation is noted in the F1 label on the disk. This reservation is also taken into account by accesses from other computers. In multiprocessor systems, any

---

reservation for a file which is not on a locally available pubset will be rejected.

If no other details are specified by a file reservation, the following default values will apply:

- Disk files: The associated disks will be mounted and treated as shareable. The file will be reserved as shareable, but can also be reserved exclusively (ALLOCATION). If the file is spread across several private disks, all the volumes concerned will be reserved.
- Tape files: The associated tapes will *always* be reserved exclusively. This has the effect that all the files which are on these tapes are also exclusively reserved. The tape device will be implicitly reserved (see MOUNT operand).  
The reserved tapes will be mounted with the write protection lock enabled (see ACCESS operand).  
If the file is spread across several tapes, then a device will only be automatically reserved for the first volume (depending on the MOUNT operand).

**ACCESS = \*READ / \*WRITE**

*This operand is only evaluated for tape files:*

Specifies whether the associated tapes are to be mounted for reading only, or for writing as well. The purpose of this operand is to inform the operator in the mount request whether the tape should be mounted with the write protection lock enabled or disabled.

**ACCESS = \*READ**

The tape is only to be read. The write protection lock must not be disabled. Tapes are *not* write-protected by default.

**ACCESS = \*WRITE**

The tape is to be written. The operator will be asked in the mount request to disable the write protection lock.

**MOUNT = 1 / <integer 0..255>**

*This operand is only evaluated for tape files:*

Specifies how many tape devices are to be implicitly reserved. The tapes will be selected in the sequence in which they are recorded in the catalog. For these tapes, MOUNT messages will be output on the operator's terminal for the devices which are implicitly reserved.

When using storage locations, the device administration determines the storage location as when reserving via the TAPE operand.

**MOUNT = 1**

Only one device will be implicitly reserved.

**MOUNT = <integer 0..255>**

The specified number of devices will be implicitly reserved.

If the number of devices implicitly reserved is less than there are tapes recorded in the catalog, then the remaining tapes will be reserved without a corresponding device reservation (offline).

If the number of devices specified is more than there are tapes recorded in the catalog, then only as many implicit device reservations will be executed as there are tapes in the catalog.

**ALLOCATION = \*SHARED / \*EXCLUSIVE**

*This operand is only evaluated for disk files:* Specifies whether the file/file generation specified by the NAME operand is to be reserved as shareable or exclusive, i.e. whether other jobs may access the reserved disk file or not.

**ALLOCATION = \*SHARED**

A check will be made to see whether the file exists. It is still accessible for other jobs (both read and write access). The required disks and devices will be implicitly reserved and remain shareable (USE=DMS). No

---

check will be made to see whether the file is already exclusively reserved. The file can still be exclusively reserved by another task.

**ALLOCATION = \*EXCLUSIVE**

The file will be reserved exclusively for the calling job, and is therefore not accessible for other jobs; disks and devices are reserved as shareable. A file can only be reserved exclusively if it is not open or not already exclusively reserved by another job.

Files belonging to the user ID TSOS or the system default ID cannot be exclusively reserved by other users. If a file generation group is specified, all the file generations which comprise it will be locked against access from outside.

**WAIT = \*PARAMETERS(...)**

Determines the maximum time that the job should wait for the fulfillment of its reservation request. When this waiting time has expired, the request will be rejected.

The waiting time includes also the time required to fetch back any files which have been migrated (by HSMS).

**TIME = \*TASK-STD / <integer 1..2097152 seconds>**

Specifies the maximum waiting time in seconds. The accuracy is in the order of minutes. If the command requires volumes to be mounted, any reservation which specifies a waiting time of less than 180 seconds will be rejected.

**TIME = \*TASK-STD**

TASK-STD is the default setting:

The system makes a distinction between interactive and batch modes.

*Interactive mode:*

The command will be rejected if the requested resources are reserved and it will be necessary to wait for their release.

*Batch mode:*

There is no limit on the waiting period. As a rule, the job will wait for the defined period for the resources to be mounted and become available. If the requests have not been fulfilled by the end of this period, spin-off will be initiated (branch to /SET-JOB-STEP).

**TIME = <integer 1..2097152 seconds>**

Waiting time in seconds: 0 <= integer <= 2097152 (approx. 582 hours or 24 days); the accuracy is of the order of minutes.

If a number < 180 is specified for the TIME operand, then the command will be rejected if a volume needs to be mounted or confirmation from the operator is required for a disk request.

**EVENT = \*ALL-MOUNT / \*DISK-MOUNT**

Specifies whether the mounting of tapes is to be synchronous or not with the reservation within the specified waiting time, i.e. whether to wait for a response to the mount or premount messages.

Mount requests for disks must always be satisfied within the waiting time.

**EVENT = \*ALL-MOUNT**

Within the specified waiting period, the job will wait until all the requested volumes have been mounted, i.e. until the operator has responded to all the MOUNT messages. In this case, the mount requests will be synchronous.

**EVENT = \*DISK-MOUNT**

The job will not wait if tapes have been requested; it will only wait for the mounting of private disks. This means that mount request and reservation are asynchronous for tapes, but on the other hand, for disks they are

---

synchronous.

Even if a reservation is satisfied, a subsequent mount request may still be rejected, and hence cause an error (spin-off).

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	32	NKS0036	Internal error
	64	NKS0001	Tape file open or in HOLD state
	64	NKS0003	Request local and remote files
	64	NKS0004	Request for a public disk
	64	NKS0005	Incompatible reservation modes
	64	NKS0006	Task deadlock
	64	NKS0007	Request for an invalid device type
	64	NKS0009	Wait time too short for operator contact
	64	NKS0013	Program loaded and USE=SPECIAL considerations
	64	NKS0035	Resources not available at present
	64	NKS0037	Termination due to CANCEL-JOB or shutdown
	64	NKS0044	Syntax error in command
	64	NKS0045	Request for resources from multiple systems
	64	NKS0048	Operator was unable to mount volume
	64	NKS0049	Requested resources not available on the system
	64	NKS0050	Command aborted after wait time elapsed
	64	NKS0051	No exclusive reservation of files under the standard system user ID
	64	NKS0052	Tape not online (wait time too short)
	64	NKS0064	Reservation via device type not permitted
	64	NKS0065	File migrated and HSMS not loaded
	64	NKS0066	File migrated and internal HSMS error
	64	NKS0067	File migrated; recall not possible without delay
	64	NKS0080	Error on processing a list object
	64	NKS0098	Error in RFA call

## Examples

### Example 1: Reserving a file

The interactive job *DIALOG1* reserves the file X.BEFORE for its use with the command:

```
/sec-res file=par(name=x.before,alloc=*excl).
```

Thereafter, if the interactive job *DIALOG2* wants to read this file with the command SHOW-FILE, it receives the error message *DMS0D99*.

```
/show-user-sta inf=*prog
```

```
%NAME      TSN TYPE      SIZE CURR-CMD
%DIALOG1    1CZI 3 DIALOG      SECURE-RESOURCE-ALLOCATION
%DIALOG2    1E1C 3 DIALOG      SHOW-USER-STATUS
```

```
/show-file x.vorher
```

```
% SHO0003 'DMS' REPORTED ERROR '0D99'. COMMAND NOT PROCESSED
```

```
/help-msg dms0d99,lang=E
```

```
% DMS0D99 FILEWRITE PROTECTED OR ALREADY IN USE
% ? Possible errors:
% 1) Attempt to open a locked file.;
% 2) Attempt to open a read-only file in a mode other than INPUT
%    or REVERSE.;
% 3) Attempt to open an ISAM or PAM file in SHARED UPDATE mode when
%    it has already been opened as nonshareable by another user.
% 4) Attempt to open an ISAM or PAM file in an OPEN mode intended to
%    prohibit opening of the file when one or more users have already
%    opened it.
% 5) Attempt to open an ISAM file with LOCKENV=XCS.
% 6) File is currently being processed by a C-COPY command.
% ! Correct and try again later.
```

### Example 2: Reserving two or more magnetic tape cartridge units

```
/sec-res dev=((type=tape-c4,num=1,location=d023ze02),
              (type=tape-u4,num=1,location=d023ze02))————— (1)
```

```
/sec-res dev=((type=tape-c4,num=1,location=roboter1),
              (type=tape-u4,num=1,location=roboter2))————— (2)
```

- (1) The SECURE-RESOURCE-ALLOCATION command reserves a magnetic tape cartridge device of type *TAPE-C4* and one of type *TAPE-U4*. Both devices should be fetched from the storage location *D023ZE02*.
- (2) The SECURE-RESOURCE-ALLOCATION command reserves a magnetic tape cartridge device of type *TAPE-C4* and one of type *TAPE-U4*. The devices should be fetched from the storage locations *ROBOTER1* and *ROBOTER2*.

---

*Example 3: Reserving a tape*

```
/set-logon-parameters ...
```

```
.  
. .  
. .
```

```
/sec-res tape=par(vol=b0000a,type=tape) _____ (1)
```

```
/start-prog from-f=prog.test
```

```
/sec-res _____ (2)
```

(1) The SECURE-RES command reserves a tape with the volume serial number *B0000A* exclusively for this interactive process. To permit its use, a 9-track tape device is assigned to the job.

(2) All the resources reserved for this job are now released.

See also the example for the SHOW-RESOURCE-ALLOCATION command.

---

## 5.70 SELECT-PRODUCT-VERSION

Select product version

**Component:** IMON-GPN

**Functional area:** Program control

**Domain:** PROGRAM  
PROGRAMMING-SUPPORT  
UTILITIES

**Privileges:** STD-PROCESSING  
SUBSYSTEM-MANAGEMENT

### Function

This command allows nonprivileged users to select the product version of an installation unit or a DSSM subsystem (TU, as of DSSM V3.5). If more than one version of this product is installed and accessible, it is possible to specify the version with which the user wishes to work. When starting the associated program or when setting up a connection to a subsystem, the selected version is used.

The following applies in the case of command calls sharing the same scope (SCOPE operand):

- Only one version of a product can be selected.
- If the command is executed twice with different versions of the same product as the last specified version applies.

The SHOW-SELECTED-PRODUCT-VERSION command provides information on the current version selection.

#### *Privileged function*

Systems support can use SCOPE=\*SYSTEM to select the product version of an installation unit for the duration of the session.

### Format

<b>SELECT-PRODUCT-VERSION</b>
<b>PRODUCT-NAME</b> = <text 1..30 without-sep>
, <b>VERSION</b> = *STD / <product-version>
, <b>SCOPE</b> = *TASK / *PROGRAM / *SYSTEM

### Operands

**PRODUCT-NAME** = <text 1..30 without-sep>

Specifies the name of the software product. For subsystems loaded by DSSM this is the name of the subsystem and /or the name of the IMON installation unit. In relation to DBL, it is the name of a load unit.

**VERSION** =

Specifies the version of the product to be loaded. The full version need not be specified. In this case, the most suitable version is selected or, in the case of a DSSM subsystem, the exact version is selected.

---

**VERSION = \*STD**

An earlier version selection is canceled. This means that the system presetting applies again (the highest version is used).

**VERSION = <product-version>**

Specifies the version of the software product. When loading the software the DBL uses only this version for external reference resolution.

**SCOPE =**

Specifies how long the selection is to apply for.

**SCOPE = \*TASK**

The selection is valid until the end of the task.

**SCOPE = \*PROGRAM**

The selection is valid until the end of the current or subsequent program.

**SCOPE = \*SYSTEM**

*This operand value can only be used by privileged users with the SUBSYSTEM-MANAGEMENT privilege.*

The selection (installation units only) is valid throughout the system for this session (until shutdown). This setting cannot be made for DSSM subsystems.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	32	IMO9101	Command terminated abnormally. Internal error in IMON-GPN
	64	CMD0216	Privilege error
	64	IMO9100	Command not executed. Installation unit or version not found

**Notes**

The command is accepted for a product and an explicitly specified version in the following two cases:

1. The product name is registered as an installation unit in the SCI: in this case, the version that is explicitly specified in the VERSION operand must exist.
2. The product name is not registered in the SCI: in this case, it must be possible to connect a corresponding DSSM subsystem. This means that the subsystem is declared in the DSSM subsystem catalog under the specified name and version and that it has been started.

---

## 5.71 SELECT-PROGRAM-VERSION

Select version of program

**Component:** IMON-GPN  
**Functional area:** Program control  
**Domain:** PROGRAM  
**Privileges:** STD-PROCESSING

### Function

The SELECT-PROGRAM-VERSION command lets the user select a specific version of a program to work with. This tells the DBL which version of a load unit to use if it has access to multiple loaded versions of it.

### Format

<b>SELECT-PROGRAM-VERSION</b>
<b>PROGRAM-NAME</b> = <composed-name 1..32> / <text 1..32 without-sep> , <b>VERSION</b> = <u>*STD</u> / <composed-name 1..24> , <b>SCOPE</b> = <u>*PROGRAM</u> / <u>*TASK</u>

### Operands

**PROGRAM-NAME** = <composed-name 1..32> / <text 1..32 without-sep>

Name of the program. From the DBL's viewpoint this is the name of a load unit. This program must not yet be loaded at the time of version selection.

**VERSION** = \*STD / <composed-name 1..24>

Version of the program.

\*STD means that the program version is disregarded. DBL acts as if the SELECT-PROGRAM-VERSION command had not been executed.

**SCOPE** =

Applicability of the version selection.

**SCOPE** = \*PROGRAM

The version selection applies only until a program terminates or a different version is selected. That means the version selection must be repeated each time the program is to be run.

**SCOPE** = \*TASK

The version selection applies until the end of the task or until a different version is selected.

**i** Separate versions of a program can be selected for SCOPE=\*PROGRAM and for SCOPE=\*TASK. A subsequent version selection supersedes an earlier selection with the same SCOPE.

SCOPE=\*PROGRAM takes precedence over SCOPE=\*TASK. If differing scopes are defined for two different versions of a program, only the version defined using SCOPE=\*PROGRAM applies.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	BLS0150	Warning during program execution
1	32	BLS0152	System error
	64	CMD0216	User not authorized to issue command

---

## 5.72 SEND-MSG

Send message to console or program (STXIT routine)

**Component:** BS2000 OSD/BC

**Functional area:** not allocated

**Domain:** JOB  
PROGRAM

**Privileges:** STD-PROCESSING  
OPERATING  
TSOS  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** P

**i** The SEND-MSG command is being replaced by the INFORM-OPERATOR and INFORM-PROGRAM commands. SEND-MSG continues to be supported to ensure backwards compatibility, but the new commands should be used for new applications. All that follows is a brief overview of the command's function, syntax and return codes.

### Function

The SEND-MSG command can be used to send a message to the console, to an interrupted program in the user's own interactive task and, for privileged users, to a program in a noninteractive task.

*Console (operand TO=\*OPERATOR):*

This function is offered by the INFORM-OPERATOR command.

*Program (operand TO=\*PROGRAM):*

This function is offered by the INFORM-PROGRAM command (JOB-IDENTIFICATION= \*OWN).

*Message to a program in a noninteractive task (privileged function):*

This function is offered by the INFORM-PROGRAM command (JOB-IDENTIFICATION= \*TSN(...) or \*MONJV(...)).

## Format

SEND-MSG
<p><b>TO = *OPERATOR (...)/ *PROGRAM(...)</b></p> <p><b>*OPERATOR(...)</b></p> <p>       <b>WAIT-RESPONSE = *NO / *YES</b></p> <p><b>*PROGRAM(...)</b></p> <p>       <b>JOB-IDENTIFICATION = *OWN / *TSN(...) / *MONJV(...)</b></p> <p>               <b>*TSN(...)</b></p> <p>                      <b>TSN = &lt;alphanum-name 1..4&gt;</b></p> <p>               <b>*MONJV(...)</b></p> <p>                      <b>MONJV = &lt;filename 1..54 without-gen&gt;</b></p> <p><b>,MSG = *NO / &lt;c-string 1..230 with-low&gt;</b></p>

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	CMD0001	No action is required because when MSG=*NO is specified no message is sent to the operator
1	1	NBR0950	TO=*OPERATOR cannot be specified from a console
	64	EXC0920	Specified job ID invalid
	64	EXC0921	Command not permitted for an interactive task
	64	EXC0922	No program loaded
	64	EXC0923	No STXIT interface defined for this event in the specified program
	64	EXC0924	No STXIT routine defined for this event in the specified program
	64	EXC0925	STXIT routine already activated
	64	EXC0090	Insufficient storage space

---

## 5.73 SET-CONSLOG-READ-MARK

Set read mark in current CONSLOG file

**Component:** BS2000 OSD/BC  
**Functional area:** Error logging  
**Domain:** ERROR-LOGGING  
**Privileges:** TSOS  
SAT-FILE-MANAGEMENT

### Function

The SET-CONSLOG-READ-MARK command sets a “read mark” at the current end of the CONSLOG file. Logging continues without a break after the read mark. Read access to the contents of the CONSLOG file ahead of the read mark is then possible without first having to close the file with the CHANGE-CONSLOG-FILE command.

### Format

<b>SET-CONSLOG-READ-MARK</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
1	0	NBR0905	No active CONSLOG file present
	32	NBR0983	Internal error on command server
	64	CMD0216	No authorization to issue command

#### *Note*

The “internal error” return code is generated in the event of bourse, DMS, memory and other system problems.

## 5.74 SET-DCAM-APPLICATION-LINK

Store specifications for DCAM application in CLT

**Component:** DCAM

**Functional area:** Data communication control

**Domain:** NETWORK-MANAGEMENT

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE

### Function

The SET-DCAM-APPLICATION-LINK command can be employed by DCAM users to store specifications for a DCAM application in a job-specific table, the CLT (communication link table).

When the DCAM application is opened by a DCAM user program, the values in the table replace the corresponding entries in the application control block ACB (Assembler) or in the application structure (COBOL). The link between the CLT entry and this program area is established by means of the link name, which must be specified for this purpose both in the command and in the program (see also the "DCAM Program Interfaces" [7] and "DCAM Macros" [6] manuals on the subject of the name assignment function).

Specifications omitted from the command are taken from the program (default value: \*BY-PROGRAM in the relevant command operands).

### Format

#### SET-DCAM-APPLICATION-LINK

```
LINK-NAME = <name 1..8>
,APPLICATION-NAME = *BY-PROGRAM / <name 1..8>
,DISTRIBUTION-NAME = *BY-PROGRAM / <name 1..8>
,PROTECTION = *PARAMETERS (...)
  *PARAMETERS(...)
    | CONNECTION-PASSWORD = *BY-PROGRAM / <c-string 1..4> / <x-string 1..8> / *SECRET
    | ,SHARE-PASSWORD = *BY-PROGRAM / <c-string 1..4> / <x-string 1..8> / *SECRET
,SHARE-PASSWORD = *BY-PROGRAM / <c-string 1..4> / <x-string 1..8> / *SECRET
,HOST-NAME = *BY-PROGRAM / <name 1..8>
```

### Operands

**LINK-NAME** = <name 1..8>

Link name defined in the ACB of the program that is to open a DCAM application or that wishes to connect with an existing DCAM application.

---

**APPLICATION-NAME = \*BY-PROGRAM / <name 1..8>**

Name of the DCAM application.

**DISTRIBUTION-NAME = \*BY-PROGRAM / <name 1..8>**

Distribution name under which a program may receive messages from the DCAM application.

**PROTECTION = \*PARAMETERS(...)**

Protection attributes for the DCAM application.

**CONNECTION-PASSWORD = \*BY-PROGRAM / <c-string 1..4> / <x-string 1..8> / \*SECRET**

Defines the connection password as declared by the primary task and to be specified at each request for connection to this DCAM application.

The operand CONNECTION-PASSWORD is defined as “secret”:

- The value which is input will not be logged.
- In guided dialog, the input field is automatically blanked out.
- In unguided dialog and in foreground procedures, \*SECRET or ^ allows for concealed input of the required value. SDF requests the input of the “secret” value and provides a blanked input field for this purpose.

**SHARE-PASSWORD = \*BY-PROGRAM / <c-string 1..4> / <x-string 1..8> / \*SECRET**

Defines the application password as defined by the primary task and to be specified by every secondary task when connecting to this DCAM application. The operand SHARE-PASSWORD is defined as “secret”:

- The value which is input will not be logged.
- In guided dialog, the input field is automatically blanked out.
- In unguided dialog and in foreground procedures, \*SECRET or ^ allows for concealed input of the required value. SDF requests the input of the “secret” value and provides a blanked input field for this purpose.

**SHARE-PASSWORD = \*BY-PROGRAM / <c-string 1..4> / <x-string 1..8> / \*SECRET**

Specifies the application password for connection to a DCAM application, in the way the password was defined in the primary task or was stored in the RDF file.

The operand SHARE-PASSWORD is defined as “secret”:

- The value which is input will not be logged.
- In guided dialog, the input field is automatically blanked out.
- In unguided dialog and in foreground procedures, \*SECRET or ^ allows for concealed input of the required value. SDF requests the input of the “secret” value and provides a blanked input field for this purpose.

**HOST-NAME = \*BY-PROGRAM / <name 1..8>**

Specifies the name of the real or virtual host on which the DCAM application is to be opened.

**Return codes**

The command provides no command-specific command return codes (see [section "Return codes"](#)).

---

## 5.75 SET-DCAM-CONNECTION-LINK

Add virtual DCAM connection to CLT

**Component:** DCAM  
**Functional area:** Data communication control  
**Domain:** NETWORK-MANAGEMENT  
**Privileges:** STD-PROCESSING

### Function

The SET-DCAM-CONNECTION-LINK command is used by DCAM users in order to store specifications for a logical DCAM connection in a job-specific table, the CLT (communication link table). When such a connection is being established, the values in the table supplement or replace the corresponding entries in the connection control block CCB (Assembler) or in the connection structure (COBOL). The linkage of the CLT entry with this program area is formed by the link name, which must be specified for this purpose both in the command and in the program (see also the “DCAM Program Interfaces” [7] and “DCAM Macros” [6] manuals on the subject of the name assignment function).

Specifications not given in the command are taken from the program (default value: \*BY-PROGRAM in the relevant command operands).

### Format

#### SET-DCAM-CONNECTION-LINK

```
LINK-NAME = <name 1..8>
,PARTNER-ADDRESS = *PARAMETERS (...)
    *PARAMETERS(...)
        | PARTNER-NAME = *BY-PROGRAM / <name 1..8>
        | ,PROCESSOR-NAME = *BY-PROGRAM / <name 1..8>
,CONNECTION-PASSWORD = *BY-PROGRAM / <c-string 1..4> / <x-string 1..8> / *SECRET
,USER-DATA = *BY-PROGRAM / <c-string 1..4> / <x-string 1..8>
```

### Operands

**LINK-NAME = <name 1..8>**

Link name defined in the CCB of the program that is to establish the logical connection. This link name forms the link between the entry in a job-specific table (CLT) and an area in the program (CCB or connection structure).

**PARTNER-ADDRESS = \*PARAMETERS(...)**

Specifications regarding the partner to whom a connection is to be established.

**PARTNER-NAME = \*BY-PROGRAM / <name 1..8>**

Name of the partner.

---

**PROCESSOR-NAME = \*BY-PROGRAM / <name 1..8>**

Name of the processor where the partner is located as a station.

**CONNECTION-PASSWORD = \*BY-PROGRAM / <c-string 1..4> / <x-string 1..8> / \*SECRET**

Specifies the connection password as defined by the partner to whom the DCAM connection is to be established.

The CONNECTION-PASSWORD operand is defined as "secret":

- The input value is not logged.
- The input field is automatically blanked in a guided dialog.
- The specification \*SECRET is only permissible in an unguided dialog. This makes it possible to conceal the entry of the desired value. SDF prompts the user to enter the "secret" value and presents a blanked input field after the message.

**USER-DATA = \*BY-PROGRAM / <c-string 1..4> / <x-string 1..8>**

Character string to be passed to the program via the connection as secondary information on a message.

With DCAM-COBOL, this operand is not evaluated.

## Return codes

The command provides no command-specific command return codes (see [section "Return codes"](#)).

---

## 5.76 SET-DISK-DEFAULTS

Define default values for disk parameters

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** D

### Function

This command defines system-global default values for disk parameters. These apply to all private disks in the DMS use mode for which no special presettings have been made with the SET-DISK-PARAMETER command.

### Format

<b>SET-DISK-DEFAULTS</b>
<b>ASSIGN-TIME = *UNCHANGED / *USER / *OPERATOR</b>
<b>,USER-ALLOCATION = *UNCHANGED / *SHARE / *EXCLUSIVE / *ALL / *NO</b>
<b>,OPERATOR-CONTROL = *UNCHANGED / *SHARE / *EXCLUSIVE / *ALL / *NO</b>

### Operands

#### *Note*

For the meanings of the operands and their values see the SET-DISK-PARAMETER command.

#### **ASSIGN-TIME = \*UNCHANGED / \*USER / \*OPERATOR**

Defines the default value for the disk parameter ASSIGN-TIME.

The system presetting is \*USER; the default value is \*UNCHANGED.

#### **USER-ALLOCATION = \*UNCHANGED / \*SHARE / \*EXCLUSIVE / \*ALL / \*NO**

Specifies the default value for the disk parameter USER-ALLOCATION.

The system presetting is \*ALL; the default value is \*UNCHANGED.

#### **OPERATOR-CONTROL = \*UNCHANGED / \*SHARE / \*EXCLUSIVE / \*ALL / \*NO**

Defines the default value for the disk parameter OPERATOR-CONTROL.

The system presetting is \*NO; the default value is \*UNCHANGED.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	NKV0001	Syntax error
	130	NKVD003	NKA system task not available

---

## 5.77 SET-DISK-PARAMETER

Set default values for monitoring disks

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** D

### Function

This command sets volume-specific default values for the allocation of private disks in the DMS use mode for:

- automatic allocation by the system (ASSIGN-TIME operand)
- the use mode of the disk with respect to other systems (SYSTEM-ALLOCATION operand)
- permitting allocation requests from users (USER-ALLOCATION operand)
- requesting allocation permission via the operator (OPERATOR-CONTROL operand).

No default values can be set with this command for public disks and for private disks in the SPECIAL use mode (special applications such as VOLIN).

### Format

#### SET-DISK-PARAMETER

```
UNIT = *VOLUME(...) / list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>
      *VOLUME(...)
          |      VOLUME = list-poss(10): <vsn 1..6>
,DEFAULT = *NO / *YES
,TYPE = *UNCHANGED / *FROM-DEVICE / *FROM-USER / <device>
,SYSTEM-ALLOCATION = *UNCHANGED / *EXCLUSIVE
,ASSIGN-TIME = *UNCHANGED / *STD / *USER / *OPERATOR
,USER-ALLOCATION = *UNCHANGED / *STD / *SHARE / *EXCLUSIVE / *ALL / *NO
,OPERATOR-CONTROL = *UNCHANGED / *STD / *SHARE / *EXCLUSIVE / *ALL / *NO
```

---

## Operands

### **UNIT =**

Specifies one or more private disks for which default values are to be set.

### **UNIT = \*VOLUME(...)**

Specifies the volume serial number of one or more private disks for which default values are to be set.

### **VOLUME = list-poss(10): <vsn 1..6>**

Specifies one or more volume serial numbers (VSNs). Up to 10 VSNs can be listed.

### **UNIT = list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>**

Specifies the mnemonic device name of one or more private disks for which defaults are to be set. A maximum of 10 private disks may be specified.

**i** This operand must not be used if the disk is intended as a mirror disk for double recording when working with the software product DRV. In this case, disk parameters may only be defined by specifying the VSN (\*VOLUME operand).

### **DEFAULT =**

Specifies whether the defined default values (see the SET-DISK-DEFAULT command) are to be set for the ASSIGN-TIME, USER-ALLOCATION and OPERATOR-CONTROL parameters and whether the system presetting (= \*ALL) is to be set for the SYSTEM-ALLOCATION parameter.

### **DEFAULT = \*NO**

The parameters described above are not changed to the default values.

### **DEFAULT = \*YES**

The parameters described above are changed into the default values.

### **TYPE =**

Specifies the device type of the disk units to be used for the disks defined in the UNIT operand.

Specification of an explicit device type is only permitted if the disk is not allocated or as long as no MOUNT message has been received for the appropriate disk (TYPE=\*FROM-USER or \*FROM-DEVICE is accepted at any time). Specification of an explicit device type for a disk specified by its mnemonic device name is rejected. The original presetting is \*FROM-DEVICE.

### **TYPE = \*UNCHANGED**

The value valid up to now (previous SET-DISK or presetting) remains unchanged.

### **TYPE = \*FROM-DEVICE**

The device type is defined either by mounting the volume on a device or by a user request for a volume which has not yet been mounted (MOUNT message). A user's request for the disk is rejected if the device type specified does not match the disk already mounted.

### **TYPE = \*FROM-USER**

The device administration uses the device type specified in the user's request.

### **TYPE = <device>**

Explicit specification of the device type. A mount request from a user in which a different device type is specified is rejected.

Only device types known within the system are accepted. In interactive mode, the possible device types are

---

displayed with TYPE=?.

The possible specifications are given in the device table in [section "Device types for DMS tape processing"](#) (device type column).

**SYSTEM-ALLOCATION =**

Specifies the use mode of the disk for the system in relation to other systems.

**i** SPD operation is not supported for disks that are connected to channel type FC (Fibre Channel).

**SYSTEM-ALLOCATION = \*UNCHANGED**

The value valid up to now (previous SET-DISK or system presetting) remains unchanged.

**SYSTEM-ALLOCATION = \*EXCLUSIVE**

The disk can only be allocated by excluding other systems.

**ASSIGN-TIME =**

Defines the time for allocation and release of a private disk which is to be used for DMS. The system presetting is \*STD.

**ASSIGN-TIME = \*UNCHANGED**

The value valid up to now (previous SET-DISK or presetting) remains unchanged.

**ASSIGN-TIME = \*STD**

The value set with the SET-DISK-DEFAULTS command is valid.

**ASSIGN-TIME = \*USER**

The time is defined as the first request or the last return of disk allocation by the user.

**ASSIGN-TIME = \*OPERATOR**

The private disk is allocated independently of a user request from the time the disk is mounted and recognized as being online. The disk is allocated until ASSIGN-TIME=\*USER is set.

**USER-ALLOCATION =**

Defines default values for disk allocation by tasks according to the allocation types task exclusive and task-shareable. The system presetting is \*STD.

**USER-ALLOCATION = \*UNCHANGED**

The value valid up to now (previous SET-DISK or presetting) remains unchanged.

**USER-ALLOCATION = \*STD**

The value set with the SET-DISK-DEFAULTS command is valid.

**USER-ALLOCATION = \*SHARE**

Only disk allocations of the allocation type task-shareable are permitted (all disk allocations resulting from DMS applications and reservations by means of SECURE-RESOURCE-ALLOCATION, except exclusive reservation for disks).

**USER-ALLOCATION = \*EXCLUSIVE**

Only disk allocations of the allocation type task-exclusive are permitted (SECURE-RESOURCE-ALLOCATION=\*EXCLUSIVE for disks).

**USER-ALLOCATION = \*ALL**

Disk allocations of the allocation types task-shareable and task-exclusive are permitted.

---

**USER-ALLOCATION = \*NO**

No disk allocations for the user type USE=DMS are permitted.

**OPERATOR-CONTROL =**

Determines whether the operator intends to check new allocations (first allocation attempt of a job for a private disk). The message is NKA0004. In this case, the allocation request is permitted or rejected only after confirmation by the operator. The operator's reply to message NKA0004 is decisive for further access authorization for the appropriate job with respect to the disk; i.e. if the operator has not granted access authorization for a job, the job is not permitted to access the private disk unless the setting of this parameter is again changed with the SET-DISK-PARAMETER command. For jobs which already occupy the private disk at the time the parameter is set, the new parameter setting has no effect unless the job releases the disk and then attempts to allocate it again. Confirmation by the operator is requested only once per job. Consequently, the message prompting the operator to authorize the allocation request is not repeated for a job which allocates the disk again once the operator has already replied to the message, regardless of whether the job has previously released the disk or not. The system presetting is \*STD.

**OPERATOR-CONTROL = \*UNCHANGED**

The value valid up to now (previous SET-DISK or presetting) remains unchanged.

**OPERATOR-CONTROL = \*STD**

The value set with the SET-DISK-DEFAULT command is valid.

**OPERATOR-CONTROL = \*SHARE**

Only new allocations of the type task-shareable are checked.

**OPERATOR-CONTROL = \*EXCLUSIVE**

Only new allocations of the type task-exclusive are checked.

**OPERATOR-CONTROL = \*ALL**

New allocations of the types task-shareable and task-exclusive are checked.

**OPERATOR-CONTROL = \*NO**

New disk allocations are not checked.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	NKV0001	Syntax error
	64	NKA0094	Command partially processed
	64	NKA0096	Command not processed
	130	NKVD003	NKA system task not available

## 5.78 SET-DSSM-OPTIONS

Activate/deactivate DSSM logging function

<b>Component:</b>	DSSM
<b>Functional area:</b>	Subsystem management
<b>Domain:</b>	SYSTEM-MANAGEMENT
<b>Privileges:</b>	OPERATING SUBSYSTEM-MANAGEMENT
<b>Routing code:</b>	R

### Function

This command is used to control the logging function of DSSM. Logging to the DSSMLOG file may diminish performance. For this reason this function should not be activated unless errors actually occur.

The command can be issued independent of the state of subsystem management. At the time of the system start, logging is switched off by default but can be activated by means of the startup parameter LOGGING=\*ON.

### Format

<b>SET-DSSM-OPTIONS</b>
<b>LOGGING = *OFF / *ON</b> <b>,TITLE = *NONE / &lt;c-string 1..100&gt;</b>

### Operands

#### LOGGING =

Controls whether DSSM-specific logging is performed for error diagnosis.

#### LOGGING = \*OFF

No DSSM-specific logging is performed.

#### LOGGING = \*ON

All DSSM-specific data relevant to error diagnosis is logged to the file DSSMLOG.date.time.

#### TITLE =

Specifies a header line to be copied into the logging file.

#### TITLE = \*NONE

No additional text is to be included in the logging file.

#### TITLE = <c-string 1..100>

The specified text is written as the first data record in the logging file.

If the file is already open, no new file is created. Instead, logging is continued at the current position. If the logging function is deactivated, this operand is ignored.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	32	ESM0432	Command terminated abnormally

---

## 5.79 SET-FILE-LINK

core attributes of file in TFT

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	not allocated
<b>Domain:</b>	not allocated
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

**i** As of BS2000/OSD V2.0, the SET-FILE-LINK command is superseded by the ADD-FILE-LINK command. SET-FILE-LINK is still supported for reasons of compatibility. The ADD-FILE-LINK command should be used for new applications. This command description is restricted to a brief description and overview of the functions, the syntax format, and the return codes.

### Function

The SET-FILE-LINK command saves the specified attribute details for a file, which will normally already exist (e.g. it has been created using a CREATE-FILE command), in the TFT under a particular file link name. These details will then be used when the file is opened, instead of the corresponding details specified in the program.

For more information on the function and purpose of the TFT entry see the Function section of the ADD-FILE-LINK command description.

## Overview of functions

Function / Meaning	Level 1 operands	Level 2/3 operands
Define the file link name for which a TFT entry is to be created	LINK-NAME

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	DMS0546	Catalog entry for specified file has reached maximum size
2	0	DMS054A	Insufficient disk space or access to disk not possible
	1	DMS0576	Invalid operand combination
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog cannot be found
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0535	Specified file not shareable
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS0588	It was not possible to allocate disk space
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS06C4	File generation group not yet cataloged
	64	DMS06FF	BCAM connection severed
	128	DMS0506	Function not executed due to change in master
	130	DMS0524	System address space exhausted
	130	DMS053C	Insufficient space for catalog file on pubset
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system
	130	DMS0586	It is not possible to access or reserve a volume at present

---

	130	DMS0588	It was not possible to allocate disk space
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

---

## 5.80 SET-FILE-NAME-PREFIX

Define file name prefix

**Component:** ACS

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The SET-FILE-NAME-PREFIX command is used to define a prefix for file or job variable names. This allows the user to effectively switch to a “subcatalog” of the user ID within the task since ACS inserts the defined prefix before all file or job variable names which are specified by the user without a user ID in commands or macro calls. Prefix insertion is not performed if there is already an alias definition for the specified file or job variable name since alias substitutions are given precedence in such cases.

If a prefix already exists and was not defined with the PROTECTED attribute, the existing prefix is overwritten. The user can have the defined prefix displayed by means of the SHOW-FILE-NAME-PREFIX command.

#### *Prefix insertion rules*

- No prefix is inserted if the file or job variable name contains a foreign user ID.
- If the file or job variable name contains the user’s own user ID and no catalog ID, the prefix is inserted, but only if it consists of just a catalog ID. Furthermore, there must not be any RFA connection for the catalog ID.
- File or job variable names with the user ID TSOS are excluded (i.e. not supplemented by the insertion of a prefix).
- If the file or job variable name and the prefix contain a catalog ID, the prefix is not inserted.
- If the file or job variable name contains a catalog ID but not a user ID, the prefix is inserted immediately after the catalog ID.
- If the file or job variable name becomes too long after inserting the prefix, the file name is rejected as invalid.
- If the file name already begins with the defined prefix, the prefix is inserted, but only if multiple insertions are permitted (see the DUPLICATE-PREFIX operand).
- The file or job variable name must comply with naming conventions even if a prefix is added to it later.

### Format

**SET-FILE-NAME-PREFIX**

Alias: **STFNP**

**PREFIX** = **\*JOB-NAME** / <partial-filename 2..53> / **\*NONE**

**,DUPLICATE-PREFIX** = **\*YES** / **\*NO**

**,ATTRIBUTES** = **\*STD** / **\*PROTECTED**

**,RANGE** = **\*STD** / **\*FILE** / **\*JV** / **\*BOTH**

---

## Operands

### **PREFIX = \*JOB-NAME / <partial-filename 2..53> / \*NONE**

New prefix for file or job variable names (followed by a period).

### **PREFIX = \*JOB-NAME**

Defines the job name of the task (followed by a period) as the new prefix. If no job name was defined, this specification is equivalent to PREFIX=\*NONE.

### **PREFIX = <partial-filename 2..53>**

Explicit specification of the prefix. The specified prefix may contain both a user ID and a catalog ID. If a catalog ID is specified, there must not be any existing RFA connection for it.

### **PREFIX = \*NONE**

No prefix is to be inserted, but an existing prefix definition is to be removed.

### **DUPLICATE-PREFIX = \*YES / \*NO**

Specifies whether the prefix is to be inserted even if the file name already begins with the same prefix.

### **ATTRIBUTES = \*STD / \*PROTECTED**

Specifies whether the defined prefix is to be protected from being overwritten by a new definition. The default value is \*STD, which means that the prefix can be overwritten by a new prefix definition.

### **RANGE = \*STD / \*FILE / \*JV / \*BOTH**

Determines the range of the prefix definition. Insertion of the prefix can be defined for files and/or job variables.

### **RANGE = \*STD**

Default: The prefix is inserted with the ACS setting applicable for the task (ACS option STANDARD-RANGE).

### **RANGE = \*FILE**

The prefix is inserted only for files.

### **RANGE = \*JV**

The prefix is inserted only for job variables.

### **RANGE = \*BOTH**

The prefix is inserted both for files and for job variables.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed normally Guaranteed message: ACS0019
	64	ACS0016	Prefix is protected
	128	ACS0018	ACS is not available
	130	ACS0036	Resource bottleneck

## Examples

*Example 1: Defining a prefix, studying the effects of its insertion, and logging the insertion*

```

- 
- (1) Shows all catalog entries for files that have names beginning with *FILE*.
  - (2) Shows all catalog entries for files that have names beginning with *PAUL.*
  - (3) The SET-FILE-NAME-PREFIX command sets the prefix insertion function for the prefix *PAUL*.
  - (4) The SHOW-FILE-NAME-PREFIX command indicates the defined prefix.
  - (5) The name *FILE* specified in the SHOW-FILE-ATTRIBUTES command has the defined prefix inserted before the command is executed. Consequently, the catalog entries of all files that have names beginning with *PAUL.FILE* are shown.
  - (6) The name *FILE.1* specified in the PRINT-DOCUMENT command has the defined prefix inserted before the command is executed. The file named *PAUL.FILE.1* is printed as a result.
  - (7) The names *FILE.1* and *FILE.3* which are specified in the COPY-FILE command have the defined prefix inserted before the command is executed. The contents of the file *PAUL.FILE.1* are thus copied to the file *PAUL.FILE.3*.
  - (8) The name *FILE* specified in the SHOW-FILE-ATTRIBUTES command has the defined prefix inserted before the command is executed. Consequently, the catalog entries of all files that have names beginning with *PAUL.FILE* are shown.
  - (9) The insertion of a prefix is prevented by specifying the user *USER1* before *FILE*. The output of the SHOW-FILE-ATTRIBUTES now shows all files that have names beginning with *FILE*. A file named *FILE.3* was not created with COPY-FILE (see also step 8).
  - (10) The prefix insertion function can be disabled by specifying the catalog ID or the catalog and user IDs.
  - (11) Shows the current ACS settings for the task. PREFIX-INSERTION=NO has been set, i.e. no messages are output during prefix insertion.
  - (12) The MODIFY-ACS-OPTIONS command is used to change the ACS settings. Prefix insertions are to be logged on SYSOUT. The name *FILE* specified in the SHOW-FILE-ATTRIBUTES command has the defined prefix inserted before the command is executed. Consequently, the catalog entries of all files that have names beginning with *PAUL.FILE* are shown. The insertion of the prefix is indicated by message *ACS0000*.
  - (13) The names *FILE.1* and *FILE.3* which are specified in the COPY-FILE command have the defined prefix inserted before the command is executed. The contents of the file *PAUL.FILE.1* are thus copied to the file *PAUL.FILE.3*. The insertion of the prefix is indicated by message *ACS0000*. When the file is processed internally, several catalog accesses may be required. ACS inserts the prefix before the file name whenever the catalog is accessed, so message *ACS0000* is output in each such case.
  - (14) The name *FILE.1* specified in the PRINT-DOCUMENT command has the defined prefix inserted before the command is executed. The file named *PAUL.FILE.1* is printed as a result. The insertion of the prefix is indicated by message *ACS0000*.

*Example 2: Preventing duplicate insertions and protecting defined prefixes*

```

In this example, all prefix insertions are reported (see example 1, step 11).

- (1) The SET-FILE-NAME-PREFIX command is used to define the prefix insertion function for the prefix *PAUL.*. The definition is protected against overwriting by means of the PROTECTED attribute.
- (2) The name *PAUL.TEST.1* specified in the CREATE-FILE command has the defined prefix inserted before the command is executed, so a catalog entry for the file *PAUL.PAUL.TEST.1* is created. This approach is defined implicitly in the SET-FILE-NAME-PREFIX command (by the default value DUPLICATE-PREFIX=YES). In other words, the prefix is inserted even if the specified file name begins with the same prefix.
- (3) The name *PAUL.* specified in the SHOW-FILE-ATTRIBUTES command has the defined prefix inserted before the command is executed. Consequently, the catalog entries of all files that have names beginning with *PAUL.PAUL.* are shown.

- 
- (4) The wildcard sequence `*<1,2>` that is specified in the `SHOW-FILE-ATTRIBUTES` command has the defined prefix inserted before the command is executed. As a result, the catalog entries of all files that have names beginning with `PAUL.` and ending with the number `1` or `2` are shown. The rest of the name may be made up of any characters (even the null string). See also message `ACS0000`.
  - (5) The command `SET-FILE-NAME-PREFIX` defines prefix insertion for the prefix `PAUL.` (the previous prefix). The prefix definition is protected against overwriting by the `PROTECTED` attribute, and duplicate insertions are prevented with `DUPLICATE-PREFIX=*NO`.
  - (6) The name `PAUL.FILE.` specified in the `CREATE-FILE` command does not receive the defined prefix, since it already begins with the same prefix (see also Point 2). A catalog entry for the file `PAUL.TEST.1` is created.
  - (7) The name `TEST.` specified in the `SHOW-FILE-ATTRIBUTES` command has the defined prefix inserted before the command is executed, so the catalog entries for all files that have names beginning with `PAUL.TEST.` are shown. The user could also specify `PAUL.TEST.` to achieve the same result, since the prefix would already be present in that case and would therefore not be inserted.
  - (8) The command `SET-FILE-NAME-PREFIX` is issued without operands. This would have normally defined the job name of the task as the new prefix (default value); however, since the prefix has the `PROTECTED` attribute (to prevent inadvertent changes), no other prefix can be defined in this case.
  - (9) The command `SET-FILE-NAME-PREFIX` is issued for the existing prefix `PAUL.` without any further operands. The settings for `DUPLICATE-PREFIX` and `ATTRIBUTES` are restored to default values, i.e. the prefix is no longer protected against changes.
  - (10) The `SET-FILE-NAME-PREFIX` command is issued without operands, so the job name of the task is defined as the prefix. The new prefix is `ULK.` (see message `ACS0000`).
  - (11) The name `TEST.1` specified in the `CREATE-FILE` command receives the defined prefix before the command is executed. A catalog entry is created for the file `ULK.TEST.1`.
  - (12) The name `TEST.` specified in the `CREATE-FILE` command receives the defined prefix before the command is executed, so the catalog entries for all files that have names beginning with `ULK.TEST.` are shown.
  - (13) The `SET-FILE-NAME-PREFIX` command with the `PREFIX=*NONE` specification turns off the prefix insertion function.
  - (14) The `CREATE-FILE` command for the name `TEST.1` creates a catalog entry for the file `TEST.1`.
  - (15) The `SHOW-FILE-ATTRIBUTES` command for the file name `TEST.1` shows the catalog entry that was created.
  - (16) The `SHOW-FILE-ATTRIBUTES` command shows the catalog entries of all files that have names beginning with any arbitrary string (including the null string) and ending with `TEST.1`.

---

Example 3: Preventing prefix insertion for a file name

**/show-file-name-prefix** \_\_\_\_\_ (1)

```
% ACS0019 CURRENT FILE NAME PREFIX IS 'PAUL.'
```

**/add-alias-cat alias=file.1,file=\*same** \_\_\_\_\_ (2)

```
% ACS0020 ALIAS CATALOG ACTIVATED
```

**/show-alias** \_\_\_\_\_ (3)

```
%      ALIAS FILE NAME      ->      FILE NAME
%UB : FILE.1                -> *SAME
% ACS0037 NUMBER OF ALIAS CATALOG ENTRIES: 1 (FOR SYSTEM: 0, FOR USER: 1)
```

**/print-doc file.1** \_\_\_\_\_ (4)

```
% SCP0810 SPOOLOUT FOR FILE ':2OS2:$USER1.FILE.1' ACCEPTED. TSN: '1Q14', SPO
LOUT-NAME: 'ULK', MONJV: '*NONE'
```

**/hold-alias** \_\_\_\_\_ (5)

```
% ACS0007 /HOLD-ALIAS-SUBSTITUTION PROCESSED
```

**/print-doc file.1** \_\_\_\_\_ (6)

```
% ACS0000 FILE NAME 'FILE.1' REPLACED BY 'PAUL.FILE.1'
% ACS0000 FILE NAME 'FILE.1' REPLACED BY 'PAUL.FILE.1'
% ACS0000 FILE NAME 'FILE.1' REPLACED BY 'PAUL.FILE.1'
% SCP0810 SPOOLOUT FOR FILE ':2OS2:$USER01.PAUL.FILE.1' ACCEPTED. TSN: '
197A', SPOOLOUT-NAME: 'ULK', MONJV: '*NONE'
% SCP1025 PRINT JOB ACCEPTED BY SERVER 'D020H027' WITH TSN '46VE'
```

**/resume-alias** \_\_\_\_\_ (7)

```
% ACS0008 /RESUME-ALIAS-SUBSTITUTION PROCESSED
% ACS0009 ALIAS CATALOG OPERATION CONTINUES
```

In this example, all prefix insertions are reported (see example 1, step 11).

- (1) The command SHOW-FILE-NAME-PREFIX shows that *PAUL.* is defined as the prefix.
- (2) The command ADD-ALIAS-CATALOG starts the ACS substitution function and creates the first entry in the task-local alias catalog with the alias *FILE.1* for a file with the same actual file name (FILE-NAME=\*SAME). This entry ensures that the name *FILE.1* is neither replaced nor supplemented by the defined prefix.
- (3) Output of the entries in the alias catalog.

- 
- (4) The file *FILE.1* is specified in the PRINT-DOCUMENT command and printed as a result.
  - (5) The command HOLD-ALIAS-SUBSTITUTION halts the ACS substitution function.
  - (6) When *FILE.1* is now specified in the PRINT-DOCUMENT command, the file *PAUL.FILE.1* is printed. The prefix was inserted before executing the command in this case, since the ACS substitution function has been halted, and the alias definition for *FILE.1* is ignored.
  - (7) The command RESUME-ALIAS-SUBSTITUTION resumes the ACS substitution function, so the alias definition now has precedence over the insertion of a prefix.

---

## 5.81 SET-INSTALLATION-PATH

Define/modify installation path

<b>Component:</b>	IMON-GPN
<b>Functional area:</b>	System control and optimization
<b>Domain:</b>	SYSTEM-MANAGEMENT
<b>Privileges:</b>	SUBSYSTEM-MANAGEMENT

### Function

The SET-INSTALLATION-PATH command allows systems support staff

- to assign a path name to the logical name of an installation item or to modify this path name.
- modify all path names of an installation unit by replacing a (sub)string of the name with a different string.

The SHOW-INSTALLATION-PATH command provides information on current assignments.

Each installation item has a logical name or identifier. A product is uniquely identified by its name and its version string.

#### *Prerequisites for the command*

The product's installation items must be included in the SCI along with their path names. This precondition is fulfilled in the following cases:

- The product is a standard software product. It was supplied by Fujitsu Technology Solutions (SOLIS2 delivery) and installed correctly using IMON.
- The product is a private software product. It was registered in SCI using a SYSSII file generated by the customer.

The path name is only allocated if its attributes allow it.

The command is a component of IMON-GPN, the nonchargeable part of the IMON software product. IMON is completely described in the "IMON" manual [19].

## Format

### SET-INSTALLATION-PATH

**SCI-NAME** = **\*STD** / <filename 1..54 without-gen-vers>

**,LEVEL** = **\*ITEM**(...) / **\*UNIT**(...)

**\*ITEM**(...)

| **PATH-NAME** = **\*NONE** / <filename 1..54 without-gen-vers> / <partial-filename 2..53>

| **,LOGICAL-IDENTIFIER** = <filename 1..30 without-cat-user-gen-vers>

| **,TARGET** = **\*STD** / **A** / **S** / **P** / **K**

| **,INSTALLATION-UNIT** = <text 1..30 without-sep>(…)

| <text 1..30 without-sep> (...)

| | **VERSION** = <product-version mandatory-man-corr>

**\*UNIT**(...)

| **,INSTALLATION-UNIT** = <text 1..30 without-sep>(…)

| <text 1..30 without-sep> (...)

| | **VERSION** = <product-version mandatory-man-corr> /

| | <product-version mandatory-man-without-corr> / <product-version without-man-corr>

| **,OLD-STRING** = <filename 1..22 without-gen-vers> / <partial-filename 2..23>

| **,NEW-STRING** = <filename 1..22 without-gen-vers> / <partial-filename 2..23>

**,ENFORCE** = **\*NO** / **\*YES**

## Operands

### **SCI-NAME =**

Defines the SCI to be processed.

### **SCI-NAME = \*STD**

The standard SCI is processed (the files \$TSOS.SYS.IMON.SCI and \$TSOS.SYS.IMON.SCI.GPN).

### **SCI-NAME = <filename 1..54 without-gen-vers>**

Name of the alien SCI. Alien SCIs (e.g. on imported subsets) can be modified using this operand. If the name of an IMON SCI is specified, the relevant IMON-GPN-SCI is also accepted by the suffix .GPN automatically being added.

### **LEVEL =**

Defines the operation to be carried out.

---

**LEVEL = \*ITEM(...)**

A path name is to be set (or possibly reset) and linked with the logical name of an item of an existing installation unit.

**PATH-NAME =**

Designates the path name assigned to the logical name of the installation item.

**PATH-NAME = \*NONE**

No path name is assigned to the logical name. Any existing assignment is canceled.

**PATH-NAME = <filename 1..54 without-gen-vers>**

Explicit path name specification.

**PATH-NAME = <partial-filename 2..53>**

The path name is specified in partially qualified form. It refers to all files assigned to the logical name.

**LOGICAL-IDENTIFIER =**

Designates the logical name of the installation item.

**LOGICAL-IDENTIFIER = <filename 1..30 without-cat-user-gen-vers>**

Explicit specification of the logical name of the installation item.

**TARGET =**

Specifies the hardware version of the subsystem to which the installation item belongs.

**TARGET = \*STD**

The current system's standard selection procedure is used.

**TARGET = A**

The installation item is independent of the hardware version.

**TARGET = S**

The installation item pertains to the /390 version of the subsystem (SU /390 and S server).

**TARGET = P**

This hardware version is meaningless for systems as of BS2000/OSD V9.0.

**TARGET = K**

The installation item belongs to the X86 version of the subsystem (SU x86).

**INSTALLATION-UNIT = <structured-name 1..30>(...)**

Name of the installation unit containing the logical name.

**VERSION = <product-version mandatory-man-corr>**

Explicit installation unit version specification.

**LEVEL = \*UNIT(...)**

A string or substring in all path names of the specified installation unit(s) is to be replaced.

**INSTALLATION-UNIT = <text 1..30 without-sep>(...)**

Name of the installation unit containing the logical name.

**VERSION = <product-version mandatory-man-corr> / <product-version mandatory-man-without-corr> / <product-version without-man-corr>**

Explicitly specified version of the installation unit.

**OLD-STRING = <filename 1..22 without-gen-vers> / <partial-filename 2..23>**

String to be searched for in the path names and to be replaced by the string specified with NEW-STRING.

---

**NEW-STRING = <filename 1..22 without-gen-vers> / <partial-filename 2..23>**

New string that will be inserted in the place of the OLD-STRING.

**ENFORCE = \*NO / YES**

Determines whether the path name can be assigned even though the logical name was defined with UPDATE=NO (see the "IMON" manual [19]).

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	32	IMO9101	Command terminated abnormally (internal error in IMON-GPN)
	64	CMD0216	User does not have required privilege
	64	IMO9100	Command not executed. Installation unit or version not found, or path name cannot be modified.

---

## 5.82 SET-JOB-STEP

Identify error handling (spin-off) section

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	File processing
<b>Domain:</b>	JOB PROCEDURE
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

With the SET-JOB-STEP command, users can subdivide a procedure or an ENTER file into sections. Processing branches to SET-JOB-STEP when spin-off is initiated in a procedure or a batch job (see “Spin-off mechanism” below). The command

- clears job switches 16 through 31 (value \*OFF),
- resets compiler options set using the ISP PARAMETER command to their default values.

This command may be used only in procedures and ENTER files; it is ignored in interactive mode and consequently not offered in the menu.

If SET-JOB-STEP is issued while a program is loaded, an error message appears.

#### *Spin-off mechanism*

If an invalid command is encountered during procedure execution, the following responses are possible:

- the invalid command is ignored and processing continues with the next command;
- the invalid command is rejected but processing ignores the following commands, with the exception of the following commands:  
EXIT-JOB, CANCEL-PROCEDURE, END-PROCEDURE, EXIT-PROCEDURE, LOGOFF, SET-JOB-STEP.

This mechanism is called spin-off.

The EXIT-JOB and LOGOFF commands terminate the job, while the CANCEL-PROCEDURE command terminates the procedure. The END-PROCEDURE and EXIT-PROCEDURE commands cause the system to branch to the last procedure level exited, but without switching off the SPIN-OFF mechanism.

The SET-JOB-STEP command switches off the spin-off mechanism and the procedure continues normally with the next command in the sequence.

Spin-off is initiated in the following cases:

- syntax errors; this applies to all commands
- content errors; this does not apply to all commands.

---

## Format

<b>SET-JOB-STEP</b>

Alias: **STJSP**

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	32	EXC0041	System error
	130	CMD2282	Command not possible because a program is loaded

---

## 5.83 SET-JV-LINK

Assign link name to job variable

<b>Component:</b>	JV
<b>Functional area:</b>	Job variables
<b>Domain:</b>	JOB-VARIABLES
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	\$ (with NBCONOPI=N) or J (with NBCONOPI=Y)

This function is available to the user only if the chargeable software product JV has been loaded as a subsystem.

### Function

The SET-JV-LINK command allows the user to assign a link name to a job variable. This assignment is entered into the JV-LINK table associated with the job. A link name is always assigned uniquely to a job variable, but more than one link name can be assigned to a single job variable.

If the specified job variable does not exist, it is created provided no other user ID has been specified (implicit CREATE-JV).

Using link names enables the names of the job variables used to be kept variable in programs and procedures (e.g. no specific name or user ID needs to be defined). Before invoking the program or procedure, the user creates JV-LINK entries with the specified link names for the job variables that are to be used.

A JV-LINK entry exists up to the end of the job, unless it is deleted beforehand with the REMOVE-JV-LINK command. The entries can be displayed using the SHOW-JV-LINK command.

#### *Default link names*

For a job-monitoring job variable, a JV-LINK entry with the link name **SMONJVJ** is automatically created. Similarly, a program-monitoring job variable is assigned the link name **SMONJVP**. This enables a job or program to access its monitoring job variable. Users should not use these default link names for their own JV-LINK entries.

#### *Privileged functions*

If systems support (TSOS and OPERATING privileges) specifies a non-existent job variable with a foreign user ID, the job variable is created under this ID. Co-ownership of TSOS can be restricted for permanent job variables when SECOS is used.

### Format

<b>SET-JV-LINK</b>	Alias: <b>STJVL</b>
<b>LINK-NAME</b> = <b>*NONE</b> / <alphanum-name 1..7>	
<b>,JV-NAME</b> = <filename 1..54 without-gen-vers>	

---

## Operands

**LINK-NAME = \*NONE / <alphanum-name 1..7>**

Link name. The JV can be accessed under this name within the currently executing job. The assignment between link name and JV name is registered in the JV-LINK table for the job.

Only one entry per link name may be present in the JV-LINK table. One JV can however be assigned to more than one link name.

If the specified link name was already assigned to another JV, the old assignment is replaced by the new assignment.

**JV-NAME = <filename 1..54 without-gen-vers>**

Name of the JV.

If the JV already exists, the user must have access authorization.

If the JV does not yet exist, only the user's own ID may be specified. The JV is cataloged with the default attributes of the CREATE-JV command.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	CMD0001	No action necessary
2	0	CMD0001	Command executed with a warning
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JVS04E0	Command not executable in the call environment; if possible, remove cause of error (see SYSOUT message JVS04xx)
	130	JVS04E1	Command cannot be executed at this time; for cause see SYSOUT message JVS04xx
	130	CMD2282	Subsystem JV not available for indefinite time

## Example

For an example see the SHOW-JV-LINK command.

---

## 5.84 SET-LOGON-PARAMETERS

Initiate interactive or batch job

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job processing
<b>Domain:</b>	JOB
<b>Privileges:</b>	all privileges
<b>Routing code:</b>	@ (only with NBCONOPI=Y)

### Function

With the SET-LOGON-PARAMETERS command, users can initiate an interactive job on the terminal. When SET-LOGON-PARAMETERS is given as the first command in an ENTER file, it initiates a batch job on starting with the ENTER-JOB command.

The specifications in the SET-LOGON-PARAMETERS command identify the user (system access authorization check), characterize the job and control logging of job execution.

The access authorization specifications are checked against the user entry; further specifications relating to the job class and to the job attributes (job/run priority, system resources) are also checked against the entry in the job class definition. The entries are accessible to the user by means of the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands. If different specifications appear for RUN-PRIORITY and CPU-LIMIT in the user entry and in the job class definition, the value more favorable to the user is permitted.

The operands of the SET-LOGON-PARAMETERS command are evaluated for batch jobs only if the operator starts the job either on the console or with the ENTER-JOB operand DEFAULT-FROM-FILE=\*YES. Explicit specifications in the ENTER-JOB command do, however, have priority, i.e. an operand value from /SET-LOGON-PARAMETERS becomes effective only if this operand also has its preset value unchanged in the ENTER-JOB command (see the ENTER-JOB command).

The JOB-PRIORITY, RERUN-AFTER-CRASH, FLUSH-AFTER-SHUTDOWN operands and a SCHEDULING-TIME not equal to \*STD are only possible for batch jobs.

#### *Operator functions on physical consoles*

If the "Operator LOGON" function is used (incompatible mode; system parameter NBCONOPI=Y), users can authenticate themselves with the SET-LOGON-PARAMETERS command on physical consoles as well. Values may then be specified for the USER-IDENTIFICATION, ACCOUNT and PASSWORD operands only.

Having successfully logged on, the operator still has no authorization to enter commands (apart from a few SHOW commands). This can be obtained with the REQUEST-OPERATOR-ROLE command; SHOW-OPERATOR-ROLE INFORMATION=\*ROUTING-CODES indicates which operator roles a user ID is allowed to assume. The operator task is ended either explicitly by an EXIT-JOB command or by the failure of the console. Without authentication through SET-LOGON-PARAMETERS, all that can be entered at physical consoles is the SHOW-PENDING-MSG command to list any unanswered response messages.

## Format

### SET-LOGON-PARAMETERS

Alias: **STLGP**

,JOB-PARAMETER = *NO / <c-string 1..127>
,PROTECTION = *NONE / *CANCEL

```

## Operands

**USER-IDENTIFICATION = \*NO / <name 1..8>**

User ID under which the job is to run.

**ACCOUNT = \*NONE / <alphanum-name 1..8>**

Account number of the user ID under which the job is to run.

**PASSWORD = \*NONE / <c-string 1..8> / <c-string 9..32> / <x-string 1..16> / \*SECRET**

Password for the user ID.

The long password mechanism is supported (<c-string 9..32>). See the MODIFY-USER-PROTECTION command for details of the long password mechanism.

The PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**JOB-CLASS = \*STD / <name 1..8>**

Job class in which the job is to run. The job class must be permitted for the job type (e.g. interactive job). The user can ascertain the job classes he is allowed to use from his user entry for the home pubset (SHOW-USER-ATTRIBUTES command output). This also displays the default job class that is preset with \*STD. Users can obtain information about the characteristics of job classes (job class definition) by means of the SHOW-JOB-CLASS command.

**JOB-NAME = \*NO / <name 1..8>**

The name of the job. The job can be accessed using this name (e.g. using SHOW-JOB-STATUS). All unnamed jobs started from within this job are also assigned this name.

**JOB-NAME = \*NO**

The job is to run without a name of its own.

If there is a non-S label prefixed to the SET-LOGON-PARAMETERS command, the job is given the name of the label.

**JOB-NAME = <name 1..8>**

Job name.

**MONJV = \*NONE / <filename 1..54 without-gen-vers>**

Specifies whether the job is to be monitored by a JV.

**MONJV = \*NONE**

The job is not monitored.

**MONJV = <filename 1..54 without-gen-vers>**

*Applies only if the JV software product is being used*

Name of the JV that is to monitor the job.

Job monitoring is only started if the job is accepted by the system's job management facility (JOB ACCEPTED).

The job originator must have write authorization because he instructs the system to write to the JV. If the JV is not accessible at the time of command processing, an error message is output to SYSOUT and the command is rejected. If the specified JV does not yet exist, it is - if the requisite authorization exists - created by the system and made available for all users (ACCESS=\*WRITE and USER-ACCESS=\*ALL-USERS).

Users can address this job via the specified JV (see the "Job Variables" manual [20]):

\$S Job on queue

\$R Job running

\$T Job terminated

\$A Job aborted

\$M Job exported with MOVE-JOBS

**JV-PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

*Applies only if the JV software product is being used*

---

Password for the JV.

The operand is only evaluated when job monitoring has been defined (see the MONJV operand). The operand JV-PASSWORD is defined as "secret":

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**JOB-PRIORITY = \*STD / <integer 1..9>**

*For batch jobs only*

Job priority to be given to the batch job. The lower the value, the higher the priority. The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

**JOB-PRIORITY = \*STD**

The standard priority specified for the job class applies.

**RERUN-AFTER-CRASH = \*NO / \*YES**

*For batch jobs only*

Specifies whether the batch job is to be restarted during the next system session if processing has been aborted as the result of a system error or termination of the system session.

**FLUSH-AFTER-SHUTDOWN = \*NO / \*YES**

Specifies whether the batch job is to be removed from the job queue if it has not been processed by the end of the session.

**SCHEDULING-TIME = \*STD / \*PARAMETERS(...) / \*BY-CALENDAR(...)**

*For batch jobs only*

Defines how scheduling times are specified for the batch job.

**SCHEDULING-TIME = \*STD**

The default settings for START and REPEAT-JOB scheduling time specifications for the selected job class apply (see the operands of the SCHEDULING-TIME=\*PARAMETERS(...) structure).

**SCHEDULING-TIME = \*PARAMETERS(...)**

Defines a scheduling time (start time) for the batch job. It is also possible to define job repeats (repeat job).

**START =**

Starting time for the batch job. Values other than \*STD are appropriate only if permitted in accordance with the job class definition (see the SHOW-JOB-CLASS command).

**START = \*STD**

The default value for the chosen job class applies.

**START = \*SOON**

The job is to be started as soon as possible, in accordance with its priority.

**START = \*IMMEDIATELY**

The job is to be started immediately.

**START = \*AT-STREAM-STARTUP**

The job is to be started after the next startup of the job scheduler.

---

**START = \*WITHIN(...)**

The job is to be started within the specified time period.

**HOURS = 0 / <integer 0..23 *hours*>**

Number of hours.

**MINUTES = 0 / <integer 0..59 *minutes*>**

Number of minutes.

**START = \*AT(...)**

The job is to be started exactly at the time specified in the following.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications.

20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes. Seconds are not interpreted.

**START = \*EARLIEST(...)**

The job is to be started no earlier than the time specified.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications.

20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes. Seconds are not interpreted.

**START = \*LATEST(...)**

The job is to be started no later than the time specified.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications.

20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes. Seconds are not interpreted.

**REPEAT-JOB =**

Time interval at which the batch job is to be repeated. Values other than \*STD are appropriate only if permitted in accordance with the job class definition (see the SHOW-JOB-CLASS command). The time interval for the repetitions depends on the specification in the START operand; see the note in this regard, "Combinations of the START and REPEAT-JOB operands". For the repetitions, the following applies:

- The i-th repetition (i >= 1) of a job is not started until the (i-1)th repetition has ended.
- Cancellation of the currently executing job (i) has no effect on the start of (i+1); (i >= 0).
- Cancellation of the entire job: Both the currently executing job (i) and the subsequent job (i+1) must be canceled, (i >= 0); (CANCEL-JOB command, or make job (i) the last job in the series using the command MODIFY-JOB ...,REPEAT-JOB=\*NO).

---

**REPEAT-JOB = \*STD**

The default value for the chosen job class applies.

**REPEAT-JOB = \*NO**

The batch job is not repeated.

**REPEAT-JOB = \*DAILY**

Daily repetition at the time specified with START.

**REPEAT-JOB = \*WEEKLY**

Weekly repetition at the time specified with START.

**REPEAT-JOB = \*AT-STREAM-STARTUP**

Repetition following each startup of the job scheduler.

**REPEAT-JOB = \*PERIOD(...)**

Repetition after the specified time interval.

**HOURS = 0 / <integer 0..23 hours >**

Number of hours.

**MINUTES = 0 / <integer 0..59 minutes >**

Number of minutes.

**SCHEDULING-TIME = \*BY-CALENDAR(...)**

*For batch jobs only*

The batch job scheduling time and any repeat jobs are specified in the form of a symbolic date defined in a calendar file (calendar job). The entries in a calendar file can be listed with the SHOW-CALENDAR command. Creation of calendar files with the CALENDAR-EDITOR utility is described in the "Calendar" manual [4].

**CALENDAR-NAME = <filename 1..54 without-gen-vers>**

Name of the calendar file.

**SYMBOLIC-DATE = <filename 1..20 without-cat-user-vers> / <partial-filename 2..20 without-cat-user>**

Symbolic date which defines the scheduling time and any repetition cycles within the calendar file. The symbolic date may also be given in partially qualified mode. In this way, several scheduling times can be defined for one calendar day with the appropriate definition of SYSDATs.

*Example:* Definition of SYMDATs in the calendar file:

- WORK.DAY.1 (every other day at 06:00 hrs)
- WORK.DAY.2 (every other day at 6:00 PM hrs)
- WORK.WEEK.1 (every Friday at 21:00 hrs)

A calendar job considering all three scheduling points is started with SYMBOLIC-DATE=WORK..

**LIMIT = \*STD / <integer 1..32767> / \*BY-DATE(...)**

Governs how long a calendar job remains in existence. This limit applies in addition to the limits set by the calendar.

**LIMIT = \*STD**

The duration of the calendar job depends entirely on the symbolic date entry in the calendar.

**LIMIT = <integer 1..32767>**

*This specification is only permitted for calendar jobs.*

Maximum number of repetitions of the calendar job.

---

When a single job run ends, the run counter is incremented by 1. Then the run counter is checked against the limit. If this is the case, the entire calendar job is terminated.

**LIMIT = \*BY-DATE(...)**

*This specification is only permitted for calendar jobs.*

After the specified date has been reached, no repeat jobs for the calendar job are started. A repeat which is currently in progress will abort when the date arrives.

The specified date relates only to the calculated starting date for repeat jobs. Overshoots due to rescheduling of postponed repeats or to delays in the job scheduler are allowed. The date specification consists of the day and the time:

**DATE = <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day.

**RESOURCES = \*PARAMETERS(...)**

Values for run priority, CPU time and maximum number of SYSLST records.

**RUN-PRIORITY = \*STD / <integer 30..255>**

Run priority which the job is to be assigned. The lower the value, the higher the priority. The maximum permissible priority value is the lesser of the two values (i.e. the more favorable of the values) from the user catalog and the job class definition.

If no maximum value is defined for the job class, the following rules apply:

- If the value specified explicitly is numerically lower than the value in the user entry, the message JMS0045 is issued. The batch job is assigned the higher of the two values (i.e. the less favorable value) for the run priority from the user entry and the default run priority for the job class.
- If no value is specified explicitly or if \*STD is specified explicitly the job is given the default job priority for the job class.

The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

**RUN-PRIORITY = \*STD**

The standard run priority specified for the job class applies.

**CPU-LIMIT = \*STD / \*NO / <integer 1..32767 seconds>**

Maximum CPU time, in seconds, that the batch job may consume. The maximum time permitted depends on the job class specified. See also [section "Time limits in BS2000"](#).

**CPU-LIMIT = \*STD**

The default value for the chosen job class applies.

**CPU-LIMIT = \*NO**

Specifies no time limit (NTL) for the job run. This operand value is permitted only if the requisite authorization exists in the user entry or the job class definition.

**SYSLST-LIMIT = \*STD / \*NO / <integer 0..999999>**

Specifies the maximum number of records the job is allowed to output to the system files SYSLST, SYSLST01, SYSLST02, ..., SYSLST99 and SYSOUT. The records for SYSOUT are counted separately from the records for SYSLST files. In interactive mode, output records on SYSOUT are only counted if the output is

---

(also) written to a file. In the case of SYSLST, SYSOUT records are not taken into account, even if the setting LISTING=\*YES has been made to ensure that they are also written to SYSLST. This value must not be above the limit set in the job class definition. This limit may be queried using the SHOW-JOB-CLASS command.

**SYSLST-LIMIT = \*STD**

The default value for the chosen job class applies. If the specified number is exceeded:

- in interactive mode, the user may specify whether the job is to be continued or terminated. If continued, output is repeated up to “number”.
- in batch mode, the job is terminated abnormally.

**SYSLST-LIMIT = \*NO**

Sets no limit on the number of records output.

**LOGGING = \*PARAMETERS(...)**

Job logging parameters.

**LISTING = \*NO / \*YES**

Specifies whether the job run is also to be logged on SYSLST.

**HARDCOPY = \*NO / \*YES**

Specifies whether the dialog job is also to be logged at a hardcopy printer.

**JOB-PARAMETER =**

Specifies additional attributes for the selected job class - assuming that systems support has defined some and made them known.

**JOB-PARAMETER = \*NO**

No additional attributes.

**JOB-PARAMETER = <c-string 1..127>**

c-string = sequence of any characters; assigned by systems support to identify additional job class attributes.

**PROTECTION = \*NONE / \*CANCEL**

Specifies whether a job is to be protected against being canceled unintentionally with the CANCEL-JOB command.

**i** The PROTECTION specification from the ENTER-JOB command always applies for batch jobs. The value entered here is ignored. This also applies when the operator starts the job on the console or by specifying the ENTER-JOB operand DEFAULT-FROM-FILE=\*YES.

**PROTECTION = \*NONE**

The job is not protected against unintentional cancellation.

**PROTECTION = \*CANCEL**

The job is not protected against accidental termination. When an interactive job is terminated with the CANCEL-JOB command, the system demands an additional confirmation from the user. Accidental termination of the job due to incorrect specification of the job number should thus be prevented.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	64	JMS0640	Command rejected

If SET-LOGON-PARAMETERS is the **first** command in the dialog (input after connection setup and LOGON prompt) or in an ENTER file, it is rejected in the event of an error (SC1 not 0) and the task aborted. The command return code cannot be evaluated in this case.

---

## 5.85 SET-MSG-SUPPRESSION

Suppress console messages

**Component:** BS2000 OSD/BC

**Functional area:** Operator terminal control  
Message processing

**Domain:** CONSOLE-MANAGEMENT

**Privileges:** OPERATING

**Routing code:** @

### Function

The SET-MSG-SUPPRESSION command enables the output of certain messages to be suppressed at operator terminals (consoles). The messages must originate from a message file and have been created by means of the MSG7 or MSG7X macro. Up to 1024 different messages can be suppressed during a session.

The following applies to messages with responses (queries):

Queries connected with commands (request for additional command information with "&") cannot be suppressed.

All other query types can be suppressed. Suppressed queries, with the exception of queries without responses (knowledgeable queries), will definitely be output (possibly at the main console).

If the "Operator LOGON" function is used (system parameter NBCONOPI=Y), only the values \*NO and \*OWN are allowed for the CONSOLE-UNIT and APPLICATION-NAME operands, which means that the command cannot be issued for other operator terminals or authorized user programs.

If the "Operator LOGON" function is not used, the operator can issue the command at the main operator terminal with reference to other operator terminals or authorized user programs as well.

In a user task with OPERATING privilege, the command applies only when reading from the event stream of the user's own task. In this case only the value \*NO is permissible for the CONSOLE-UNIT and APPLICATION-NAME operands.

The operator can use the SHOW-MSG-SUPPRESSION command to request a list of the currently defined arrangements to be displayed.

### Format

#### SET-MSG-SUPPRESSION

**MSG-ID** = list-poss(12): <alphanum-name 7..7>

,**CONSOLE-UNIT** = \*NO / \*OWN / \*ALL / list-poss(20): <name 2..2>

,**APPLICATION-NAME** = \*NO / \*OWN / \*ALL / list-poss(20): <name 4..4>

---

## Operands

### **MSG-ID = list-poss(12): <alphanum-name 7..7>**

Mandatory operand which specifies a seven-digit message number or a list of message numbers identifying messages whose output to the operator terminal is to be suppressed.

#### *Note*

Messages with nonexistent message numbers or messages which cannot be suppressed are not rejected (see also “Control of message delivery” in the “Introduction to System Administration” [14]).

### **CONSOLE-UNIT =**

Mnemonic device name of the operator terminal on which the specified messages are not to appear.

### **CONSOLE-UNIT = \*NO**

The existing definition for the operator terminal is retained. However, when input is from an operator terminal, the change becomes effective for the operator terminal where the input is made.

### **CONSOLE-UNIT = \*OWN**

*This operand value is only possible when input is made at a console.*

The messages are suppressed at the operator terminal on which the command was issued.

### **CONSOLE-UNIT = \*ALL**

The arrangements made are to apply to all operator terminals.

This operand may only be used in the mode without operator LOGON at the main operator terminal.

### **CONSOLE-UNIT = list-poss(20): <name 2..2>**

Mnemonic device name of the main or standby operator terminal at which the specified messages are no longer to appear.

In this operand remote consoles may only be specified in the mode without operator LOGON from the main operator terminal.

### **APPLICATION-NAME =**

Specifies the authorized user program for which the specified messages are to be suppressed.

#### *Note*

If messages are suppressed by an authorized user program with generated authorization names, suppression applies until the authorized user program is disconnected. On disconnection, suppression is remembered and comes back into force automatically as soon as the program is reconnected.

In the case of user programs with dynamic authorization names, suppression applies only until disconnection.

### **APPLICATION-NAME = \*OWN APPLICATION-NAME = \*NO**

The existing definition for the authorized user programs is retained. However, when input is from an authorized user program, the changes become effective for this user program.

*This operand value is only permissible when input is from an authorized user program.*

Message suppression is to apply to the authorized user program for which the command was issued.

---

**APPLICATION-NAME = \*ALL**

The specified messages are suppressed for all known authorized user programs.

This operand may only be used in the mode without operator LOGON at the main operator terminal.

**APPLICATION-NAME = list-poss(20): <name 4..4>**

Name of the authorized user program (4 alphanumeric characters) for which the specified messages are to be suppressed.

Remote authorized user programs may only be specified in the mode without operator LOGON from the main operator terminal.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NBR0884	Command partially executed
	32	NBR0007	OPR task anchor not accessible
	64	NBR0200	Command not available
	1	CMD0202	Syntax error
	64	NBR0865	Authorized application not found
	64	NBR0866	Operator terminal not found
	64	NBR0881	Maximum number of suppressed messages
	64	NBR0883	May only be issued from main operator terminal in this form
	130	NBR0875	Class-4 memory shortage
	130	NBR0877	Message table locked
	130	NBR0921	Class-5 memory shortage

---

## 5.86 SET-NET-CLIENT-ALTERNATE

Assign net clients for high availability

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Net-Storage administration
<b>Domain:</b>	DEVICE STORAGE-MANAGEMENT
<b>Privileges:</b>	TSOS OPERATING
<b>Routing code:</b>	G

### Function

The SET-NET-CLIENT-ALTERNATE command specifies an assignment of two net clients on redundant HNCs for high availability. This assignment is a symmetrical relationship between the two net clients. There can only ever be one alternative net client for a net client. When one of the two net clients fails, the other takes over the existing Net-Storage connections of the failed net client.

Another SET-NET-CLIENT-ALTERNATE for one of the two net clients has the following effect:

- ALTERNATE-CLIENT=\*NONE cancels the existing assignment.
- ALTERNATE-CLIENT=<client> cancels the existing assignment and specifies a new assignment for the specified net clients.

Information on the high availability of net clients can be requested using the SHOW-NET-CLIENT-ALTERNATE command.

Fundamental information on the use of Net-Storage in BS2000 is provided in the "Introduction to System Administration" [14]. How to work with files on Net-Storage is described in the "Introductory Guide to DMS" [13].

---

## Format

### SET-NET-CLIENT-ALTERNATE

**CLIENT** = <composed-name 1..8 with-under> / <c-string 1..8> / \***DNS**(...) / \***IP-ADDRESS**(...)

\***DNS**(...)

|   **DNS-NAME** = <c-string 1..256 with-low>

\***IP-ADDRESS**(...)

|   **IP-ADDRESS** = <composed-name 7..15> / <c-string 2..39>

,**ALTERNATE-CLIENT** = <composed-name 1..8 with-under> / <c-string 1..8> / \***DNS**(...) / \***IP-ADDRESS**(...)

\***DNS**(...)

|   **DNS-NAME** = <c-string 1..256 with-low>

\***IP-ADDRESS**(...)

|   **IP-ADDRESS** = <composed-name 7..15> / <c-string 2..39>

## Operands

### **CLIENT =**

Specifies the net client to which an alternative net client is to be assigned.

**CLIENT = <composed-name 1..8 with-under> / <c-string 1..8>**

Internal BCAM name of the net client.

**CLIENT = \*DNS(...)**

Domain name of the net client.

**DNS-NAME = <c-string 1..256 with-low>**

Specifies the fully qualified domain name of the net client.

**CLIENT = \*IP-ADDRESS(...)**

IP address of the net client.

**IP-ADDRESS = <composed-name 7..15> / <c-string 2..39>**

Specifies the IP address of the net client in IPv4 or IPv6 format.

### **ALTERNATE-CLIENT =**

Specifies the net client which is to be assigned as alternative net client.

**ALTERNATE-CLIENT = <composed-name 1..8 with-under> / <c-string 1..8>**

Internal BCAM name of the alternative net client.

**ALTERNATE-CLIENT = \*DNS(...)**

Domain name of the alternative net client.

**DNS-NAME = <c-string 1..256 with-low>**

Specifies the fully qualified domain name of the net client.

---

**ALTERNATE-CLIENT = \*IP-ADDRESS(...)**

IP address of the alternative net client.

**IP-ADDRESS = <composed-name 7..15> / <c-string 2..39>**

Specifies the IP address of the net client in IPv4 or IPv6 format.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
1	0	NKAN015	Alternate assignment already exists
	1	NKAN003	Syntax error in the input
	32	NKAN004	Error in command execution

---

## 5.87 SET-PROCEDURE-OPTIONS

Define procedure attributes

<b>Component:</b>	SDF-P-BASYS
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The SET-PROCEDURE-OPTIONS command enables the user to define the attributes of an *S procedure*. It is an optional command. If used, it must be the *first* command in the procedure head; if it is not used, the attributes are defined in accordance with the SDF-P default values.

The following options can be set in the SET-PROCEDURE-OPTIONS command (the SDF-P default values are given in parentheses):

- permissible procedure call (CALLER=\*ANY)
- implicit declaration of S variables (IMPLICIT-DECLARATION=\*YES)
- scope of logging (LOGGING=\*YES)
- interruption of the procedure (INTERRUPT-ALLOWED=\*YES)
- format of the procedure (INPUT-FORMAT=\*FREE-RECORD-LENGTH)
- replacement of variables within data records (DATA-ESCAPE-CHAR=\*NONE)
- SYSFILE context of the current procedure level (SYSTEM-FILE-CONTEXT=\*STD)
- error recovery when there is a mixture of input data and commands (DATA-ERROR-HANDLING=\*YES)
- setting for job variable replacement (default in interactive mode: JV-REPLACEMENT=\*AFTER-BUILTIN-FUNCTION; in S procedures JV-REPLACEMENT=\*NO)
- setting for error handling (ERROR-MECHANISM=\*SPIN-OFF-COMPATIBLE)
- suppression of selected SDF-P messages (SUPPRESS-SDP-MSG=\*NONE)

**i** If the SET-PROCEDURE-OPTIONS command is not specified explicitly, the SDF-P defaults apply. Defaults for the command which have been modified in the activated syntax file apply to the procedure only when the SET-PROCEDURE-OPTIONS command is specified explicitly.

The procedure attributes can be changed by means of the MODIFY-PROCEDURE-OPTIONS command. The “SDF-P message suppression” option can be modified at any time, but the other settings can only be changed if the changeable SDF-P subsystem is in operation (see the MODIFY-PROCEDURE-OPTIONS command).

## Format

### SET-PROCEDURE-OPTIONS

```
CALLER = *ANY / *CALL / *INCLUDE
,IMPLICIT-DECLARATION = *YES / *NO
,LOGGING-ALLOWED = *PARAMETERS(...) / *YES / *NO /
    *PARAMETERS(...)
        | CMD = *YES / *NO
        | ,DATA = *YES / *NO
,INTERRUPT-ALLOWED = *YES / *NO
,INPUT-FORMAT = *FREE-RECORD-LENGTH / *BY-SDF-OPTION
,DATA-ESCAPE-CHAR = *NONE / '&&' / '#' / '*' / '@' / '$' / *STD
,SYSTEM-FILE-CONTEXT = *STD / *SAME-AS-CALLER / *OWN
,DATA-ERROR-HANDLING = *YES / *NO
,JV-REPLACEMENT = *NONE / *AFTER-BUILTIN-FUNCTION
,ERROR-MECHANISM = *SPIN-OFF-COMPATIBLE / *BY-RETURNCODE
,SUPPRESS-SDP-MSG = *NONE / list-poss(2000): <alphanum-name 7..7>
,TRANSLATION-CCS = *STD / *EDF03IRV / *CURRENT
```

## Operands

### **CALLER =**

This defines how the procedure may be called.

### **CALLER = \*ANY**

The procedure can be called using the commands CALL-PROCEDURE and INCLUDE-PROCEDURE. The latter command is only available if the chargeable subsystem SDF-P is loaded. Invocation as an INCLUDE procedure is described in the “SDF-P” manual [34].

### **CALLER = \*CALL**

The procedure can only be called by means of the CALL-PROCEDURE command.

### **CALLER = \*INCLUDE**

The procedure can only be called by means of the INCLUDE-PROCEDURE command (which in turn is only possible if the subsystem SDF-P is loaded).

---

**IMPLICIT-DECLARATION = \*YES / \*NO**

This specifies whether S variables may be declared implicitly.

Implicit declaration means that S variables are created automatically when they are assigned for the first time, and corresponds to explicit declaration using DECLARE-VARIABLE and preset values:

A *simple* S variable without an initial value and without definition of the variable type is created in class 5 memory. This S variable is known only within the procedure (see [section "SDF-P-BASYS"](#)).

S variables which are used as procedure parameters (see the DECLARE-PARAMETER command) are also declared explicitly. They too are created within the procedure only.

If implicit declaration is not permitted, S variables must be created explicitly before they are first assigned. The attributes of the S variables can be defined at this point. Only variables of type ANY are permitted with SDF-P-BASYS.

**LOGGING-ALLOWED =**

This determines whether logging of procedure execution is permitted. The specification applies only to the current procedure level.

Whether logging is actually performed is determined by the caller in the CALL-PROCEDURE command.

**LOGGING-ALLOWED = \*PARAMETERS(...)**

Logging is permitted. However, the user can grant the requisite authorization separately for commands and data records:

**CMD = \*YES / \*NO**

This specifies whether commands can be logged.

**DATA = \*YES / \*NO**

This specifies whether data records can be logged.

**LOGGING-ALLOWED = \*YES**

Logging is permitted without restrictions.

**LOGGING-ALLOWED = \*NO**

Logging is not permitted.

**INTERRUPT-ALLOWED = \*YES / \*NO**

This specifies whether the procedure may be interrupted by means of the [K2] key or the HOLD-PROCEDURE command. The interrupted procedure can be resumed by means of the RESUME-PROCEDURE command.

If interruption is not permitted, a query to this effect is output after the interrupt request. If the user insists upon an interruption, the system terminates the job immediately.

**INPUT-FORMAT =**

This specifies the length in which the input records for the procedure are to be evaluated and the positions at which a continuation character is possible.

**INPUT-FORMAT = \*FREE-RECORD-LENGTH**

Input records are evaluated in their full length. The continuation character is located in the last column that does not contain a blank.

The maximum length of an input record is 4096 characters (4 K).

**INPUT-FORMAT = \*BY-SDF-OPTION**

Input records are evaluated up to and including column 72; any subsequent characters are ignored. The location of the continuation character is determined by the current SDF setting (output by means of the SHOW-SDF-OPTIONS command; setting via the CONTINUATION operand of the MODIFY-SDF-OPTIONS command).

---

**DATA-ESCAPE-CHAR = \*NONE / '&&' / '#' / '\*' / '@' / '\$' / \*STD**

This specifies whether variables are to be replaced and expressions evaluated in data records.

It is possible to define the character with which the relevant variables or expressions begin. Permissible characters are &, #, \*, @ and \$. Specifying & is equivalent to specifying \*STD (as on command level). If the character & is to be specified explicitly, it *must* be entered twice.

**SYSTEM-FILE-CONTEXT =**

This specifies the system file context with which the procedure is to execute.

**SYSTEM-FILE-CONTEXT = \*STD**

A separate system file context is created. The system file SYSDTA is assigned automatically to the system file SYSCMD (i.e. to the procedure file) and the assignments made by the caller are assumed for the other system files. Modifications to assignments apply solely to the current procedure level. When a procedure is terminated, the system files are again given the assignments made by the caller.

**SYSTEM-FILE-CONTEXT = \*SAME-AS-CALLER**

The procedure executes in the system file context of the caller.

Modifications to assignments within the current procedure level thus *always* affect the system file context of the caller.

**SYSTEM-FILE-CONTEXT = \*OWN**

A separate system file context is created. The assignments made by the caller are adopted for *all* system files (including SYSDTA). Modifications to assignments are only valid within the current procedure level. When a procedure is terminated, the system files are again given the assignments made by the caller.

The specification \*OWN corresponds to what was previously valid for *non-S procedures*.

**DATA-ERROR-HANDLING =**

This specifies whether SDF-P error recovery is to be activated in the following cases:

- data (without a leading slash or with a leading double slash) is found at a point where commands are expected
- &<variable> or only & occurs within data, and <variable> is not known either as an S variable or as a builtin function.

**DATA-ERROR-HANDLING = \*YES**

SDF-P error recovery is triggered in the cases specified above.

**DATA-ERROR-HANDLING = \*NO**

SDF-P error recovery is not triggered in the cases specified above.

**JV-REPLACEMENT =**

This specifies whether job variable replacement is to be carried out.

**JV-REPLACEMENT = \*NONE**

Job variables are not replaced. Only S variables or builtin functions are replaced. This setting guarantees that builtin functions can be introduced compatibly (i.e. their names will not overlap with JV names already assigned by the user).

**JV-REPLACEMENT = \*AFTER-BUILTIN-FUNCTION**

Job variables are replaced. Replacement occurs in the following sequence: first S variable, then builtin function and finally job variable. Incompatibilities during job variable replacement due to like-named builtin functions can be avoided by specifying the user ID along with the JV names. Moreover, the desired job variable replacement can also be achieved through the builtin function JV.

---

**ERROR-MECHANISM =**

Specifies whether SDF-P error handling is triggered in compatible fashion with the previous spin-off mechanism or on a nonzero subcode1.

**ERROR-MECHANISM = \*SPIN-OFF-COMPATIBLE**

SDF-P error handling is triggered in compatible fashion with the previous spin-off mechanism. Subcode1 is **not** taken into consideration.

This setting ensures that the error behavior of S procedures created in BS2000 Version 10.0A remains compatible.

**ERROR-MECHANISM = \*BY-RETURNCODE**

SDF-P error handling is triggered on a nonzero subcode1. Spin-off is **not** taken into consideration. Error handling in the procedure must be based on the possible command return codes of the commands contained in the procedure.

**SUPPRESS-SDP-MSG =**

Determines whether the output of certain SDF-P messages (message class SDP) is to be suppressed. The option applies only to the calling procedure (it is not propagated).

**SUPPRESS-SDP-MSG = \*NONE**

Message output is not suppressed; all SDF-P messages are output.

**SUPPRESS-SDP-MSG = list-poss(2000): <alphanum-name 7..7>**

Set of SDF-P messages which are to be suppressed.

**TRANSLATION-CCS =**

Determines which character set (CCS, Coded Character Set) the built-in functions UPPER-CASE and LOWER-CASE use for conversion to uppercase and lowercase letters.

**TRANSLATION-CCS = \*STD**

The standard character set EDF03IRV is used. When an optional Rep is employed for SDF-P-BASYS, \*STD has a system-global effect like \*CURRENT.

**TRANSLATION-CCS = \*EDF03IRV**

Forces the use of the standard character set EDF03IRV.

**TRANSLATION-CCS = \*CURRENT**

The character set which is currently set for the task's input stream is used. The command is rejected in the following cases:

- The character set used is not supported or is not known.
- The character set is not EDF03IRV and the XHCS subsystem is not loaded.
- The character set is a 16-bit character set (only 8-bit character sets are supported).

---

## Return codes

The SET-PROCEDURE-OPTIONS command can only be used as the first command in the procedure head of an S procedure. SDF-P detects errors in the procedure head during preanalysis and terminates the procedure call.

The command return codes can only occur if the command is used outside the procedure head.

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SDP0118	Command in incorrect context
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	130	SDP0099	No further address space available

---

## 5.88 SET-PUBSET-ATTRIBUTES

Define attributes of pubset

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

This command is used by systems support to define the following pubset attributes:

- shareability of the pubset
- desired owner (master) of the pubset
- desired master change mode
- desired backup owner (backup master) of the pubset
- system identification (SYSID) of the processor that uses this pubset as the home pubset.
- the pubset's disk and file properties (> 32 GB)
- maximum permitted number of Snapsets

Only the PUBRES of the pubset in question must be available for execution of the command (in an SM pubset this is the PUBRES of the control volume set). The attributes defined here (the pubset characteristics) are recorded in the SVL (standard volume label) of the PUBRES.

When assigning a SYSID which is used internally as a synonym of the BCAM name, a distinction must be made according to the type of catalog ID.

- Single-character catalog identifier complying with naming convention PUBxyy

PUB = distinguishes public from private disks		VSN (6 characters)
x = catalog identifier, 1 character		
yy = no. within the pubset, 2 characters		

The SYSID must be **identical** to the catalog identifier (x).

- Multiple-character catalog identifier complying with naming convention xxx.yy (period notation)

xxx = catalog identifier, 2-3 characters long		
. = delimiter between catalog identifier and no. within the pubset, distinguishes public from private disks		VSN (6 characters)
yy = no. within the pubset, 1-3 characters long		

The SYSID must be an integer in the range **65...192**.

When assigning the SYSID it must be avoided that two processors of an MSCF network have the same SYSID.

Specification of new attributes is not immediately effective for pubsets that have already been imported but only after the subset is re-imported.

## Format

### SET-PUBSET-ATTRIBUTES

```
PUBSET = <catid 1..4>
,PUBSET-TYPE = *ANY / *SINGLE-FEATURE / *SYSTEM-MANAGED(...)
    *SYSTEM-MANAGED(...)
        | CONTROL-VOLUME-SET = *ANY / <catid 1..4>
,DEVICE-TYPE = *STD / *NONE / <device>
,SYSID = *UNCHANGED / <alphanum-name 1..3>
,MASTER = *UNCHANGED / *NONE / <alphanum-name 1..3>
,ALTERNATE-MASTER = *UNCHANGED / *BACKUP-MASTER / *NONE
,BACKUP-MASTER = *UNCHANGED / *NONE / <alphanum-name 1..3>
,ALTERNATE-BACKUP = *UNCHANGED / *BY-OPERATOR / *BY-SHARER / *NONE
,SHARE = *UNCHANGED / *NO / *YES
,LARGE-VOLUMES = *UNCHANGED / *ALLOWED(...)
    *ALLOWED(...)
        | LARGE-FILES = *UNCHANGED / *ALLOWED
,SNAPSET-LIMIT = *UNCHANGED / <integer 1..52>
```

## Operands

**PUBSET** = <cat-id 1..4>

Pubset to which the following declarations are to apply.

**PUBSET-TYPE** = \*ANY / \*SINGLE-FEATURE / \*SYSTEM-MANAGED(...)

Specifies the type of pubset involved.

The default applies if an MRSCAT entry exists or if the pubset identifier refers to a single-feature pubset.

**PUBSET-TYPE** = \*ANY

Default: A valid MRSCAT entry exists (the pubset type is irrelevant), or the pubset is a single-feature pubset.

**PUBSET-TYPE** = \*SINGLE-FEATURE

The pubset in question is a single-feature pubset.

**PUBSET-TYPE** = \*SYSTEM-MANAGED(...)

The pubset in question is a system-managed pubset.

---

**CONTROL-VOLUME-SET = \*ANY**

The pubset in question is an SM pubset with a valid MRSCAT entry.

**CONTROL-VOLUME-SET = <cat-id 1..4>**

The pubset in question is an SM pubset for which there is no MRSCAT entry.

**DEVICE-TYPE = \*STD / \*NONE / <device>**

Device type of the PUBRES of the SF pubset or of the control volume set of the SM pubset, as appropriate.

**DEVICE-TYPE = \*STD**

The default value applies if an MRSCAT entry with the device type exists for this pubset.

**DEVICE-TYPE = \*NONE**

A valid MRSCAT entry exists; there is no need to specify the device type.

**DEVICE-TYPE = <device>**

Device type of the PUBRES or of the control volume set, as appropriate.

Only disk device types known on the system will be accepted.

Entering DEVICE-TYPE=? in interactive mode calls up a list of available device types.

**SYSID = \*UNCHANGED / <alphanum-name 1..3>**

Issues a SYSID assigned to the pubset.

**SYSID = <alphanum-name 1..3>**

If the pubset with the name convention PUBxyy is used as a home pubset, the specification here, which corresponds to the catalog identifier, is used as the SYSID for the processor. In the case of a catalog identifier with 2-4 characters, a whole number in the range 65 to 192 must be assigned to the pubset as the SYSID.

**MASTER = \*UNCHANGED / \*NONE / <alphanum-name 1..3>**

Specifies the ownership of the pubset.

**MASTER = \*NONE**

Ownership is not explicitly declared. Instead, ownership passes to the system that executes the first IMPORT-PUBSET.

**MASTER = <alphanum-name 1..3>**

SYSID of the desired master system.

**BACKUP-MASTER = \*UNCHANGED / \*NONE / <alphanum-name 1..3>**

Specifies which system is to automatically take over the function of master if the owner of a shared pubset fails. The ALTERNATE-BACKUP operand can be used to define a secondary backup system to take over the function of the master if the backup master specified here is also unavailable.

**BACKUP-MASTER = \*UNCHANGED**

Default: the existing backup master setting continues to apply.

**BACKUP-MASTER = \*NONE**

No preselected system is to take over the role of master automatically if the owner of a shared pubset fails.

**BACKUP-MASTER = <alphanum-name 1..3>**

SYSID of the required backup owner system.

If the specified system is active as a slave at the time when the owner of a shared pubset fails, it automatically takes over the role of master; if it is not active, the ALTERNATE-BACKUP operand determines whether or how the new master can be identified.

---

After a change of master to the specified backup master, a further change of master can be carried out without modification of the BACKUP-MASTER operand if the system identified by the MASTER operand is active as a slave system.

**ALTERNATE-MASTER = \*UNCHANGED / \*BACKUP-MASTER / \*NONE**

Specifies whether the backup master is used as owner in case the pubset is imported on it before the specified owner becomes active.

**ALTERNATE-MASTER=\*UNCHANGED**

Default: the existing alternate master setting continues to apply.

**ALTERNATE-MASTER = \*BACKUP-MASTER**

If the pubset is imported on the backup master before it is imported on the owner, the backup master becomes the owner and the originally specified owner becomes the slave.

**ALTERNATE-MASTER=\*NONE**

During the pubset import, the backup master waits for the pubset import of the owner.

**ALTERNATE-BACKUP = \*UNCHANGED / \*NONE / \*BY-OPERATOR / \*BY-SHARER**

Defines how a change of master is to be implemented if the backup master is not active or not defined (BACKUP-MASTER operand). If the backup master is active, the master is changed automatically and the backup master becomes the new master.

**ALTERNATE-BACKUP = \*UNCHANGED**

Default: the existing setting continues to apply.

**ALTERNATE-BACKUP = \*NONE**

No alternate backup master is defined. If there is an explicitly defined backup master which is not active, no other system is allowed to act as master.

**ALTERNATE-BACKUP = \*BY-OPERATOR**

If the backup master is not active or not defined, an operator can nominate an alternate backup master on one of the slave systems and thus initiate a change of masters (using the command /IMPORT-PUBSET . . . , MASTER-CHANGE=\*YES).

**ALTERNATE-BACKUP = \*BY-SHARER**

If the backup master is not active or not defined, the role of master is automatically taken by the system which is the first sharer in the current SVL sharer list and hence currently the oldest slave system.

**SHARE = \*UNCHANGED / \*NO / \*YES**

Governs whether the pubset may be operated as a shared pubset.

**SHARE = \*UNCHANGED**

Default: the existing setting continues to apply.

**SHARE = \*NO**

The pubset must not be imported as a shared pubset.

**SHARE = \*YES**

The pubset may be imported as a shared pubset.

**LARGE-VOLUMES = \*UNCHANGED / \*ALLOWED(...)**

Specifies whether the pubset may contain large volumes (capacity > 32 GB).

**LARGE-VOLUMES = \*UNCHANGED**

Default: the existing setting is unchanged.

---

**LARGE-VOLUMES = \*ALLOWED(...)**

*Once set, this attribute cannot be revoked using a command.*

The pubset may contain large volumes.

**LARGE-FILES = \*UNCHANGED / \*ALLOWED**

Specifies whether the pubset may contain files >= 32 GB.

**LARGE-FILES = \*UNCHANGED**

Default: the existing setting is unchanged.

**LARGE-FILES = \*ALLOWED**

*Once set, this attribute cannot be revoked using a command.*

The pubset may contain large volumes.

**SNAPSET-LIMIT = \*UNCHANGED / <integer 1..52>**

Specifies the maximum number of Snapsets permitted for the pubset. Up to 52 Snapsets can exist for a pubset (provided this maximum number is supported by the disk storage system).

Any attempt to reduce the Snapset limit to below the number of existing Snapsets is rejected. However, as this can only be checked in the case of imported pubsets, for safety's sake all snap mirrors are treated as if they belonged to a Snapset in the case of a pubset which was not imported.

An increase to the Snapset limit is rejected if the number of unused snap units is not sufficient for this.

*Notes*

The /DELETE-SNAPSET SNAPSET=\*ALL command causes all Snapsets of a pubset to be deleted, the Snapset catalog also being removed. When the Snapset catalog is removed, the Snapset limit in the SVL is reset to 0.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	32	DMS03BE	Error during communications processing: <ul style="list-style-type: none"><li>• during read access to MRSCAT</li><li>• during time-stamped read access</li><li>• during SVL access</li><li>• during the SYSID conversion call</li><li>• during output to SYSOUT</li><li>• in the pubset occupancy</li></ul>
	64	DMS03BE	No authorization to use command
	64	DMS03BE	Device type missing in the MRSCAT
	64	DMS03BE	Current CATID is not a volume set CATID
	64	DMS13DA	Snapset limit not in the possible value range
	64	DMS13DF	SHC-OSD subsystem not available
	64	DMS13E7	No Snapsets are supported for the pubset
	130	DMS03BE	Disk request rejected
	130	DMS03BE	Pubset in process of being exported

## Notes

1. A change of master can only take place in a shared pubset network if a backup master is defined and active, or if the ALTERNATE-BACKUP=\*BY-SHARER operand is set. If none of the permissible backup masters is active, all pubset sharers are switched to "INACCESSIBLE, QUIET" if the master fails. In this case, a change of master can subsequently take place provided the ALTERNATE-BACKUP=\*BY-OPERATOR operand is set. A subsequent change of master must be triggered manually by explicitly issuing an IMPORT-PUBSET command (specifying MASTER-CHANGE=\*YES).
2. Once set, the pubset attributes LARGE-VOLUMES=\*ALLOWED and LARGE-FILES=\*ALLOWED cannot be changed using a command, i.e. they cannot be revoked.

---

## 5.89 SET-REPLOG-READ-MARK

Close REPLOG file briefly

**Component:** BLSSERV  
**Functional area:** Program control  
**Domain:** PROGRAM  
**Privileges:** TSOS  
SAT-FILE-MANAGEMENT

### Function

The SET-REPLOG-READ-MARK command allows systems support under TSOS or - if SECOS is being used - the SAT file administrator under the SYSAUDIT user ID, to effect temporary closure of the REPLOG file.

All the correction data (REPs) imported for SYSIPL, SYSSTART, for BS2000 and all dynamically loaded subsystems, is logged in the REP logging file \$SYSAUDIT.SYS.REPLOG.<date>.<session-number>.01.

All data logged up to the point when the file is input can be analyzed or, if desired, copied to a file. Systems support cannot access correction data written to the REPLOG file after this command call until SET-REPLOG-READ-MARK has been issued again.

### Format

<b>SET-REPLOG-READ-MARK</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	BLS0979	No REPLOG file available
	32	BLS0152	System error
	32	BLS0994	Error during the Close function
	64	CMD0216	Caller is not privileged

---

## 5.90 SET-RESTART-OPTIONS

Control automatic restart

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** not allocated  
**Privileges:** OPERATING  
**Routing code:** R

### Function

The SET-RESTART-OPTIONS command specifies whether, and if so when, an automatic restart is to be performed. In the case of an automatic restart, the type of error documentation to be generated before the restart can also be defined.

For information on automatic restart see the “Introduction to System Administration” [14].

### Format

**SET-RESTART-OPTIONS**

**MODE = \*ON(...)** / \*OFF

**\*ON(...)**

|     **DELAY = \*STD** / <integer 0..32767 *seconds*>

|     **,UPTIME = \*STD** / <integer 0..32767 *minutes*>

|     **,DUMP = \*STD** / \*NO / \*SNAP / \*SLED

### Operands

**MODE =**

Specifies whether the automatic restart is to be activated.

**MODE = \*ON(...)**

The automatic restart is to be activated.

In the event of a system crash the system will be reloaded automatically.

**DELAY =**

After a system crash has been reported (NRTT501 SETS;...) it defines how much time elapses before a memory dump is taken with SLED.

This gives the operator an opportunity to intervene.

**DELAY = \*STD**

No waiting is the default.

---

**DELAY = <integer 0..32767 seconds>**

Specifies the time in seconds to be waited before making a memory dump.

**UPTIME =**

Specifies a time interval in minutes after SYSTEM READY. If a system crash occurs within this time, **no** automatic restart is initiated.

**UPTIME = \*STD**

The default time interval after SYSTEM READY is 10 minutes, in which time no automatic restart is to be initiated.

**UPTIME = <integer 0..32767 minutes>**

If a system crash occurs within the time specified in minutes after SYSTEM READY, no automatic restart is to be initiated.

**DUMP = \*STD / \*NO / \*SNAP / \*SLED**

Determines what type of error documentation is to be generated before an automatic restart.

The default value is \*STD, i.e. the caller determines the type of error documentation. \*SNAP and \*SLED specify snapshot and SLED documentation respectively.

**MODE = \*OFF**

The automatic restart is not to be activated.

Any previous SET-RESTART-OPTIONS command with MODE = \*ON is ineffective, i.e. the system is not automatically reloaded after a system crash.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	EXC0750	Automatic restart must be set because of STCK error
	1	CMD0202	Syntax error or semantic error
	64	CMD0216	Caller is not privileged
	64	EXC0688	IPL disk is not a public disk

---

## 5.91 SET-RFA-CONNECTION

Set up RFA connection

<b>Component:</b>	RFA
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT

This command is available only to users who have the RFA software product (see also the “RFA” manual [31]).

### Function

This command sets up an RFA connection. The first time a connection to a remote system is set up, a partner task is generated under the specified user ID. This command can also be used for a local catalog. In that case, an RFA connection is set up within the local system; a partner task is not generated.

The user can issue the SHOW-RFA-CONNECTIONS command to get information on all existing RFA connections.

The REMOVE-RFA-CONNECTION command is used to clear down an RFA connection. For each SET-RFA-CONNECTION command, a corresponding REMOVE-RFA-CONNECTION must be given. A partner task on a remote system is not terminated until the last connection is cleared. When the local user task is terminated, all existing RFA connections are automatically cleared down by the system.

#### *Prerequisite*

Each processor on which the command will be given must have an entry for the specified catalog ID with the appropriate processor name in the MRS catalog. The user can check up on entries in the MRS catalog with the aid of the SHOW-MASTER-CATALOG-ENTRY command.

## Format

### SET-RFA-CONNECTION

**CATALOG-ID** = <cat-id 1..4>

,**PROCESSING-ADMISSION** = **\*PARAMETERS** (...)

**\*PARAMETERS**(...)

|     **USER-IDENTIFICATION** = **\*SAME** / <name 1..8>

|     ,**ACCOUNT** = **\*SAME** / <alphanum-name 1..8>

|     ,**PASSWORD** = **\*NONE** / <c-string 1..8> / <c-string 9..32> / <x-string 1..16> / **\*SECRET**

,**CONNECTION** = **\*IMMEDIATE** / **\*WITHIN**(...)

**\*WITHIN**(...)

|     **SECONDS** = <integer 32..99999999 *seconds*>

,**ANSWER** = **\*STD** / **N** / **Y** / **\*SYSDTA**

## Operands

### **CATALOG-ID** = <cat-id 1..4>

Catalog ID to which the RFA connection is to be set up.

If the catalog ID is not entered in the MRS catalog, or the entry is incorrect or incomplete or the catalog is not accessible, the command is rejected.

The user can issue the command SHOW-MASTER-CATALOG-ENTRY to find out if the catalog ID is entered in the MRS catalog.

If the catalog ID refers to a remote processor, and if the SET-RFA-CONNECTION command is the first for this processor, a partner task will be generated on this processor. If the catalog ID refers to the local system, no partner task is generated.

### **PROCESSING-ADMISSION** = **\*PARAMETERS**(...)

Specifications concerning the partner task to be created.

These specifications are only evaluated if the RFA connection to a remote processor is being set up for the first time. In this case, a partner task is generated and the specifications checked for LOGON authorization.

For subsequent SET-RFA-CONNECTIONS to other catalogs of the remote processor these specifications are ignored. (For exception, see notes for shared subset "**SET-RFA-CONNECTION**".) The already-generated partner task is used for access to additional catalogs of this remote processor.

### **USER-IDENTIFICATION** = **\*SAME** / <name 1..8>

User ID under which the partner task is to run.

### **USER-IDENTIFICATION** = **\*SAME**

The user's own user ID (under which the command is issued) applies.

### **ACCOUNT** = **\*SAME** / <alphanum-name 1..8>

Account number under which the partner task is to run.

---

**ACCOUNT = \*SAME**

The account number of the current user task (under which the command was issued) applies.

**PASSWORD = \*NONE / <c-string 1..8> / <c-string 9.32>/ <x-string 1..16> / \*SECRET**

Password of the user ID under which the partner task is to run.

The long password mechanism is supported (<c-string 9..32>). See the MODIFY-USER-PROTECTION command description for details of the long password mechanism.

If the PASSWORD operand is defined as “secret”:

- The value which is input will not be logged.
- In guided dialog, the input field is automatically blanked out.
- In unguided dialog and in foreground procedures, \*SECRET or ^ allows for concealed input of the required value. SDF requests the input of the “secret” value and provides a blanked input field for this purpose.

The password must be specified even if it is the same as the one for the current user task. The user ID, account number and password are all checked by the remote system. The other LOGON parameters (JOB-NAME and LOGGING) for the partner task are taken from the current user task.

**CONNECTION =**

Specifies whether the attempt to set up a connection is to be made only once or more than once within a defined period.

**CONNECTION = \*IMMEDIATE**

The attempt to set up an RFA connection is made just once. If it is unsuccessful, the user is issued an error message.

**CONNECTION = \*WITHIN(...)**

Specification of a period within which the system attempts to set up the RFA connection.

**SECONDS = <integer 32..99999999 seconds>**

Period in seconds within which the system attempts to set up the connection every 32 seconds (if repetition is reasonable).

If the attempts were unsuccessful, an error message is issued.

**ANSWER = \*STD / N / Y / \*SYSDTA**

*This operand is evaluated only in procedures or batch operation.*

After the LOGON is processed, the first information block of the bulletin file, containing systems support information, is output. If the prompt CONTINUE Y/N is issued, the user can see the next information block by entering “Y”, or answer “N” to decline.

This operand specifies how prompts concerning continued output of the information blocks output by the remote system during connection setup are to be answered.

**ANSWER = \*STD**

In interactive operation, the prompts of the remote system are sent to the local processor and are to be answered there from the terminal. The responses are sent to the remote system and evaluated there.

In procedure mode and batch mode, ANSWER=N applies, i.e. all prompts are answered with “N”.

**ANSWER = N**

All prompts from the remote system are answered with “N”.

**ANSWER = Y**

All prompts from the remote system are answered with “Y”.

---

## ANSWER = \*SYSDTA

All prompts from the remote system are sent to the local processor, where the responses are expected from SYSDTA. The responses are sent to the remote system and evaluated there.

Responses from SYSDTA make sense only if the user knows the number of information blocks in the remote bulletin file, i.e. when the user knows exactly which information blocks he or she wants to receive.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	RFA0002	Command executed
	1	RFA0026	Command for shared pubset rejected
	64	RFA0016	BS2000 version of remote system not supported
	64	RFA0023	RFA connection faulty
	64	RFA0024	No additional RFA connections possible
	64	RFA0027	Configuration error

## Notes

- Setting up a connection to a target processor by means of RFA is subject to the following restrictions:
- RFA does not support user authentication via the Kerberos LOGON, i.e. no user ID protected by the Kerberos LOGON may be specified in the target processor in the SET-RFA-CONNECTION command.
- RFA does not support the entry of a personal user ID (SET-PERSONAL-ATTRIBUTES command, see the “SECOS” manual [35]). RFA connection setup to a target ID protected with a “personal LOGON” is only possible if PASSWORD-CHECK=\*NO is set for the user ID, but the password is specified anyway in the SET-RFA-CONNECTION command.
- The REMOVE-RFA-CONNECTION command clears down the RFA connection. When the task is terminated, the system automatically clears down any RFA connections which still exist.
- Procedure nesting: if two or more SET-RFA-CONNECTION commands are issued for the same catalog ID (of the remote system), there must be as many REMOVE-RFA-CONNECTION commands as there were SET-RFA-CONNECTION commands in order to clear this connection.

### *Shared pubsets*

- A pubset entered in the MRSCAT in conjunction with SHARED-PUBSET=\*YES in the ADD-MASTER-CATALOG-ENTRY or MODIFY-MASTER-CATALOG-ENTRY command can be used as a shared pubset.  
If there is not yet an RFA connection to the processor associated with this pubset, an RFA connection can be set up to the pubset
- if the user ID in the SET-RFA-CONNECTION command matches the user ID of the RFA task;
- if the user ID in the SET-RFA-CONNECTION command is not the same as the user ID of the RFA task, and the pubset is not imported as a shared pubset and not locally accessible.

---

If there already is an RFA connection to the processor associated with this pubset, an RFA connection to the pubset can only be set up if the user ID in the SET-RFA-CONNECTION command matches the user ID of the RFA task **and** the AFR partner task.

In all other cases, a SET-RFA-CONNECTION command for this pubset is rejected. Due **to this restriction**, **SHARED-PUBSET=\*YES should only be defined for pubsets which are really used as shared pubsets.**

- An RFA connection to a shared pubset with the catalog ID *catid* will not be set up if *catid* is entered in the user catalog as the default catalog ID for the user ID of the local task.

---

## 5.92 SET-SNAPSET-PARAMETER

Define the Snapset environment

**Component:** BS2000 OSD/BC

**Functional area:** Pubset and MRSCAT management

**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
SNAPSET

**Privileges:** TSOS  
HSMS-ADMINISTRATION

### Function

The SET-SNAPSET-PARAMETER command sets the processing environment for the Snapsets of an (imported) pubset. The settings are stored in the pubset's Snapset catalog.

The following settings are possible (see the manual "Introduction to System Administration" [14]):

- In the case of ETERNUS systems in SDV operating mode, only a single (Default) save pool is supported.
- In the case of ETERNUS systems in S# volume operation, no save pools are supported.
- In the case of EMC systems with TimeFinder/Snap, a special save pool can be assigned to the pubset.
- In the case of EMC systems with TimeFinder/SnapVX, no save pools are supported.
- In the case of remote mirroring, snap copies can also be generated on the remote disk storage system. When Concurrent SRDF on EMC system is used, which of the remote disk storage systems the snap copies are to be generated on must be specified.

The SHOW-SNAPSET-CONFIGURATION command displays the current settings.

### Format

#### SET-SNAPSET-PARAMETER

**PUBSET** = <cat-id 1..4>

,**SAVE-POOL-NAME** = **\*UNCHAN GED** / <name 1..32 with-under-low> / **\*DEFAULT-POOL**

,**REMOTE-COPY** = **\*UNCHAN GED** / **\*NO** / **\*YES(...)**

**\*YES(...)**

| **RA-GROUP** = **\*UNIQUE** / <integer 1..250>

### Operands

**PUBSET** = <cat-id 1..4>

Catalog ID of the pubset for which the Snapset processing environment is to be set.

**SAVE-POOL-NAME** =

*This value is relevant for Symmetrix systems only.*

Name of the save pool in the disk storage system which is to be used for snap copies from the specified pubset.

---

**SAVE-POOL-NAME = \*UNCHANGED**

The current setting is retained.

**SAVE-POOL-NAME = <name 1..32 with-under-low>**

Name of a dedicated save pool which is used for snap copies of the pubset. The specified save pool must have been set up in the disk storage system by an engineer.

**SAVE-POOL-NAME = \*DEFAULT-POOL**

The default save pool in the disk storage system is used.

**REMOTE-COPY = \*UNCHANGED / \*NO / \*YES(...)**

*This setting is evaluated only in the case of mirroring in a remote disk storage system.*

Specifies whether snap copies are also to be created on the remote disk storage system.

**REMOTE-COPY = \*UNCHANGED**

The current setting is retained.

**REMOTE-COPY = \*NO**

No snap copies are created on the remote disk storage system.

**REMOTE-COPY = \*YES(...)**

Snap copies are also created on the remote disk storage system.

**RA-GROUP = \*UNIQUE**

Only one remote disk storage system is operated, and additional snap copies (target units) are also kept on this.

**RA-GROUP = <integer 1..250>**

*Only for Symmetrix or VMAX3 systems.*

The specified RA group determines the remote disk storage system on which the snap copies are kept. This specification is required if the pubset is mirrored on multiple remote disk storage systems using Concurrent SRDF.

---

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	32	CMD0216	Required authorization not available
	64	DMS1351	Internal error
	64	DMS1386	Error in the memory request
	64	DMS1389	Error in MSCF communication
	64	DMS138B	Not an MRSCAT entry
	64	DMS138C	Pubset not accessible
	64	DMS13D6	Snapset limit exceeded
1	64	DMS13D7	Internal error in Snapset management: Return code of GCF
	64	DMS148F	GCF not loaded

## 5.93 SET-SPACE-SATURATION-LEVEL

Change allocation parameters

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-TUNING  
**Privileges:** TSOS

**i** The SET-SPACE-SATURATION-LEVEL command is now supported only to ensure backwards compatibility. The following replacement commands should be used for new applications:

- MODIFY-SPACE-SATURATION-LEVELS to set saturation levels
- MODIFY-PUBSET-SPACE-DEFAULTS to modify allocation parameters

### Format

#### SET-SPACE-SATURATION-LEVEL

**SATURATION-LEVEL** = **\*STD** / **\*PARAMETERS(...)**

**\*PARAMETERS(...)**

| **LEVEL1** = <integer 1..999999 2Kbyte>

| ,**LEVEL2** = <integer 1..999999 2Kbyte>

| ,**LEVEL3** = <integer 1..999999 2Kbyte>

| ,**LEVEL4** = <integer 1..999999 2Kbyte>

| ,**LEVEL5** = <integer 1..999999 2Kbyte>

,**PUBLIC-VOLUME-SET** = **\*HOME** / <cat-id 1..4>

,**PRIMARY-ALLOCATION** = **\*STD** / <integer 1..999999 2Kbyte>

,**SECONDARY-ALLOCATION** = **\*STD** / <integer 1..32767 2Kbyte>

,**MAXIMAL-ALLOCATION** = **\*STD** / <integer 1..999999 2Kbyte>

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	DMS0670	Syntax error
	64	DMS0668	Caller is not privileged
	64	DMS0671	Pubset is not available
	64	DMS0672	Operand error

---

## 5.94 SET-SYSLST-READ-MARK

Set read mark in SYSLST file

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Job processing File processing
<b>Domain:</b>	JOB PROCEDURE PROGRAM
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The SET-SYSLST-READ-MARK command sets a “read mark” at the current end of the SYSLST file. Further outputs to SYSLST are continued without interruption behind the read mark. When SYSLST is assigned to a file, the content of the file ahead of the read mark can then be accessed in read mode without the assignment of SYSLST having to be changed.

A read mark cannot be set if a library element or an S variable is assigned.

By default, the command applies for the SYSLST file of the user’s own task. The read mark can also be set in files which are assigned to the system files SYSLST01 through SYSLST99.

Specifying a TSN or monitor JV permits nonprivileged users also to issue the command for the SYSLST files of other tasks under their user ID.

The primary allocation and properties of SYSLST are described in [section "System files"](#).

#### *Privileged function*

The TSOS privilege enables the command to be issued for the SYSLST file of any task.

### Format

#### SET-SYSLST-READ-MARK

**JOB-IDENTIFICATION** = **\*OWN** / <alphanum-name 1..4> / **\*TSN(...)** / **\*MONJV(...)**

**\*TSN(...)**

| **TSN** = <alphanum-name 1..4>

**\*MONJV(...)**

| **MONJV** = <filename 1..54 without-gen-vers>

**,SYSLST-NUMBER** = **\*STD** / <integer 1..99>

---

## Operands

### **JOB-IDENTIFICATION =**

Specifies the job in whose SYSLST file the read mark is to be set. The job can be identified either via its TSN or the JV which monitors it.

### **JOB-IDENTIFICATION = \*OWN**

The command is executed for the user's own task.

### **JOB-IDENTIFICATION = <alphanum-name 1..4>**

TSN of the job (see also JOB-IDENTIFICATION=\*TSN).

### **JOB-IDENTIFICATION = \*TSN(...)**

The job is identified by its task serial number (TSN). The command is rejected if the TSN does not exist or a job under a foreign user ID is not concerned.

#### **TSN = <alphanum-name 1..4>**

TSN of the job. Leading zeros can be omitted.

### **JOB-IDENTIFICATION = \*MONJV(...)**

*This operand is only available to a user with the software product JV.*

The job is identified via the monitoring JV. The command is rejected if the JV cannot be accessed (no read permission or the JV does not exist), if the JV is not monitoring a job or if the job is running on a foreign computer.

#### **MONJV = <filename 1..54 without-gen-vers>**

Name of the JV which monitors the job.

### **SYSLST-NUMBER = \*STD / <integer 1..99>**

Specifies the SYSLST file for which the read mark is to be set. \*STD presets the system file SYSLST. The specification <integer 1..99> sets the read mark in the file which is assigned to the system file SYSLST01 through SYSLST99.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	0	SSM1204	Pseudo close for system file successful
	0	SSM1205	Wait time for pseudo close has expired; processing will continue
	32	SSM1201	Internal error when setting the read mark
	64	CMD0216	No authorization to execute command
	64	SSM1202	System file is empty or not assigned

---

## 5.95 SET-SYSOUT-READ-MARK

Set read mark in SYSOUT file

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Job processing File processing
<b>Domain:</b>	JOB PROCEDURE PROGRAM
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The SET-SYSOUT-READ-MARK command sets a “read mark” at the current end of the SYSOUT file. Further outputs to SYSOUT are continued without interruption behind the read mark. When SYSOUT is assigned to a file, the content of the file ahead of the read mark can then be accessed in read mode without the assignment of SYSOUT having to be changed.

A read mark cannot be set if a library element or an S variable is assigned.

By default, the command applies for the SYSOUT file of the user’s own task.

Specifying a TSN or monitor JV permits nonprivileged users also to issue the command for the SYSOUT files of other tasks under their user ID.

The primary allocation and properties of SYSOUT are described in [section "System files"](#).

*Privileged function*

The TSOS privilege enables the command to be issued for the SYSOUT file of any task.

### Format

#### SET-SYSOUT-READ-MARK

**JOB-IDENTIFICATION** = **\*OWN** / <alphanum-name 1..4> / **\*TSN(...)** / **\*MONJV(...)**

**\*TSN(...)**

| **TSN** = <alphanum-name 1..4>

**\*MONJV(...)**

| **MONJV** = <filename 1..54 without-gen-vers>

---

## Operands

### **JOB-IDENTIFICATION =**

Specifies the job in whose SYSOUT file the read mark is to be set. The job can be identified either via its TSN or the JV which monitors it.

### **JOB-IDENTIFICATION = \*OWN**

The command is executed for the user's own task.

### **JOB-IDENTIFICATION = <alphanum-name 1..4>**

TSN of the job (see also JOB-IDENTIFICATION=\*TSN).

### **JOB-IDENTIFICATION = \*TSN(...)**

The job is identified by its task serial number (TSN). The command is rejected if the TSN does not exist or a job under a foreign user ID is not concerned.

### **TSN = <alphanum-name 1..4>**

TSN of the job. Leading zeros can be omitted.

### **JOB-IDENTIFICATION = \*MONJV(...)**

*This operand is only available to a user with the software product JV.*

The job is identified via the monitoring JV. The command is rejected if the JV cannot be accessed (no read permission or the JV does not exist), if the JV is not monitoring a job or if the job is running on a foreign computer.

### **MONJV = <filename 1..54 without-gen-vers>**

Name of the JV which monitors the job.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	0	SSM1204	Pseudo close for system file successful
	0	SSM1205	Wait time for pseudo close has expired; processing will continue
	32	SSM1201	Internal error when setting the read mark
	64	CMD0216	No authorization to execute command
	64	SSM1202	System file is empty or not assigned

---

## 5.96 SET-TASKLIB

Assign TASKLIB to object module library

**Component:** SYSFILE  
**Functional area:** Program control  
**Domain:** PROGRAM  
**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE

### Function

The SET-TASKLIB command assigns an object module library as a TASKLIB. The Dynamic Binder Loader (DBL) searches for the object module in the allocated object module library on the following calls:

- When the LOAD or START-EXECUTABLE-PROGRAM command is called, the Tasklib is used as an alternate library (ALTERNATE-LIBRARY=\*TASKLIB operand) when searching for symbols.
- When the BIND macro is called with ALTLIB=\*TASKLIB, the Tasklib is used as an alternate library when searching for unresolved external references.
- When the LOAD or START-PROGRAM command is called with LIBRARY=\*STD and RUN-MODE=\*STD, the Tasklib is used as the input source for the object modules.

When the Tasklib is searched, the DBL searches in the following libraries in the following order:

1. The Tasklib assigned with SET-TASKLIB
2. The TASKLIB file under the caller's user ID or, if this does not exist, the TASKLIB file in the system default ID (DEFLUID)

### Format

<b>SET-TASKLIB</b>	Alias: <b>STTL</b>
<b>LIBRARY</b> = <filename 1..54 without-gen>	

### Operands

**LIBRARY = <filename 1..54 without-gen>**

Name of the object module library.

After termination of a procedure (END-PROCEDURE, EXIT-PROCEDURE or EOF condition) TASKLIB is given the same assignment it had before the procedure was called (contingent, in *S procedures*, upon the declaration made in SET-PROCEDURE-OPTIONS).

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	SSM2036	Operand invalid

---

## 5.97 SET-VARIABLE

Assign values to S variable

<b>Component:</b>	SDF-P-BASYS
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SECURITY-ADMINISTRATION SAT-FILE-MANAGEMENT SAT-FILE-EVALUATION

### Function

The SET-VARIABLE command assigns values to an S variable. If the S variable does not yet exist, it is *implicitly* declared by SDF-P. Implicit declaration of S variables is preset but can be prohibited using the SET-PROCEDURE-OPTIONS command.

**i** The operands for the SET-VARIABLE command are evaluated by SDF-P only and should be entered as shown below. It is not necessary to include the command name. The SDF abbreviation rules apply to the operands. SDF functions such as information about possible operand values or correction dialog are not available at operand level. Only one input field with “# =” is provided by SDF in guided dialog.

For command entry, it is also possible to abbreviate

```
/SET-VARIABLE <variable1> = <variable2> / <text>
```

to

```
/<variable1> = <variable1> / <text>
```

The notation without the command name is also recommended for performance reasons (see the “SDF-P” User Guide [34]).

#### *Restrictions*

If the chargeable SDF-P subsystem is not available, the SET-VARIABLE command may refer to simple S variables only (TYPE=\*ANY and MULTIPLE-ELEMENTS=\*NO).

Complex S variables are part of the chargeable SDF-P subsystem; their use is described in the “SDF-P” manual [34].

## Format

**SET-VARIABLE** Alias: **STV**

**<composed-name<sub>1</sub> 1..255>** = <text 0..1800 with-low expr> / <composed-name<sub>2</sub> 1..255> /

**\*STRING-TO-VARIABLE(...)** / **\*LIST(...)**

**\*STRING-TO-VARIABLE(...)**

| **STRING** = <text 0..1800 with-low *expr*>

| **,VALUE-TYPE** = **\*STD** / **\*STRING**

**\*LIST(...)**

| **LIST-NAME** = <composed-name 1..255>

| **,FROM-INDEX** = **\*FIRST** / <integer 1..2147483647>

| **,NUMBER-OF-ELEMENTS** = **1** / <integer 1..2147483647>

**,WRITE-MODE** = **\*REPLACE** / **\*MERGE** / **\*EXTEND** / **\*PREFIX**

## Operands

**<composed-name<sub>1</sub> 1..255>**

Name of an S variable to which a value is assigned.

**= <text 0..1800 with-low *expr*>**

Assigns the value which results from the evaluation of *expression* to *composed-name<sub>1</sub>*.

A valid SDF-P expression must be specified for *expression* (see [section "SDF-P-BASYS"](#) or the "SDF-P" manual [34]).

**= <composed-name<sub>2</sub> 1..255>**

Assigns the value of the S variable *composed-name<sub>2</sub>* to the specified S variable *composed-name<sub>1</sub>*.

**= \*STRING-TO-VARIABLE(STRING=<text 0..1800 with-low *string-expr*>, VALUE-TYPE=...)**

*Only allowed in the case of complex S variables*

Assigns to the specified S variable *composed-name<sub>1</sub>* the value resulting from the conversion of *string-expression* to an S variable structure. For conversion rules, see the "SDF-P" manual [34].

**= \*LIST( LIST-NAME=...,FROM-INDEX=...,NUMBER-OF-ELEMENTS=... )**

*Only allowed in the case of complex S variables*

Assigns the elements of a list variable to the specified S variable *composed-name*. Depending on the number of assigned list elements, *composed-name* must be either a simple or a composed S variable.

## WRITE-MODE

Defines how the allocation of values is to be carried out.

**= \*REPLACE**

Overwrites an existing value (default).

---

**= \*MERGE**

*Only allowed in the case of complex S variables*

**= \*EXTEND**

*Only allowed in the case of complex S variables*

**= \*PREFIX**

*Only allowed in the case of complex S variables*

Complex S variables are part of the chargeable SDF-P subsystem; their use is described in the “SDF-P” manual [34].

## Return codes

The command return code has no guaranteed value if an error occurs when complex S variables are assigned.

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error Guaranteed message: CMD0001
	1	CMD0202	Syntax error Guaranteed message: CMD0202
	1	SDP0118	Command in incorrect context Guaranteed message: SDP0118
	3	CMD2203	Incorrect syntax file Guaranteed message: CMD2203
	32	CMD0221	System error (internal error) Guaranteed message: CMD0221
	64	SDP0091	Semantic error Guaranteed message: SDP1030
	130	SDP0099	No more address space available

---

## 5.98 SHOW-ACCOUNTING-STATUS

Display accounting system information

**Component:** BS2000 OSD/BC  
**Functional area:** Accounting system control  
**Domain:** ACCOUNTING  
**Privileges:** TSOS

### Function

The following information on the accounting system can be requested by means of the SHOW-ACCOUNTING-STATUS command.

- state of the accounting procedure
- name of the current accounting file
- time at which the file was opened
- names of the continuation files
- list of account records and record extensions that were explicitly activated or deactivated
- frequency of periodic saving of specific accounting records
- names of cyclically monitored job classes

The command supports structured output in S variables (see "Output in S variables").

### Format

<b>SHOW-ACCOUNTING-STATUS</b>
<b>INFORMATION = *<u>SUMMARY</u> / *FILES / *PARAMETERS / *ALL</b>

### Operands

#### **INFORMATION =**

Defines the type of information desired.

#### **INFORMATION = \*SUMMARY**

If the accounting system is active, the name of the currently active accounting file is displayed in addition to the information `ACCOUNTING ACTIVE`.

If the accounting system is inactive, the following information is displayed:

`ACCOUNTING NOT ACTIVE`.

#### **INFORMATION = \*FILES**

Specifies:

- whether the accounting system is active/inactive
- name of the currently active accounting file
- time and date when the file was opened

- continuation file names

**INFORMATION = \*PARAMETERS**

Displays all accounting records and record extensions that were explicitly activated or deactivated as well as the frequency of the accounting interval and the names of the job classes monitored within this interval.

**INFORMATION = \*ALL**

Displays an overview of all information provided by this command.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NAM3001	Requested action has been performed, but linked with warnings
	1	CMD0202	Syntax error
	32	CMD0221	Internal system error
	64	NAM0012	No authorization for the command
	128	CMD2280	Command cannot temporarily be executed

**Example**

**/show-acc**

```
ACCOUNTING ACTIVE, FILENAME= :B6F1:$TSOS.SYS.ACCOUNT.2017-01-26.074.01
```

**/show-acc inf=\*files**

```
ACCOUNTING STATUS INFORMATION
=====
CURRENT ACCOUNTING FILE:           (AUTOMATIC)
-----
:SBZ8:$TSOS.SYS.ACCOUNT.2017-01-26.074.01
  OPENED AT : 2017-01-26, 17:02:07-W
ALTERNATE FILENAMES:
-----
** NONE SPECIFIED **
```

---

## Output in S variables

The command's INFORMATION operand identifies the S variables which are to be created. The following specifications are possible for INFORMATION:

Notation used in command	Abbreviated form used in table
INFORMATION = SUMMARY	1
INFORMATION = FILES	2
INFORMATION = PARAMETERS	3
INFORMATION = ALL	4

Supplementary conditions which work in combination with the INFORMATION specifications:

Supplementary conditions	Abbreviated form used in table
Value assignment; only if ACCOUNT-ACTIVE=TRUE	a
*NONE and <name> cannot appear together as values	b
*ALL and <name> cannot appear together as values	c

Output information	Name of the S variable	T	Contents	Condition
Accounting system active	var(*LIST).ACCOUNT- ACTIVE	B	TRUE FALSE	1-4
Frequency of periodic saving of accounting records	var(*LIST).ACCOUNT- PERIOD	I	<integer>	3,4,a
Names of continuation files	var(*LIST).ALT-FILES (*LIST)	S	*NONE <name>	2,4,a,b
Names of job classes cyclically monitored by the accounting system	var(*LIST).JOB-CLASS (*LIST)	S	*NONE <name>	3,4,a,b
Name of the current accounting files	var(*LIST).NAME	S	<filename>	1,2,4,a
Activation of list of accounting records and record extensions	var(*LIST).NOT-LISTED- REC	S	*ON *OFF	3,4,a
Date when the file was opened	var(*LIST).OPEN-DATE	S	<date>	2,4,a
Time when the file was opened	var(*LIST).OPEN-TIME	S	<open time & season>	2,4,a
Deactivated accounting records	var(*LIST).REM-REC- TYPE(*LIST)	S	*NONE <name>	3,4,a,b
Activated accounting records	var(*LIST).SET-REC- TYPE(*LIST)	S	*ALL <name>	3,4,a,c

---

## 5.99 SHOW-ACS-OPTIONS

Show ACS option settings

**Component:** ACS

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
ACS-ADMINISTRATION  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The SHOW-ACS-OPTIONS command writes the following information on the currently set ACS options of the task to SYSOUT:

- status of the alias catalog (INACTIVE, ACTIVE or INHOLD)
- list of all the AC system files and AC files that were loaded since the beginning of the task or since the alias catalog was last deleted
- number of changes made to the current alias catalog with the ADD-, MODIFY- and REMOVE-ALIAS-CATALOG-ENTRY commands
- current settings of all ACS options:
  - Message output when the alias catalog is loaded
  - Logging of alias substitution and prefix insertion
  - Permitting catalog and user IDs in the alias (fully qualified)
  - Permitting user IDs in the alias
  - Standard range of alias substitution and prefix insertion (for files and/or job variables)

The command supports structured output in S variables (see "[Output in S variables](#)").

#### *Privileged functions*

Users with the ACS-ADMINISTRATION privilege can select the SCOPE operand to request details of ACS option settings for the task which is running or of the system-global preset values:

- the logging of ACS actions
- the permissibility of catalog and user IDs in alias names
- the pubset on which temporary SPOOL files are set up.

### Format

<b>SHOW-ACS-OPTIONS</b>
<b>SCOPE = *TASK / *SYSTEM</b>

## Operands

### SCOPE =

*Only for users with ACS-ADMINISTRATION privilege:*

Selects whether the task-local or the system-global default settings are being requested.

### SCOPE = \*TASK

Preset value: only the options specified for the task currently running are to be displayed.

### SCOPE = \*SYSTEM

Specifies that all the system-global options should be displayed.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed normally

## Information output

The output begins with the version of the system component ACS. The following information is then output:

Output field	Meaning
STATUS	Status of the alias catalog (INACTIVE, ACTIVE or IN HOLD)
ACTIVATED ALIAS CATALOG FILE(S):	List of all AC system files and AC files which have been loaded since the start of the task or since the last time the alias catalog was deleted.
<ul style="list-style-type: none"><li>ID</li></ul>	<ul style="list-style-type: none"><li>Symbolic name of the AC system file or AC file</li></ul>
<ul style="list-style-type: none"><li>U-INFO</li></ul>	<ul style="list-style-type: none"><li>User information specified when saving</li></ul>

Table 86: Output fields for the SHOW-ACS-OPTIONS command

## Examples

See the ADD-ALIAS-CATALOG-ENTRY and SET-FILE-NAME-PREFIX commands.

## Output in S variable

The SCOPE operand identifies the S variables which are to be created. The possible values for SCOPE are \*TASK and \*SYSTEM.

Output information	Name of the S variable	T	Contents	Condition
AC file name alias	var(*LIST).ALIAS-CAT-F (*LIST).ALIAS-CAT-ID	S	" * *OWN <name 1...20>	SCOPE= *TASK
AC file creation date	var(*LIST).ALIAS-CAT-F (*LIST).DATE	S	" <yyyy-mm-dd>	SCOPE= *TASK
Additional information on AC file	var(*LIST).ALIAS-CAT-F (*LIST).DESCRIPTOR	S	" <alphan.-name 1..8>	SCOPE= *TASK
Actual file name of AC file	var(*LIST).ALIAS-CAT-F (*LIST).F-NAME	S	" *SYS <filename 1..54>	SCOPE= *TASK
Additional name for AC file	var(*LIST).ALIAS-CAT-F (*LIST).USER-INFO	S	" <name 1...8>	SCOPE= *TASK
Output of message ACS0000 each time the alias is substituted	var(*LIST).ALIAS-SUBST	S	*STD *YES	SCOPE= *TASK/ *SYSTEM
User IDs allowed in aliases	var(*LIST).ALIAS-USER-ID	S	*ALLOW *NOT-ALLOW	SCOPE= *TASK/ *SYSTEM
Changing of user IDs allowed in aliases	var(*LIST).ALIAS-USER-ID- MOD	S	*ALLOW *NOT-ALLOW	SCOPE= *TASK/ *SYSTEM
Fully qualified aliases allowed	var(*LIST).COMPL-ALIAS- NAME	S	*ALLOW *NOT-ALLOW	SCOPE= *TASK/ *SYSTEM
Changing of ACS option ALIAS- USERID allowed	var(*LIST).COMPL-USER- MOD	S	*ALLOW *NOT-ALLOW	SCOPE= *TASK/ *SYSTEM
Number of changes to the alias catalog	var(*LIST).NUM-OF-AC- CMD	I	<integer 0...65535>	SCOPE= *TASK
Output of message ACS0000 each time a prefix is inserted	var(*LIST).PREFIX-INS	S	*NO *YES	SCOPE= *TASK/ *SYSTEM

Security level	var(*LIST).SEC-LEV	S	*HIGH *LOW *UNDEF	SCOPE= *SYSTEM
Pubset for spool file	var(*LIST).SPOOL-F-PUBSET	S	*STD <cat-id 1..4>	SCOPE= *SYSTEM
Alias catalog status	var(*LIST).STA	S	*ACTIVE *IN-HOLD *INACTIVE *NOT-AVAIL	SCOPE= *TASK
Range when replacing the alias or adding a prefix (for files and/or job variables)	var(*LIST).STANDARD-RANGE	S	*FILE *JV *BOTH	SCOPE= *TASK/ *SYSTEM
Message output from ACS0001 to an AC device	var(*LIST).SYS-F-MSG	S	*NO *YES	SCOPE= *TASK/ *SYSTEM
Message output from ACS0001 to an AC file	var(*LIST).USER-F-MSG	S	*NO *YES	SCOPE= *TASK/ *SYSTEM

---

## 5.100 SHOW-ACS-SYSTEM-FILES

Show names of available AC system files

**Component:** ACS

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The SHOW-ACS-SYSTEM-FILES command displays the alias catalog IDs and file names of all AC system files that the ACS system administrator has made available to all users. The output is written to SYSOUT. AC system files with the attribute INVISIBLE are shown only to the ACS administrator. The default AC system file is identified in the output by a preceding ">" symbol.

The command supports structured output in S variables (see ["Output in S variables"](#)).

### Format

<b>SHOW-ACS-SYSTEM-FILES</b>
<b>ALIAS-CATALOG-ID</b> = <b>*ALL</b> / <b>*STD</b> / <composed-name 1..20>

### Operands

**ALIAS-CATALOG-ID =**

Specifies which AC system files are to be displayed. AC system files which were created by the ACS-administrator with the INVISIBLE attribute are only shown to the ACS administrator.

**ALIAS-CATALOG-ID = \*ALL**

Displays all AC system files.

**ALIAS-CATALOG-ID = \*STD**

Displays only the default AC system file.

**ALIAS-CATALOG-ID = <composed-name 1..20 with-wild>**

ID of the AC system file to be displayed or a wildcard sequence to identify and select AC system files to be displayed.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed normally
	32	CMD2009	Error during S variable generation
	32	CMD0221	Internal error
	64	ACS0012	Error: AC system file not found
	64	OPS0001	Insufficient memory for output in S variables
	130	ACS0036	Resource bottleneck

## Output in S variables

This command outputs the alias catalog IDs and file names of all the AC system files that the ACS administrator makes available to all users.

Output information	Name of the S variable	T	Contents	Condition
Symbolic name of the AC system file	var(*LIST).ALIAS-CAT-ID	S	<name 1...20 >	
Fully qualified actual file name of the AC system file	var(*LIST).F-NAME	S	*SYS <filename 1..54>	
Entries in the AC system file are added to the task's virtual alias catalog as system entries	var(*LIST).PRIVIL	S	*NO *YES	
The string *SYS is output instead of the file name of the AC system file if a nonprivileged user has AC files output	var(*LIST).SECRET-F-NAME	S	*NO *YES	
The AC system file acts as a default AC system file	var(*LIST).SYS-DEF	S	*NO *YES	
The AC system file name is displayed if a nonprivileged user has AC system files output	var(*LIST).VISIBLE	S	*NO *YES	

## Example

See the ADD-ALIAS-CATALOG-ENTRY command.

---

## 5.101 SHOW-ACTIVE-SPOOL-DEVICES

Request information on active SPOOL devices

<b>Component:</b>	SPOOL
<b>Functional area:</b>	Controlling spoolout job
<b>Domain:</b>	SPOOL-PRINT-ADMINISTRATION SPOOL-PRINT-SERVICES
<b>Privileges:</b>	STD-PROCESSING OPERATING PRINT-SERVICE-ADMINISTRATION SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	S

### Function

The SHOW-ACTIVE-SPOOL-DEVICES command requests information on assigned SPOOL and RSO devices (i.e. on devices to which a START-PRINTER-OUTPUT command has been issued; output to SYSOUT).

**i** Starting with BS2000 OSD/BC V11.0, printers that are connectable to the channel are no longer supported. However, print jobs for “local” printers defined in SPOOL are still accepted and can be forwarded to real, LAN-connected high-performance printers by using a SPOOL add-on product (e.g. ROUTER by Océ).

The state of the printer in BS2000 has no effect on this forwarding. The SHOW-ACTIVE-SPOOL-DEVICES command is therefore now only relevant for RSO printers and virtual devices.

The command supports structured output in S variables (see "[Output in S variables](#)").

#### *Privileged functions*

Nonprivileged users are only given information on devices whose authorization list contains the user ID or \*ALL. RSO device administrators also receive information on the devices they manage, while systems support staff can call down information on all devices. Information on user IDs and account numbers is only output to privileged users (RSO device administrators or systems support).

*Effect of the device specification in START-PRINTER-OUTPUT*

The following table shows how the devices specified (explicitly/implicitly) in the START-PRINTER-OUTPUT command are displayed in the output of the SHOW-ACTIVE-SPOOL-DEVICES command:

Value specified in SHOW-ACTIVE-SPOOL-DEVICES	Value specified in START-PRINTER-OUTPUT				
	*ALL	(A, B)	*EX(A, B)	A	*EX(A)
*ALL	EXPL	EXPL	EXPL	EXPL	EXPL
A	IMPL	EXPL	=====	EXPL	=====
C	IMPL	=====	IMPL	=====	IMPL
*EX(A)	=====	=====	EXPL	=====	EXPL
*EX(C)	=====	IMPL	=====	IMPL	=====
(A,B)	IMPL	EXPL	=====	EXPL	IMPL
(A,C)	IMPL	EXPL	IMPL	EXPL	IMPL
*EX(A,B)	=====	=====	EXPL	IMPL	EXPL
*EX(A,C)	=====	IMPL	EXPL	IMPL	EXPL

Table 87: Explicit/implicit specifications in START-PRINTER-OUTPUT

## Format

SHOW-ACTIVE-SPOOL-DEVICES

```

,**ROTATION** = \* ANY / \*YES / \*NO / \*MANUAL

,**TWO-UP-PROCESSING** = \*ANY / \*YES / \*NO / \*MODE-1 / \*MODE-2

## Operands

**DEVICE-NAME** = \*ALL / list-poss(8): <alphanum-name 1..8> / <alphanum-name 1..24 with-wild>

Names of active SPOOL devices on which information is requested. If \*ALL is specified, brief information is output on each device you are allowed to access. If a device name is specified, only the SCHEDULING-STATE operand may be specified in addition.

If the character string ALL occurs in a name (e.g. FIXALL) and this name is addressed using the \*ALL wildcard pattern, the asterisk must be doubled: \*\*ALL.

**INFORMATION** = \*STD / \*COUNT

Determines the type of information returned.

**INFORMATION** = \*STD

Returns information on the devices which match the selection criteria either in the form of a summary list if DEVICE-NAME=\*ALL or contains wildcards, or in the form of a complete list if an explicit list without wildcards is specified in the DEVICE-NAME operand.

**INFORMATION** = \*COUNT

Returns the number of devices which match the selection criteria with the message SCP1124.

**SERVER-NAME** = \*ALL / \*HOME / list-poss(16): <alphanum-name 1..8> / <alphanum-name 1..24 with-wild>

Selects the SPOOL device by means of the server that manages it. An active printer can only process print jobs accepted by the server belonging to the host to which the printer is connected.

If a remote cluster is specified, \*ALL is the only value permitted here.

**SERVER-NAME** = \*ALL

Addresses SPOOL devices managed by all the servers on all the hosts in the addressed cluster.

**SERVER-NAME** = \*HOME

Addresses only SPOOL devices managed by the local server. The printers can be started on a distributed or local basis.

**SERVER-NAME** = list-poss(16): <alphanum-name 1..8>

Selects the SPOOL devices managed by the specified servers on the hosts in the specified clusters.

**CLUSTER-NAME** = \*LOCAL-CLUSTER / <name 1..8>

Selects the SPOOL device by means of the cluster containing the server that manages it.

**SCHEDULING-STATE** = \*NEXT-JOB / \*CURRENT-JOB

Determines whether the operand values for the next scheduling operation on SYSOUT (default value) or those valid for the current job should be output. Differences can arise only if changes have been made with MODIFY-PRINTER-OUTPUT during the current job.

The following applies to all the operands that follow:

If several devices are specified information is output only for those devices which satisfy all the selection criteria defined with the subsequent operands. The values ANY and \*ALL each mean that there are no restrictions.

---

**DESTINATION = \*LOCAL / \*ALL / \*REMOTE / \*PUBLIC-REMOTE / list-poss(16): \*CENTRAL / <alphanum-name 1..8>**

Information is requested on active SPOOL devices which have been defined in START-PRINTER-OUTPUT under DESTINATION as

- local printers (default value)
- RSO printers - private devices
- RSO printers - public devices
- central printers
- any printers

or the specified active printers.

**FORM-NAME = \*ALL / \*STD / \*EXCEPT(...) / list-poss(8): <alphanum-name 1..6>**

Information is requested on active SPOOL devices to which the specified forms have been assigned or for which they have been excluded (START-PRINTER-OUTPUT).

**FORM-NAME = \*EXCEPT(...)**

Information is requested on active SPOOL devices for which the specified forms are not admitted.

**FORMS-LIST = list-poss(16): <alphanum-name 1..6>**

List of forms which are not admitted.

**USER-IDENTIFICATION = \*ALL / \*EXCEPT(...) / list-poss(16): <name 1..8> / <c-string 1..8 with-low>**

Information is requested on active SPOOL devices to which the specified user IDs have been assigned or for which they have been excluded (START-PRINTER-OUTPUT).

**USER-IDENTIFICATION = \*EXCEPT(...)**

Information is requested on active SPOOL devices for which the specified user IDs are not admitted.

**USER-IDENT-LIST = list-poss(16): <name 1..8> / <c-string 1..8 with-low>**

List of user IDs which are not admitted.

**HOST-NAME = \*ALL-CLUSTERS / \*HOME / \*LOCAL-CLUSTER / \*EXCEPT(...) / list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

Information is requested on active SPOOL devices on which print jobs coming from the specified host can or cannot be printed (see also the START-PRINTER-OUTPUT command).

**HOST-NAME = \*ALL-CLUSTERS**

Information is output on active SPOOL devices on which print jobs from any host in any cluster can be processed.

**HOST-NAME = \*HOME**

Information is output on active SPOOL devices on which print jobs from the local host can be processed.

**HOST-NAME = \*LOCAL-CLUSTER**

Information is output on active SPOOL devices on which print jobs from any host in the local cluster can be processed.

**HOST-NAME = \*EXCEPT(...)**

Information is output on active SPOOL devices on which print jobs from any host except those specified in this list can be processed.

---

**HOST-LIST = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

Specifies the active devices that cannot accept print jobs from the specified hosts (see also the START-PRINTER-OUTPUT command).

**HOST-NAME = list-poss(16): <alphanum-name 1..8>**

Information is output on active SPOOL devices on which print jobs from the specified hosts can be processed.

**SPOOLOUT-CLASS = \*ALL / \*EXCEPT(...) / list-poss(16): <integer 1..255>**

Information is requested on active SPOOL devices to which the specified spoolout classes have been assigned or for which they have been excluded (START-PRINTER-OUTPUT).

**SPOOLOUT-CLASS = \*EXCEPT(...)**

Information is requested on active SPOOL devices for which the specified spoolout classes are not admitted.

**SPOOLOUT-CLASS-LIST = list-poss(16): <integer 1..255>**

List of spoolout classes which are not admitted.

**SPOOLOUT-NAME = \*ALL / \*EXCEPT(...) / list-poss(16): <alphanum-name 1..8 / <c-string 1..8 with-low>**

Information is requested on active SPOOL devices to which the specified job names have been assigned or for which they have been excluded (START-PRINTER-OUTPUT).

**SPOOLOUT-NAME = \*EXCEPT(...)**

Information is requested on active SPOOL devices for which the specified job names are not admitted.

**SPOOLOUT-NAME-LIST = list-poss(16): <alphanum-name 1..8> / <c-string 1..8 with-low>**

List of job names which are not admitted.

**ACCOUNT = \*ALL / \*EXCEPT(...) / list-poss(16): <alphanum-name 1..8>**

Information is requested on active SPOOL devices to which the specified account numbers have been assigned or for which they have been excluded (START-PRINTER-OUTPUT).

**ACCOUNT = \*EXCEPT(...)**

Information is requested on active SPOOL devices for which the specified account numbers are not admitted.

**ACCOUNT-LIST = list-poss(16): <alphanum-name 1..8>**

List of account numbers which are not admitted.

**FORMS-OVERLAY = \*ALL / \*NONE / \*ONLY / \*EXCEPT(...) / list-poss(16): <alphanum-name 2..2>**

Information is requested on active SPOOL devices to which the specified film overlays have been assigned or for which they have been excluded (START-PRINTER-OUTPUT).

**FORMS-OVERLAY = \*NONE**

Information is requested about devices which do not process film overlays.

**FORMS-OVERLAY = \*ONLY**

Information is requested about devices which do process film overlays.

**FORMS-OVERLAY = \*EXCEPT(...)**

Information is requested on active SPOOL devices for which the specified film overlays are not admitted.

**FORMS-OVERLAY-LIST = list-poss(16): <alphanum-name 2..2>**

List of film overlays which are not admitted.

---

**FORMS-OVERLAY-BUFFER = \*ANY / \*ONLY / \*NO / \*RANGE(...)**

Information is requested on active SPOOL devices for which matching entries have been made in the FORMS-OVERLAY-BUFFER (FOB data overlays) operand in the START-PRINTER-OUTPUT command.

The values for RANGE in the START-PRINTER-OUTPUT command (number of sublines) must lie within the range specified here.

Information on printers without graphics buffer is only output for the operand value \*ANY.

**FORMS-OVERLAY-BUFFER = \*RANGE(...)**

Graphics buffer range.

**LOW = 0 / <integer 0..32767>**

Lower limit of the range.

**HIGH = 4032 / <integer 0..32767>**

Upper limit of the range.

**PRIORITY = \*ALL / \*RANGE(...)**

Information is requested on active SPOOL devices for which a priority in the range has been defined (START-PRINTER-OUTPUT).

**PRIORITY = \*RANGE(...)**

Priority range.

**FROM = 30 / <integer 30..255>**

Lower limit of the range.

**TO = 255 / <integer 30..255>**

Upper limit of the range.

**CHARACTER-SET-NUMBER = \*ALL / \*ONE / \*RANGE(...)**

Information is requested on active SPOOL devices for which any number character sets or a single character set or a number of character sets within the range (RANGE) are admitted (START-PRINTER-OUTPUT).

Information on non-HP printers is only output if CHARACTER-SET-NUMBER=ALL is specified.

**CHARACTER-SET-NUMBER = \*RANGE(...)**

Information is requested on active SPOOL devices for which a number of character sets within a specified range are admitted.

**LOW = 1 / <integer 1..32767>**

Lower limit of the range.

**HIGH = 64 / <integer 1..32767>**

Upper limit of the range.

**ROTATION = \*ANY / \*YES / \*NO / \*MANUAL**

Information is requested on active SPOOL devices according to the entry in the ROTATION operand in the START-PRINTER-OUTPUT or START-TAPE-OUTPUT or START-TAPE-REPLAY command.

Information on printers without page rotation modules is only output for ROTATION=\*ANY. (\*NO means that ROTATION is deactivated).

**TWO-UP-PROCESSING = \*ANY / \*YES / \*NO / \*MODE-1 / \*MODE-2**

Information is requested about printers (LP65) for which the corresponding value for TWO-UP-PROCESSING was specified in the START-PRINTER-OUTPUT command.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SCP1052	Information incomplete
	1	CMD0202	Syntax error
	1	SCP0973	Semantic error
	32	SCP0974	System error. Command rejected
	64	SCP0976	Invalid operand value
	128	SPS0266	SPOOL subsystem not available

---

## Notes

Within the framework of support for interoperability between BS2000- and UNIX-based systems, new printer statuses based on an ISO reference have been introduced. The following statuses are displayed by means of the SHOW-ACTIVE-SPOOL-DEVICES command:

- I(IDLE): the printer is ready to output; no print job is currently being processed
- R(RUN): the printer is active
- M(Message): there is a console message concerning the printer
- D(DETACHED): this is the status between the entry of the START-PRINTER-OUTPUT command and its execution by the controller task or the status after the STOP-PRINTER-OUTPUT command is entered
- T(TRANSFER): a started spoolout job is waiting for transport confirmation
- U(UNKNOWN): the status is not known

The connections between the statuses above and the statuses in the ISO reference are shown in the following table:

Displayed status	Print jobs for printers of type			ISO statuses
	Spool	APA	RSO	
A (ATTACHED)			X	idle
I (IDLE)	X	X	X	idle
T (TRANSFER)	X		X	running
R (RUN)	X	X	X	running
M (MESSAGE)	X	X	X	needs attention
S (STOPPED)			X	needs attention
W (WORKING FOR ADM)			X	needs attention
D (DETACHED)	X	X	X	shutdown
U (UNKNOWN)	X	X	X	shutdown

## Output forms

### Output when no device is specified or if a device name is specified with a wildcard

```
DEV-NAME DEV-TYPE C-USERID C-TSN EXIT C-FORM C-CL SSU ADM CRI
@@@@@@@@ @@@@@@@@@ @@@@@@@@@ @@@@   @@@ @@@@@@ ### @@@ @@@ @@@
...      ...      ...      ...      ... ..      ... ..      ... ..
```

#### *Meanings of the output fields*

Output field	Meaning
DEV-NAME	Device name
DEV-TYPE	Device type
C-USERID	User ID of the current job (output for systems support and RSO device administrator only; otherwise blank).
C-TSN	TSN of the current job (output for systems support and RSO device administrator only; otherwise blank).
EXIT	Exit routines activated: YES/NO
C-FORM	Form used for printing out the current job
C-CL	Spoolout class of the current job
SSU	S: printer status, see notes S: printer area; the printer is started locally (L) or as a distributed printer (C) U: STOP-... command issued. NO/blank.
ADM	Caller of the command is systems support / RSO device administrator for this device: YES/blank
CRI	Selection criteria were all specified explicitly in the START-... command for the specified device (EXP) not specified at all (blank).

Table 88: SHOW-ACTIVE-SPOOL-DEVICES; output with no device specification or with wildcard specification

## Output when an individual device is specified

### Meanings of the output fields

Output field	Meaning
DEV-NAME	Device name
DEV-TYP	Device type
USE	Type of device activation
REV	Revision number; processing state of the device; a counter is incremented by 1 for each MODIFY-PRINTER-OUTPUT-STATUS command
SCHED	SCHEDULING-STATE: During a job, device characteristics can be changed via MODIFY-...-OUTPUT-STATUS; this does not take effect until the subsequent job. The field indicates whether the values output apply to the current job or the next job.
PRIORITY	Value range of the priorities admitted for the specified device
C-USERID	User ID of the current job (output for RSO device administrator and systems support only; otherwise blank)
C-TSN	TSN of the current job (output for RSO device administrator and systems support only; otherwise blank)
CLASSES(@)	Spoolout classes admitted for the specified device.

• Auxiliary field	A : All spoolout classes are admitted P : All specified spoolout classes are admitted N : All spoolout classes except those specified here are admitted
FORM(@@)	Forms admitted for the specified device.
• Auxiliary field 1	A : All forms are admitted. P : All specified forms are admitted. N : All forms except those specified here are admitted.
• Auxiliary field 2	E : The specified forms are equivalent. _ : The specified forms are not equivalent.
PNAME(@)	Job names admitted for the specified device.
• Auxiliary field	A : All job names are admitted P : All specified job names are admitted N : All job names except those specified here are admitted
USER(@)	User IDs admitted for the specified device (output to systems support and RSO device administrator only; otherwise blank).
• Auxiliary field	A : All user IDs are admitted P : All specified user IDs are admitted N : All user IDs except those specified here are admitted
ACC(@)	Account numbers admitted for the specified device (displayed only to systems support and the device administrator; otherwise blank).
• Auxiliary field	A : All account numbers are admitted P : All specified account numbers are admitted N : All account numbers except those specified here are admitted
DESTS	Device pools that can contain the specified device.

Table 89: SHOW-ACTIVE-SPOOL-DEVICES output for all device types

### Meanings of the output fields

Output field	Meaning
CHAR-SET	HP printers only: Number of character sets (range) that can be processed on the specified device.
CURRENT-DIA	Film overlay loaded on the specified device.
CURRENT-FORM	Form loaded on the specified device
DIAS	In local SPOOL only for HP and HP90: List of film overlays that can be processed on the device.
<ul style="list-style-type: none"> <li>Auxiliary field:</li> </ul>	(A): All film overlays (P): The specified film overlays (positive list) (N): All except the specified film overlays (negative list) (ONLY): Only devices on which film overlays can be processed (NONE): Only devices on which film overlays cannot be processed
EXIT	Exit routines activated for the specified device: yes/no
FOB	HP or LED printers only. Size range of an FOB data overlay that can be processed on the specified device.
PRINTER STATE	See <a href="#">"Notes"</a> .
PRINTER SCOPE	Printer scope (L: local or C: distributed).
PRINTER-ERR-TYPE	Error class based on the printer error status: <ul style="list-style-type: none"> <li>OPER: Technical error: manual intervention is necessary before the message can be answered at the console.</li> <li>DATA: Data error: the message at the console must be answered.</li> <li>LOAD: Loading error: the message at the console must be answered.</li> <li>JOB: Job error: the message at the console concerning the job just processed by the printer must be answered.</li> <li>UNDEF: Undefined error.</li> </ul>

ROTATION	Jobs that call the page rotation module can be processed on the specified device: YES/NO/ANY/MANUAL (see START-PRINTER-OUTPUT)
SAMPLE	Sample printout: yes/no
T-UP-P	TWO-UP-PROCESSING: output of two pages side by side on HP90 printers
TRACE Auxiliary field:	TRACE activated with START-PRINTER-OUTPUT command y/n LEVEL: trace level activated

Table 90: Output fields of SHOW-ACTIVE-SPOOL-DEVICES for local printers

### Additional information when a virtual printer is specified

This information is only output if a virtual printer is specified in the NAME operand.

```

#### Meanings of the output fields

Output field	Meaning
CURRENT-FORM	Form loaded on the specified device.
TRACE	A TRACE file is to be created for the specified device: YES/NO (this is only issued to systems support; the field remains empty in all other cases).
EXIT	EXIT routine activated for the specified device: YES/NO.
SAMPLE	Sample printout: YES/NO
PRINTER STATE	See "Notes".
MONJV	Name of the monitoring job variable if specified in the device record of the SPOOL parameter file (\$SYSSPOOL.PRT.RSO.<device-name>), otherwise *NONE
ACCESSES	Access paths allowed, e.g. RSO, UTM

Table 91: Output fields of SHOW-ACTIVE-SPOOL-DEVICES for RSO printers

T-UP-P	See output for local printers.
VSN	List of volume serial numbers permitted on the device (output for systems support only; otherwise blank)

Table 92: Output fields of SHOW-ACTIVE-SPOOL-DEVICES for tape devices

## Output in S variables

The command's DEVICE-NAME operand identifies the S variables which are to be created. The following specifications are possible for DEVICE-NAME:

Notation used in command	Abbreviated form used in table
DEVICE-NAME=*ALL	DEV =*ALL
DEVICE-NAME= <alphanum-name 1..8>	DEV =<name>
DEVICE-NAME= <alphanum-name 1..24 with-wild>	DEV =<name with-wild>

### *Note*

S variables marked S/X in the "Name of the S variable" column are generated both for SPOOL and for Xprint jobs. All other S variables are generated for SPOOL jobs only.

Output information	Name of the S variable	T	Contents	Condition
Print jobs permitted for the specified device (RSO and UTM print jobs)	var(*LIST).ACCESS (*LIST)	S	' ' <allowed-accesses>	DEV=<name>
Account number	var(*LIST).ACCOUNT (*LIST)	S	' ' <account>	DEV=<name>
Account numbers with authorization for the specified device (output for system administrator/RSO device administrator only) *ALL = all numbers are authorized *NEGATIV = all except those listed *POSITIV = all those listed	var(*LIST).ACCOUNT-ADMIS	S	*ALL *NEGATIV *POSITIV	DEV=<name>
Command issued by the system administrator/RSO device administrator for this device	var(*LIST).ADM	S	*NO *YES	DEV=*ALL/ <name with-wild>
Form used to print the current job	var(*LIST).CURR-FORM S/X	S	' ' <form-name>	DEV=<name>
Current form name	var(*LIST).CURR-FORM-NAME	S	' ' <form-name>	DEV=*ALL/ <name with-wild>
Current forms overlay	var(*LIST).CURR-FORM-OVERLAY	S	<forms-overl>	DEV=<name>
Current SPOOLOUT class	var(*LIST).CURR-PRINT-JOB-CLASS	S	0..255	DEV=*ALL/ <name with-wild>
TSN of the current job	var(*LIST).CURR-TSN	S	' ' <tsn>	
User ID of the current job	var(*LIST).CURR-USER-ID	S	' ' <user-id>	
Number of character sets, bottom of range	var(*LIST).CHAR-SET-NUM.FROM	S	0..32767	DEV=<name>
Number of character sets, top of range	var(*LIST).CHAR-SET-NUM.TO	S	0..32767	DEV=<name>
Recording density supported by a tape	var(*LIST).DENSITY	S	' ' <density>	DEV=<name>
Device pool that may contain the device	var(*LIST).DEST(*LIST)	S	<destination>	DEV=<name>
Device name	var(*LIST).DEV-NAME <sup>S</sup> /X	S	' ' <dev-name>	

Device type	var(*LIST).DEV-TYPE	S	' ' <dev-type>	
Number of devices which match the selection criteria	var(*LIST).DEVICE-NUMBER	S	<0..999999>	
Error code	var(*LIST).ERR-CODE	S	' ' <error code>	DEV=<name>
Error message	var(*LIST).ERR-MSG	S	' ' <error msg>	DEV=<name>
Are exit routines activated for the specified device?	var(*LIST).EXIT	S	*NO *YES	
Forms overlay buffer, bottom of range	var(*LIST).FOB.FROM	S	0..32767	DEV=<name>
Forms overlay buffer, top of range	var(*LIST).FOB.TO	S	0..32767	DEV=<name>
Form name	var(*LIST).FORM-NAME (*LIST)	S	' ' <form-name>	DEV=<name>
Forms authorized for use on the specified device *ALL = all forms are authorized *NEGATIV = all except those listed *POSITIV = all those listed	var(*LIST).FORM-NAME-ADMIS	S	*ALL *NEGATIV *POSITIV	DEV=<name>
Equivalence of the output forms	var(*LIST).FORM-NAME-EQUIV	S	' ' *EQUIVALENT	DEV=<name>
Name of the forms overlay	var(*LIST).FORM-OVERLAY(*LIST)	S	' ' <forms-overl>	DEV=<name>
Forms overlays which can be processed on the device *ALL = all overlays *POSITIV = all those listed *NEGATIV = all except those listed *ONLY = only devices which support forms overlay processing *NONE = only devices which do not support forms overlay processing	var(*LIST).FORM-OVERLAY-ADMIS	S	*ALL *NEGATIV *NONE *ONLY *POSITIV	DEV=<name>
Host system	var(*LIST).HOST(*LIST)	S	' ' <host-name>	DEV=<name>
Hosts authorized to use the specified device *ALL=all hosts *POSITIV=all those listed *NEGATIV=all except those listed	var(*LIST).HOST-ADMIS	S	*ALL *POSITIV *NEGATIV *LOCAL-HOST *LOCAL-CLUSTER	DEV=<name>

*LOCAL-HOST=local host *LOCAL-CLUSTER=all hosts in the local cluster				
Name of the host	var(*LIST).HOST-NAME	S	' ' <host-name>	DEV=<name>
VSN of the tape containing the directory file	var(*LIST).IMPORT	S	' ' <import>	DEV=<name>
Date of most recent scheduling operation	var(*LIST).LAST-SCHED.DATE	S	*NONE <yyyy-mm-dd>	
Time of most recent scheduling operation	var(*LIST).LAST-SCHED.TIME	S	*NONE <hh:mm>	
Season information for the time of most recent scheduling operation	var(*LIST).LAST-SCHED.SEASON	S	*NONE *SUMMER *WINTER	
Local name of the device as defined in the SPOOL parameters. With local printer: Logical name used when the printer is started. With distributed printer: Name of the logical device which is connected to the distributed printer.	var(*LIST).LOCAL-DEVICE-NAME <sup>S/X</sup>	S	<device-name>	
Name of the RSO job variables	var(*LIST).MONJV	S	' ' \$SYSSPOOL.PRT. RSO.<devicename>	DEV=<name>
Tape operating mode	var(*LIST).OUT-MODE	S	' ' *COPY *DIRECT	DEV=<name>

---

## Example

Four devices have been activated as follows:

```
Device 1:  START-PRINTER-OUTPUT DEV-NAME=L1
Device 2:  START-PRINTER-OUTPUT DEV-NAME=L2, ( FORM-NAME=FORM01 )
Device 3:  START-PRINTER-OUTPUT DEV-NAME=L3, ( FORM-NAME=( FORM01 , FORM02 ) )
Device 4:  START-PRINTER-OUTPUT DEV-NAME=L4, ( FORM=FORM02 )
```

If the FORM operand is omitted in SHOW-ACTIVE-SPOOL-DEVICES, information on all four devices is output. For FORM=FORM01, information on device 2 and device 3 is output. For FORM=FORM02, information on device 3 and device 4 is output.

For FORM=(FORM01,FORM02), information on device 3 is output.

---

## 5.102 SHOW-ADDRESS-SPACE-STATUS

Show information on system and user address space

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	System control and optimization
<b>Domain:</b>	SYSTEM-MANAGEMENT SYSTEM-TUNING
<b>Privileges:</b>	STD-PROCESSING SW-MONITOR-ADMINISTRATION TSOS

### Function

The SHOW-ADDRESS-SPACE-STATUS command displays information on important and possibly critical values of the system and user address space. The following information is displayed:

- Information on the system address space
  - Size of the system address space
  - Current size of memory classes 1 through 4
  - Maximum size of memory classes 3 and 4 during the session
  - Current and maximum sizes of the system address space used
  - Free gap between memory classes 3 and 4
- Information on the user address space
  - Size of the user address space
  - Maximum size of class 5 and class 6 memory in the user address space during the runtime of the specified task

The information on the system address space is only received by privileged users. The scope of information on the user address space can be defined with the USER-ADDRESS-SPACE operand.

The command supports structured output in S variables (see ["Output in S variable"](#)).

#### *Privileged functions*

Privileged users (TSOS or SW-MONITOR-ADMINISTRATION privilege) receive information on the system address space and can have information displayed on the user address space of tasks of foreign user IDs.

---

### *Indications of critical situations*

When class 3 and class 4 memory is requested, the system address space is searched for an adequately sized free area, but in different directions:

- In the case of class 3 memory, the search takes place from the front in the direction of ascending addresses.
- In the case of class 4 memory, the search takes place from the back in the direction of descending addresses.

Normally a gap of many MB remains free between class 3 and class 4 memory. If this gap shrinks to a few MB or disappears totally, larger requests for class 3 or class 4 memory are generally no longer possible. An acute danger of system address space saturation then exists.

Critical situations exist in the following cases:

- The size of the system address space used differs by only a few MB from the maximum size of the system address space.
- The maximum size of the class 5 and class 6 memory of a task differs by just a few MB from the size of the user address space.

### Format

#### SHOW-ADDRESS-SPACE-STATUS

**USER-ADDRESS-SPACE** = \*OWN / \*LARGEST(...) / \*ALL / \*NONE / \*TSN (...)

\*LARGEST(...)

|     **NUMBER** = 5 / <integer 1..4096>

\*TSN(...)

|     **TSN** = <alphanum-name 1..4>

### Operands

**USER-ADDRESS-SPACE** = \*OWN / \*LARGEST(...) / \*ALL / \*NONE / \*TSN (...)

Determines the scope of the information on the user address space.

**USER-ADDRESS-SPACE** = \*OWN

Information is output on the user address space of the local task.

**USER-ADDRESS-SPACE** = \*LARGEST(...)

Information is output on the user address space of a particular number of tasks which occupy the most user address space. The output takes place in descending order beginning with the task which has reached the highest level of class 5 and class 6 memory. Nonprivileged users are only provided with information relating to tasks running under their own user ID.

**NUMBER** = 5 / <integer 1..4096>

Specifies the maximum number of tasks for which information will be output. The default is 5 tasks.

### USER-ADDRESS-SPACE = \*ALL

Information is output on the user address space of all tasks. The output takes place in descending order beginning with the task which has reached the highest level of class 5 and class 6 memory. Nonprivileged users are only provided with information relating to tasks running under their own user ID.

### USER-ADDRESS-SPACE = \*NONE

No information on the user address space will be output.

### USER-ADDRESS-SPACE = \*TSN(...)

Information is output on the user address space of the specified task.

**TSN = <alphanum-name 1..4>**

TSN of the task. Nonprivileged users can only specify a task which is running under their own user ID.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed successfully
	32	EMM3601	system error
	64	CMD0216	Error: command privilege missing
	64	EMM3600	Error: access authorization missing
	64	EMM3602	Specified task does not exist
	130	EMM3603	Insufficient storage space

## Output format

*Sample output*

```
/show-address-space-status user-address-space=*all
```

```
SYSTEM ADDRESS SPACE REPORT
  SYSSIZE      MAX. USED    MAX. CLASS 3    MAX. CLASS 4    SIZE OF HOLE
  1024 MB      258.25 MB      98.18 MB      104.48 MB      754.18 MB
  SUM SIZE     SIZE CLASS 1    SIZE CLASS 2    SIZE CLASS 3    SIZE CLASS 4
  237.38 MB    36.09 MB       0.28 MB       96.78 MB      104.22 MB
USER ADDRESS SPACE REPORT
SIZE USER ADDRESS SPACE:      1900 MB
TASK      MAX. CLASS 5/6
1RHC      553.08 MB
1RHE      544.76 MB
1RC0      306.77 MB
...
IGPN      17.95 MB
1RGD      17.87 MB
BCAM      17.84 MB
...
PGE       0.16 MB
VMM       0.16 MB
KTT       0.16 MB
```

*Explanation of the output information*

<b>Info column</b>	<b>Meaning</b>
<b><i>SYSTEM ADDRESS SPACE REPORT</i></b>	Information block for the system address space
SYSSIZE	Size of the system address space
MAX. USED	Maximum system address space used during the session
MAX. CLASS 3	Maximum class 3 memory used during the session
MAX. CLASS 4	Maximum class 4 memory used during the session
SIZE OF HOLE	Size of the gap between class 3 and class 4 memory
SUM SIZE	Current size of the class 1 through class 4 memory
SIZE CLASS 1	Current size of the class 1 memory (=maximum)
SIZE CLASS 2	Current size of the class 2 memory(=maximum)
SIZE CLASS 3	Current size of the class 3 memory
SIZE CLASS 4	Current size of the class 4 memory
<b><i>USER ADDRESS SPACE REPORT</i></b>	Information block for the user address space
SIZE USER ADDRESS SPACE:	Size of the user address space The following values are displayed for each task:
TASK	The task's TSN
MAX. CLASS 5/6	Maximum class 5 and class 6 memory used by the task (including memory pools)

*Notes*

- The total system and user address space used always remains below 2048 MB on SUs /390 and S servers because there the nonprivileged class 4 memory counts neither as user nor as system address space. On SUs /x86 this total always remains below the maximum possible value of 4096 MB because there the area between user and system address space is used for shared modules (nonprivileged class 4 memory) and for HAL data.
- The value MAX. USED is generally not equivalent to the total of MAX. CLASS 3, MAX. CLASS 4, SIZE CLASS 1 and SIZE CLASS 2, because MAX. CLASS 3 and MAX. CLASS 4 can be reached at different times during the session.  
In the system address space there are areas which cannot be assigned to any of the memory classes 1 through 4. These areas are contained in the MAX. USED value.

## Output in S variable

The command's USER-ADDRESS-SPACE operand identifies the S variables which are to be created.

Notation used in command	Abbreviated form used in table
USER-ADDRESS-SPACE=*OWN / *LARGEST(...) / *ALL / *TSN (...), i.e. not *NONE	1

Output information	Name of the S variable	T	Contents	Condition
Current size of the class 1 memory (=maximum)	var(*LIST).CLASS-1-SIZE	I	<integer 1..2048>	
Current size of the class 2 memory (=maximum)	var(*LIST).CLASS-2-SIZE	I	<integer 1..2048>	
Current size of the class 3 memory	var(*LIST).CLASS-3-SIZE	I	<integer 1..2048>	
Current size of the class 4 memory	var(*LIST).CLASS-4-SIZE	I	<integer 1..2048>	
Size of the gap between class 3 and class 4 memory	var(*LIST).HOLE-SIZE	I	<integer 1..2048>	
Maximum class 3 memory used during the session	var(*LIST).MAX-CLASS-3	I	<integer 1..2048>	
Maximum class 4 memory used during the session	var(*LIST).MAX-CLASS-4	I	<integer 1..2048>	
Maximum system address space used during the session	var(*LIST).MAX-USED	I	<integer 1..2048>	
Number of tasks for which information on the user address is output	var(*LIST).NUM-OF-TASK	I	<integer 1..4096>	1
Current size of the class 1 through class 4 memory	var(*LIST).SUM-SIZE	I	<integer 1..2048>	
Size of the system address space	var(*LIST).SYSSIZE	I	<integer 1..2048>	
Size of the user address space	var(*LIST).USER-SIZE	I	<integer 1..2048>	1
Maximum class 5 and class 6 memory used by the task (including memory pools)	var(*LIST).USER(*LIST).MAX-CLASS-5-6	I	<integer 1..2048>	1
The task's TSN	var(*LIST).USER(*LIST).TASK	S	<c-string 4..4>	1

For memory sizes that are displayed with decimal places in the SYSOUT output, the integer MB value is rounded up or off and then written into the S variable.

---

## 5.103 SHOW-ALIAS-CATALOG-ENTRY

Show entries in alias catalog

**Component:** ACS

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The SHOW-ALIAS-CATALOG-ENTRY command outputs AC entries to SYSOUT. Entries with the attribute INVISIBLE are shown to the ACS administrator only. The user selects the entries to be displayed by specifying the defined aliases. If all entries are selected, the scope of the output information can be restricted as follows:

- output of a totals line for all AC entries
- selection based on the scope of entries (user or system entries).
- selection based on the range of the entries (for files and/or job variables)

The command supports structured output in S variables (see "[Output in S variables](#)").

### Format

#### SHOW-ALIAS-CATALOG-ENTRY

```
ALIAS-FILE-NAME = *ALL / <filename 1..80 with-wild>  
,SELECT = *ALL / [*BY-ATTRIBUTES](...)  
    [*BY-ATTRIBUTES](...  
        | TYPE = *ALL / *USER-ENTRIES / *SYSTEM-ENTRIES  
        | ,RANGE = *ANY / *FILE / *JV  
,INFORMATION = *STD / *SUMMARY
```

### Operands

**ALIAS-FILE-NAME** = **\*ALL** / <filename 1..80 with-wild>

Selects the AC entries to be output on the basis of the associated alias contained in the entry. Entries with the INVISIBLE attribute are shown only to the ACS administration.

**ALIAS-FILE-NAME** = **\*ALL**

Selects the AC entries for all aliases. The scope of the information to be shown can be restricted.

---

**ALIAS-FILE-NAME = <filename 1..80 with-wild>**

Specification of a defined alias or a wildcard sequence to select a set of aliases for which AC entries are to be shown.

**SELECT = \*ALL / \*BY-ATTRIBUTES(...)**

The AC entry selection criteria.

**SELECT = \*ALL**

Returns information on all AC entries.

**SELECT = \*BY-ATTRIBUTES(...)**

Restricts the AC entries selected from the set to those which satisfy the following specifications.

**TYPE = \*ALL / \*USER-ENTRIES / \*SYSTEM-ENTRIES**

Returns information on AC entries depending on the entry type (user or system entries).

**TYPE = \*ALL**

The entry type is not to be used as a selection criterion. Both user and system entries (\*ALL) are to be shown.

**TYPE = \*USER-ENTRIES**

Returns information on user entries.

**TYPE = \*SYSTEM-ENTRIES**

Returns information on system entries.

**RANGE = \*ANY / \*FILE / \*JV**

Returns information on AC entries depending on the range (for files or job variables).

**RANGE = \*ANY**

The range is not to be used as a selection criterion.

**RANGE = \*FILE**

Provides information on all AC entries which are valid for files (i.e. all entries which are set up with the range RANGE=\*FILE or \*BOTH).

**RANGE = \*JV**

Provides information on all AC entries which are valid for job variables (i.e. all entries which are set up with the range RANGE=\*JV or \*BOTH).

**INFORMATION = \*STD / \*SUMMARY**

Defines the scope of the output.

**INFORMATION = \*STD**

For each ACS entry, the alias and the actual file or job variable name are shown with a preceding "S" to identify system entries and a preceding "U" for user entries. The "+" character before an alias indicates that the entry has the LOGGING attribute; the character "P" indicates that it is protected (by the PROTECTED attribute).

The third character shows the range of the AC entry (definition in the RANGE operand). The possible values are "F" (\*FILE), "J" (\*JV) and "B" (\*BOTH).

The output ends with a totals line containing the total number of aliases selected in the ALIAS-FILE-NAME operand and a breakdown of system and user entries.

**INFORMATION = \*SUMMARY**

Only the totals line is to be shown.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed normally
2	0	ACS0006	Warning: AC entry not found
	32	CMD0221	Internal error
	64	ACS0017	Error: alias catalog not available
	64	ACS0024	Invalid alias catalog entry
	128	ACS0018	ACS is not available

## Output in S variables

The INFORMATION operand identifies the S variables which are to be created. The possible values for INFORMATION are \*STD and \*SUMMARY.

Output information	Name of the S variable	T	Contents	Condition
File or job variable name alias	var(*LIST).ACS(*LIST). ALIAS-F-NAME	S	<filename 1..54>	INF=*STD
Actual file or job variable name	var(*LIST).ACS(*LIST).F- NAME	S	<filename 1..54>	INF=*STD
Logging enabled	var(*LIST).ACS(*LIST).LOG	S	*NO *YES	INF=*STD
Alias catalog entry protection enabled	var(*LIST).ACS(*LIST). PROT	S	*NO *YES	INF=*STD
Range of the alias catalog entry (for files and/or job variables)	var(*LIST).ACS(*LIST). RANGE	S	*FILE *JV *BOTH	INF=*STD
Type of alias catalog entry	var(*LIST).ACS(*LIST). TYPE	S	*SYS *USER	INF=*STD
AC entry visible	var(*LIST).ACS(*LIST). VISIBLE	S	*NO *YES	INF=*STD
Number of system entries	var(*LIST).NUM-OF- ENTRY.SYS	I	<integer 0...65535>	INF=*STD/ *SUMMARY
Total number of AC entries	var(*LIST).NUM-OF- ENTRY.TOTAL	I	<integer 1...65535>	INF=*STD/ *SUMMARY
Number of user entries	var(*LIST).NUM-OF- ENTRY.USER	I	<integer 0...65535>	INF=*STD/ *SUMMARY

---

## Examples

```
/SHOW-ALIAS-CATALOG-ENTRY                (Output with the privilege ACS-
ADMINISTRATION)
%      ALIAS FILE NAME                    ->    FILE NAME
%UB   : BOTH                             ->    FILE-OR-JV-NAME
%UF   : FILE                              ->    FILE-NAME
%UJ   : JV                                ->    JV-NAME
%UJI  : JV.INV                           ->    JV-ALIAS.BLIND
%SB   : LOAD-BIND                         ->    $.BINDER
%SB   : LOAD-PAMCONV                      ->    $.PAMCONV
%UJIP+ SF                                ->    FILE-ALL
% ACS0037 NUMBER OF ALIAS CATALOG ENTRIES: 7 (FOR SYSTEM: 2, FOR USER: 5)
```

Output of an entry has the following format:

```
EXAMPLE: %SB : LOAD-BIND                  -> $.BINDER                (Example of a line)
FORMAT:  %abcde alias-name                -> Job variable or file name
```

The first 5 characters mean the following:

%abcde	possible	meaning of the
	content	possible contents
e	:	Alias replacement not logged
e	+	Alias replacement logged
d	' '	Entry not protected
d	P	Protected
c	' '	Entry shown by SHOW-ALIAS-CATALOG-ENTRY command
c	I	Invisible, entry only shown to the administrator
b	F	File Entry
b	J	JV Entry
b	B	Both (File or JV)
a	S	System Entry
a	U	User Entry

For detailed description see the ADD-ALIAS-CATALOG-ENTRY command.

For further examples, please refer to ADD-ALIAS-CATALOG-ENTRY, LOAD-ALIAS-CATALOG and SET-FILE-NAME-PREFIX commands.

---

## 5.104 SHOW-ASE-ELEMENT

Display ASE element

**Component:** ASE  
**Functional area:** Error logging  
**Domain:** ERROR-LOGGING  
**Privileges:** TSOS

### Function

The SHOW-ASE-ELEMENT command provides information on the properties of all ASE elements which are declared in the system. Specifying the element ID enables information to be displayed for a particular ASE element.

In addition to the declared properties, the element ID, the TSN of the task under which the declaration was made, the number of actions already performed and the date and time of the declaration are displayed.

### Format

<b>SHOW-ASE-ELEMENT</b>
-------------------------

<b>ELEMENT-ID</b> = *ALL / <x-text 2..2>
--

### Operands

**ELEMENT-ID** = \*ALL / <x-text 2..2>

Specifies which ASE elements are to be displayed. The default \*ALL causes all elements to be displayed. Specifying the element ID also enables the display of a particular element to be requested.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	1	ASE0010	Syntax error
	32	CMD0221	System error
	64	ASE0011	Semantic error

### Output format

The information is displayed in a table. The output begins with a header line containing the names of the output columns. This is followed by a value line for each declared ASE element. If a range of message numbers, a list with multiple elements or elements that are to be excluded was specified when the SERSLOG events were selected, the value line is followed by one or more continuation lines.

When the value displayed in an output column comes from the declaration made with ADD-ASE-ELEMENT, the corresponding operand is enclosed in parentheses in the explanation.

*Sample output*

ID	OWNER	RECTYPE	TH	S(#, SLEEP )	ACTION	DONE	CRE-DATE	CRE-TIME	TASK
04	(OWN)	(ALL)	__	Y(3,UNLIMIT )	LO	0003	2012-02-01	01:30:00	0015
01	0ABC	(ALL)	1F	N	LO+CO	*1AFE	2012-02-01	01:30:00	_____
		\IDA							
		\AUD0815							
02	0ABC	IDA(ALL)	03	N	CO	0000	2012-02-01	01:30:00	_____
		\IDA0BAD							
		\IDA0DUM							
2A	0ABC	AUD(ALL)	01	N	CO	0000	2012-02-01	01:30:00	_____
22	0ABC	IDA0002-	__	N	CO	0000	2012-02-01	01:30:00	_____
		IDA0006							
		\IDA0004							
3E	1TSN	AUD4711,	__	Y(1,01:30:00)	CO	0000	2012-02-01	01:30:00	_____
		IDA0911							
3F	1TSN	IDA0911	__	Y(1,024hours)	LO+CO+TS	0000	2012-02-01	01:30:00	_____

*Explanation of the output columns*

Output column	Meaning
ID	Identifier of the ASE elements which is specified uniquely when the declaration is made. Possible values: <x-text 2..2> or empty in the case of a continuation line
OWNER	TSN of the task which declared the ASE element. Possible values: <alphanumeric-name 4..4>, (OWN) for the user's own task or empty in the case of a continuation line
RECTYPE	Monitored SERSLOG events (RECORD-ID operand). Possible values: <ul style="list-style-type: none"> <li>• (ALL) = All SERSLOG records are selected</li> <li>• ccc(ALL) = All SERSLOG records of message class ccc are selected</li> <li>• cccmmmm = The SERSLOG record with message number cccmmmm is selected</li> <li>• cccmmmm, = First element of a list of message numbers (for further list elements see continuation line)</li> <li>• cccmmmm- = Specifies a lower limit for the range (for the upper limit see continuation line)</li> </ul> <p><i>In event of output in continuation lines</i></p> <ul style="list-style-type: none"> <li>• cccmmmm, = Another list element</li> <li>• cccmmmm = Last list element or upper limit of range</li> <li>• \cccmmmm = Excluded SERSLOG record</li> <li>• \cccm(ALL) = Excluded message class</li> </ul>
TH	Threshold value (hexadecimal value of the THRESHOLD operand). Possible values: <x-text 2..2> or “__” for *NONE

Output column	Meaning
S(#, SLEEP)	<p>Handling of duplicated SERSLOG events (SUPPRESS-DUPLICATES operand)</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>• N when SUPPRESS-DUPLICATES=*NO</li> <li>• Y(&lt;integer 1..9&gt;, &lt;sleep&gt;) when SUPPRESS-DUPLICATES=*YES, where the values of the AFTER and SLEEP-TIME operands are displayed in parentheses. The following values are possible for &lt;sleep&gt;: UNLIMIT, hh.mm.ss (when the time is specified) or nnn hours (when nnn hours is specified)</li> </ul>
ACTION	<p>Action which is to be executed when the defined event occurs (ACTION operand).</p> <p>Possible values: LO (internal logging), CO (console message) or TS (teleservice call); in a list the values are separated from each other by “+”</p>
DONE	<p>Number (hexadecimal display) of the actions executed. A leading asterisk indicates a counter overflow.</p> <p>Possible values: &lt;x-text 4..4&gt;</p>
CRE-ATE	<p>Date of the declaration in the format yyyy-mm-dd</p>
CRE-IME	<p>Time of the declaration in the format hh:mm:ss</p>
TASK	<p>TSN of the task which is monitored (TASK operand).</p> <p>Possible values: &lt;alphanum-name 4..4&gt; or “_____” for all tasks</p>

Table 93: Output columns of the SHOW-ASE-ELEMENT command

---

## 5.105 SHOW-ASE-LOGGING

Display ASE logging data

**Component:** ASE  
**Functional area:** Error logging  
**Domain:** ERROR-LOGGING  
**Privileges:** TSOS

### Function

The SHOW-ASE-LOGGING command outputs all SERSLOG events which have been logged internally (ACTION=\*INTERNAL-LOGGING). The output is directed to SYSOUT, and can also optionally be directed to SYSLST. The set of logging records to be output can be restricted to message keys which, in the length specified, match the specified substring.

### Format

**SHOW-ASE-LOGGING**

**RECORD-ID** = \*ALL / <alphanum-name 1..7>

,**OUTPUT** = list-poss(2): \*SYSOUT / \*SYSLST

### Operands

**RECORD-ID** = \*ALL / <alphanum-name 1..7>

Specifies the SERSLOG events for which the logged information is to be output. The default \*ALL causes all logging records to be output. When a particular message key is specified or part of one, information is output only for the message keys which, in the length specified, match the specified value.

**OUTPUT** = list-poss(2): \*SYSOUT / \*SYSLST

Specifies where the information is to be output. The default setting is output to SYSOUT.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	1	ASE0010	Syntax error
	32	CMD0221	System error
	64	ASE0011	Semantic error

## Output format

The information is displayed in a table. The output begins with a header line containing the names of the output columns. This is followed by a value line for each logging record.

RECTYPE	TSN	CALLER	DATE	TIME	ELSN	CRY0001	83N6	CRYASS	+000007C4
2012-02-17	09:29:20	0000AFFE							

Output column	Meaning
RECTYPE	SERSLOG record identifier (corresponds to message number)
TSN	TSN of the task which triggered the SERSLOG event
CALLER	Address of the \$NERLOS call, defined by module name and relative distance (hexadecimal) to the start of the module in the format <name 1..8>+<x-text 8..8>
DATE	Date of the SERSLOG event in the format yyyy-mm-dd
TIME	Time of the SERSLOG event in the format hh-mm-ss
ELSN	Error Logging Sequence Number (hexadecimal) of the SERSLOG event in the format <x-text 8..8>

Table 94: Output columns of the SHOW-ASE-LOGGING column

---

## 5.106 SHOW-ASE-PARAMETERS

Display global ASE settings

**Component:** ASE  
**Functional area:** Error logging  
**Domain:** ERROR-LOGGING  
**Privileges:** TSOS

### Function

The SHOW-ASE-PARAMETERS command displays global ASE settings which can be changed using the MODIFY-ASE-PARAMETERS command. The output provides information on the current size of the logging buffer.

### Format

<b>SHOW-ASE-PARAMETERS</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	1	ASE0010	Syntax error
	32	CMD0221	System error
	64	ASE0011	Semantic error

### Output format

The size of the internal logging buffer is displayed in an information line:

```
SIZE OF LOGGING TABLE: n KB
```

Here n is a multiple of 4 from <integer 4..64>.

---

## 5.107 SHOW-ASE-STATUS

Display ASE status information

**Component:** ASE  
**Functional area:** Error logging  
**Domain:** ERROR-LOGGING  
**Privileges:** TSOS

### Function

The SHOW-ASE-STATUS command enables status information about the ASE subsystem to be queried. The output provides information on whether ASE buffer areas which are not large enough had to be overwritten. When required, the internal logging buffer can be enlarged using the MODIFY-ASE-PARAMETERS command.

### Format

<b>SHOW-ASE-STATUS</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	1	ASE0010	Syntax error
	32	CMD0221	System error
	64	ASE0011	Semantic error

### Output format

An information line is output for each ASE buffer area.

#### *Sample output*

```
LOGGING TABLE WRAPPED: YES  
INTERNAL DATA WRAPPED: NO
```

---

*Explanation of the output columns*

<b>Output field</b>	<b>Meaning</b>
LOGGING TABLE WRAPPED:	Indicates whether a wrap-around (i.e. the new data overwrites the oldest entries in the event of a buffer overflow) of the internal logging buffer has occurred. If necessary, the buffer can be enlarged using the MODIFY-ASE-PARAMETERS command. Possible values: YES or NO
INTERNAL DATA WRAPPED:	<i>This information is only relevant for internal diagnostics.</i> Indicates whether a wrap-around of an internal table has occurred. Possible values: YES or NO

Table 95: Output information of the SHOW-ASE-STATUS command

---

## 5.108 SHOW-AUDIT-STATUS

Show status information on linkage and hardware AUDIT

**Component:** BS2000 OSD/BC  
**Functional area:** AUDIT mode control  
**Domain:** PROGRAM  
**Privileges:** TSOS

### Function

The SHOW-AUDIT-STATUS command outputs status information on the linkage and hardware AUDIT modes to SYSOUT. Both the system-wide and the task-specific usage of the AUDIT functions in the system are displayed. In addition to the general overview, the display can also show which tasks started the linkage or hardware AUDIT mode.

### Format

**SHOW-AUDIT-STATUS**

**INFORMATION** = \*SUMMARY / \*ALL(...)

\*ALL(...)

| **SELECT** = \*ALL / \*LINKAGE-AUDIT / \*HARDWARE-AUDIT

### Operands

**INFORMATION** = \*SUMMARY / \*ALL(...)

Specifies the scope of the information which is to be displayed.

**INFORMATION** = \*SUMMARY

The statuses of the following AUDIT functions are displayed:

- processor-local linkage AUDIT
- ALL-JOBS-AUDIT for linkage AUDIT
- ALL-JOBS-AUDIT for hardware AUDIT

The number of tasks in which the linkage or hardware AUDIT is still active (enabled and not on hold) is also shown.

**INFORMATION** = \*ALL(...)

The same information is displayed as with \*SUMMARY. Further task-specific information is also displayed for each task which has linkage or hardware AUDIT enabled.

**SELECT** = \*ALL / \*LINKAGE-AUDIT / \*HARDWARE-AUDIT

Specifies the AUDIT mode for which information is to be displayed.

**SELECT** = \*ALL

Information is displayed for linkage AUDIT and for hardware AUDIT.

**SELECT = \*LINKAGE-AUDIT**

Information is displayed for linkage AUDIT only.

**SELECT = \*HARDWARE-AUDIT**

Information is displayed for hardware AUDIT only.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	32	CMD0221	System error
	64	CMD0216	Privileges error

**Output format**

INFORMATION =\*SUMMARY causes the 5 following information lines to be displayed which contain global information:

Information line	Meaning
Processor-local LINKAGE-AUDIT:	Status of the processor-local linkage AUDIT: <ul style="list-style-type: none"> <li>• INTERRUPT-HANDLING (ON for SIH)</li> <li>• SYSTEM-LEVEL (ON for SIH and TPR)</li> <li>• OFF</li> </ul>
All-task LINKAGE-AUDIT :	Status of the ALL-JOBS-AUDIT for linkage AUDIT: ON or OFF
All-task HARDWARE-AUDIT :	Status of the ALL-JOBS-AUDIT for hardware AUDIT
LINKAGE-AUDIT active in <i>nnnn</i> task(s)	Number of tasks with active linkage AUDIT (ON, but not in HOLD status)
HARDWARE-AUDIT active in <i>nnnn</i> task (s)	Number of tasks with active hardware AUDIT (ON, but not in HOLD status)

Table 96: AUDIT status information

INFORMATION=\*ALL causes task-specific information to be displayed in addition for each task with the AUDIT function enabled. This detailed information is displayed in table form ahead of the information lines which show the total number of tasks. One value line containing the following information is displayed for each task:

Information column	Meaning
TID	TID of the task displayed
TSN	TSN of the task displayed
TYPE	Type of enabled AUDIT function: <ul style="list-style-type: none"> <li>• LKA (linkage AUDIT)</li> <li>• HWA (hardware AUDIT)</li> </ul>
STATE	Function status of the enabled AUDIT function: <ul style="list-style-type: none"> <li>• SYSTEM (ON for TPR)</li> <li>• USER (ON for TU)</li> </ul>
ACTIVE	Activity status of the enabled AUDIT function: <ul style="list-style-type: none"> <li>• YES (ON, but not in HOLD status)</li> <li>• NO (ON, but not in HOLD status)</li> </ul>

Table 97: AUDIT status information (task-specific information)

---

## Examples

**/show-audit-sta inf=\*all**

```
Processor-local LINKAGE-AUDIT: INTERRUPT-HANDLING
All-task LINKAGE-AUDIT      : OFF
All-task HARDWARE-AUDIT    : OFF
Task-specific AUDITs:
  TID   TSN   TYPE STATE  ACTIVE
00010001 TSC  LKA  SYSTEM YES
00010002 HERS  HWA  SYSTEM YES
00010068 0FQ3 LKA  SYSTEM YES
00010068 0FQ3 LKA  USER  YES
00010068 0FQ3 HWA  SYSTEM YES
00010068 0FQ3 HWA  USER  YES
0001006C 0FQ7 LKA  USER  NO
0001006D 0FQ8 HWA  SYSTEM NO
LINKAGE-AUDIT active in 0002 task(s)
HARDWARE-AUDIT active in 0002 task(s)
```

**/show-audit-sta inf=\*sum**

```
Processor-local LINKAGE-AUDIT: INTERRUPT-HANDLING
All-task LINKAGE-AUDIT      : OFF
All-task HARDWARE-AUDIT    : OFF
LINKAGE-AUDIT active in 0002 task(s)
HARDWARE-AUDIT active in 0002 task(s)
```

---

## 5.109 SHOW-BLOCK-TO-FILE-ASSIGNMENT

Show file name associated with specified block

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-TUNING  
**Privileges:** TSOS

### Function

This command tells systems support the names of the files in which the specified blocks are located. Its primary function is to identify the files which are associated with bad blocks. For files to be consistently associated with disks /blocks, the corresponding pubset must not be subject to CMS or allocator actions. Such conditions apply only during a pubset's IMCAT phase or in the case of an exclusively imported pubset.

The command supports structured output in S variables (see ["Output in S variables"](#)).

### Format

<b>SHOW-BLOCK-TO-FILE-ASSIGNMENT</b>
<b>VOLUME</b> = <vsn 1..6> <b>,BLOCK-NUMBER</b> = list-poss(255): <integer 1..2147483647>

### Operands

**VOLUME = <vsn 1..6>**

Identifies the disk containing the specified blocks by volume serial number (VSN).

**BLOCK-NUMBER = list-poss(255): <integer 1..2147483647>**

Identifies the physical half-page number of the required block.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
1	0	CMD0001	K2 interrupt
	32	CMD2009	Error on output to S variables (e.g. subsystem not available)
	32	DMS05C7	Internal DMS error
	64	CMD0202	Syntax or semantic error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS06CC	No file uses the specified block
	64	OPS0002	K2 interrupt on output to S variables
	130	OPS0001	Space problems on output to S variables

## Output in S variables

Output information	Name of the S variable	T	Contents	Condition
Physical half-page number of a (defective) block which can be associated with a file	var(*LIST).FOUND (*LIST).BLOCK	I	<integer>	
Name of the file containing the (defective) block	var(*LIST).FOUND (*LIST).F-NAME	S	<path-name>	
Physical half-page number of a (defective) block which cannot be associated with a file	var(*LIST).NOT-FOUND (*LIST).BLOCK	I	<integer>	
VSN of the disk on which the (defective) blocks are located	var(*LIST).VOL	S	<vsn>	

---

## 5.110 SHOW-CACHE-CONFIGURATION

Show configuration of the PFA cache areas

**Component:** BS2000 OSD/BC

**Functional area:** Caching media control Pubset and MRSCAT management

**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT

**Privileges:** TSOS  
HARDWARE-MAINTENANCE  
SW-MONITOR-ADMINISTRATION

### Function

The SHOW-CACHE-CONFIGURATION command supplies systems support staff with information on the PFA cache areas. As part of the PFA ("Performant File Access") concept, the user can put files into buffer storage ("cache" them) via the DMS interfaces. The cache medium supported via PFA interfaces is: main memory (MM). The DAB subsystem is required as the cache handler driver software for the use of the cache medium.

The command supports structured output in S variables (see "[Output in S variable](#)").

### Format

```
SHOW-CACHE-CONFIGURATION  
  
CACHE-MEDIUM = *ALL / *MAIN-MEMORY  
,CACHE-ID = *ALL / list-poss(2000): <alphanum-name 1..4>
```

### Operands

#### **CACHE-MEDIUM =**

Identifies the storage medium which is used for caching.

#### **CACHE-MEDIUM = \*ALL**

Preset value: all supported storage media will be considered. If an explicit CACHE-ID is specified, a check is made to determine if this cache area is held in any of the supported media. If CACHE-ID=\*ALL is specified, information is supplied for all the cache areas in the supported media.

**i** The cache medium main memory is currently the only supported medium.

#### **CACHE-MEDIUM = \*MAIN-MEMORY**

Requests information about the cache areas which use main memory as the cache medium.

If the cache area is not found in this medium, or if there is no cache area set up in this medium, the command will be rejected with an error message.

#### **CACHE-ID = \*ALL / list-poss(2000): <alphanum-name 1..4>**

Identifier of the cache area for which information is required. With PFA cache areas this is the pubset identifier (SF pubsets) or the volume set identifier (SM pubsets).

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD2201	Error at the interface between SDF and the command server
	3	CMD2203	SDF version is not supported
	32	ECC0001	Internal error
	64	CMD0216	No authorization to call command
	64	ECC0303	No cache handler loaded
	64	ECC0006	Cache handler DAB not loaded
	64	ECC0301	Cache area does not exist
	64	ECC0304	No cache area exists

## Format of the output data

The output starts with the heading line:

```
CACHE-CONFIGURATION IN CACHE-MEDIUM <mdm> FOR CACHE-METHOD <mtd>
```

where the following values are possible:

<mdm> = MAIN-MEMORY

<mtd> = DAB

The output specifies the configuration of all the cache buffers for the named cache medium and managed by the DAB cache handler. This is subdivided into various configuration records; these are

1. PARTITION-CONFIGURATION-RECORD
2. Buffer configuration records.

A PARTITION-CONFIGURATION-RECORD is always output. The partition configuration record contains the following information on the DAB partitions:

- Size of the partition in megabytes: Size of the reserved cache storage. With MM, what is shown is the total amount of cache storage occupied so far; with ES and GS it is the area within the cache medium which is allocated to the partition in question.
- Status of the partition in the cache medium.  
With MM, the availability of the medium is indicated (OPERABLE / DEFECT).
- The number of installed cache areas in the medium or in the GS partition

A BUFFER-CONFIGURATION-RECORD for each cache area. When MM is used as the cache medium, the BUFFER-CONFIGURATION-RECORD provides the following information:

- Cache ID:  
Identifier of the cache area for which information is required. With PFA cache areas this is the pubset ID (SF pubsets) or the volume set ID (SM pubsets).
- Cache size in megabytes or kilobytes.
- Segment size of the cache area in kilobytes (not for AutoDAB).
- Cache area utilization.  
Indicates how much of the cache area is occupied by data.
- Status.
  - CONNECTED: the cache area is being actively used for a pubset.
  - DISCONNECTED: the cache area is currently not being used (typically because it could not be saved when the pubset was exported). The next time the pubset is imported, the status will change back to CONNECTED.
  - DEFECT: an access error was detected when the cache medium was addressed. Where possible, caching is disabled.
- Force-out cycle.  
Indicates when the write data in the cache area is transferred to the associated disks
  - NO: the data is not written out periodically, but only when the files are closed or the cache area is deleted
  - AT-HIGH-FILLING: the data is written out when the cache is 75% full of write data
  - AT-LOW-FILLING: the data is written out when the cache is 25% full of write data.

## Example

**/show-cache-configuration**

```
%
% CACHE-CONFIGURATION IN CACHE-MEDIUM MAIN-MEMORY OF CACHE-METHOD DAB :
%
% PARTITION-CONFIGURATION-RECORD:
% PARTITION-ID  SIZE      FREE          STATE          #BUFFER
% -----      31MB      ----          OPERABLE          1
%
% BUFFER-CONFIGURATION-RECORD:

```

*Explanation of output for the DAB cache media*

The information consists of several information

```
PARTITION-CONFIGURATION-RECORD:
PARTITION-ID  SIZE      FREE          STATE          #BUFFER
(1)           (2)      (3)          (4)           (5)

BUFFER-CONFIGURATION-RECORD:
CACHE-ID      SIZE  SEG-SIZE      IN-USE  STATE          FORCE-OUT
(6)           (7)  (8)          (9)      (10)          (11)
```

---

## *Explanation*

### Partition information block (PARTITION-CONFIGURATION-RECORD)

- (1) PARTITION-ID  
Information on the partition ID. The information is only of relevance for the global storage cache medium.
- (2) SIZE  
Size of the partition in Mbytes. Size of the available cache. For the main memory (MM) cache medium, the total cache space in use.
- (3) FREE  
Only displays '----'.
- (4) STATE  
Status of the partition of the cache medium and the slices. The following states may occur:
  - HOME partition referring to the home pubset of the current system (ADM PFA partition).
  - OPERABLE The availability of the cache medium main memory.
  - DEFECT Indicates that the cache medium is not available.
  - SHARED The partition is used for a shared pubset.
- (5) #BUFFER  
Number of cache areas installed in this partition.

### Cache area information block (BUFFER-CONFIGURATION-RECORD)

- (6) CACHE-ID  
Identifies the cache area on which information is requested. With PFA cache areas this is the pubset ID (SF pubsets) or the volume set ID (SM pubsets).
- (7) SIZE  
The size of the cache area in megabytes (or in kilobytes, if the cache medium specified was MM).
- (8) SEG-SIZE  
Segment size of the cache area in kilobytes.
- (9) IN-USE  
Degree of utilization of the cache area.
- (10) STATE  
State of the cache area. The following states may occur:
  - CONNECTED The cache area is currently in use.
  - DISCONNECTED The cache area is not in use at the moment, e.g. because it was not possible to save the related files when the pubset was exported.
  - DEFECT An error was encountered when accessing the cache medium. Where possible, caching is disabled.

## (11) FORCE-OUT

The intervals at which the write data in the cache area is transferred to the associated disks.

- NO The data is not transferred periodically. The data is only transferred to the disk when the files are closed or when the cache area is deleted.
- AT-HIGH-FILLING The data is written out when the cache area is 75% full of write data.
- AT-LOW-FILLING The data is written out when the cache area is 25% full of write data.

## Output in S variable

The CACHE-MEDIUM operand specifies the cache medium to which the output information relates.

Notation used in command	Abbreviated form used in table
CACHE-MEDIUM = *ALL	1
CACHE-MEDIUM = *MAIN-MEMORY	2

Output information	Name of the S variable	T	Contents	Condition
Cache medium *MAIN-MEM=main memory	var(*LIST).CACHE-MED	S	*MAIN-MEM	1.2
Name of the cache area (corresponds to the pubset ID)	var(*LIST).PART(*LIST).BUF (*LIST).CACHE-ID	S	<c-string 1..4>	2
Segment size of the cache area	var(*LIST).PART(*LIST).BUF (*LIST).CACHE-SEGMENT- SIZE	S	*UNDEF <c-string 1..2>	2
Size of the cache area	var(*LIST).PART(*LIST).BUF (*LIST).CACHE-SIZE	I	<integer 1..999999>	2
Cache filling level from which the write data of the cache area is written back to the disks	var(*LIST).PART(*LIST).BUF (*LIST).FORCE-OUT	S	*NO *AT-HIGH-FILL *AT-LOW-FILL	2
Portion of cache space allocated	var(*LIST).PART(*LIST).BUF (*LIST).IN-USE	I	<integer 0..100>	2
Specification of the size of the cache area in: *KB=kilobytes *MB=megabytes	var(*LIST).PART(*LIST).BUF (*LIST). SIZE-DIM	S	*KB *MB	2
Status of the cache area	var(*LIST).PART(*LIST).BUF (*LIST).STA	S	*CONN *DISCONN *DEFECT	2

Output information	Name of the S variable	T	Contents	Condition
Number of cache areas in the main memory	var(*LIST).PART(*LIST).NUM-OF-BUF	I	<integer 1..999999>	2
Partition ID	var(*LIST).PART(*LIST).PART-ID	S	" <c-string 1..8>	2
Size of the partition or total of the sizes of the cache areas in main memory	var(*LIST).PART(*LIST).SIZE	I	<integer 1..999999>	2
Specification of the size of the partition in: *KB=kilobytes *MB=megabytes	var(*LIST).PART(*LIST).SIZE-DIM	S	*KB *MB	2
Status of the partition	var(*LIST).PART(*LIST).STA	S	*HOME *PFA *SHARED *CONN *OPERABLE *DEFECT	2

---

## 5.111 SHOW-CALENDAR

Request information from calendar file

<b>Component:</b>	CALENDAR
<b>Functional area:</b>	Job processing
<b>Domain:</b>	UTILITIES
<b>Privileges:</b>	STD-PROCESSING

### Function

The SHOW-CALENDAR command is used to obtain information on the calendar data in the specified calendar file. By default, (SELECT=\*TODAY), the following information is output for the current day: the name of the calendar file, the current date, the name of the weekday (Monday...Sunday), the attribute of the current day (free day / working day), the number of associated SYMDATs (symbolic dates), the working hours, and if appropriate the holiday name, the names of the associated SYMDATs, and the time specifications assigned to them.

You use SELECT=\*BASIC-INFORMATION to output the basic information of the calendar file: the name of the calendar, the calendar limits, and definitions of the standard working week. Within the standard working week, the attributes and working hours for the weekdays are defined.

You use SELECT=\*DATE to output the day information relating to one or more days: the date, the name of the weekday, the attribute, the number of assigned SYMDATs, the working hours, the holiday name if appropriate, and using a special operand the names of the associated SYMDATs and the assigned time specifications.

You use SELECT=\*SYMBOLIC-DATE to output information on SYMDATs. These are symbolic dates under whose names calendar days are combined (see the "Calendar" manual [4]).

You use SELECT=\*HOLIDAY to output information on holidays. Output can be routed to SYSOUT or SYSLST.

The command supports structured output in S variables (see "[Output in S variables](#)").

SHOW-CALENDAR accesses the specified calendar file in read-only mode. You can create and modify calendar files using the CALENDAR utility or the program interface (CALENDAR macro). To start the CALENDAR utility you use the START-CALENDAR-EDITOR command. There are in-depth descriptions of the utility and the program interface in the "Calendar" manual [4].

## Format

### SHOW-CALENDAR

**CALENDAR-NAME** = <filename 1..54>

,**SELECT** = **\*TODAY** / **\*BASIC-INFORMATION** / **\*DATE(...)** / **\*SYMBOLIC-DATE(...)** / **\*HOLIDAY(...)**

**\*DATE(...)**

| **FROM** = **\*TODAY** / **\*FIRST-CALENDAR-DATE** / <date>

| ,**TO** = **\*SAME** / **\*TODAY** / **\*LAST-CALENDAR-DATE** / <date> / **\*BY-NUMBER-OF-DAYS(...)**

| **\*BY-NUMBER-OF-DAYS(...)**

| | **NUMBER-OF-DAYS** = <integer 1..1827 days>

| ,**ASSIGNED-SYM-DATE** = **\*NONE** / **\*ALL(...)** /

| | <filename 1..20 without-cat-user-gen-vers with-wild>(...)

| **\*ALL(...)**

| | **ORDER-WITHIN-DAY** = **\*BY-TIME** / **\*BY-SYMBOLIC-DATE**

| | <filename 1..20 without-cat-user-gen-vers with-wild>(...)

| | **ORDER-WITHIN-DAY** = **\*BY-TIME** / **\*BY-SYMBOLIC-DATE**

**\*SYMBOLIC-DATE(...)**

| **FROM** = **\*FIRST-SYMBOLIC-DATE** / <filename 1..20 without-cat-user-gen-vers with-wild>

| ,**TO** = **\*SAME** / **\*LAST-SYMBOLIC-DATE** /

| | <filename 1..20 without-cat-user-gen-vers with-wild> /

| **\*BY-NUMBER-OF-SYMBOLIC-DATES(...)**

| **\*BY-NUMBER-OF-SYMBOLIC-DATES(...)**

| | **NUMBER-OF-SYM-DATES** = <integer 1..4096>

| ,**ASSIGNED-DATES** = **\*NO** / **\*ALL** / **\*NEXT-DATE** / **\*INTERVAL(...)**

| **\*INTERVAL(...)**

| | **FROM** = **\*TODAY** / **\*FIRST-ASSIGNED-DATE** / <date>

| | ,**TO** = **\*SAME** / **\*TODAY** / **\*LAST-ASSIGNED-DATE** / <date> /

| | **\*BY-NUMBER-OF-DAYS(...)**

| | **\*BY-NUMBER-OF-DAYS(...)**

| | | **NUMBER-OF-DAYS** = <integer 1..1827 days>

**\*HOLIDAY(...)**

```

| FROM = *FIRST-HOLIDAY / <filename 1..30 without-cat-user-gen-vers with-wild>
| ,TO = *SAME / <filename 1..30 without-cat-user-gen-vers with-wild> /
|   *LAST-HOLIDAY / *BY-NUMBER-OF-HOLIDAYS(...)
|   *BY-NUMBER-OF-HOLIDAYS(...)
|     |   NUMBER-OF-HOLIDAYS = <integer 1..1024 days>
| ,ASSIGNED-DATES = *NO / *YES
, OUTPUT = *SYSOUT / list-poss(2): *SYSOUT / *SYSLST(...)
  *SYSLST(...)
|   SYSLST-NUMBER = *STD / <integer 1..99>

```

## Operands

**CALENDAR-NAME** = <filename 1..54>

Name of the calendar file from which information is to be output.

**SELECT** = \***TODAY** / \***BASIC-INFORMATION** / \***DATE**(...) / \***SYMBOLIC-DATE**(...) / \***HOLIDAY**(...)

Specification indicating which information is to be output from the calendar file.

**SELECT** = \***TODAY**

Specifies the information for the current day:

- name of the calendar file
- current date
- name of the weekday
- attribute: W = workday or F = free day
- number of associated SYMDATs
- working hours (beginning and end)
- if appropriate, the name of the holiday
- a list containing the names of associated SYMDATs and the time specifications assigned to them (sorted by time)

**SELECT** = \***BASIC-INFORMATION**

Specifies the basic information of the calendar:

- name of the calendar file
- calendar limits
- days of the standard working week and their attributes (working day / free day)

**SELECT** = \***DATE**(...)

Specifies the day information for a range of days. The desired range is selected using the subordinate operands FROM and TO. The following information is output for each selected day:

- date
- name of the weekday
- attribute: W = workday or F = free day

- number of associated SYMDATs
- working hours (beginning and end)
- if appropriate, the name of the holiday

You can also use the subordinate operand ASSIGNED-SYM-DATE to request a list of the names of associated SYMDATs and the times assigned to them.

**FROM = \*TODAY / \*FIRST-CALENDAR-DATE / <date>**

Determines the first day at which output of the information is to begin.

**FROM = \*TODAY**

Output begins from the current day.

**FROM = \*FIRST-CALENDAR-DATE**

Output begins with the first day in the calendar file.

**FROM = <date>**

Output begins with the specified date.

**TO = \*SAME / \*TODAY / \*LAST-CALENDAR-DATE / <date> / \*BY-NUMBER-OF-DAYS(...)**

Determines the last day at which output of the information is to end.

**TO = \*SAME**

Information is output for the day specified in FROM only.

**TO = \*TODAY**

Output ends with the current day.

**TO = \*LAST-CALENDAR-DATE**

Output ends with the last day in the calendar file.

**TO = \*BY-NUMBER-OF-DAYS(...)**

Determines the size of the desired range in days beginning with the day specified in FROM.

**NUMBER-OF-DAYS = <integer 1..1827 *days*>**

Number of days.

**ASSIGNED-SYM-DATE = \*NONE / \*ALL(...) / <filename 1..20 without-cat-user-gen-vers with-wild>(...)**

Specifies whether the associated SYMDATs are to be output in addition to the calendar days.

The default value is \*NONE, i.e. no additional list is output.

**ASSIGNED-SYM-DATE = \*ALL(...)**

All the names of the SYMDATs assigned to the specified calendar days are output.

**ORDER-WITHIN-DAY = \*BY-TIME / \*BY-SYMBOLIC-DATE**

Determines the sort criterion. Output is sorted in accordance with the assigned time (\*BY-TIME; default) or alphabetically by SYMDAT name (\*BY-SYMBOLIC-DATE).

**ASSIGNED-SYM-DATE = <filename 1..20 without-cat-user-gen-vers with-wild>(...)**

The specified SYMDAT or the group of SYMDATs identified in the pattern string is also output. (You can select several SYMDATs with a single specification using a pattern string, where only the pattern character \* is permitted at the end for any character string.)

---

**ORDER-WITHIN-DAY = \*BY-TIME / \*BY-SYMBOLIC-DATE**

Determines the sort criterion.

Output is sorted in accordance with the assigned time (\*BY-TIME; default) or alphabetically by SYMDAT name (\*BY-SYMBOLIC-DATE).

**SELECT = \*SYMBOLIC-DATE(...)**

Specifies information on the SYMDATs defined in the calendar. The range of output is defined using the subordinate operands FROM and TO. You can also output the assigned days using the subordinate operand ASSIGNED-DATES.

**FROM = \*FIRST-SYMBOLIC-DATE / <filename 1..20 without-cat-user-gen-vers with-wild>**

Specifies the SYMDAT at which output is to begin.

**FROM = \*FIRST-SYMBOLIC-DATE**

Output begins with the first SYMDAT in the alphabetical sequence.

**FROM = <filename 1..20 without-cat-user-gen-vers with-wild>**

Output begins with the specified SYMDAT or with the group of SYMDATs (in alphabetical order) identified in the pattern string.

(You can select several SYMDATs with a single pattern string, where only the pattern character \* is permitted at the end for any character string.)

**TO = \*SAME / \*LAST-SYMBOLIC-DATE / <filename 1..20 without-cat-user-gen-vers with-wild> / \*BY-NUMBER-OF-SYMBOLIC-DATES(...)**

Specifies the SYMDAT at which output is to end.

**TO = \*SAME**

The specification entered for the FROM operand also applies here.

**TO = \*LAST-SYMBOLIC-DATE**

Output ends with the last SYMDAT in the alphabetical sequence.

**TO = <filename 1..20 without-cat-user-gen-vers with-wild>**

Output ends with the specified SYMDAT or with the group of SYMDATs (in alphabetical order) identified in the pattern string.

(You can select several SYMDATs with a single pattern string, where only the pattern character \* is permitted at the end for any character string.)

**TO = \*BY-NUMBER-OF-SYMBOLIC-DATES(...)**

Determines the number of SYMDATs to be output beginning with the SYMDAT specified in FROM.

**NUMBER-OF-SYM-DATES = <integer 1..4096>**

Number of SYMDATs.

**ASSIGNED-DATES = \*NO / \*ALL / \*NEXT-DATE / \*INTERVAL(...)**

Specifies whether the calendar days assigned to a selected SYMDAT are also to be output.

The default value is \*NO, i.e. no additional list is output.

**ASSIGNED-DATES = \*ALL**

All calendar days assigned to the selected SYMDAT are also output.

**ASSIGNED-DATES = \*NEXT-DATE**

All calendar days assigned to the selected SYMDAT which occur after the current date are also output.

---

**ASSIGNED-DATES = \*INTERVAL(...)**

Defines a range of days to be listed.

**FROM = \*TODAY / \*FIRST-ASSIGNED-DATE / <date>**

First day in the range of days to be listed.

**FROM = \*TODAY**

The range begins with the current day.

**FROM = \*FIRST-ASSIGNED-DATE**

The range begins with the next assigned day.

**FROM = <date>**

The range begins with the specified day.

**TO = \*SAME / \*TODAY / \*LAST-ASSIGNED-DATE / <date> / \*BY-NUMBER-OF-DAYS(...)**

Last day in the range of days to be listed.

**TO = \*SAME**

The specification entered for the FROM operand also applies here.

**TO = \*TODAY**

The range ends with the current day.

**TO = \*LAST-ASSIGNED-DATE**

The range ends with the last assigned day.

**TO = <date>**

The range ends with the specified day.

**TO = \*BY-NUMBER-OF-DAYS(...)**

Determines the number of days to be listed beginning with the day specified in FROM.

**NUMBER-OF-DAYS = <integer 1..1827 *days*>**

Number of days.

**SELECT = \*HOLIDAY(...)**

Specifies information on holidays. This includes the names of the holidays and their properties (type: cyclic / non-cyclic; activation status: yes / no). The range of output is defined using the subordinate operands FROM and TO. You can also request a list of assigned days using the subordinate operand ASSIGNED-DATES.

**FROM = \*FIRST-HOLIDAY / <filename 1..30 without-cat-user-gen-vers with-wild>**

Specifies the holiday at which output is to begin.

**FROM = \*FIRST-HOLIDAY**

Output begins with the first holiday (alphabetically) in the calendar file.

**FROM = <filename 1..30 without-cat-user-gen-vers with-wild>**

Output begins with the specified holiday or with the group of holidays (in alphabetical order) identified in the pattern string.

(You can select several holidays with a single pattern string, where only the pattern character \* is permitted at the end for any character string.)

**TO = \*SAME / <filename 1..30 without-cat-user-gen-vers with-wild> / \*LAST-HOLIDAY / \*BY-NUMBER-OF-HOLIDAYS(...)**

Specifies the holiday at which output is to end.

---

**TO = \*SAME**

The specification entered for the FROM operand also applies here.

**TO = \*LAST-HOLIDAY**

Output ends with the last holiday (alphabetically) in the calendar file.

**TO = <filename 1..30 without-cat-user-gen-vers with-wild>**

Output ends with the specified holiday or with the group of holidays (in alphabetical order) identified in the pattern string.

(You can select several holidays with a single pattern string, where only the pattern character \* is permitted at the end for any character string.)

**TO = \*BY-NUMBER-OF-HOLIDAYS(...)**

Determines the number of holidays to be output beginning with the holiday specified in FROM.

**NUMBER-OF-HOLIDAYS = <integer 1..1024 days>**

Number of days to be output.

**ASSIGNED-DATES = \*NO / \*YES**

Specifies whether all calendar days that fall on the selected holidays are also to be listed.

The default value is \*NO, i.e. no additional list is output.

**OUTPUT = \*SYSOUT / list-poss(2): \*SYSOUT / \*SYSLST(...)**

Specifies whether output is to be written to SYSOUT or SYSLST.

The default value is \*SYSOUT. Simultaneous output to both SYSLST and SYSOUT is possible (list specification).

**OUTPUT = \*SYSLST(...)**

Output is written to SYSLST.

**SYSLST-NUMBER = \*STD / <integer 1..99>**

Number of the SYSLST file.

The default value is \*STD, i.e. output is written to SYSLST.

When entering a number, you must make sure that a cataloged file is assigned to the corresponding SYSLST file (SYSLST01 through SYSLST99) (see ASSIGN-SYSLST command).

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	64	CLD1031	Calendar file does not exist
	64	CLD1032	DMS error when accessing calendar file

## Output formats

You can use the OUTPUT operand to route the desired output to SYSOUT and/or SYSLST. If desired, the user has the option of using a German-language interface. The layouts of the English interface, which are described below, are identical for SYSOUT and SYSLST.

```

*Description of output fields*

<b>Output field</b>	<b>Meaning</b>
ACTIVE	Activation status of the holiday: Y = activated, N = not activated
ASSIGNED DATES	Dates of the calendar days assigned to a SYMDAT or a holiday; output in yyyy-mm-dd format
ATTR	Attribute of the weekday: W = working day, F = free day
CALENDAR LIMITS	Calendar limits:
• START	First date in the calendar (lower calendar limit); output in yyyy-mm-dd format
• END	Last date in the calendar (upper calendar limit); output in yyyy-mm-dd format
CALENDAR NAME	Name of the calendar file
CYCLALT	Alternative for a case where a calculated SYMDAT entry is a free day; possible values: BEFORE = insert before free day, AFTER = insert after free day, SKIP = skip day, ON = insert on free day
CYCLTYP	Cycle type of the SYMDAT: DAY, WORKDAY, MONTH, WEEK
CYCLVAL	Cycle value
DATE	Date; output in yyyy-mm-dd format; for cyclic holidays, output in format: ****-mm-dd
DAY	Name of the weekday: MON (Monday), TUE (Tuesday), WED (Wednesday), THU (Thursday), FRI (Friday), SAT (Saturday), SUN (Sunday)
HOLIDAY	Name of the associated holiday
HOLIDAY NAME	Name of the holiday; max. 30 characters
SYMBOLIC DATE	Name of a SYMDAT; max. 20 characters
STANDARD WEEK	Definitions of the standard working week include the following information: DAY, ATTR, and WORKING HOURS (see relevant descriptions)
TIME	Time entry assigned to the SYMDAT; output in hh:mm:ss format
TYPE	Type of SYMDAT or holiday: C = cyclic, N = non-cyclic
WORKING HOURS	Beginning and end of the working hours; output in hh:mm-hh:mm format
#SYM	Number of SYMDATs assigned to a particular day

Table 98: Output fields of the SHOW-CALENDAR command

## Output in S variables

The command's SELECT operand identifies the S variables which are to be created. The following specifications are possible for SELECT

Notation used in command	Abbreviated form used in table
SEL=*BASIC-INFORMATION	1
SEL=*DATE(ASSIGNED-SYM-DATE=*NONE)	2
SEL=*DATE(ASSIGNED-SYM-DATE=*ALL/name)	3
SEL=*HOLIDAY(ASSIGNED-DATES=*NO)	4
SEL=*HOLIDAY(ASSIGNED-DATES=*YES)	5
SEL=*SYMBOLIC-DATE(ASSIGNED-DATES=*NO)	6
SEL=*SYMBOLIC-DATE(ASSIGNED-DATES=*ALL/*NEXT-DATE/*INTERVAL)	7
SEL=*TODAY	8

Output information	Name of the S variable	T	Contents	Condition
Public holidays activated	var(*LIST).ACTIVE	S	*NO *YES	4,5
Alternative in case the calculated SYMDAT falls on a free day *AFTER=enter the first available working day after the calculated SYMDAT <sup>1</sup> *BEFORE=enter the first available working day before the calculated SYMDAT <sup>2</sup> *ON=do not search; enter the SYMDAT on the free day *SKIP=do not search; do not enter an alternative date	var(*LIST).ALT	S	*AFTER *BEFORE *ON *SKIP	6,7
Date of the days assigned to the SYMDAT or holiday	var(*LIST).ASS-DATE (*LIST)	S	<yyyy-mm-dd>	5,7
Type of day *FREE=free day *WORK=working day	var(*LIST).ATTR	S	*FREE *WORK	2,3,8
First date in the calendar (beginning of range)	var(*LIST).CALEN-BEGIN	S	<yyyy-mm-dd>	1

Last date in the calendar (end of range)	var(*LIST).CALEN-END	S	<yyyy-mm-dd>	1
Name of the calendar file	var(*LIST).CALEN-NAME	S	<filename 1..54>	1,2,3,4,5,6,7,8
Cycle type for symbolic date	var(*LIST).CYCL-TYPE	S	*DAY *MONTH *WEEK *WORKDAY	6,7
Cycle value	var(*LIST).CYCL-VAL	I	<integer 1..9999>	6,7
Date If 5: date assigned to the public holiday; the S variable is assigned a value only for cyclic holidays. In this case, the output for yyyy is ****. In the case of non-cyclic holidays the output consists of a blank.	var(*LIST).DATE	S	<yyyy-mm-dd>	2,3,5,8
Name of the day of the week	var(*LIST).DAY	S	MON TUE WED THU FRI SAT SUN	2,3,8
The designated day is a holiday(see var (*LIST).DATE)	var(*LIST).HOLIDAY	S	*NO *YES	2,3,8
Name of the holiday	var(*LIST).HOLIDAY-NAME	S	" <name 1..30>	2,3,4,5,8
Number of SYMDATs associated with the day (see var(*LIST).DATE)	var(*LIST).NUM-OF-SYMB-DATE	I	<integer ..4096>	2,3,8
Type of day *FREE=free day *WORK=working day (standard working week)	var(*LIST).STD-WEEK (*LIST).ATTR	S	*FREE *WORK	1
Name of the day of the week (standard working week)	var(*LIST).STD-WEEK (*LIST).DAY	S	MON TUE WED THU FRI SAT SUN	1
Start of working hours (standard working week)	var(*LIST).STD-WEEK (*LIST).WORK-TIME-BEGIN	S	<hh:mm>	1

Output information	Name of the S variable	T	Contents	Condition
End of working hours (standard working week)	var(*LIST).STD-WEEK (*LIST).WORK-TIME-END	S	<hh:mm>	1
Name of the SYMDAT (lexically ascending series starts with the specified SYMDAT)	var(*LIST).SYMB-DATE-NAME	S	<name 1..20>	6,7
Name of the SYMDAT assigned to the day (see var(*LIST).DATE); if no SYMDAT is defined, the S variable is not generated	var(*LIST).SYMB-DATE (*LIST).NAME	S	<name 1..20>	3,8
Time of day on the SYMDAT assigned to the day (see var(*LIST).DATE); if no SYMDAT is defined, the S variable is not generated	var(*LIST).SYMB-DATE (*LIST).TIME	S	<hh:mm:ss>	3,8
Time of day assigned to the SYMDAT	var(*LIST).TIME	S	<hh:mm:ss>	6,7
Type of SYMDAT or holiday	var(*LIST).TYPE	S	*CYCL *NOT-CYCL	4,5,6,7
Start of working hours	var(*LIST).WORK-TIME-BEGIN	S	<hh:mm>	2,3,8
End of working hours	var(*LIST).WORK-TIME-END	S	<hh:mm>	2,3,8

*Key to var(\*LIST).ALT:*

- 1 \*AFTER: The next working day is searched for in the range “calculated date + (cycle value - 1)”. If the search is successful, the alternative day is entered *after* the date originally calculated. If no working day is found within the period, the entry is dropped.
- 2 \*BEFORE: The next working day is searched for in the range “calculated date - (cycle value - 1)”. If the search is successful, the alternative day is entered *before* the date originally calculated. If no working day is found within the period, the entry is dropped.

---

## 5.112 SHOW-CCOPY-SESSION

Display information on CCOPY sessions

**Component:** CCOPY

**Functional area:** Pubset and MRSCAT management

**Domain:** STORAGE-MANAGEMENT

**Privileges:** TSOS  
HSMS-ADMINISTRATION

### Function

The user can obtain information on all existing CCOPY sessions using the SHOW-CCOPY-SESSION command (as of CCOPY V3.0A). Output can be directed to either SYSOUT or SYSLST. The INFORMATION operand can be used in order to define whether only the attributes of the installed CCOPY sessions are to be output (e.g. identification, status, name and size of work file) or whether the relevant objects (files and job variables) are to be displayed as well.

The command supports structured output in S variables (see "[Output in S variables](#)").

### Format

#### SHOW-CCOPY-SESSION

```
SESSION-ID = *ALL / <alphanum-name 8..8>  
,INFORMATION = *ATTRIBUTES / *OBJECTS-AND-ATTRIBUTES  
,OUTPUT = *SYSOUT / *SYSLST(...)  
    *SYSLST(...)  
        | SYSLST-NUMBER = *STD / <integer 1..99>
```

### Operands

**SESSION-ID = \*ALL / <alphanum-name 8..8>**

Specifies whether information is to be output on all CCOPY sessions or only on a specific CCOPY session.

**SESSION-ID = \*ALL**

Information is to be output on all CCOPY sessions

**SESSION-ID = <alphanum-name 8..8>**

Information is to be output on the specified CCOPY session only.

**INFORMATION = \*ATTRIBUTES / \*OBJECTS-AND-ATTRIBUTES**

Defines the scope of the information that is to be output for each CCOPY session that is selected.

**INFORMATION = \*ATTRIBUTES**

The attributes of the installed CCOPY sessions are output (e.g. identification, status, name and size of the work file).

---

**INFORMATION = \*OBJECTS-AND-ATTRIBUTES**

The same information is output as with INFORMATION=\*ATTRIBUTES, but with additional information on the objects (e.g. object name, object type and object status).

**OUTPUT = \*SYSOUT / \*SYSLST(...)**

Defines the destination to which the information is output.

**OUTPUT = \*SYSOUT**

Output is directed into the SYSOUT system file.

**OUTPUT = \*SYSLST(...)**

Output is directed into the SYSLST system file.

**SYSLST-NUMBER = \*STD /<integer 1..99>**

For SYSLST-NUMBER=\*STD, output is directed to SYSLST or into a SYSLST file whose name consists of "SYSLST" and a number between 1 and 99 (SYSLST01 to SYSLST99).

**Return codes**

(SC2)	SC1	Maincode	Meaning
	00	CMD0001	No error
	32	CMD2009	VAS / OPS reports an internal error
	32	DCH0005	Internal error occurred when setting / releasing a lock in the CCOPY subsystem
	32	DCH000D	System error occurred on program execution
	32	DCH000E	System error during output in S variable
	64	CMD0216	User not privileged
	64	DCH0006	No CCOPY session
	64	DCH0007	Invalid SESSION-ID
	130	OPS0001	Insufficient storage for output in S variable

## Output in S variables

Output information	Name of the S variable	T	Contents
Creation date	var(*LIST).CRE-DATE	S	<c-string 10..10: yyyy-mm-dd>
Creation time	var(*LIST).CRE-TIME	S	<c-string 8..8: hh:mm:ss>
Runtime environment *HOST= local *CCS= shared pubset network	var(*LIST).ENVIR	S	*HOST *CCS
Number of objects	var(*LIST).NUM-OF-OBJECT	I	<integer 0..2147483647>
Number of objects already backed up	var(*LIST).OBJECT-PROCESS	I	<integer 0..2147483647>
Object status *OMIT=object will not be backed up *SEL-FOR-SAVE=object will be backed up *SAVE-START=backing up *SAVE-ABORT=backup aborted *OBJECT-SAVE=object has been backed up *WORK-FILE=object is a work file and will not be backed up	var(*LIST).OBJECT-STA	S	*OMIT' *SEL-FOR-SAVE *SAVE-START *SAVE-ABORT *OBJECT-SAVE *WORK-FILE
Number of objects to be backed up	var(*LIST).OBJECT-TO-SAVE	I	<integer 0..2147483647>
Fully qualified object name	var(*LIST).OBJECT (*LIST).OBJECT-NAME	S	<c-string 1..54>
Object type *FILE=file *FGGI=file generation index *FGG=file generation group *JV=job variable	var(*LIST).OBJECT (*LIST).OBJECT-TYPE	S	*FILE *FGGI *FGG *JV
CCOPY session ID (eight characters long)	var(*LIST).SESSION-ID	S	<c-string 8..8>
Status of CCOPY session *IN-CRE=being created *RUN=running *BACKUP-IN-PROGRESS=backing up *TERM=terminated *ABORT=aborted	var(*LIST).STA	S	*IN-CRE *RUN *BACKUP-IN-PROGRESS *TERM *ABORT
Fully qualified name of work file	var(*LIST).WORK-FILE-NAME	S	<c-sting 1..54>

---

Size of work file	var(*LIST).WORK-FILE-SIZE	I	<integer 0..2147483647>
-------------------	---------------------------	---	-------------------------

## Examples

*Output format for INFORMATION=\*ATTRIBUTES*

```
===== CCOPY - SESSION - DATA =====
SESSION-ID = 00010001      STATUS = RUNNING              ENV = HOST
CRE-DATE = 2012-03-31     CRE-TIME = 12:00:00
OBJECTS-TO-SAVE = 10      OBJECTS-PROCESSED = 7
WORK-FILE-NAME = <work file>
WORK-FILE-SIZE = 48 KB
```

An output block as shown in this example is issued for every CCOPY session (if SESSION-ID=\*ALL was specified) or for the session chosen.

*Output format for INFORMATION=\*OBJECTS-AND-ATTRIBUTES*

```
===== CCOPY - SESSION - DATA =====
SESSION-ID = 00010001      STATUS = RUNNING              ENV = HOST
CRE-DATE = 2012-03-31     CRE-TIME = 12:00:00
OBJECTS-TO-SAVE = 10      OBJECTS-PROCESSED = 7
WORK-FILE-NAME = <work file>
WORK-FILE-SIZE = 48 KB
----- OBJECTS ----- TYPE ----- STATUS -----
<filename>                FILE      SELECTED-FOR-SAVE
<filename>                FILE      SELECTED-FOR-SAVE
<filename>                FGGI     SELECTED-FOR-SAVE
<filename>                JV       SELECTED-FOR-SAVE
<filename>                FILE     SELECTED-FOR-SAVE
...

```

---

## 5.113 SHOW-CE-LOCK

Display locks for catalog entries

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
FILE-GENERATION  
**Privileges:** STD-PROCESSING  
TSOS

### Function

The SHOW-CE-LOCK command determines whether a lock (CE lock) exists for the catalog entry of a file or job variable. If a lock exists the TID (task ID) of the lock holder and the SYSID (system identification) of the system in which the task is running are output to SYSOUT.

The catalog entry cannot be modified while it is locked. Systems support staff can reset a CE lock that is hung, e.g. due to an error in systems communication (see REMOVE-CE-LOCK command).

For a shared pubset, this command can be entered from any system in the network.

The command supports structured output in S variables (see ["Output in S variables"](#)).

### Format

<b>SHOW-CE-LOCK</b>
<b>FILE-NAME</b> = <filename 1..54> <b>,OBJECT</b> = * <u>FILE</u> / *JV

### Operands

**FILE-NAME = <filename 1..54>**

Name of the file or job variable whose catalog entry is to be examined for CE locks. A file generation may not be specified relatively.

**OBJECT = \*FILE / \*JV**

Specifies whether the catalog entry of a file or of a job variable is to be examined.

## Return code

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	DMS1342	No CE lock
	1	CMD0202	Syntax error
	32	CMD0221	Internal error
	32	CMD2009	Error during output to S variable (e.g. subsystem not available)
	64	CMD0501	Catalog not available
	64	DMS0505	Error during systems communication
	64	DMS0512	Catalog unknown in the system
	64	DMS1343	Master change underway for the pubset
	64	OPS0001	SDF-P reports insufficient storage (poss. reaction: FREE-VARIABLE and repeat command)

## Output in S variables

Output information	Name of the S variable	T	Contents	Condition
Name of the file or JV	var(*LIST).NAME	S	<filename 1..54>	
Sysid of the system in which the lockholder operates	var(*LIST).SYSID	S	<sys-id>	
Task identifier (TID) of the lockholder	var(*LIST).TID	S	<x-text 4..4>	

---

## 5.114 SHOW-CHANGE-DATES

Display changeover times

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** TSOS

### Function

The SHOW-CHANGE-DATES command displays changeover times from standard daylight time to daylight saving time (or vice versa).

### Format

<b>SHOW-CHANGE-DATES</b>
--------------------------

<b>SELECT = *NEXT / *PREVIOUS / *FUTURE / *PAST / *ALL</b>
--

### Operands

**SELECT = \*NEXT / \*PREVIOUS / \*FUTURE / \*PAST / \*ALL**

Selects the changeover times which are to be displayed.

**SELECT = \*NEXT**

The next future changeover time is displayed.

**SELECT = \*PREVIOUS**

The most recent past changeover time is displayed.

**SELECT = \*FUTURE**

All future changeover times are displayed.

**SELECT = \*PAST**

All past changeover times are displayed.

**SELECT = \*ALL**

All changeover times are displayed.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CHD0010	Syntax error in the command
	32	CMD0221	System error in the command
	64	CHD0011	Semantic error in the command

## Output format

`/SHOW-CHANGE-DATES SELECT=*FUTURE`

```
DATE      TIME W/S
2011-10-30 03:00(S)
2012-03-25 02:00(W)
```

Output field	Meaning / Information
DATE	Date of the changeover time.
TIME	Time of day of the changeover time.
W/S	(W): Specification of standard daylight time. Changeover time from standard daylight time to daylight saving time.  (S): Specification of daylight saving time. Changeover time from daylight saving time to standard daylight time.  <i>Exception:</i> In the first changeover time the specification refers to the next current season.

Table 99: Meaning of the output fields of the SHOW-CHANGE-DATES command

---

## 5.115 SHOW-CJC-STATUS

Display conditional job control information

**Component:** JV

**Functional area:** Job variables

**Domain:** JOB-VARIABLES

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** E

This function is available to the user only if the chargeable software product JV has been loaded as a subsystem.

### Function

The SHOW-CJC-STATUS command displays information about jobs that are currently using CJC (conditional job control) functions.

The query may be limited to the user's own processor, but may also be extended to include any or all processors in an existing multiprocessor network. When queries concern "foreign" processors, only information about jobs using job variables belonging to the user's processor is displayed. Nonprivileged users are only supplied with information about jobs running under their own user ID.

Furthermore, it is possible to limit the information to one or more job variables, identified by name. In this case, only those jobs are shown that have functions in which the job variables named occur in conditional expressions.

The following information can be output:

- number of jobs, number of user IDs, referenced catalogs (INFORMATION = \*SUMMARY).
- job numbers of the jobs, user IDs (listed under TSOS only), referenced catalogs (INFORMATION = \*USER-LIST).

The command supports structured output in S variables (see "[Output in S variables](#)").

#### *Privileged functions*

Systems support staff (TSOS user ID or OPERATING privilege) are supplied with information about all jobs.

---

## Format

### SHOW-CJC-STATUS

**HOST** = \*OWN / \*ALL / \*FOREIGN / \*CATALOG(...) /

list-poss(25): <c-string 1..8> / <filename 1..54 without-gen>

\*CATALOG(...)

|      **CATALOG-ID** = list-poss(25): <c-string 1..4> / <filename 1..54 without-gen>

,**JV-NAME** = \*ALL / list-poss(25): <filename 1..54 without-gen> / <partial-filename 2..53>

,**INFORMATION** = \*SUMMARY / \*USER-LIST

## Operands

### HOST =

Processor or catalog IDs to which the query refers. Non-local processors may be specified only if the software product HIPLEX MSCF is installed (see the “HIPLEX MSCF” manual [25]).

With non-local processors, jobs are taken into account only if in CJC functions they use at least one job variable not cataloged in the local processor.

### HOST = \*OWN

Local processor.

### HOST = \*ALL

All processors in the MSCF network.

### HOST = \*FOREIGN

All processors in the MSCF network, with the exception of the local processor.

### HOST = \*CATALOG(...)

Catalog ID, specified in the following.

**CATALOG-ID** = list-poss(25): <c-string 1..4> / <filename 1..54 without-gen>

Catalog ID of the processor to which the query refers, or name of a JV whose value denotes the catalog ID (left-justified, no following characters or blanks).

### HOST = list-poss(25): <c-string 1..8> / <filename 1..54 without-gen>

BCAM name (left-justified with no trailing characters or blanks) of the processor in the MSCF network to which the query refers, or name of a JV whose value denotes the BCAM name of a processor. If a list is specified, BCAM and job variable names may not be mixed.

### JV-NAME = \*ALL / list-poss(25): <filename 1..54 without-gen> / <partial-filename 2..53>

JVs to which the query refers.

Default: All JVs.

Only jobs using one of the specified JVs in CJC functions are taken into account. The argument “JV-NAME=:cat1:”, for example, refers to all jobs which use JVs cataloged on subset cat1 in CJC functions.

Special job variables must not be specified.

---

**INFORMATION = \*SUMMARY / \*USER-LIST**

Type of information to be displayed.

**INFORMATION = \*SUMMARY**

For each processor:

- local catalogs of the processor
- number of jobs
- number of user IDs
- referenced catalogs (slave processors of a shared pubset obtain, if required, information on a catalog which is not available locally)

**INFORMATION = \*USER-LIST**

For each processor:

- local catalogs of the processor
- task sequence number (TSN) of the jobs
- user IDs (under TSOS only)
- referenced catalogs (slave processors of a shared pubset obtain, if required, information on a catalog which is not available locally)

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Buffer overflow or output not possible, syntax error
	32	CMD2009	Error during S variable generation
	32	CMD0221	Internal error
	130	CJC0070	No access to other processors because MSCF is not active

## Output in S variables

The INFORMATION operand identifies the S variables which are to be created. The possible values for INFORMATION are \*SUMMARY and \*USER-LIST.

Output information	Name of the S variable	T	Contents	Condition
Name of the host	var(*LIST).HOST	S	*LOC <host-name>	INF=*SUM/ *USER-LIST
Local catalog IDs of the host	var(*LIST).LOC-CAT-ID(*LIST)	S	<cat-id>	INF=*SUM/ *USER-LIST
Number of jobs; on error (RESULT=*ERROR) NUM-OF-TSN is set to -1.	var(*LIST).NUM-OF-TSN	I	-1 <integer>	INF=*SUM
Number of user IDs; on error (RESULT=*ERROR) NUM-OF-USER is set to -1.	var(*LIST).NUM-OF-USER	I	-1 <integer>	INF=*SUM
Referenced catalogs	var(*LIST).REF-CAT-ID(*LIST)	S	" <cat-id>	INF=*SUM
Result of the query	var(*LIST).RESULT	S	*ERROR *NO-CJC *NO-ERROR	INF=*SUM/ *USER-LIST
Catalogs referenced for the job	var(*LIST).TASK(*LIST).REF-CAT-ID(*LIST)	S	" <cat-id>	INF=*USER-LIST
TSN of the job currently using the CJC function; on error (RESULT=*ERROR) TASK(*LIST).TSN is set to "".	var(*LIST).TASK(*LIST).TSN	S	" *NO-TASK <tsn>	INF=*USER-LIST
User ID under which the job is running; on error (RESULT=*ERROR) TASK(*LIST).USER-ID is set to "".	var(*LIST).TASK(*LIST).USER-ID	S	" *NO-USER <user-id>	INF=*USER-LIST

## Example (privileged user)

```
/show-cjc
```

HOST	!CAT.LOC.	! # TASKS	# USERS	CAT.REF.
*LOC	!1STZ	!	4	2 1STZ

```
/show-cjc inf=*user-list
```

HOST	!CAT.LOC.	! TSN	USER	CAT.REF.
*LOC	!1STZ	! 042M	TSOS	1STZ
	!	! 05BT	FT	1STZ
	!	! 05BP	FT	1STZ
	!	! 042P	TSOS	1STZ

## Example (S variable output)

```
/declare-var var-name=var(type=struc),multiple-elem=*list  
/exec-cmd (show-cjc-status inf=*summary),text-output=*none,struc-output=var  
/show-var var,inf=*par(val=*c-literal)
```

```
VAR(*LIST).HOST = '*LOC'  
VAR(*LIST).LOC-CAT-ID(*LIST) = '1SBZ'  
VAR(*LIST).RESULT = '*NO-ERROR'  
VAR(*LIST).NUM-OF-TSN = 2  
VAR(*LIST).NUM-OF-USER = 1  
VAR(*LIST).REF-CAT-ID(*LIST) = '1SBZ'
```

```
/exec-cmd (show-cjc-status inf=*user-list),text-output=*none,struc-output=var  
/show-var var,inf=*par(val=*c-literal)
```

```
VAR(*LIST).HOST = '*LOC'  
VAR(*LIST).LOC-CAT-ID(*LIST) = '1SBZ'  
VAR(*LIST).RESULT = '*NO-ERROR'  
VAR(*LIST).TASK(*LIST).TSN = '08NB'  
VAR(*LIST).TASK(*LIST).USER-ID = 'TSOS'  
VAR(*LIST).TASK(*LIST).REF-CAT-ID(*LIST) = '1SBZ'  
VAR(*LIST).TASK(*LIST).TSN = '08ND'  
VAR(*LIST).TASK(*LIST).USER-ID = 'TSOS'  
VAR(*LIST).TASK(*LIST).REF-CAT-ID(*LIST) = '1SBZ'
```

---

## 5.116 SHOW-CMD

Output command syntax description

**Component:** SDF

**Functional area:** SDF control

**Domain:** SDF

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The SHOW-CMD command outputs the syntax description of a command. In addition, the name and type of the employed syntax file are displayed. CMD-NAME= \*ALL produces a list of all command names. Using wildcards in the command name, the user can display a list of command names which match the search pattern.

Output can be directed to either SYSOUT or to SYSLST.

The INFORMATION operand controls the scope of the syntax description. INFORMATION= \*MINIMUM displays the command name, the name of the syntax file containing the syntax description, the operand names and any default values. Alternative operand values are displayed with INFORMATION=\*MEDIUM, while with INFORMATION=\*MAXIMUM help texts are also displayed.

The output only shows the syntax description of the assigned syntax files. In particular, task-specific default values are not displayed.

The FORM operand controls output of syntax objects whose input is not permitted in guided dialog.

FORM=\*UNGUIDED shows the command syntax which can also be entered in unguided dialog, or a command list which also contains aliases of the command names. Commands and operands which are not permitted in unguided dialog are indicated in the output with an asterisk (\*).

The CHECK-PRIVILEGES operand determines whether the output will take account of the privileges of the user. If CHECK-PRIVILEGES=\*YES is specified, the output only contains information on operands and operand values of commands which the user's privileges allow him/her to use. If a list of command names is output, commands which the user is not authorized to use are marked with an asterisk (\*).

The CHECK-INPUT-MODE operand controls the output of syntax objects which may only be input in a particular input mode. Users can thus inform themselves as to which operands and values are permissible, for example, for input in batch mode. If no input mode is specified (\*NO), commands and operands for which restrictions exist as regards the input modes (interactive mode, batch mode, procedure in interactive or batch mode) are marked with an asterisk (\*).

---

## Format

### SHOW-CMD

```
CMD-NAME = *ALL / <structured-name 1..30 with-wild>
,INFORMATION = *MINIMUM / *MEDIUM / *MAXIMUM
,FORM = *GUIDED / *UNGUIDED
,CHECK-PRIVILEGES = *YES / *NO
,CHECK-INPUT-MODE = *CURRENT / *DIALOG / *DIALOG-PROC / *BATCH / *BATCH-PROC / *NO
,OUTPUT = *SYSOUT / *SYSLST(...)
    *SYSLST(...)
        |   SYSLST-NUMBER = *STD / <integer 1..99>
        |   ,LINES-PER-PAGE = *STD / *UNLIMITED / <integer 1..200>
```

## Operands

**CMD-NAME** = \***ALL** / <structured-name 1..30 with-wild>

Name of the desired command.

**CMD-NAME** = \***ALL**

Lists all commands in alphabetical order. FORM=\***UNGUIDED** also displays defined aliases (in separate output lines).

**CMD-NAME** = <structured-name 1..30 with-wild>

Name of the command whose syntax is to be output. If you specify an alias, the real command name is displayed followed by the alias in parentheses.

If wildcards are used, all commands which match the search pattern are listed in alphabetical order.

FORM=\***UNGUIDED** also outputs defined aliases (in separate output lines).

**INFORMATION** = \***MINIMUM** / \***MEDIUM** / \***MAXIMUM**

Determines the scope of the output. When lists of commands are output, the SIZE operand is ignored.

**INFORMATION** = \***MINIMUM**

The output contains the command names, operands and preset operand values.

**INFORMATION** = \***MEDIUM**

The output contains the command names, operands, preset operand values and alternative operand values.

**INFORMATION** = \***MAXIMUM**

The output contains the command names, operands, preset and alternative operand values and help texts.

**FORM** = \***GUIDED** / \***UNGUIDED**

Determines whether the syntax for guided or unguided dialog is to be output.

**FORM** = \***GUIDED**

Operands and operand values which are not allowed in guided dialog are not output.

---

**FORM = \*UNGUIDED**

The output also contains operands and operand values which are not allowed in guided dialog. When lists of commands are displayed (CMD=\*ALL), these also contain the aliases.

**CHECK-PRIVILEGES = \*YES / \*NO**

Specifies whether the output is to take account of the privileges of the user.

**CHECK-PRIVILEGES = \*YES**

Information is displayed only on commands, operands and operand values which the user is authorized to use.

**CHECK-PRIVILEGES = \*NO**

Information is displayed on all commands, operands and operand values, regardless of the user's privileges.

**CHECK-INPUT-MODE = \*CURRENT / \*DIALOG / \*DIALOG-PROC / \*BATCH / \*BATCH-PROC / \*NO**

Determines the input mode for which the syntax is to be displayed. Only those syntax objects are displayed for the user which are permissible in the specified input mode.

**CHECK-INPUT-MODE = \*CURRENT**

The output contains only the syntax objects permitted for the current input mode.

**CHECK-INPUT-MODE = \*DIALOG**

The output contains only the syntax objects permitted for interactive mode.

**CHECK-INPUT-MODE = \*DIALOG-PROC**

The output contains only the syntax objects permitted for the interactive procedure mode.

**CHECK-INPUT-MODE = \*BATCH**

The output contains only the syntax objects permitted for batch mode.

**CHECK-INPUT-MODE = \*BATCH-PROC**

The output contains only the syntax objects permitted for the batch procedure mode.

**CHECK-INPUT-MODE = \*NO**

Output takes place independently of the input mode. The output lines with commands and operands which are not permitted in the current input mode are marked with an asterisk (\*).

**OUTPUT = \*SYSOUT / \*SYSLST(...)**

Specifies where the information is to be output.

**OUTPUT = \*SYSOUT**

The information is output to the system file SYSOUT.

**OUTPUT = \*SYSLST(...)**

The information is output ready for printing to the system file SYSLST.

The first byte of each output record is X'40'. The LINES-PER-PAGES operand defines after how many output records a header line with page feed is generated.

**SYSLST-NUMBER = \*STD / <integer 1..99>**

Specifies whether the information is to be output to the system file SYSLST or to a SYSLST file from the set SYSLST01 through SYSLST99.

The default is \*STD, i.e. output is directed to the system file SYSLST.

**LINES-PER-PAGE = \*STD / \*UNLIMITED / <integer 1..200>**

Defines after how many output records a new page is to begin. Each printed page begins with a header line which contains a page-feed control character in the first byte. The header contains the name of the displayed command and the page number.

## LINES-PER-PAGE = \*STD

A new page begins after 55 output records.

## LINES-PER-PAGE = \*UNLIMITED

The output is not divided into printed pages. No header lines are output.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
1	32	CMD0500	Syntax description in current syntax file invalid
1	64	CMD0812	Command execution not successful. Guaranteed messages: CMD0500, CMD0812

## Examples

```
/show-cmd cmd=add-pass _____ (1)
```

```
%ADD-PASSWORD (ADD-PASS,ADPW)
% FROM :2OSH:$TSOS.SYSSDF.BS2CP.190 (SYSTEM)
% PASSWORD =
```

```
/show-cmd cmd=add-pass,information=max _____ (2)
```

```
%ADD-PASSWORD (ADD-PASS,ADPW)
% FROM :2OSH:$TSOS.SYSSDF.BS2CP.190 (SYSTEM)
%Adds passwords for files or job variables to the password table of the
%task
% PASSWORD =
% -list-possible (63)-: x-string_1..8 or c-string_1..4 or
% integer_-2147483648..2147483647
% Specifies passwords to be added to the password table
```

```
/show-cmd cmd=write* _____ (3)
```

```
% WRITE-ACCOUNTING-RECORD
% WRITE-SPOOL-TAPE
% WRITE-TEXT
```

- (1) The syntax of the ADD-PASSWORD command is output.
- (2) The syntax of the ADD-PASSWORD command is output with all operands, operand values and help texts (INFORMATION=\*MAXIMUM).
- (3) All commands beginning with the string "WRITE" are output.

## 5.117 SHOW-CMD-ATTRIBUTES

Display information on operator commands

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** CONSOLE-MANAGEMENT  
**Privileges:** OPERATING  
**Routing code:** @

### Function

This command provides the operator with an overview of the authorization and type of the operator commands. The CMD-NAME and SELECT operands are used to select the commands to be queried. The INFORMATION operand controls the scope of the information to be output.

#### *Restriction*

The command can be entered only at logical or physical operator terminals (consoles). It must not be issued from a user task with the OPERATING privilege.

### Format

#### SHOW-CMD-ATTRIBUTES

```
CMD-NAME = *ALL / <structured-name 1..30>
,SELECT = *ALL / *EXTERNAL-SERVER(...) / *INTERNAL-SERVER(...) / *AUTHORIZATION-CODE(...)
  *EXTERNAL-SERVER(...)
    | APPLICATION-NAME = *ALL / *OWN / <name 1..4>
  *INTERNAL-SERVER(...)
    | ENTRY = *ALL / *NONE / *ENTRY-NAME(...) / *ENTRY-ADDRESS(...)
    |   *ENTRY-NAME(...)
    |     | ENTRY-NAME = *ALL / <name 1..8>
    |   *ENTRY-ADDRESS(...)
    |     | ENTRY-ADDRESS = *ALL / <x-string 1..8>
  *AUTHORIZATION-CODE(...)
    | AUTHORIZATION-CODE = *ALL / <alphanum-name 1..1> / *
,INFORMATION = *MINIMUM / *MEDIUM / *MAXIMUM
```

---

## Operands

### **CMD-NAME =**

Specifies the command name for which an entry in the command table is to be displayed.

### **CMD-NAME = \*ALL**

All operator commands are to be displayed.

If SHOW-CMD-ATTRIBUTES CMD-NAME=\*ALL is entered, the command output is sorted, with identical commands grouped together. The first command listed (in the previously valid format) is the primary command, which is fully abbreviable. This is usually the longest of the identical commands (current exception: SET/RESET /SHOW-MSG-SUPPRESSION).

Then the aliases of the given command are listed. They are marked as aliases by being indented by one column in the associated output line. These aliases cannot be abbreviated.

### **CMD-NAME = <structured-name 1..30>**

Specifies the name of the command for which the entry in the command table is to be displayed. The command name can be up to 30 characters long and must comply with the naming convention for command names.

### **SELECT =**

Selects the information.

### **SELECT = \*ALL**

All command names are to be output.

### **SELECT = \*EXTERNAL-SERVER(...)**

Specifies that information on special operator commands is to be displayed. Special operator commands are commands that are executed in \$CONSOLE applications (authorized user programs).

#### **APPLICATION-NAME =**

Specifies the names of the \$CONSOLE applications.

#### **APPLICATION-NAME = \*ALL**

Information on all special operator commands is requested.

#### **APPLICATION-NAME = \*OWN**

Information is listed on all special operator commands for which the command issuer is also the command processor. The scope of the information is defined in the INFORMATION operand. In this form, the command can only be issued from \$CONSOLE applications.

#### **APPLICATION-NAME = <alphanum-name 4..4>**

Lists the set of special operator commands for which the specified \$CONSOLE application acts as command processor.

### **SELECT = \*INTERNAL-SERVER(...)**

The information should relate to standard operator commands.

These commands are executed in system components.

#### **ENTRY =**

Selects the commands via the call interface.

#### **ENTRY = \*ALL**

Selects all call interfaces.

---

**ENTRY = \*NONE**

Selects all standard operator commands for which there are no entries in the command table relating to the call interface.

**ENTRY = \*ENTRY-NAME(...)**

Selects standard operator commands whose call interface is entered by name.

**ENTRY-NAME = \*ALL**

Displays all the commands whose call interface is entered by name in the table.

**ENTRY-NAME = <name 1..8>**

Name of the call interface which the command uses.

**ENTRY = \*ENTRY-ADDRESS(...)**

Selects the standard operator commands whose call interface is entered via the address.

**ENTRY-ADDRESS = \*ALL**

Displays all commands for which the address of their call interface is entered into the table.

**ENTRY-ADDRESS = <x-string 1..8>**

Address of the call interface which the command uses.

**SELECT = \*AUTHORIZATION-CODE(...)**

The commands that are to be displayed are to be selected on the basis of the routing code (authorization code) needed to be able to issue them at an operator terminal.

**AUTHORIZATION-CODE =**

Commands are selected by routing code.

**AUTHORIZATION-CODE = \*ALL**

All commands which are protected by any routing code are to be displayed.

**AUTHORIZATION-CODE = <alphanum-name 1..1> / \***

All the commands protected by the specified routing code (one of the characters A..Z, 0..9, #, @ and \*) are to be displayed.

**INFORMATION =**

Defines the scope of the information to be output on the selected command.

**INFORMATION = \*MINIMUM**

For each selected command, the command name and routing code required for its use are output.

**INFORMATION = \*MEDIUM**

As for INFORMATION=\*MAXIMUM, all available information is displayed (see below).

The only difference between \*MEDIUM and \*MAXIMUM is that \*MEDIUM outputs the current values and \*MAXIMUM also outputs the “inactive” table entries. Normally, where the command is entered just once in the table, the output of \*MEDIUM and \*MAXIMUM is identical; you have multiple table entries for the following cases only:

- multiple command name logon (see CONNECT-CMD-SERVER)
- for “safe” system commands for which all the four maximum table entries possible are occupied to prevent anyone else logging on for the command.

## INFORMATION = \*MAXIMUM

All available information is displayed for each selected command.

The following information is output:

- the command name
- the authorization lock of the command
- the command type (INTERNAL = command execution in system components EXTERNAL = command execution in authorized user programs)
- the call interface (D=direct, S=SDF, \$=\$CONSOLE)
- the communication interval limit (unit = *n* seconds)

The specified number multiplied by *n* (the unit *n* is governed by the class 2 system parameter NBRCILU) gives the time that may elapse during command processing before the next command waiting for execution is started.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NBR1111	No output of command/server links
	1	CMD0202	Syntax error
1	64	NBR1115	Semantic operand error

## Example

```
/show-cmd-attr show-conslog

## 5.118 SHOW-CONSLOG-ATTRIBUTES

Show system logging information

**Component:** BS2000 OSD/BC

**Functional area:** Error logging

**Domain:** ERROR-LOGGING  
SECURITY-ADMINISTRATION

**Privileges:** OPERATING  
SAT-FILE-MANAGEMENT  
TSOS

**Routing code:** @

### Function

The SHOW-CONSLOG-ATTRIBUTES command shows whether logging is active or inactive and the name of the current logging file.

Using the NBKESNR system parameter, systems support can define whether the CONSLOG file is cataloged under the user ID TSOS or SYSAUDIT and whether the serial number of the file is to have two or three digits.

Using the FMTYFNLG system parameter, systems support can define whether the date contained in the name of the CONSLOG file is to have two digits (without the century, in yy.mm.dd format) or four digits (with the century, in yyyy-mm-dd format).

The command supports structured output in S variables (see "[Output in S variables](#)").

### Format

<b>SHOW-CONSLOG-ATTRIBUTES</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NBR0905	CONSLOG inactive

## Output in S variables

Output information	Name of the S variable	T	Contents	Condition
Catalog ID of the logging file	var(*LIST).CAT-ID	S	<cat-id 1..4>	
Logging file creation date; the output format is governed by the class 2 system parameter FMTYFNLG: FMTYFNLG=2: <yy.mm.dd> FMTYFNLG=4: <yyyy-mm-dd>	var(*LIST).CRE-DATE	S	<yyyy-mm-dd>	
Logging file path name	var(*LIST).F-NAME	S	<path-name>	
Logging file sequence number; the output format is governed by the class 2 system parameter NBKESNR: NBKESNR=0/1:<integer 1..999> NBKESNR=2/3:<integer 1..99>	var(*LIST).SEQ-NUM	I	<integer>	
System session number	var(*LIST).SESSION-NUM	I	<integer 1..999>	
Logging file base name	var(*LIST).SHORT-F-NAME	S	<filename>	
Logging file user ID	var(*LIST).USER-ID	S	<name 1..8>	

---

## 5.119 SHOW-CONSOLE-FILTER

Show filter levels for routing codes

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Operator terminal control
<b>Domain:</b>	CONSOLE-MANAGEMENT
<b>Privileges:</b>	OPERATING
<b>Routing code:</b>	@

### Function

This command provides operators with information on the filter levels defined for the various routing codes. The information relates only to the console or authorized user program from which the command was issued.

For details of the routing code and filter level mechanism see the manuals "Introduction to System Administration" [14].

*Utilization in a user task with the OPERATING privilege*

Like any operator terminal, the user task can display only those filter levels which are set for itself. The filter levels apply only to event stream read operations.

When the user task terminates, all the filter levels that it has set are reset.

The command supports structured output in S variables (see "Output in S variables").

These functions are available regardless of any system parameter settings.

### Format

#### SHOW-CONSOLE-FILTER

**SELECT** = \***FILTER** (...) / \***ROUTING-CODE**(...)

\***FILTER**(...)

|     **FILTER** = \***ANY** / **ALL** / list-poss(5): <integer 1..5>

\***ROUTING-CODE**(...)

|     **ROUTING-CODE** = \***ALL** / list-poss(40): <alphanum-name 1..1> / \*

### Operands

**SELECT** = \***FILTER** (...) / \***ROUTING-CODE** (...)

Indicates whether to sort the output data by filter level or by routing code.

---

### **SELECT = \*FILTER (...)**

The output data is to be sorted by filter level.

The output shows which routing codes are associated with each filter level.

#### **FILTER = \*ANY**

There are five filter levels. Message NBR1063 is issued for each filter level, indicating the routing codes associated with that filter level at the console where the command was entered. If there are no routing codes associated with a particular filter level, message NBR1064 is issued.

#### **FILTER = \*ALL**

Message NBR1065 lists all the routing codes for which all filter levels are set on the console where the command was entered. If there are no routing codes with all the filter levels set, message NBR1066 is issued.

#### **FILTER = list-poss(5): <integer 1..5>**

Message NBR1063 is issued for each of the specified filter levels, indicating the routing codes associated with that filter level. If there are no routing codes associated with a particular filter level, message NBR1064 is issued.

### **SELECT = \*ROUTING-CODE (...)**

The output data is to be sorted by routing code.

The output shows which filter levels are allocated to each routing code.

#### **ROUTING-CODE = \*ALL**

Message NBR1062 is issued for each of the 40 routing codes defined on the system, indicating the filter levels associated with that routing code on the console where the command was entered. If there are no filter levels set for a particular routing code, message NBR1061 is issued; if a particular routing code is not assigned to the input console, message NBR1061 is issued.

#### **ROUTING-CODE = list-poss(40): <alphanum-name 1..1> / \***

Routing code for which the filter level settings are to be displayed.

### **Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	1	CMD0202	Syntax error in command
	2	CMD0198	Shutdown in progress
	32	CMD2009	Error on output to structured S variable
	64	CMD0216	User does not have required privilege
	130	NBR1042	Not enough class 5 memory; filter levels cannot be displayed

## Example

```
/show-console-filter sel=*routing
```

```
% NBR1061 ROUTING-CODE '*' FILTER NONE
% NBR1061 ROUTING-CODE 'A' FILTER NONE
% NBR1061 ROUTING-CODE 'B' FILTER NONE
% NBR1061 ROUTING-CODE 'C' FILTER NONE
% NBR1061 ROUTING-CODE 'D' FILTER NONE
% NBR1061 ROUTING-CODE 'E' FILTER NONE
% NBR1061 ROUTING-CODE 'F' FILTER NONE
% NBR1061 ROUTING-CODE 'G' FILTER NONE
% NBR1061 ROUTING-CODE 'H' FILTER NONE
% NBR1061 ROUTING-CODE 'I' FILTER NONE
% NBR1061 ROUTING-CODE 'J' FILTER NONE
% NBR1061 ROUTING-CODE 'K' FILTER NONE
% NBR1061 ROUTING-CODE 'L' FILTER NONE
% NBR1061 ROUTING-CODE 'M' FILTER NONE
% NBR1061 ROUTING-CODE 'N' FILTER NONE
% NBR1061 ROUTING-CODE 'O' FILTER NONE
% NBR1061 ROUTING-CODE 'P' FILTER NONE
% NBR1061 ROUTING-CODE 'Q' FILTER NONE
% NBR1061 ROUTING-CODE 'R' FILTER NONE
% NBR1061 ROUTING-CODE 'S' FILTER NONE

## Output in S variables

The SELECT operand of this command identifies the S variables which are to be created. The possible values for SELECT are \*FILTER and \*ROUTING-CODE (given in the table in abbreviated form as SEL=\*FILT/\*ROUT):

Output information	Name of the S variable	T	Contents	Condition
Filter assigned	var(*LIST).FILTER	S	<filter>	SEL=*FILT
Routing code to which the filter is assigned	var(*LIST).ROUT-CODE(*LIST)	S	<routing-code>	SEL=*FILT
Filter levels set for the specified routing code	var(*LIST).FILTER(*LIST)	S	<filter>	SEL=*ROUT
Routing code assigned	var(*LIST).ROUT-CODE	S	<routing-code>	SEL=*ROUT

---

## 5.120 SHOW-CONSOLE-OPTIONS

Display console output control settings

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** not allocated  
**Privileges:** OPERATING  
**Routing code:** @

### Function

The SHOW-CONSOLE-OPTIONS command displays information on the values set by means of the MODIFY-CONSOLE-OPTIONS command for controlling operator terminal output.

### Format

<b>SHOW-CONSOLE-OPTIONS</b>
-----------------------------

<b>CONSOLE-UNIT</b> = <u>*OWN</u> / <alphanum-name 2..2>
--

### Operands

#### CONSOLE-UNIT =

Specifies the operator terminal about which information is to be displayed.

#### CONSOLE-UNIT = \*OWN

The information displayed refers to the operator terminal at which the command was issued (default).

#### CONSOLE-UNIT = <alphanum-name 2..2>

Mnemonic device name of the operator terminal about which information is to be displayed.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NBR0928	Warning: not all operands could be processed
	1	CMD0002	Syntax error
1	32	NBR0926	Internal error in the command server
	64	CMD0216	Privilege violation
2	64	NBR0923	Invalid console name
	130	NBR0921	Memory shortage

---

## 5.121 SHOW-CONSOLE-STATUS

Fetch information on console and authorized user programs

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** CONSOLE-MANAGEMENT  
**Privileges:** OPERATING  
**Routing code:** @

### Function

This command supplies operators with the following information:

- device mnemonics for operator consoles or authorization names for authorized user programs
- station and processor names of available authorized user programs
- set of routing codes
- availability of consoles and authorized user programs
- current main console

If entered from a user task with OPERATING privilege, the command supports structured output in S variables (see ["Output in S variable"](#)).

### Format

#### SHOW-CONSOLE-STATUS

**CONSOLE** = \*OWN / \*ALL(...) / list-poss(216): <alphanum-name 2..2> / <name 4..4>

\*ALL(...)

|     **TYPE** = \*ANY / \*PHYSICAL / \*LOGICAL

|     **,STATE** = \*ANY / \*OPERABLE / \*INOPERABLE

### Operands

**CONSOLE** = \*OWN / \*ALL(...) / list-poss(216): <alphanum-name 2..2> / <name 4..4>

Selects the consoles and authorized user programs for which status information is required.

**CONSOLE** = \*OWN

Status information is required for the command issuer's own console.

**CONSOLE** = \*ALL(...)

Status information is required for all consoles and authorized user programs.

**TYPE** = \*ANY

The information is output for all consoles and authorized user programs.

**TYPE = \*PHYSICAL**

This information is output for consoles only.

**TYPE = \*LOGICAL**

This information is output for authorized user programs only.

**STATE = \*ANY**

This information is output irrespective of the state.

**STATE = \*OPERABLE**

Information is only output for consoles or user programs ready for operation.

**STATE = \*INOPERABLE**

Information is only output for consoles or user programs not ready for operation (status INOP).

**CONSOLE = list-poss(216): <alphanum-name 2..2> / <name 4..4>**

Up to 216 mnemonic console names (2-character) or names of authorized applications (4-character) can be specified.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed successfully
2	0	NBR1074	Some of the specified console names not found. Commando only partially executed
	1	CMD0202	Syntax error in command
	2	CMD0198	Shutdown in progress
	32	CMD2009	Error on output to structured S variable
	64	CMD0216	Required authorization not available
	64	NBR1070	CONSOLE=*OWN operand only permissible on the console
	64	NBR1073	None of the specified console names found. Command not executed

**Notes**

If the command is issued from a user task with the OPERATING privilege, a value other than \*OWN must be specified explicitly for the CONSOLE operand.

In interactive mode, [K2] may be used as an interrupt key. In this case no return code is supplied.

The station and processor name information for an authorized user program allows operators to disconnect the identified user program (command /BCCONN PARTNER= (NEA,<station-name><processor-name>); see the "BCAM" manual [2]).

---

## Results

Each time the command is entered, the following message is issued:

```
NBR1071 MAIN CONSOLE IS '(&00)'
```

In conjunction with the Operator LOGON function: if the physical main console has implicitly gained additional message output routing codes owing to the non-availability of other consoles, the following message is also issued:

```
NBR1054 CONSOLE ,(&00)' IMPLICIT CODES: '(&01)'
```

In the case of physical consoles, the following additional message is output:

```
NBR1052 CONSOLE '(&00)' ASSIGNED CODES: '(&01)'
```

If the console is not assigned any routing codes, the value of Insert 01 is “NONE”.

If the routing code set of a physical console has been temporarily extended because that console is currently acting as substitute for other unavailable physical consoles, the following message indicates the temporary additions:

```
NBR1053 CONSOLE '(&00)' TEMPORARY CODES: '(&01)'
```

If the Operator LOGON function is used, message NBR1053 does not appear.

If an operator has logged on at a physical console, the operator ID is included in the following message:

```
NBR1078 CONSOLE '(&00)' OPERATOR-ID '(&01)'
```

If a physical console is defective (INOP) or has been switched off (OFF) with the command CONSOLE SWITCH, OFF=<mn>, or if no operator has logged on there (INACTIVE), this is indicated by the following message:

```
NBR1077 CONSOLE '(&00)' STATES: (&01)
```

The value of Insert 01 may be “INOP”, “OFF” or “INACTIVE”. INACTIVE is possible only in conjunction with the Operator LOGON function, in which case OFF is not possible. If the INOP state applies, the INACTIVE state is not displayed; but the combination of INOP and OFF is possible.

The following message reports the routing codes assigned to each authorized user program selected:

```
NBR1051 APPLICATION '(&00)' CODES: '(&01)'
```

If the authorized user program is not assigned any routing codes, the value of Insert 01 is “NONE”.

If an authorized user program is unavailable, the following message is issued:

```
NBR1076 APPLICATION '(&00)' STATES: '(&01)'
```

The value of Insert 01 may be “INOP”.

The following message reports on connected authorized user programs:

```
NBR1075 APPLICATION '(&00)' PROCESSOR '(&01)' STATION '(&02)'
```

If an operator has logged on to a user program with dynamic authorization names, the operator ID is included in the following message:

```
NBR1079 APPLICATION '(&00)' OPERATOR-ID '(&01)'
```

If consoles or authorized user programs have been explicitly specified and the given names do not exist, message NBR1072 is issued for each nonexistent name.

---

If `CONSOLE=*ALL` is specified, the number of unavailable authorized user programs is indicated by the following message:

```
NBR1058 /SHOW-CONSOLE-STATUS: (&00) FUTHER APPLICATIONS WITH DYNAMICAL
AUTHORIZATION NAMES ARE NOT CONNECTED
```

### Output in S variable

The `CONSOLE` operand identifies the S variables which are to be created. The following specifications are possible for `CONSOLE`:

Notation used in command	Abbreviated form used in table
<code>CONSOLE=*ALL</code>	1
<code>CONSOLE=&lt;alphanum-name 2..2&gt;</code> (corresponds to console)	2
<code>CONSOLE=&lt;name 4..4&gt;</code> (corresponds to user program)	3
<code>CONSOLE=*OWN</code>	4

The command allows consoles and authorized user programs to be included together in a list. In this case all the S variables are generated.

Output information	Name of the S variable	T	Contents	Condition
Availability of the authorized user program	var(*LIST).APPL(*LIST).CONN-STA	S	*CONN *DISCONN	1.3
Routing code of the authorized user program	var(*LIST).APPL(*LIST).NAME	S	<application-name>	1.3
Operator ID (*)	var(*LIST).APPL(*LIST).OPER-ID	S	<operator-id>	1.3
Processor name of the authorized user program	var(*LIST).APPL(*LIST).PROCESSOR-NAME	S	" <processor-name>	1.3
Routing code for authorized user program	var(*LIST).APPL(*LIST).ROUT-CODE(*LIST)	S	<routing-code>	1.3
Station name of the authorized user program	var(*LIST).APPL(*LIST).STATION-NAME	S	" <station-name>	1.3
Status of the console	var(*LIST).CONS(*LIST).OPERABLE-STA	S	*INOP *OPERABLE	1.2
Operator ID (*)	var(*LIST).CONS(*LIST).OPER-ID	S	<operator-id>	1.2
Routing code for console	var(*LIST).CONS(*LIST).ROUT-CODE(*LIST)	S	" <routing-code>	1.2
Mnemonic device name of the console	var(*LIST).CONS(*LIST).UNIT	S	<mnemo-name>	1.2
Implicit routing code	var(*LIST).IMPL-ROUT-CODE(*LIST)	S	<routing-code>	NBCONOP=Y
Mnemonic device name of the main console	var(*LIST).MAIN-CONS-UNIT	S	<mnemo-name>	
Routing code for user task with OPR privilege	var(*LIST).TASK(*LIST).ROUT-CODE(*LIST)	S	<routing-code>	4
TSN of the user task with OPR privilege	var(*LIST).TASK(*LIST).TSN	S	<tsn>	4

(\*) For physical consoles and authorized user programs 8 blanks are output as the operator ID if the "operator logon" function is not used or if nobody has logged on as the operator. The same contents are also output for authorized user programs with static authorization names.

## Examples

```
/decl-var var-name=var(type=*structure),multiple-elem=*list  
/exec-cmd (show-console-status console=@002),text-output=*none,strucoutput=var  
/show-var var,inf=*par(val=*c-literal)

```

---

## 5.122 SHOW-DBL-DEFAULTS

Show defaults for DBL calls

**Component:** BLSSERV

**Functional area:** Program control

**Domain:** PROGRAM

**Privileges:** STD-PROCESSING

### Function

The SHOW-DBL-DEFAULTS command outputs the current defaults for DBL (dynamic binder loader) calls on SYSOUT.

These settings can be modified with the MODIFY-DBL-DEFAULTS command or restored to the original DBL defaults with RESET-DBL-DEFAULTS.

### Format

<b>SHOW-DBL-DEFAULTS</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	32	BLS0152	System error
	64	CMD0216	User is not authorized to issue the command

## Output information

The following example illustrates the output of SHOW-DBL-DEFAULTS. For explanations of the listed operands which apply to command calls (CMD-CALLS output field), see the LOAD- and START-EXECUTABLE-PROGRAM commands. For explanations of operands which apply only to programs calls (PROG-CALLS output field), see the MODIFY-DBL-DEFAULTS command.

The defaults for command and program calls are shown separately for each operand. The right-hand column of the output shows the value of the PRIORITY operand (see the MODIFY-DBL-DEFAULTS command).

```

#####
##### D B L   D E F A U L T S #####

## 5.123 SHOW-DEVICE-CONFIGURATION

Display system configuration and hardware unit availability

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Device management
<b>Domain:</b>	DEVICE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SW-MONITOR-ADMINISTRATION
<b>Routing code:</b>	E

### Function

This command provides information about the system configuration and the availability of hardware units (see also [section "Information services of device management: Meanings of the output values of SHOW commands"](#)).

The command supports structured output in S variables (see ["Output in S variables"](#)).

## Format

### SHOW-DEVICE-CONFIGURATION

**UNIT** = **\*STD** / **\*SELECT(...)** / **\*CPU(...)** / **\*CHANNEL(...)** / **\*CONTROLLER(...)** /

**\*CHANNEL-RANGE(...)** / **\*PUBSET-DEVICES(...)** /

list-poss(26): <alphanum-name 2..2 with-wild(20)> / <alphanum-name 4..4 with-wild(20)>

**\*SELECT(...)**

| **CLASS** = **\*ALL** / **\*CENTRAL-PROCESSOR** / **\*CHANNEL** / **\*CONTROLLER** / **\*DEVICE(...)**

| **\*DEVICE(...)**

| | **TYPE** = **\*ALL** / <device>

---

## Operands

**UNIT = \*STD / \*SELECT(...) / \*CPU(...) / \*CHANNEL(...) / \*CONTROLLER(...) / \*CHANNEL-RANGE(...) / \*PUBSET-DEVICES(...) / list-poss(26): <alphanum-name 4..4>**

Selection of hardware units by device class or device mnemonic (2 or 4 symbols). A maximum of 26 device mnemonics may be specified.

**UNIT = \*STD**

The default value is output for all generated units. Users should note that the output may be very extensive.

The command is rejected if entered at the console, since the output of the entire configuration can be extensive and may occupy the operating terminal for too long.

**UNIT = \*SELECT(...)**

Specifies a subset of the hardware units known to the system for which information is to be output. Hardware units are selected by the following device class and state:

**CLASS = \*ALL / \*CENTRAL-PROCESSOR / \*CHANNEL / \*CONTROLLER / \*DEVICE(...)**

Device class. Default information is output for all hardware units belonging to the device class specified.

The following device classes can be specified:

Operand value (device class)	Meaning
*ALL	any device class
*CENTRAL-PROCESSOR	central processors
*CHANNEL	channels
*CONTROLLER	controllers
*DEVICE(...)	devices

**CLASS = \*DEVICE(...)**

Information on terminal devices is output.

**TYPE = \*ALL / <device>**

Information on terminal devices belonging to the specified type is output. The default setting is \*ALL, i.e. all device types are displayed. If a device type is explicitly specified then only device or volume types known within the system are accepted.

To display the possible types, enter TYPE=? in the dialog.

The device type can be specified for all devices (see also the device table (device type column) of the "System Installation" manual [46]). For tape devices, volume types can also be specified (see [section "Device types for DMS tape processing"](#)).

**VM-ASSIGNMENT = \*ANY / \*NO / \*YES / \*BY-GUEST-POSSIBLE**

Displays information on terminal devices which possess the specified status. The default setting is \*ANY, i.e. output is independent of the status.

**VM-ASSIGNMENT = \*NO**

If INFORMATION=\*VM2000 is specified information is displayed on terminal devices which are not assigned to the user's own VM.

**VM-ASSIGNMENT = \*YES**

Information is displayed on terminal devices which are assigned to the user's own VM.

**VM-ASSIGNMENT = \*BY-GUEST-POSSIBLE**

Information is displayed on terminal devices which are not assigned to the user's own VM. but which can currently be explicitly assigned (e.g. with the ATTACH-DEVICE command).

**ATTRIBUTE = \*ALL / \*ATTACHED / \*DETACHED / \*DETACH-PENDING / \*ATTACH-PENDING / INVALID / \*ENABLED / \*DISABLED**

Specifies the state of hardware units for which default information is to be output. The following states can be specified:

Operand value (state)	Information about
*ALL	Hardware units in any state
*ATTACHED	Hardware units attached to the system
*DETACHED	Hardware units detached from the system
*DETACH-PENDING	Hardware units which are currently assigned but will be unavailable when the assignment ends
*ATTACH-PENDING	Hardware units which are currently not available owing to ATTACH processing
*INVALID	Unusable hardware units (see the "System Installation" manual [46])
*ENABLED	All FastDPAV alias devices in the ENABLED state (FastDPAV see "Introduction to System Administration" [14])
*DISABLED	All FastDPAV alias devices in the DISABLED state

**i** When specifying the operand values \*ATTACHED, \*DETACHED, \*ATTACH-PENDING, \*DETACH-PENDING, and \*INVALID, no FastDPAV alias devices are output.

**UNIT = \*CPU(...)**

Denotes one or more CPUs for which information is output.

**CPU-IDENTIFIER = list-poss(26): <alphanum-name 2..2 with-wild(10)>**

Identifiers for the CPUs.

**UNIT = \*CHANNEL(...)**

Denotes one or more channels for which information is output.

**CHANNEL-PATH-ID = list-poss(26): <alphanum-name 2..2 with-wild(10)>**

Channel path IDs for the channels. In the case of channels, the device name (MN) is the same as the channel path ID in hexadecimal representation.

**UNIT = \*CONTROLLER(...)**

Denotes one or more controllers for which information is output.

---

**CONTROLLER-UNIT = list-poss(26): <alphanum-name 2..2 with-wild(20)> / <alphanum-name 4..4 with-wild(20)>**

Mnemonic device names (MN) of the controllers.

**UNIT = \*CHANNEL-RANGE(...)**

Denotes a range of channels for which information is output.

**FROM = <alphanum-name 2..2>**

First channel path ID of a range of channels.

**TO = <alphanum-name 2..2>**

Last channel path ID of a range of channels.

**UNIT = \*PUBSET-DEVICES(...)**

Specifies that information on a pubset's disks is to be output.

The pubset must have been imported at least once. The mnemonic device codes (MNs) of the associated disks are administered in the system disk's SVL. This entry is made on IMPORT-PUBSET, EXPORT-PUBSET or MODIFY-PUBSET-PROCESSING. If the system disk or the associated mirror disk is not attached then it is implicitly attached and the information is then read from the SVL before the disk is implicitly detached again. Under VM2000, the disk must also be assigned to the guest system.

If pubset disks are mirrored then the following should be noted:

- In the case of mirroring with DRV, both disks are output.
- In the case of mirroring in a disk storage system then only the standard disks (source units) are output. If the mirror disks are to be output, then the mirror disk (target unit) of the system disk (pubres) must be specified in the PUBSET operand. For detailed information on mirroring in disk storage systems, see, for example, the "SHC-OSD" manual [37].

**PUBSET =**

Designates the pubset whose disks are to be output. The pubset can be specified via the catalog ID or the device code of its system disk.

**PUBSET = <cat-id 1..4>**

Specifies the pubset's catalog ID. A corresponding entry must exist in the MRS catalog. If no such entry exists then the disks can only be output by specifying the system disk (see PUBSET=\*BY-PUBRES-DEVICE).

**PUBSET = \*BY-PUBRES-DEVICE(...)**

Specifies the pubset's system disk (pubres).

**UNIT = <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device code (MN) of the pubres.

**UNIT = list-poss(26): <alphanum-name 2..2 with-wild(20)> / <alphanum-name 4..4 with-wild(20)>**

Denotes one or more devices for which information is output, using their mnemonic device names (2 or 4 alphanumeric characters; see Notes). A maximum of 26 devices can be specified.

**INFORMATION = \*STD / \*INNER / \*OUTER / \*PATH / \*ALL / \*VM2000 / \*PAV**

Type of information desired. If UNIT=\*SELECT is specified, only standard information is output, i.e. any specification other than \*STD is ignored.

A header line is output, followed by a new line for each device containing the values.

**INFORMATION = \*STD**

Default information.

Output format:

MNEM	UN-CLASS	UN-TYPE	CONF-STATE	POOL/SIDE
------	----------	---------	------------	-----------

**INFORMATION = \*INNER**

In addition to the default information, information about all inner connections (i.e. from the specified unit to the CPU) is output.

Output format:

UN-TYPE	CONF-STATE	INNER CONNECTION
---------	------------	------------------

**INFORMATION = \*OUTER**

In addition to the default information, information about all outer connections (i.e. from the specified unit to peripherals) is output.

Output format:

UN-TYPE	CONF-STATE	OUTER CONNECTION
---------	------------	------------------

**INFORMATION = \*ALL**

In addition to the standard information, information about all internal and external connections of the designated units is output.

**INFORMATION = \*PATH**

Information about the possible I/O paths of the designated terminals and their status is output. In the case of devices with path groups (disk and MTC devices), output may be delayed since the command triggers an internal update of the path statuses with Sense-Path-Group-Id.

Output format:

DVC	DEV-TYPE	CONF-STATE	PID	CTL	CHPID	PM	DEV-ADDR	PATH
-----	----------	------------	-----	-----	-------	----	----------	------

**INFORMATION = \*VM2000**

Information on possible assignments to the user's own VM and utilization of the user's own VM.

Output format:

MNEM	UN-CLASS	UN-TYPE	CONF-STATE	VM-ASSIGN	VM-USAGE
------	----------	---------	------------	-----------	----------

**INFORMATION = \*PAV**

Information on PAV devices (**Parallel Access Volumes**, see the "Introduction to System Administration" [14]). The basic device name and the alias device names (max. 7) combined with the relevant status information are output for each logical PAV device.

Output format:

```
BASE      ALIAS1    ALIAS2    ALIAS3    ALIAS4 ...    ALIAS7
```

For FastDPAV devices, when entering `UNIT=*CONTROLLER( . . . )`, the basis control and alias control names are output additionally, as well as the number of FastDPAV devices in the state ENABLED and DISABLED. The column MAX USED shows the maximum number of FastDPAV devices simultaneously used at alias controlling.

Output format:

```
FPAV BASE CTL    FPAV ALIAS CTL    ENABLED ALIAS    DISABLED ALIAS    MAX USED
```

**Note:**

- For the DVC device class, no external connections exist.
- For the CPU device class, no defined connections exist.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NKD0005	Warning: information incomplete
	1	NKD0001	Syntax error in the input, correction of the command parameters recovers the error
4	1	NKD0001	Syntax error in subprocedure
	1	NKD0013	Syntax error in SHOW-DEVICE-CONFIGURATION
	32	CMD2009	Error on output to S variable (e.g. subsystem not available)
	64	NKD0002	No information available
	64	NKD0006	Internal error during initialization of the command server or: Syntax error in NKDDEVC procedure
	64	NKD0024	No information available for <unit class> and <config state>
	64	NKD0025	No information available for <unit> and <information>
	64	OPS0002	Interrupt (e.g. by K2 key) during S variable generation
	130	OPS0001	SDF-P reporting space problems (possible response: FREE-VARIABLE and repeat command)

**Note**

Mnemonics which cannot be generated are treated as unknown mnemonics.

---

## Examples

*Example 1: Information about an device*

**/show-dev-conf unit=hf**

```
% MNEM UN-CLASS UN-TYPE CONF-STATE POOL/SIDE
% HF DVC 3590E DET(EX) SW
```

**/show-dev-conf unit=hf,inf=\*inner**

```
% MNEM UN-CLASS UN-TYPE CONF-STATE INNER-CONNECTION
% HF DVC 3590E DET(EX) CTL :HY ,INCLUDED
% CTL :HZ ,INCLUDED
```

**/show-dev-conf unit=8000,inf=\*path**

```
%DVC DEV-TYPE CONF-STATE PID CTL CHPID PM DEV-ADDR PATH
%8000 D3435 DET(EX) 007C 8000 0A 80 0A000000 AVAIL
% 8000 0D 40 0D000000 AVAIL
% 8001 4A 20 4A000000 AVAIL
% 8001 4B 10 4B000000 AVAIL
```

*Example 2: Information about CPUs (S210-40 system with 1 spare CPU)*

**/show-dev-conf unit=\*select(class=\*central-proc)**

```
% MNEM UN-CLASS UN-TYPE CONF-STATE POOL/SIDE
% 00 CPU S210-40 ATTACH /ON NORMAL
% 01 CPU S210-40 ATTACH /ON NORMAL
% 02 CPU S210-40 ATTACH /ON NORMAL
% 03 CPU S210-40 ATTACH /ON NORMAL
% 04 CPU S210-40 DET(EX)/OFF SPARE
```

**/show-dev-conf unit=\*cpu(00),inf=\*outer**

```
% NKD0030 OPERAND CHANGED TO 'INFORMATION = STD'. PROCESSING CONTINUES
% MNEM UN-CLASS UN-TYPE CONF-STATE POOL/SIDE
% 00 CPU S210-40 ATTACH /ON NORMAL
```

*Example 3: Information about CPUs (S210-20 system with 1 extra and 1 spare CPU)*

```
/show-dev-conf unit=*select(class=*central-proc)
```

```
% MNEM UN-CLASS UN-TYPE CONF-STATE POOL/SIDE
% 00 CPU S210-20 ATTACH /ON NORMAL
% 01 CPU S210-20 ATTACH /ON NORMAL
% 02 CPU S210-20 DETACH /OFF EXTRA
% 03 CPU S210-20 DETACH /OFF SPARE
```

*Example 4: Information about an controller*

```
/show-dev-conf unit=*contr(contr-unit=2900)
```

```
% MNEM UN-CLASS UN-TYPE CONF-STATE INNER-CONNECTION
% 2900 CTL DISK01 ATTACHED CHN :4A ,INCLUDED
% WWPN=500000E0DAC19A00
% CHN :0D ,INCLUDED
% WWPN=500000E0DAC19AC5
```

## Output in S variables

The command's INFORMATION operand identifies the S variables which are to be created. The following values are possible for INFORMATION: \*STD/\*ALL/\*INNER/OUTER/\*PATH/\*VM2000 and \*PAV.

Output information	Name of the S variable	T	Contents	Condition
Mnemonic base name of a PAV device x='P' for Preferred Device, otherwise '-' y='A' for Active, 'R' for Ready or 'N' for Not Ready	var(*LIST).BASE	S	<mnemo-name>-xy x = 'P' / '-' y = 'A' / 'R' / 'N'	INF=*PAV
Mnemonic alias name n of a PAV device (for a definition of the extension xy, see BASE), where x = 'F' of a FastDPAV device	var(*LIST).ALIASn	S	<mnemo-name>-xy x = 'F' / 'P' / '-' y = 'A' / 'R' / 'N'	INF=*PAV

## 5.124 SHOW-DEVICE-DEPOT

Show assignment of tape devices to storage locations

**Component:** BS2000 OSD/BC

**Functional area:** Device management

**Domain:** DEVICE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE

**Routing code:** E

### Function

The SHOW-DEVICE-DEPOT command provides information on the assignment of tape devices to volume storage locations.

The command supports structured output in S variables (see "Output in S variables").

### Format

#### SHOW-DEVICE-DEPOT

```
UNIT = *SELECT(...) / *LOCATION(...) /  
list-poss(26): <alphanum-name 2..2 with-wild(20)> / <alphanum-name 4..4 with-wild(20)>  
*SELECT(...)  
| ROUTING-CODE = *ANY / <name 1..1>  
*LOCATION(...)  
| LOCATION = list-poss(10): <alphanum-name 1..8 with-wild(40)>
```

### Operands

#### UNIT =

Selection criterion for information output. Possible specifications: storage locations, routing codes of storage locations, device mnemonics.

#### UNIT = \*SELECT(...)

Specification of a subset of the possible selection parameters that determine the scope of the output.

#### **ROUTING-CODE** = \*ANY / <name 1..1>

Provides information about device sets to which storage locations with the specified routing code are assigned.

#### **ROUTING-CODE** = \*ANY

Provides information about device sets, not depending on the routing codes of the assigned storage locations.

**ROUTING-CODE = <name 1..1>**

The storage locations with the specified routing code are selected.

**UNIT = \*LOCATION(...)**

Specifies one or more depots whose assigned tape devices are to be output.

**LOCATION = list-poss(10): <alphanum-name 1..8 with-wild(40)>**

Depot names (1 - 8 characters long). A maximum of 10 depots can be specified.

**UNIT = list-poss(26): <alphanum-name 2..2 with-wild(20)> / <alphanum-name 4..4 with-wild(20)>**

Specification of tape devices whose storage location is to be output. Up to 26 devices can be specified.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NKD0005	Warning: information incomplete
	1	NKD0001	Syntax error in the input, correction of the command parameters recovers the error
	32	CMD2009	Error on output to S variable (e.g. subsystem not available)
	64	NKD0006	Internal error during initialization of the command server
	64	NKD0002	No information available
	64	NKD0006	Software error in NKDDEV procedure
	64	NKD0023	No information available
	64	NKD0036	No information available for LOCATION list
	64	NKD0037	No information available for routing code
	64	OPS0002	Interrupt (e.g. by K2 key) during S variable generation
	130	OPS0001	SDF-P reporting space problems (possible response: FREE-VARIABLE and repeat command)

**Output format**

All three command options have the following header line:

```
LOCATION RTC TAPE-MNEMONICS
```

## Example

/show-dev-depot

```
% LOCATION RTC TAPE-MNEMONICS
% ROBOTER1 T E0 ,E1 ,E2 ,E3 ,E4 ,E5 ,E6 ,E7 ,E8
%          E9 ,EC ,ED ,EA ,EB ,EE ,EF
% ROBOTER2 T EU ,EX ,ES ,ET ,EW ,EV ,EY ,EZ ,EK
%          EL ,EO ,EP ,EM ,EN ,EQ ,ER
% D016ZE04 T TE ,TL ,MA ,MB ,MC ,ME ,MD ,MF ,MM
%          MN ,MO ,MP ,MQ ,MR
```

## Output in S variables

Output information	Name of the S variable	T	Contents	Condition
Name of the depot	var(*LIST).LOCATION	S	" <location>	
Routing code of the depot	var(*LIST).ROUT-CODE	S	" <alphan.-name 1..1>	
Tape device mnemonic	var(*LIST).UNIT(*LIST)	S	" <mnemo-name>	

---

## 5.125 SHOW-DEVICE-STATUS

Show assignment and monitoring of devices

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Device management
<b>Domain:</b>	DEVICE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SAT-FILE-MANAGEMENT SAT-FILE-EVALUATION SW-MONITOR-ADMINISTRATION TAPE-ADMINISTRATION
<b>Routing code:</b>	E

### Function

The SHOW-DEVICE-STATUS command displays information on device assignment and monitoring. Nonprivileged users obtain information only on devices reserved for their own jobs. Information on volumes is displayed only if the volumes are physically online (in contrast to SHOW-DISK-STATUS). If there is no volume online on a device, the output indicates which volume should be mounted on that device.

The command supports structured output in S variables (see "[Output in S variables](#)").

#### *Privileged functions*

Systems support staff are shown information about all devices.

## Format

### SHOW-DEVICE-STATUS

**UNIT** = **\*STD** / **\*SELECT-TYPE(...)** / **\*SELECT-LOCATION(...)** / **\*DEVICE-RANGE(...)** /

list-poss(26): <alphanum-name 2..2 with-wild(20)> / <alphanum-name 4..4 with-wild(20)>

**\*SELECT-TYPE(...)**

| **TYPE** = **\*ALL** / <composed-name 1..8> / <structured-name 1..8> / <device>

| **,ATTRIBUTE** = **\*ALL** / **\*ATTACHED** / **\*DETACHED** / **\*DETACH-PENDING** / **\*ATTACH-PENDING** /

| **\*INVALID** / **\*FREE** / **\*DMS** / **\*EXCLUSIVE** / **\*PUBLIC** / **\*SWITCH** / **\*SHARE** /

| **\*ENABLED** / **\*DISABLED**

**\*DEVICE-RANGE(...)**

| **FROM** = <alphanum-name 2..2> / <x-text 4..4>

| **,TO** = <alphanum-name 2..2> / <x-text 4..4>

**\*SELECT-LOCATION(...)**

| **LOCATION** = **\*ALL** / list-poss(10): <structured-name 1..8 with-wild(40)>

**,INFORMATION** = **\*STD** / **\*SUMMARY** / **\*TASK** / **\*ALL** / **\*LOCATION**

## Operands

**UNIT** = **\*STD(...)** / **\*SELECT-TYPE(...)** / **\*SELECT-LOCATION** / **\*DEVICE-RANGE(...)** /

list-poss(26): <alphanum-name 2..2 with-wild(20)> / <alphanum-name 4..4 with-wild(20)>

Specifies the hardware units for which information is to be output. The selection is made on the basis of device type, device family or device mnemonic (two or four characters). Mnemonic device names that cannot be generated are handled like nongenerated devices. A maximum of 26 device mnemonics may be specified.

**UNIT** = **\*STD**

The scope of the information displayed depends on the user's privilege level. Nonprivileged users (privilege STD-PROCESSING) receive information about all devices occupied by their own jobs. The possible scope of the output should be borne in mind. Privileged users receive information for all devices. UNIT=\*STD is rejected at operating consoles, since the output may be very extensive.

**UNIT** = **\*SELECT-TYPE(...)**

Information is output for the devices known to the system that have the specified type and attributes.

**TYPE** = **\*ALL** / <composed-name 1..8> / <alphanum-name 1..8> / <device>

Information is output for all devices (TYPE=\*ALL) or for all devices of the specified type.

In interactive mode, TYPE=? displays the possible type specifications.

The device type and device family are possible values for all devices (see also the device table (device type column or “Family” column) of the “System Installation” [46] manual). Volume types can also be specified for tape devices.

Possible values may be found in the device table, device type column, (see device table (device type column) of the “System Installation” manual [46]). For tape devices, the possible values may be found in the volume types table.

**ATTRIBUTE = \*ALL / \*ATTACHED / \*DETACHED / \*DETACH-PENDING / \*ATTACH-PENDING / \*INVALID / \*FREE / \*DMS / \*EXCLUSIVE / \*PUBLIC / \*SWITCH / \*SHARE / \*ENABLED / \*DISABLED**

Device attribute. The hardware units corresponding to the specified device attribute are selected.

Operand value (device attribute)	Meaning
*ALL	any attribute
	<i>configuration-state</i>
*ATTACHED	attached to the system
*DETACHED	not attached to the system
*DET[ACHED]-P[ENDING]	currently assigned, no longer available thereafter
*ATT[ACHED]-P[ENDING]	currently not available
*INVALID	not available
*ENABLED	FastDPAV alias devices are ENABLED
*DISABLED	FastDPAV alias devices are DISABLED
	<i>device-allocation-state</i>
*FREE	attached to the system
*DMS	occupied by DMS application
*EXCL[USIVE]	exclusively reserved
*PUB[LIC]	occupied by public disk
	<i>pool-attribute</i>
*SWITCH	generated for multiple systems
*SHARE	shareable

**UNIT = \*SELECT-LOCATION(...)**

Information is output for devices that are assigned to the storage locations.

**LOCATION =**

Denotes the storage locations assigned to the devices.

---

**LOCATION = ALL**

Information is output for the devices of all storage locations.

**LOCATION = list-poss(10): <structured-name 1..8 with-wild(40)>**

Information is output for the devices of the specified storage locations. A maximum of 10 storage locations can be specified.

**UNIT = \*DEVICE-RANGE(...)**

Information is output for a set of devices which exist in the specified range of device codes. Starting with the device designated in the FROM operand, up to 256 devices are determined until the TO operand is reached. The output only includes existing devices; nonexistent devices are ignored.

**FROM = <alphanum-name 2..2> / <x-text 4..4>**

Specifies the mnemonic device code (MN) of the first device.

**TO = <alphanum-name 2..2> / <x-text 4..4>**

Specifies the mnemonic device code (MN) of the last device.

**UNIT = list-poss(26): <alphanum-name 2..2 with-wild(20)> / <alphanum-name 4..4 with-wild(20)>**

Specifies by their mnemonic device name one or more devices for which information is output. You can specify up to 26 devices.

**INFORMATION = \*STD / \*SUMMARY / \*TASK / \*ALL / \*LOCATION**

Type of information is output. If UNIT = <mn> is specified, only the value \*STD is permitted here.

**INFORMATION = \*STD**

Standard information is output.

Output format:

MNEM	DEV-TYPE	CONF-STATE	POOL	VSN	DEV-A	PHASE	ACTION
------	----------	------------	------	-----	-------	-------	--------

**INFORMATION = \*SUMMARY**

A summary of configuration and assignment status, related to device type, is output.

Output format:

DEV-TYPE	AVAIL	PRE-/IN-USE	RES-BY-MN	RES-BY-TYPE	ATT	DET	DET-P
----------	-------	-------------	-----------	-------------	-----	-----	-------

**INFORMATION = \*TASK**

A summary of the occupying or reserving tasks is generated for the specified type. The nonprivileged user receives information only about assignments for his own task.

Output format:

1. List of assignments/reservations with device reference

MNEM	TYPE	DEV-A	PHASE	MNEM	TYPE	DEV-A . . .
------	------	-------	-------	------	------	-------------

2. List of assignments/reservations without device reference

TYPE	TASKS-WITH-RESERVATIONS
------	-------------------------

**INFORMATION = \*ALL**

Output of \*STD, \*SUMMARY and \*TASK.

**INFORMATION = \*LOCATION**

Outputs the scope of \*SUMMARY and \*TASK, arranged by storage location. The nonprivileged user receives information only about assignments for his own task.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NKD0005	Warning: information incomplete
2	0	NKD0030	Warning: INFORMATION parameter changed
	1	NKD0001	Syntax error in the input, correction of the command parameters recovers the error
	1	NKD0013	Syntax error in SH-DEV-STATUS
	32	CMD2009	Error on output to S variable (e.g. subsystem not available)
	64	NKD0002	No information available
	64	NKD0006	Software error in NKDDEVS procedure
	64	NKD0021	No information available for type and attribute
	64	NKD0023	No information available for MN list
	64	NKD0036	No information available for the specified storage locations
	64	NKD0038	No device of specified type is assigned to a storage location
	64	OPS0002	Interrupt (e.g. by K2 key) during S variable generation
4	130	NKD0009	The disk monitor is temporarily not available; the information may be incomplete
8	130	NKD0009	The tape monitor is temporarily not available; the information may be incomplete
12	130	NKD0009	The disk and tape monitors are not available
	130	OPS0001	SDF-P reporting space problems (possible response: FREE-VARIABLE and repeat command)

## Notes

- A VSN can appear in two output records at the same time during a remount operation: in the record of the device on which the volume is physically online, and in the record of the device on which the volume is to be mounted.
- Mnemonics or VSNs which cannot be generated are treated as unknown mnemonics or VSNs. If VSNs are specified which are currently unknown to the system, “empty” records containing only VSN and “NO ACTION” are returned. Only if “\*” is specified in the VSN operand will no records be output for unknown VSNs.
- ATTRIBUTES=\*ENABLED or \*DISABLED selects all FastDPAV devices in the mentioned state (FastDPAV see “Introduction to System Administration” [14])

## Output in S variables

The INFORMATION operand identifies the S variables which are to be created. The following values are possible for INFORMATION: \*STD/\*SUMMARY/\*TASK/\*ALL/ \*LOCATION.

Output information	Name of the S variable	T	Contents	Condition
Mount operation being performed for the volume by the volume monitoring system	var(*LIST).ACTION	S	" *CANCEL *DISMOUNT INOP *MOUNT NO-ACTION *NO-DEV *POS *PREMOUNT *RECOVER REMOUNT SNATCHED *SVL-UPDATE *UNLOCK WP-MISSING	INF=ALL/STD
Number of devices in the “ATTACHED” state (available)	var(*LIST).ATTACH	I	<integer>	INF=LOCATION
Number of available devices	var(*LIST).AVAIL	I	<integer>	INF=LOCATION
Configuration state of the specified device.  *ENABLED / *DISABLED states are only possible for FastDPAV alias devices	var(*LIST).CONF-STA	S	" *ATTACH ATTACH- *ATTACH-PEND *DET *DET-PEND *INVALID *ENABLED *DISABLED	INF=ALL/STD
Number of devices in the “DETACHED” state (unavailable)	var(*LIST).DET	I	<integer>	INF=LOCATION

Number of devices in the "DETACHED-PENDING" state (not shareable after use)	var(*LIST).DET-PEND	I	<integer>	INF=LOCATION
Type of device allocation; if the device is reserved exclusively, the TSN is output	var(*LIST).DEV-ALLOC	S	" *DMS DMS-DRV DMS-PAGING *DRV DRV-PAGING *FREE PAGING PUB-DRV *PUBLIC <tsn>	INF=ALL/STD
Name of the depot	var(*LIST).LOCATION	S	" <location>	INF=LOCATION

## 5.126 SHOW-DISK-DEFAULTS

Show default values for DISK parameters

**Component:** BS2000 OSD/BC

**Functional area:** Device management

**Domain:** DEVICE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SW-MONITOR-ADMINISTRATION

**Routing code:** E

### Function

With the SHOW-DISK-DEFAULTS command, users can obtain information on the default values for the assignment of private disks. These values do not apply to private disks requested with USE=SPECIAL.

The following presettings are possible:

- Time of device assignment or release (ASSIGN-TIME)  
The following values can be set for ASSIGN-TIME:
  - USER: Default value; the time of assignment or release of the device corresponds to the time the user assigns or releases the private disk.
  - OPERATOR: If the private disk is mounted (online), the assignment is executed immediately. Otherwise, the assignment cannot be made until the disk is placed online.
- Permissible initial job allocation types SHARED or EXCLUSIVE (USER-ALLOCATION)  
The following values can be set for USER-ALLOCATION:
  - NO: permits no initial allocations.
  - ALL: permits SHARED and EXCLUSIVE initial allocations.
  - EXCL(usive): permits only EXCLUSIVE initial allocations.
  - SHARE: permits only SHARED initial allocations.
- Monitor of initial job allocations SHARED or EXCLUSIVE  
The following values can be set for OPERATOR-CONTROL:
  - NO: monitors no initial allocations.
  - ALL: SHARED and EXCLUSIVE initial allocations must be confirmed by the operator.
  - EXCL(usive): EXCLUSIVE initial allocations must be confirmed by the operator.
  - SHARE: SHARED initial allocations must be confirmed by the operator.

The command supports structured output in S variables (see "Output in S variables").

## Format

```
SHOW-DISK-DEFAULTS
```

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NKD0005	Warning: information incomplete
	1	NKD0001	Syntax error in the input, correction of the command parameters recovers the error
4	1	NKD0001	Syntax error in subprocedure
	32	CMD2009	Error on output to S variable (e.g. subsystem not available)
	64	NKD0002	No information available
	64	NKD0006	Internal error during initialization of the command server
	130	OPS0001	SDF-P reporting space problems (possible response: FREE-VARIABLE and repeat command)

## Output format

A header line and a values line are displayed.

```
Header line:
ASSIGN-TIME      USER-ALLOCATION      OPERATOR-CONTROL
Values line:
<assign-time>   <user-allocation>  <operator-control>
```

The output fields and their meanings are described in [section "Information services of device management: Meanings of the output values of SHOW commands"](#).

## Example

*Example of information displayed*

```
/show-disk-def
```

```
% ASSIGN-TIME  USER-ALLOCATION  OPERATOR-CONTROL
%      USER           ALL                NO
```

---

## Output in S variables

Output information	Name of the S variable	T	Contents	Condition
Time of device assignment/release	var(*LIST).ASS-TIME	S	" *OPER *USER	
Amount of information for the operator about new disk allocations for tasks	var(*LIST).OPER-CONTR	S	" *ALL *EXCL *NO *SHARE	
Type of disk allocation request the user is allowed to make	var(*LIST).USER-ALLOC	S	" *ALL *EXCL *NO *SHARE	

---

## 5.127 SHOW-DISK-STATUS

Show information about assignment, DISK parameters and monitoring of disks

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Device management
<b>Domain:</b>	DEVICE
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE OPERATING SW-MONITOR-ADMINISTRATION
<b>Routing code:</b>	E

### Function

The SHOW-DISK-STATUS command provides information relating to the assignment, disk parameters and volume monitoring of the specified disks. The VSN of the disk can also be specified using a wildcard. The information displayed refers to the reserving disk, irrespective of which volume is physically online (in contrast to SHOW-DEVICE-STATUS). Nonprivileged users are shown information only on private disks on which their own jobs have reserved space.

The various output fields and their functions are described in [section "Information services of device management: Meanings of the output values of SHOW commands"](#).

The command supports structured output in S variables (see ["Output in S variables"](#)).

#### *Privileged functions*

System support staff are supplied with information for all devices. If they select \*TASK or \*SYSTEMS with the INFORMATION operand they are shown all the available information.

## Format

### SHOW-DISK-STATUS

**UNIT** = **\*SELECT** (...) / **\*VOLUME**(...) / list-poss(26): <alphanum-name 2..2 with-wild(20)> /

<alphanum-name 4..4 with-wild(20)>

**\*SELECT**(...)

| **ATTRIBUTE** = **\*ALL** / **\*FREE** / **\*EXCLUSIVE** / **\*SHARE** / **\*PUBLIC** / **\*ONLINE** / **\*MOUNTING** /

| **\*IN-USE** / **\*CANCELLED** / **\*NO-DEVICE** / **\*RECOVER** / **\*DMS** / **\*SPECIAL** /

| **\*DISMOUNT** / **\*UNLOCK** / **\*SVL-UPDATE** / **\*STD** / **\*NON-STD** / **\*BS1000**

**\*VOLUME**(...)

| **VOLUME** = list-poss(10): <vsn 1..6> / <alphanum-name 1..6 with-wild(30)>

**,INFORMATION** = **\*STD** / **\*PARAMETER** / **\*TASK** / **\*SYSTEMS** / **\*ALL**

## Operands

**UNIT** = **\*SELECT**(...) / **\*VOLUME**(...) / list-poss(26): <alphanum-name 2..2 with-wild(20)> /

<alphanum-name 4..4 with-wild(20)>

Selection of disks by attributes, volume serial numbers or the mnemonic (two- or four-character) device name of the device on which the disk is mounted. At most 26 mnemonic device names are permitted.

Mnemonic device names that cannot be generated are handled like non-generated devices.

**UNIT** = **\*SELECT**(...)

Selection by attributes.

**ATTRIBUTE** =

Information is output for the disks with the specified attribute.

**ATTRIBUTE** = **\*ALL**

Information is output for all specified disks.

**ATTRIBUTE** = **\*FREE** / **\*EXCLUSIVE** / **\*SHARE** / **\*PUBLIC** / **\*ONLINE** / **\*MOUNTING** / **\*IN-USE** / **\*CANCELLED** / **\*NO-DEVICE** / **\*RECOVER** / **\*DMS** / **\*SPECIAL** / **\*DISMOUNT** / **\*UNLOCK** / **\*SVL-UPDATE** / **\*STD** / **\*NON-STD** / **\*BS1000**

Default information is output for all disks with the specified attribute.

Possible specifications:

Operand value (device attribute)	Meaning
*ALL	any attribute
	<i>volume-allocation-state</i>
*FREE	free

*EXCL[USIVE]	exclusively reserved
*SHARE	shareable
	<i>device-allocation-state</i>
*PUB[LIC]	public
	<i>volume-phase</i>
*ONLINE	mounted, but not assigned
*MOUNTING	waiting for operator answer
*IN-USE	assigned
	<i>action-state</i>
*CAN[CELED]	permanently locked
*NO-DEV[ICE]	no device assignment
*REC[OVER]	interrupt handling
*DISMOUNT	REMOUNT or MOUNT message still pending
*UNLOCK	UNLOCK job being executed
*SVL-UPD[ATE]	system occupancy log being stored
	<i>use-mode</i>
*DMS	occupied by DMS application
*SPECIAL	occupied by special application
	<i>label-type</i>
*STD	standard labels
*N[ON]-STD	nonstandard labels
*BS1000	BS1000 labels

#### UNIT = \*VOLUME(...)

Specifies the volume serial numbers of the disks for which information is to be output.

#### VOLUME = list-poss(10): <vsn 1..6> / <alphanum-name 1..6 with-wild(30)>

Specifies the volume serial numbers (VSN, up to 6 characters) of the disks for which information is to be output.

A maximum of 10 VSNs can be specified.

With certain restrictions, wildcard characters may also be used in the volume serial numbers; an asterisk "\*" may be specified in place of any character string. If two or more asterisks are entered, they must be separated in each case by at least one character.

**UNIT = list-poss(26): <alphanum-name 2..2> / <alphanum-name 4..4>**

Lists up to 10 disks for which information is to be output.

**INFORMATION =**

Type of information to be displayed. This operand is only evaluated if device names or volume serial numbers (UNIT or VOLUME operand) are used to select the disks. If ATTRIBUTE is specified, only INFORMATION=\*STD is possible.

**INFORMATION = \*STD**

For each private disk occupied by the task, a record is displayed with global occupancy and monitoring information (e.g. access by START-PROGRAM to a program on private disk).

**INFORMATION = \*PARAMETER**

Parameters set with the SET-DISK-PARAMETER or SET-DISK-DEFAULTS command are displayed. Parameter values set with SET-DISK-DEFAULTS are marked with "(D)". Output is independent of occupancy by the task. No information can be requested for public disks with this operand.

**INFORMATION = \*TASK**

*For nonprivileged users, INFORMATION = \*STD applies.*

A list of the TSNs that are occupying this disk in DMS usage mode is displayed.

**INFORMATION = \*SYSTEMS**

*For nonprivileged users, only the first line for the disks occupied by them is displayed.*

A list of systems occupying this disk is displayed.

**INFORMATION = \*ALL**

*For nonprivileged users, only STD, PARAMETER and SYSTEMS information is displayed.*

Displays all four output records for the specified disks (\*STD, \*PARAMETER, \*TASK, and the second output line of \*SYSTEMS).

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NKD0005	Warning: information incomplete
2	0	NKD0030	Warning: INFORMATION parameter changed
	1	NKD0001	Syntax error in the input, correction of the command parameters recovers the error
	1	NKD0013	Syntax error in SHOW-DISK-STATUS
	64	NKD0002	No information available
	64	NKD0005	No information available for MN list
	64	NKD0006	Software error in NKDDISC procedure
	64	NKD0032	No information available for ATTRIBUTE
4	130	NKD0010	The disk monitor is temporarily not available; try again later

## Output formats

The output shows a header line followed by one values line for each disk specified. Five display formats are possible, depending on the entry made in the INFORMATION operand.

The meaning of the output columns and possible values are explained in [section "Information services of device management: Meanings of the output values of SHOW commands"](#).

### 1. Standard output record (INFORMATION=\*STD)

Header line						
MNEM	VSN	USE	DEV-A	VOL-A	PHASE	ACTION
Values						
mn	vsn	use mode	device allocation state	volume allocation state	volume phase	action state

#### Note

The distinction between PAGING and PUBLIC assignments (dynamic paging area modification) also affects information columns DEV-A and VOL-A. The meanings of the possible combinations of values in these two columns are as follows:

DEV-A	VOL-A	Meaning
PUBLIC	PUBLIC	The disk is imported and is not used for PAGING.
PUBLIC	PAGING	The disk is imported and is used for PAGING.
PAGING	PAGING	The disk is used exclusively for PAGING.
PUB-DRV	PAGING	The disk is imported as a DRV volume and is used for PAGING.
DRV-PAG	PAGING	The disk is used for PAGING in DRV mode.
DRV-PAG		The matching second disk of a DRV pair is used for PAGING in DRV mode.
DMS-PAG	SHARE	The disk is used for PAGING and is also shareable for tasks.

### 2. Output record for INFORMATION=\*PARAMETER

Header line							
ALLOC	VSN	TYPE	SYS-ALLOC	ASS-TIME	USER-ALLOC	OP-CTL	ACCESS
Values							
<Y/N>	vsn	device type	system allocation mode	assign time	user allocation type	operator access control	access mode

### 3. Output record for INFORMATION=\*TASK

```
Header line
MNEM  VSN  TSN  S
Values
mn      vsn  tsn,tsn,...
```

### 4. Output record for INFORMATION=\*SYSTEMS

```
Header line 1
MNEM  VSN          TIME-STAMP  SVL-RECORDING-MODE
Values
mn    *vsn          time-stamp  svl-recording-mode
Header line 2
MNEM  VSN  #PHYS-HALF-PAGES      PAMKEY/FRMT
Values
mn    *vsn  #php                  pamkey/format
Header line 3 (privileged users only)
MNEM  VSN  VTOC-SYS              SVL-ALLOC          SYSTEMS
Values
mn    *vsn  vtoc-sys              system allocation mode  sys-id[,...]
```

where:

format	=	disk format (2K or 4K)
time stamp	=	yyyy-mm-dd hh:mm:ss (time of last occupancy of the disk)
vtoc-tsn	=	designates the task in the user's own system that is locking or wishes to lock the VTOC of the disk, but has not yet successfully completed the SVL I/O operation.
vtoc-sys	=	System ID of the system that is occupying the VTOC of the disk. In this phase, no VTOC operations by other systems are possible.

## Notes

- Nonprivileged users are shown no information for public disks if they specify INFORMATION=\*PARAMETER or \*ALL.  
Privileged users are shown no information if they specify INFORMATION=\*PARAMETER or \*TASK and are shown information only for \*STD and \*SYSTEMS if they specify INFORMATION=\*ALL.
- If more than one disk with the same VSN exists within one system, only one record is displayed if INFORMATION=\*PARAMETER or \*TASK or \*SYSTEMS is specified.
- A VSN may appear in two or more output records: For all devices on which the volumes are also physically available.
- MNs or VSNs which cannot be generated are handled like unknown MNs or VSNs. If VSNs are specified which are not known to the system at present, "empty" records containing only VSN and "NO ACTION" are returned. Only when "\*" is specified in the VSN operand are no records output for unknown VSNs.

---

## Examples

*Example 1: Output for private disk with INFORMATION=\*PARAMETER*

```
/show-disk-sta *vol(work01),inf=*par
```

```
% ALLOC VSN      TYPE      SYS-ALLOC ASS-TIME USER-ALLOC OP-CTL ACCESS
%   Y   WORK01 D3435      EXCL      OPERATOR  SHARE     NO      WRITE
```

*Example 2: Output for private disk with INFORMATION=\*SYSTEM*

```
/show-disk-sta *vol(work01),inf=*sys
```

```
% MNEM VSN      TIME-STAMP      SVL-RECORDING-MODE
% B156 WORK01 2017-02-27 07:04:09 SRV
```

*Example 3: Output for private disk with INFORMATION=\*ALL and device reservation information*

```
/show-disk-sta *vol(work01),inf=*all
```

```
% MNEM VSN      USE      DEV-A      VOL-A      PHASE      ACTION
% B156 WORK01 DMS      DMS      SHARE     IN-USE     NO ACTION
% ALLOC VSN      TYPE      SYS-ALLOC ASS-TIME USER-ALLOC OP-CTL ACCESS
%   Y   WORK01 D3435      EXCL      OPERATOR  SHARE     NO      WRITE
% MNEM VSN      TIME-STAMP      SVL-RECORDING-MODE
% B156 WORK01 2017-02-27 07:04:09 SRV
```

```
/show-res-alloc
```

```
% MNEM TYPE      VSN      VOL-A TSN NAME/ID      PHASE      ACTION
% B156 D3435     WORK01  SHARE 3QLJ ALF          IN-USE     NO ACTION
```

## Output in S variables

The INFORMATION operand identifies the S variables which are to be created. The following values are possible for INFORMATION: \*STD/\*PARAMETER/\*TASK/ \*SYSTEMS/\*ALL:

Output information	Name of the S variable	T	Contents	Condition
Read or write access to data on the disk	var(*LIST).ACCESS	S	" WRITE ALL	INF=PAR
Mount operation being performed for the disk from the volume monitoring system	var(*LIST).ACTION	S	" *CANCEL *DISMOUNT INOP *MOUNT NO-ACTION *NO-DEV *PREMOUNT REMOUNT *RECOVER SNATCHED *SVL-UPDATE *UNLOCK WP-MISSING	INF=STD
Disk is allocated	var(*LIST).ALLOC	S	Y N	INF=PAR
Time of device assignment/release If "(D)" is appended, the data has been taken from the disk defaults	var(*LIST).ASS-TIME	S	" *OPER *USER	INF=PAR
Date of last disk allocation	var(*LIST).DATE	S	" <yyyy-mm-dd>	INF=SYS
Type of device allocation	var(*LIST).DEV-ALLOC	S	" *DMS DMS-DRV DMS-PAGING *DRV DRV-PAGING *FREE PAGING PUB-DRV *PUBLIC	INF=STD
A REMOUNT or MOUNT message is pending for the DISMOUNT volume on this device	var(*LIST).DISMOUNT-ACTION	S	" *DISMOUNT	INF=STD

DISMOUNT volume	var(*LIST).DISMOUNT-VOL	S	" <vsn>	INF=STD
Mnemonic of the corresponding DRV unit	var(*LIST).DRV-UNIT	S	" <mnemo-name>	INF=TASK
Disk format	var(*LIST).FORM	S	" 2KB 4KB	INF=SYS
Inconsistency indicator in SVL (Standard Volume Lable)	var(*LIST).INCONS	S	YES NO	INF=SYS
Disk capacity in PAM pages (PHP: physical half pages)	var(*LIST).NUM-OF-PHP	S	<number-of-php>	INF=SYS
Amount of information for the operator about new disk allocations for tasks If "(D)" is appended, the data has been taken from the disk defaults	var(*LIST).OPER-CONTR	S	" *ALL *EXCL *NO *SHARE *STD	INF=PAR
Use of the PAM key allowed	var(*LIST).PAM-KEY	S	" NO YES	INF=SYS
Disk monitoring mode	var(*LIST).PHASE	S	" *IN-USE *MOUNT *ONLINE *PREMOUNT RAID1-SUB RAID5-SPARE	INF=STD
Recording mode last used for the disk	var(*LIST).REC-MODE	S	" *DRV *SRV	INF=SYS
Actual disk allocation mode	var(*LIST).SVL-ALLOC	S	" *EXCL *SHARE	INF=SYS
Disk operating mode for the system	var(*LIST).SYS-ALLOC	S	" *ALL *EXCL EXCL(A) *SHARE SHARE(A)	INF=PAR
System ID	var(*LIST).SYSID(*LIST)	S	" <sys-id>	INF=SYS

Time of last allocation	var(*LIST).TIME	S	" <hh:mm:ss>	INF=SYS
TSN of the task	var(*LIST).TSN(*LIST)	S	" <tsn>,<tsn>,...	INF=TASK
Device type from which the information is retrieved	var(*LIST).TYPE	S	" <dev-type>	INF=PAR
Device unit mnemonic	var(*LIST).UNIT	S	" <mnemo-name>	INF=TASK/ STD/SYS
Usage mode in which the mounted volume is to be operated	var(*LIST).USE	S	" *DMS *SPECIAL *WORK	INF=STD
Type of disk allocation request the user is allowed to make. If "(D)" is appended, the data has been taken from the disk defaults	var(*LIST).USER-ALLOC	S	" *ALL *EXCL *NO *SHARE	INF=PAR
VSN of the private disk	var(*LIST).VOL	S	" <vsn>	
Mounted disk type	var(*LIST).VOL-ALLOC	S	" *CANCEL *EXCL *FREE *PAGING *PUBLIC *SHARE	INF=STD
System ID of the system currently holding the VTOC lock for the disk	var(*LIST).VTOC-SYS	S	" <vtoc-sys>	INF=SYS

## 5.128 SHOW-DSSM-INFORMATION

Show information on DSSM

**Component:** DSSM  
**Functional area:** Subsystem management  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** SUBSYSTEM-MANAGEMENT

### Function

The SHOW-DSSM-INFORMATION command outputs information on the Dynamic Subsystem Management (DSSM). The following information is provided for diagnostic purposes:

- DSSM version
- Memory class of the DSSM task (class-4 or class-5 memory)
- Status of DSSM logging
- Path name of the object module library from which DSSM was loaded at the last startup
- Path name of the REP file which was used at the last startup to load DSSM
- Path name of the subsystem catalog which DSSM used to initialize the system

### Format

<b>SHOW-DSSM-INFORMATION</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Without errors
	1	ESM0431	Privilege errors

---

## Example

`/show-dssm-info`

```
-----          FROM PARAMETER FILE          -----  
-  
DSSM VERSION           : 043  
CREATION MEMORY CLASS : CL5  
DSSM LOGGING           : OFF  
-----          FILES          -----  
-  
DSSM LIBRARY           : :SBZ8:$TSOS.SYSLNK.DSSM.043  
DSSM REPFIL           : :SBZ8:$TSOS.SYSREP.DSSM.043  
INITIAL DSSM CATALOG  : :SBZ8:$TSOS.SYS.SSD.CAT.X
```

---

## 6 SHOW-FILE - SHOW-PUBSET-SPACE-DEFAULTS

The manual "Commands" is divided into the following chapters:

- General Part
- ACTIVATE-SNAPSHOT - DECRYPT-FILE
- DELETE-ALTERNATE-INDEX - LOGOFF
- MAIL-FILE - MOVE-TASK-TO-CATEGORY
- OPEN-VARIABLE-CONTAINER - SHOW-DSSM-INFORMATION
- SHOW-FILE - SHOW-PUBSET-SPACE-DEFAULTS
- SHOW-RESOURCE-ALLOCATION - WRITE-TEXT

---

## 6.1 SHOW-FILE

Display contents of file

<b>Component:</b>	SHOW-FILE
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The SHOW-FILE command displays the contents of a file on the terminal without requiring the user to load an editor program. The following file types are supported:

- SAM file
- ISAM file
- PAM file
- PLAM library element with the following record types:
  - records of the B format are contained in elements of the type C (executable program), L (LLM) and H (compiler information file). The record length is always a multiple  $n$  of 2048 bytes ( $1 \leq n \leq 128$ ).
  - records of the A format can occur in any element type. The record length is variable.

If an element contains both record types, only the records of the B format are displayed.

After the command has been entered, the specified file or library element is opened and the first section is displayed on the terminal. The program then expects further statements from the user, e.g. scrolling in the file (vertical/horizontal), searching for a character string, modification of the output format, reading in of another element from the specified library, termination of file output.

This command may be used only in interactive mode.

With the help of XHCS, SHOW-FILE can also display files if the terminal does not support the data character set (e.g. Unicode). For details, see section "[Character sets](#)". If the XHCS subsystem is not active, SHOW-FILE terminates and message SH00021 is issued.

## Format

<b>SHOW-FILE</b>	Alias: <b>SHF</b>
<b>FILE-NAME</b> = * <b>LIBRARY-ELEMENT</b> (...) / <filename 1..54> * <b>LIBRARY-ELEMENT</b> (...)   <b>LIBRARY</b> = <filename 1..54>       , <b>ELEMENT</b> = <composed-name 1..64 with-under>(…)               <composed-name 1..64 with-under>(…)                 <b>VERSION</b> = * <b>HIGHEST-EXISTING</b> / <composed-name 1..24 with-under>       , <b>TYPE</b> = <alphanum-name 1..8> <b>,OUTPUT-FORMAT</b> = * <b>STD</b> / * <b>DUMP</b> / * <b>CHARACTER</b> / * <b>HEX</b>	

## Operands

**FILE-NAME** = \***LIBRARY-ELEMENT**(...) / <filename 1..54>

Name of the file to be output.

**FILE-NAME** = \***LIBRARY-ELEMENT**(...)

Indicates the PLAM library element to be output.

**LIBRARY** = <filename 1..54>

Name of the PLAM library containing the element to be output.

**ELEMENT** = <composed-name 1..64 with-under>(…)

Name of the element to be output. Further elements of the same library can be output with the OPEN statement without calling the command again (see "OPEN").

**VERSION** = \***HIGHEST-EXISTING** / <composed-name 1..24 with-under>

Version number of the element (max. 24 characters).

**VERSION** = \***HIGHEST-EXISTING**

The element with the highest version and variant number is opened.

**TYPE** = <alphanum-name 1..8>

Designation of the element type.

**OUTPUT-FORMAT** =

Determines the output format.

**OUTPUT-FORMAT** = \***STD**

SAM and ISAM files, in addition to library elements, which contain exclusively A records, are displayed in a character-oriented text format, the character format (OUTPUT-FORMAT=\*CHARACTER).

Library elements which contain records of the format B and PAM files are displayed in dump format (OUTPUT-FORMAT=\*DUMP), but tape files with nonstandard blocks are not supported.

---

## OUTPUT-FORMAT = \*CHARACTER

*Library elements which contain B records are displayed in dump format after message SHO0313 has been issued.*

The data is output in a character-oriented text format, the character format. The data is output as characters. The substitute character specified is output in place of nonprintable characters (see SUBSTITUTE-CHARACTER in the output of the SHOW-TERMINAL-OPTIONS command).

When the characters are displayed, the bytes in the specified data character set which are read from the file are interpreted and displayed in the specified communication character set. Interpretation begins with the character which is logically the first in each record (depending on the specified OFFSET).

The position count begins with the first character with the *not displayable* or *not defined* attribute; characters which cannot be converted to the communication character set are replaced by the specified substitute character. In this context, the null character is regarded as displayable (in accordance with the XHCS attribute but contrary to the Unicode convention).

In the case of UTFE or UTF8, byte sequences which are illegal in the data character set are converted byte by byte to the substitute character. The restart point is the continuation byte for the byte which is substituted. Illegal UTF16 characters are replaced completely (2 bytes) by the substitute character. Any isolated remainder byte which is present at the end of the record is also replaced by the substitute character.

When the output is supposed to be to a file, in other words, if SYSOUT is assigned to a file in procedure mode, these specifications apply analogously, with the file's CCS being taken as the communication character set.

Each record is terminated with a logical end-of-line character. An empty record is displayed with just the logical end-of-line character. The logical end-of-line character is not output if SYSOUT is assigned to a file in procedure mode. When a 3270 data display terminal is used, no logical end-of-line characters are displayed, either, but the lines are filled with null characters.

The [HEX ON](#) statement is used to switch the display to hex format (see OUTPUT-FORMAT=\*HEX).

## OUTPUT-FORMAT = \*HEX

*Library elements which contain B records are displayed in dump format after message SHO0313 has been issued.*

The data is edited in a character-oriented text format, hex format. This output complies with character format; the hexadecimal character encoding is displayed in printable form in additional lines:

- The data is output as characters in the first lines (as with character format).
- Pairs of hex lines which display the content of each byte are then output. The upper line contains the high-order half byte, the lower line the low-order half byte.  
Depending on the data character set, the number of these line pairs can vary: precisely one line pair is required with 7/8-bit character sets.  
Two hex lines are generally not sufficient for output in the case of Unicode files. With UTF16 two line pairs are required for the hex display, with UTF8 up to three line pairs, and with UTFE as many as four line pairs.  
However, with UTF8 and UTFE one line pair is normally adequate as the characters can be encoded with variable lengths, and more line pairs are needed only for special characters (such as umlauts, “ß” or the euro sign).
- An edited record is followed by a format line as an optical separator to the next record.

If the hexadecimal output of a record no longer fits completely in the data window, this record, and possibly others, will only be displayed in character format in the remaining lines and will only be edited when further positioning takes place.

The [HEX OFF](#) statement can be used to switch to character format (see OUTPUT-FORMAT=\*CHARACTER).

---

## **OUTPUT-FORMAT = \*DUMP**

*This output format is not allowed for library elements that only contain A records or for tape files with nonstandard blocks.*

Output takes place in dump format. For this purpose SHOW-FILE opens the file to be output using the PAM access method or opens the library element with PLAM and outputs the content in 2-Kbyte units (PAM page):

Each line begins with an 8-digit hexadecimal number, the byte number of the first data byte in the line in the current PAM page. The output follows as an eight-digit decimal number in parentheses.

The byte number is followed by 16 data bytes in groups of 4 bytes each as hexadecimal constants. 32 bytes are displayed in screen format F2.

The data bytes are then displayed as printable characters. As with character format, the substitute character is displayed in place of nonprintable characters. The line ends with a logical end-of-line character. The position count begins with 0, i.e. the first byte of a record occupies byte position 0.

Multibyte sequences of variable length (UTF8, UTFE) are displayed in the part edited for printing in such a way that the character is output at the position of the 1st byte; null characters are output as filler characters at the positions of the 2nd, 3rd and 4th bytes (depending on the length of the sequence). Interpretation begins with the first byte displayed in the data window. Multibyte sequences which extend over more than one screen line result in the character string concerned being made up when it is edited for printing.

Multibyte sequences of fixed length (UTF16) are displayed without filler characters, i.e. two bytes are displayed as one character. If in the case of UTF16, the problem occurs that interspersed 1-byte characters cause the interpretation to be incorrect up to the end of the block, this is simple to correct by shifting the area displayed by one byte. This also applies for the case that unaligned UTF16 character strings in the file which it would not be possible to correct using the OFFSET statement occur in the middle of the block.

As the dump format should in particular also display files which do not have consistent encoding, it is accepted that (in contrast to the text output formats) horizontal displacement might change how the characters are interpreted. The OFFSET statement is consequently also rejected for dump format with message SHO0128.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
2	0	SHO0004	File is empty (HIGHEST-USED-PAGE=0)
	1	CMD0202	Error while executing in batch mode
	32	SHO0001	Internal error
	32	SHO0003	Error during execution of a system component Guaranteed message: SHO0003
	32	SHO0023	PLAM error during library processing
	64	SHO0002	PLAM reported DMS error Guaranteed message: SHO0002
	64	SHO0005	Only SAM, ISAM, PAM files and PLAM libraries are supported
	64	SHO0006	Files with RECORD-FORMAT=UNDEFINED are not supported
	64	SHO0008	PLAM library elements cannot be output in dump format
	64	SHO0011	Specified file is not a PLAM library
	64	SHO0012	Specified PLAM library element is not known
	64	SHO0015	Terminal type is not supported
	64	SHO0016	Device type is not supported
	64	SHO0017	EOF in the case of SYSDTA in procedure mode
	64	SHO0018	WROUT error
	64	SHO0019	Invalid character set for SYSDTA
	64	SHO0020	Invalid character set for SYSOUT
	64	SHO0021	XHCS not available
	64	SHO0022	Dump format not possible with SAM or ISAM access method

---

## Character sets

SHOW-FILE V17.1A or higher also supports the output of files with the character sets UTFE, UTF8 and UTF16 and further ASCII character sets. As BS2000 terminals only directly support selected EBCDIC character sets, a distinction must be made between the character set in which the data is available/interpreted and the character set in which the data is displayed.

SHOW-FILE interprets the data in the data character set and converts it to the communication character set for output. The contents of files can consequently be output in all the character sets supported by XHCS with the help of XHCS. This is also the case if the data character set is not supported by the terminal.

If XHCS is not active, SHOW-FILE cannot output the file and terminates with SHO0021.

### *Data character set*

The data character set is the character set in which SHOW-FILE interprets the content of the file. SHOW-FILE uses the character set which is stored in the catalog entry of the file or in the metadata of the library element (CCS, Coded Character Set) as the data character set. If no character set (\*NONE) is entered, the EDF03IRV character set is used.

If the character set is not known in XHCS, EDF03IRV is also used and warning SHO0314 is output.

The data character set specified automatically by SHOW-FILE can be changed explicitly using the CODENAME statement. This also permits, for instance, a file to be displayed in which the character set from the catalog entry or the EDF03IRV character set which is used as a replacement does not match the character set actually used.

### *Communication character set*

The communication character set is the character set in which the work window is displayed on the terminal and inputs from the terminal are received. The communication character set must be a character set which is accepted by the terminal. When SHOW-FILE is called, it determines the communication character set as follows:

- The data character set if it is accepted by the terminal.
- A comprehensive character set of the EBCDIC equivalent of the data character set if it is accepted by the terminal.
- EDF041 (or EDF03IRV in the case of 7-bit terminals) if the terminal does not accept a comprehensive character set (e.g. data character set UTF16, but the terminal does not support UTFE).

This then results in the following substitutions:

Original	EBCDIC equivalent	Accepted by the terminal
ISO88591	EDF041	EDF041
UTF16	UTFE	UTFE
EDF03DRV	EDF03DRV	EDF041

The communication character set specified automatically by SHOW-FILE can also be changed explicitly using the TERMINAL statement.

---

### *Input and output character sets*

In procedure mode (see "SHOW-FILE") SHOW-FILE uses the following character sets:

- Input character set for reading the statements:
  - Communication character set when SYSDTA has primary allocation (terminal)
  - CCS of the file to which SYSDTA is assigned
- As output characters for outputting the data:
  - Communication character set when SYSOUT has primary allocation (terminal)
  - CCS of the file to which SYSOUT is assigned

Both the input and output character set must be an EBCDIC character set. If this is not the case, SHOW-FILE issues message SHO0019 (input character set) or SHO0020 (output character set) and terminates.

### *Displaying nondisplayable characters*

It may not be possible to display a byte code for the following reasons:

- Byte code is flagged in XHCS with the "not displayable" attribute (e.g. control character).
- Byte code is not defined in the character set (e.g. X'B5' in EDF03IRV).
- Byte code is illegal in the character set (e.g. X'5454' in UTFE, two consecutive multibyte start characters).
- Byte code cannot be converted to the communication character set (e.g. X'B5' = '§' in EDF041 with communication character set EDF03IRV).

Instead of the nondisplayable byte code the substitute character which is specified as the SUBSTITUTE-CHARACTER in the terminal options is output (see the SHOW-TERMINAL-OPTIONS command).

In the case of illegal byte sequences, the individual bytes of a sequence are replaced byte by byte via the substitute character. The restart point is the continuation byte for the byte which is substituted.

In the case of files in UTF16 character code, occasionally the problem is encountered that a single byte is inserted in the actual UTF16 sequence.

A typical case is that the UTF16 sequence is preceded by a 1-byte printer feed control character (e.g. in IBM print files). Such a file can be displayed effectively if the OFFSET statement is used to ignore the first n bytes of each record.

---

## SHOW-FILE in procedure mode

If job switch 5 is on when the command is called, SHOW-FILE operates in procedure mode, i.e. it reads its inputs from SYSDTA and writes its outputs to SYSOUT.

The maximum record length when reading from SYSDTA is 80 characters.

If a FIND or OPEN statement was entered incompletely up to an interrupt point, the next record which is read in is interpreted as a continuation line.

When SYSDTA or SYSOUT is assigned to the terminal, reading/writing takes place in the communication character set. When they are assigned to a file, this is the CCS of the file concerned. In this case, only EBCDIC character sets are permitted (the communication character set can also only be an EBCDIC character set) to permit the statements to be interpreted.

In procedure mode, INFORMATION also outputs the input and output character sets.

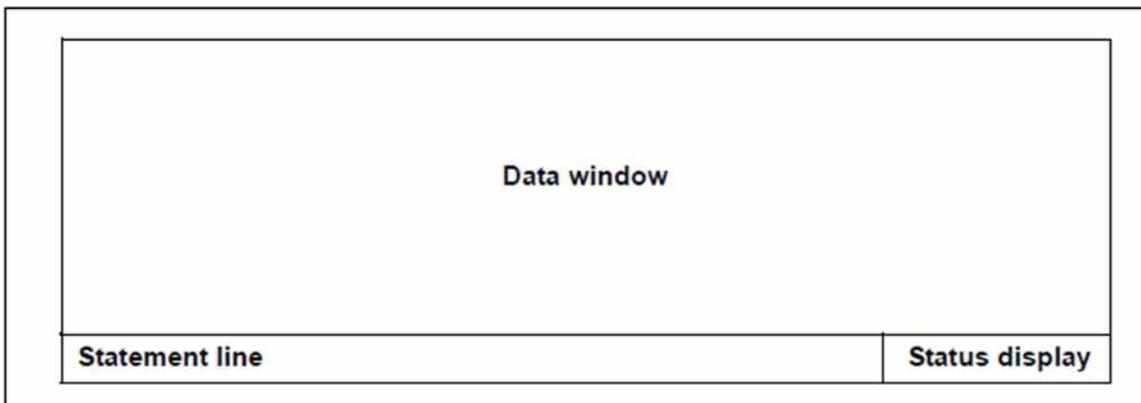

The penultimate line of the work window only contains the status indicator. The RDATA prompt appears in the last line if SYSDTA is assigned to a terminal.

For the output the screen is output to SYSOUT in its normal layout with all control characters. The terminating logical end-of-line characters are not output when a file is output.

## Screen display

SHOW-FILE displays the opened file or the library element in the work window on the screen in formatted form. The size of the work window depends on the properties of the data display terminal or terminal emulation used. On a 975x terminal 24 lines each 80 characters long are available for the screen display. The same values apply for a 9763 terminal in start format (F1 format). Here the VDT statement (see ["VDT - Specify a new screen format"](#)) can also be used to set other formats (F2, F3 or F4 format). In the case of terminals which do not support the F1 format, the format which they support is used as the start format.

The work window subdivides the screen into three areas with different functions:

### Data window

The data in the file or of the library element is output in the data window. All lines on the screen except the last line are available for this purpose in their full length. Normally this means 23 lines each containing 80 columns. When a different screen format is specified (see the VDT statement, "[SHOW-FILE](#)"), the values change accordingly.

When required, the lower lines of the data window are used to output information lines (2 or 6 lines, see the INFORMATION statement), for message output (1 line) or to provide continuation lines (up to the maximum number of lines in the data window minus 1. After the screen has been refreshed (e.g. using [K3]), the original data lines are visible again.

### Statement line

The statement line occupies the last line on the screen (by default line 24) with the exception of the last 26 characters, which are reserved for the status display.

In procedure mode, this line is not displayed in the last line, but one line above this. The RDATA prompt becomes visible in the last line, and the statements can be entered there.

## Status indicator

The status indicator provides information on the file type and positional attributes of the file section displayed. The display is in the form:

```
'BLANK'<type>*<reference><direction><recordno> (<recordpos>)
```

where:

Position	Content	Meaning and value range
1	'BLANK'	Blank
2	<type>	File type: I (=ISAM), S (=SAM), P (=PAM) or L (=PLAM)
3	*	Separator
4	<reference>	Reference position for <code>recordno</code> with <ul style="list-style-type: none"><li>• SOF=start of file</li><li>• EOF=end of file</li><li>• KEY=last record searched for with ISAM key</li></ul> For PLAM libraries (file type=L), the PLAM record type is shown.
7	<direction>	Direction specifies the sign for the record number in relation to the reference position: + or - In the case of library elements, only a blank is displayed.

Position	Content	Meaning and value range
8	<recordno>	Record number relative to the reference position (see <reference>) in the case of a SAM or ISAM file. For PAM files, the PAM page number is shown. For library elements, the record number is shown: <ul style="list-style-type: none"> <li>• In the case of A records, the record number within the record type displayed</li> <li>• In the case of B records, the record number within the chain of records of the format B</li> </ul> In the case of record numbers with more than 10 characters, the high-order part is truncated: the character # followed by the last 9 characters in the record number is displayed.
18	(	Separator
19	<recordpos>	Record position, i.e. number of the first character on the screen. For PAM files, the position within the PAM page is displayed. For library elements with B format records, the current record position is specified. Starting with the position <recordpos>, the section of the B record is displayed in dump format.
25	)	Separator
26		Not assigned or [LZE]in procedure mode

Table 100: Status indicator of the SHOW-FILE command

### Example

```
S*SOF+ 1( 1)
```

### Maximum character/byte position

Horizontal scrolling in character and hex format is possible to the maximum character position, and in dump format to the maximum byte position. The maximum character/byte position applies irrespective of whether records of this length exist.

The maximum character position in character and hex format specifies the (theoretical) maximum length for a record in this file. This applies irrespective of whether the file contains records of this length at all. The existence of a record length field is taken into account here, but no other file or device properties.

In the case of SAM and ISAM files with fixed record length, the maximum character position is exactly the record length defined in the catalog.

In the case of SAM and ISAM files with variable record length, the maximum character position is the block size minus 4.

In the case of library elements which only contain A records, the maximum character position is 32764.

In dump format the maximum byte position for files is 2047 (PAM page), and for library elements which contain B records 256 Kbytes-1.

In the text formats, scrolling to the right takes place only as far as to permit the maximum character position to be displayed in the first column of the data window.

---

In dump format, scrolling to the right takes place only as far as to permit the maximum byte position to be displayed in the first byte position of the data window.

## Entering statements

One or more statements can be entered in the statement line. If several statements are entered, they must be separated by semicolons.

The statements are interpreted in EBCDIC. A distinction between uppercase/lowercase is only made within c-strings of the FIND statement if this has been preset using the LOWER operand or the LOWER statement. Keywords are not case-sensitive.

Null characters are treated like blanks when they are entered.

When job switch 5 is on, SHOW-FILE operates in procedure mode (see "[SHOW-FILE in procedure mode](#)").

Commands can only be entered again after SHOW-FILE has terminated (e.g. /HELP-MSG-INFORMATION to explain an error message).

The [K3] key can be used to restore the screen contents if, for example, the screen has been overwritten by a message from the operator.

### *Continuation lines*

The space required for the OPEN or CLOSE statement can be more than one line. If the statement completely fills and overruns the line allocated to it, the required continuation lines are provided.

When a search string is being entered, a continuation line is offered until the maximum search string length of 256 bytes (256 characters in the case of a c-string and 512 characters in the case of an X string) is reached or a concluding apostrophe is entered. When the maximum search string length is exceeded, the input is aborted with message SHO0113.

No more than the maximum number of continuation lines required to make another data line visible is offered. If the statement is still incomplete after this, the input is aborted with message SHO0101.

### *Interrupting long-running statements*

Positioning and searching in big files may take a long time. In such cases, it is possible to interrupt long-running statements of the SHOW-FILE command by pressing the [K2] key. This applies to the following statements:

- sequential forward positioning with +n
- sequential backward positioning with -n
- search for string (c-string or x-string) with FIND

In procedure mode, interruption by the [K2] key is not possible.

If one of the above statements is interrupted, the warning SHO0307 is issued and SHOW-FILE waits for your next input. Screen output resumes at the position that had just been reached. The presetting of the statement line depends on the interrupted statement (see "[Presettings for the statement line](#)").

### *Presettings for the statement line*

In interactive dialog, SHOW-FILE presets the statement line after a positioning statement has been entered or the FIND and OPEN statements have been issued with a plausible continuation statement. This permits, for example, the file to be scrolled through simply using [DUE] without reentering “+”.

After SHOW-FILE has been called, “+” is initially preset in the statement line if the file contains more than one record.

<b>Input</b>	<b>Preset with</b>	<b>No presetting</b>
+ <i>[n]</i>	+ <i>[n]</i>	Only one record is displayed.
++	- + if fewer records exist than can be displayed in the data window	Only one record exists.
- <i>[n]</i>	- <i>[n]</i>	The first record is displayed.
--	+	Only one record exists.
> <i>[n]</i>	> <i>[n]</i>	Maximum character or byte position has been reached.
< <i>[n]</i>	< <i>[n]</i>	First character or byte position is displayed.
<<	>	
FIND [REVERSE]	FIND [REVERSE]	No hit found.
OPEN	+	The element contains only one record.

The statement line is not preset in the following cases:

- SHOW-FILE was called in procedure mode (job switch 5 is set).
- The file consists of only one record,
- When errors occur, the last entry is output once more in the statement line. If the statement line was overwritten, the presetting can be made visible again with [K3].

---

## Overview of the statements

The table below lists all the statement in the order in which they are subsequently described. Statement names and operands can be abbreviated from left to right as long as they remain unambiguous.

Statement	Function
<i>Statements for vertical positioning (scrolling)</i>	
++	Position to end of file
+ <i>[n]</i>	Scroll forward <i>n</i> lines
- <i>[n]</i>	Scroll backward <i>n</i> lines
--	Position to start of file
R <i>n</i>	Position to a particular record
<i>Statements for horizontal positioning</i>	
<<	Position to first character or byte 1
< <i>[n]</i>	Move <i>n</i> characters/bytes to the left
> <i>[n]</i>	Move <i>n</i> characters/bytes to the right
S <i>n</i>	Position to a particular character or byte
<i>Further instructions</i>	
FIND	Search for character string or ISAM key
LOWER	Preset conversion of lowercase letters in search strings
HEX	Enable/disable hexadecimal presentation
OFFSET	Ignore bytes at start of record
CODE-NAME	Specify a new data character set
TERMINAL	Specify a new communication character set
VDT	Specify a new screen format
INFORMATION	Output information about file or library element
OPEN	Open new library element
END	Terminate file output

Table 101: Statement overview (SHOW-FILE command)

---

## Statements for scrolling

The character or byte position currently set is not changed when vertical scrolling takes place. This also applies if the records in the new display are shorter than the position set.

- ++** Position to the end of file, i.e. the last record is (if possible) displayed in the last line of the data window.

In the text formats, the last record is displayed as far down in the data window as possible when scrolling takes place.

In hex output format it is ensured that the last recorded is displayed in edited form.

To enable the first record in the data window also to be displayed in edited form, unused lines (filled with null characters) may appear at the end of the data window.

In dump format, the last record is scrolled to.

In the case of tape files, this statement is rejected with message `SHO0129`.
- Position to the start of file, i.e. the first record is displayed in the first line of the data window.
- +*[n]*** Scroll forward in the file (toward the end of file).

*n* determines the number of records by which you scroll forward.

Values where *n*=<integer 0..9223372036854775807> are accepted. Leading zeros are ignored.

If *n* is not specified, you scroll forward by the number of lines contained in the data window. If records which had not yet been edited were visible in hex output format, you scroll to the first record which has not been edited.

Any hidden lines are taken into account in the text formats.

In hex output format it is ensured that this record is displayed in edited form. To permit the first record in the data window to be displayed in edited form, records which were already visible in the current data window may be displayed again at the end of the data window.

You scroll forward no further than to the last record. If *n* goes beyond this, you scroll to the last record and message `SHO0301` is issued.
- [n]*** Scroll backward in the file (toward the start of file).

*n* determines the number of records by which you scroll backward.

Values where *n*=<integer 0..9223372036854775807> are accepted. Leading zeros are ignored.

If *n* is not specified, you scroll in such a manner that the record preceding the first record visible in the data window is displayed as far down as possible in the data window.

In hex output format it is ensured that this record is displayed in edited form. To permit the first record in the data window to be displayed in edited form, records which were already visible in the current data window may be displayed again at the end of the data window.

You scroll backward no further than to the first record. If *n* goes beyond this, you scroll to the first record and message `SHO0302` is issued.

---

### *Vertical positioning to a specific record*

Rn Position to the nth record, in the case of a display in dump format to the nth PAM page.  
Values where n=<integer 0..9223372036854775807> are accepted. Leading zeros are ignored.

The records in the file are regarded as being numbered consecutively. This is also the case for library elements in which the numbering is displayed for each record type.

When n=0, the position is set to the first record. If n is greater than the number of the last record, the position is set to the last record and message SH00301 is issued.

## **Statements for horizontal positioning**

<< Move the record section to the left, to the start of the record.  
The record section displayed then begins at character position 1 or byte position 0.

<[n] Move the record section to the left character by character or byte by byte (toward the start of the record).  
n determines the number of characters or bytes by which it is moved.  
Values where n=<integer 0..2147483647> are accepted. Leading zeros are ignored.

If n is not specified, the following default applies:

- With the text formats, the record section is moved to the left by the current line length.
- With dump format, the record section is moved to the left by the number of bytes visible in the data window.

If n is greater than the current character or byte position, the position is set to the first character position or the first byte (byte position 0) and message SH00316 is issued.

>[n] Move the record section to the right character by character or byte by byte (toward the end of the record and beyond). n determines the number of characters or bytes by which it is moved.  
Values where n=<integer 0..2147483647> are accepted. Leading zeros are ignored.

If n is not specified, the following default applies:

- With the text formats, the record section is moved to the right by the current line length.
- With dump format, the record section is moved to the right by the number of bytes visible in the data window.

However, the record section is moved to the right no farther than to permit the maximum character position of a record to be displayed in the first column of the data window or to permit the maximum byte position of a record to be displayed in the first byte position of the data window (see "[Maximum character /byte position](#)").

---

### *Horizontal positioning to a particular character or byte*

S[n] Position the record section displayed to the nth character, in the case of display in dump format to the nth byte of the PAM page.

Values where n=<integer 0..2147483647> are accepted. Leading zeros are ignored. Default: n = 1.  
If n=0 is specified, the position is set to column 1 in the text formats, and in dump format to byte position 0.

The position is set to the right no farther than to permit the maximum character position of a record to be displayed in the first column of the data window or to permit the maximum byte position of a record to be displayed in the first byte position of the data window (see "[Maximum character/byte position](#)").

## **FIND - Search for a character string or an ISAM key**

The FIND statement is used to search for character strings or ISAM keys and sets the position to the first hit.

Format:

```
FIND [ [K] { [C]'string' [,LOWER = { ON / OFF } ] / X'hexstring' } [,ALL] ]  
      [,REVERSE]
```

Meaning of the operands

K	Specifies that the search string is to be interpreted as an ISAM key. A search string which does not comply with the key length is filled with null characters on the right if it has too few characters or truncated on the right if it has too many. The ALL and REVERSE operands are ignored. If the current file was not opened with ISAM, SHOW-FILE rejects the statement with message SHO0118.
[C]'string'	Search string (character string containing a maximum of 256 characters from the communication character set or the CCS assigned to SYSDTA). Quotes within the search string must be doubled.  If the character string is too long, the statement is rejected with SHO0113. If the character string is empty, the statement is rejected with SHO0122.  The character string is converted to the data character set for the search. If that is not possible, the statement is rejected with SHO0402.
X'hexstring'	Search string in hexadecimal format (character string containing a maximum of 512 hexadecimal characters). An even number of characters must be specified. Otherwise, the statement is rejected with SHO0115. If the character string is too long, the statement is rejected with SHO0113. If the character string is empty, the statement is rejected with SHO0122.
LOWER=	Specifies whether lowercase letters in the search string are to be converted to uppercase letters. If this operand is not specified, the default value of the LOWER statement applies (see " <a href="#">LOWER - Preset conversion of lowercase letters in search strings</a> ").
ON	Lowercase letters are retained. A hit is found only if uppercase/lowercase match.

---

OFF	Lowercase letters are converted to uppercase letters. Even when lowercase letters are entered, only uppercase letters are found.
ALL	Selects the hit-based search strategy (see " <a href="#">Search strategies</a> "). This operand can only be specified in conjunction with a search string.  The operand is ignored in a search for ISAM keys.
REVERSE	Reverses the search direction, i.e. the search is made toward the start of file.  The operand is ignored in a search for ISAM keys.

#### *Hit display when searching for ISAM keys*

When the K operand is specified, the specified search string is interpreted as an ISAM key and the search is restricted to the ISAM keys. The following applies for the hit display:

- Data is output starts at the record with the specified ISAM key, the character/byte position in the record remains unchanged.
- If no corresponding key exists, error message SH00409 is issued and the position is set to the record with the next highest existing key. If there is no record with a higher key, the position is set to the last record.

#### *Search strategies*

In a new search (a character or byte string was specified) FIND starts at the current character or byte position in the uppermost record which is displayed in the data window. Depending on the data type and the ALL operand, the FIND statement uses two different search strategies when searching for character or byte strings:

- The **record-based strategy** is employed for SAM and ISAM files and library elements with records of the A format if they are displayed in a text format and the ALL operand is not specified. In the event of a hit, i.e. when a record is found which contains the search string at least once, the position is set to the start of the hit record. The search for the next hit begins at the start of the record following the hit record or, in the case of REVERSE, at the start of the preceding record.
- The **hit-based strategy** is always employed for PAM files and library elements with format B records. It is also always employed for SAM and ISAM files if these are displayed in dump format. In all other cases, it is employed only if the ALL operand is specified. To permit the hit-based strategy to be used in the reverse direction, the search direction is also reversed within the record. In the event of a hit, the position is set to the first byte of the character string or byte string found. If, when searching for byte strings, a hit is recorded within a character encoded in several bytes, the position is set to the first byte of this character. The search for the next hit begins with the first byte following the hit byte or, in the case of REVERSE, with the byte preceding the hit byte.

#### *Further information*

- In the event of a hit, the statement line is preset with FIND or FIND REVERSE, thus enabling the search to be continued in the same direction simply by pressing [DUE]. If the continued search (FIND without a search string) yields no further hits, message SH00303 is issued and the statement line is no longer preset.
- If no hit is found in the first search (FIND with a search string), error message SH00408 is issued. To search the entire file backward in accordance with the hit-based strategy, the position must first be set to the last character or byte of the last record (or behind it).
- If no operand or only the REVERSE operand is specified, the search is continued with the last search string specified, and if required the search direction is changed. If no search string has been saved, the statement is rejected with message SH00401.

---

## LOWER - Preset conversion of lowercase letters in search strings

The LOWER statement determines whether SHOW-FILE should convert lowercase letters in the search string to uppercase letters if the LOWER parameter is not specified in a FIND statement.

Format:        **LOWER** [ ON / OFF ]

Meaning of the operands:

ON    Lowercase letters are retained if no other specification is made within a search statement.

OFF   Lowercase letters are converted if no other specification is made within a search statement.

LOWER OFF is preset when SHOW-FILE is called.

## HEX - Switch hexadecimal on/off

The HEX statement switches the display between the two text output formats.

Format:        **HEX** [ ON / OFF ]

Meaning of the operands:

ON    Output takes place in hex format (see OUTPUT-FORMAT=\*HEX).

OFF   Output takes place in character format (see OUTPUT-FORMAT= \*CHARACTER).

In dump format, the statement is rejected with message SH00119.

## OFFSET - Ignore bytes at the start of a record

In text formats the OFFSET statement causes the first n bytes in each record to be ignored. In dump format the statement is rejected with message SH00128.

In this display mode records with a length <= n are treated like records with a length of zero.

Format:        **OFFSET** [ n ]

Meaning of the operands:

n    Number of bytes which are to be ignored at the start of the record. Values where n=<integer 0.. 2147483647> are accepted. Leading zeros are ignored.

When the maximum search string length is exceeded, the input is aborted with message SH00125.

If n is not specified, no bytes are ignored (corresponds to n=0).

When the statement is executed, the character position for the display is implicitly reset to 1 because the way the characters are interpreted may change.

---

## **CODENAME - Specify a new data character set**

The CODENAME statement is used to explicitly specify the data character set in which the content of the file is interpreted.

Format:        **CODENAME** [ ccs-name ]

Meaning of the operands:

css-name    Name of the communication character set to be specified (<name 1..8>).

The character set named must be known to XHCS and must be accepted by the terminal. Otherwise, SHOW-FILE will reject the statement with message SH00405.

If the operand is not specified, SHOW-FILE once again specifies the communication character set which was determined automatically (see also "[SHOW-FILE](#)").

Switching the data character set implicitly triggers a number of actions:

- If automatic selection of the communication character set is active (see the TERMINAL statement), it is determined again and, if necessary, specified once more.
- The last search string is invalidated, i.e. a FIND statement without a search string is then rejected.
- The character position is reset to 1 or the byte position to 0 because the way the data is interpreted may have changed.

The file position remains unchanged so that the user can recognize the effects which changing the character set has on the record which is currently being examined.

## **TERMINAL - Specify a new communication character set**

The TERMINAL statement is used to explicitly specify the communication character set.

Format:        **TERMINAL** [ ccs-name ]

Meaning of the operands:

css-name    Name of the communication character set to be specified (<name 1..8>). The character set named must be known to XHCS and must be accepted by the terminal, otherwise SHOW-FILE will reject the statement with message SH00405.

If the statement is specified without an operand, SHOW-FILE once again specifies the communication character set which was determined automatically (see also "[SHOW-FILE](#)").

## **VDT - Specify a new screen format**

The VDT statement is used to explicitly specify a screen format (see also "[Screen display](#)") if the terminal supports the format specified.

Format:        **VDT** [ F1 / F2 / F3 / F4 ]

Meaning of the operands:

F1    Sets the screen format to 24 lines and 80 columns.

- F2 Sets the screen format to 27 lines and 132 columns.
- F3 Sets the screen format to 32 lines and 80 columns.
- F4 Sets the screen format to 43 lines and 80 columns.

Screen formats F2, F3, and F4 are only supported by terminals of the type 9763. If the terminal does not support the format specified, the statement is rejected with message SHO0306.

## INFORMATION - Output information about a file or library element

The INFORMATION statement outputs information about the file or library element which is currently displayed.

Format:           **INFORMATION**

In the case of files, the information output overwrites the last two data lines (by default lines 22-23). The file name and an information line containing the character sets concerned (CCS of the file, data character set, and communication character set) are displayed:

```
FILE: <filename 1..54>
CCSN: FILE=<name 1..8> DATA=<name 1..8> TERM=<name 1..8>
FILE: <filename 1..54>
CCSN: FILE=<name 1..8> DATA=<name 1..8> TERM=<name 1..8>
```

In the case of library elements, the information output overwrites the last six data lines (by default lines 19-23). The library name, element name, element type, version, and variant are displayed, as well as an information line containing the character sets concerned (CCS of the file, data character set and communication character set):

```
LIBRARY: <filename 1..54>
ELEMENT: <composed-name 1..64>
TYPE:     <name 1..8>
VERSION: <text 1..24>
VARIANT: <integer 1..9999>
CCSN: FILE=<name 1..8> DATA=<name 1..8> TERM=<name 1..8>
```

The information displayed can be cleared by pressing [DUE] (send key) or by entering the next statement. It disappears the next time the screen is redrawn.

If INFORMATION is entered as part of a statement chain, the information is displayed on the next screen of output information. Processing of the statement chain is not interrupted. If output of another message is pending at the same time, it takes precedence over the INFORMATION output.

### *Example*

If you enter **+;inf;find c'find'** and the 'find' string is not found, the message "SHO0408 SPECIFIED STRING DOES NOT EXIST" is output instead of the information.

---

## OPEN - Open new library element

This statement opens a new element in the library specified with the SHOW-FILE call. Any element which had already been opened is automatically closed. If a file is specified in the SHOW-FILE call instead of a library element, the statement is rejected with message SHO0107.

Format:        **OPEN** ([type[,elname[,version]]])

Meaning of the operands:

<code>type</code>	Element type (see also the <a href="#">TYPE</a> operand). If this specification is missing, SHOW-FILE selects the last available element type in alphabetical order.
<code>elname</code>	Element name (see also the <a href="#">ELEMENT</a> operand). If this specification is missing, SHOW-FILE selects the last available element in alphabetical order.
<code>version</code>	Version of the element (see also the <a href="#">VERSION</a> operand). If this specification is missing, SHOW-FILE selects the highest available version of the element in alphabetical order.

### *Notes:*

- When the new element is opened, the data character set and the output format are determined again in accordance with the element's properties.
- The communication character set is determined again if automatic selection is enabled.
- The position is reset and the search string is invalidated.
- Any communication character set which is explicitly specified, the screen format and the default for converting lowercase letters to search strings (see the LOWER statement) are retained.
- If the element does not exist, SHOW-FILE issues message SHO0407. No library element can then be opened and SHOW-FILE only accepts the OPEN and END statements.

## END - Terminate file output

The END statement closes the file or library element which is currently being displayed and terminates SHOW-FILE. The terminating message SHO0500 contains the complete file name of the last file displayed or the library name, element name, version, variant and element type of the last library element displayed.

Format:        **END**

The [K1] key has the same effect as the END statement. However, specifications in the statement line are ignored.

---

## Notes for disk files

- Files with BLOCK-CONTROL-INFORMATION=\*PAMKEY or \*WITHIN-DATA-BLOCK may exhibit interblock gaps, i.e. logical blocks which are in fact reserved for a file but not yet actually occupied. These logical blocks are recognized via their invalid CFIDs. As these blocks may still contain data that does not belong to the file, the PAM pages of such blocks are output as “empty” PAM pages (2048 \* X'00'). In addition, a message is issued pointing out that
  - the currently displayed PAM page (OUTPUT-FORMAT=\*DUMP) or
  - one or more PAM pages (in the case of PAM files and OUTPUT-FORMAT=\*CHAR or \*HEX)is/are not occupied.

This applies to all PAM files (regardless of the OUTPUT-FORMAT) and to all ISAM and SAM files with OUTPUT-FORMAT=\*DUMP.

- If DMS error '0BB7' (record with invalid length was read) occurs when a SAM file is being displayed, SHOW-FILE is terminated with a message.
- The following disk files are opened with SHARED-UPDATE=\*YES:
  - PAM files, irrespective of the output format
  - ISAM files, only when displayed in one of the text formats

Write accesses of another task are not possible if the file is also opened with SHARED-UPDATE=\*YES.

## Notes for tape files

- The SHOW-FILE command can also be used to display the contents of tape files, in which case attention must be paid to the following:
- Positioning to the end of the file (using ++) is not possible and is rejected with message SHO0129 .
- Tape files of the type PAM (in all output formats) and type files of the type SAM (in dump format) can be displayed only if the catalog entry contains the correct number of data blocks.
- Tape files of the type SAM without a catalog entry (foreign files) can be displayed in the text formats as follows:
  - Create catalog entry with IMPORT-FILE, e.g.:

```
/import-file support=*tape(volume=vol001,  
                             dev-type=tape,file-name=tape.file)
```
  - Create TFT entry with the link name DSHOW and the access method SAM using ADD-FILE-LINK, e.g.:

```
/add-file-link link=dshow, file-name=band.datei, access-method=*sam
```
  - Open the file with SHOW-FILE, e.g.:

```
/show-file tape.file
```
- Tape files should be displayed sequentially right to the end of the file in a single SHOW-FILE call. When the output is concluded the current block counter is transferred to the catalog entry as the number of file data blocks (see SHOW-FILE-ATTRIBUTES command, BLK-COUNT output field).  
If SHOW-FILE is terminated before the end of the file is reached, the file will only be output up to this data block the next time SHOW-FILE is called, the remaining data blocks will not be displayed.  
In order to resolve this, the catalog entry may have to be deleted and recreated (EXPORT-FILE and IMPORT-FILE commands).
- Tape files of the type SAM which have no catalog entry cannot be displayed in dump format. Tape files of the type PAM which have no catalog entry can never be displayed.

## Examples

Hex format display of a file in the UTF8 character set (=data character set):

## 6.2 SHOW-FILE-ATTRIBUTES

Output file attributes from catalog

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** @

### Function

The SHOW-FILE-ATTRIBUTES command enables users to request information on the catalog entries which they are permitted to access, for files, file generations, and file generation groups. This information can be a simple listing of the names of files, etc., which satisfy the criteria specified in the SHOW-FILE-ATTRIBUTES command; or on the other hand, detailed information from the catalog entry can be requested. Users can request information on all files under their own user IDs and on files under user IDs for which they are co-owners (see "Privileged functions" in the CREATE-FILE command), as well all other users' files that they are permitted to access (see USER-ACCESS, BASIC-ACL, GUARDS, and PROTECTION-ACTIVE). The request can cover all the information stored in the catalog (INFORMATION=\*ALL-ATTRIBUTES) or the following information units:

- Names and storage space allocations for the selected files (INFORMATION=\*NAME-AND-SPACE; default)
- The total number of PAM pages allocated to the selected files, split into storage space on public volumes, on Net-Storage and on private volumes (INFORMATION=\*SPACE-SUMMARY)
- The following blocks of information, individually or in any combination (INFORMATION=\*PARAMETERS):
  - history block with historic data of the file: time of creation, time of last access, time the file was last changed, number of storage space extensions (secondary allocations).
  - security block with the protection attributes of the file
  - backup block with all the file attributes for backing up data
  - organization block with all the file attributes related to the file structure
  - allocation block with all the relevant information on storage space allocation
- Brief information on the access method with which the file was created, the password protection, and the highest activated access control (INFORMATION=\*MINIMUM)
- Storage space allocation for all selected files and file generations, with totals for each type of volume (INFORMATION=\*STATISTICS).

---

The FILE-NAME and SELECT operands are used to select the files for which the required information is to be output:

- FILE-NAME: the selection criteria are the catalog ID, user ID, and file name (fully or partially qualified, wildcards are permitted in catalog number and file name). Default value: all permanent files under the user's own user ID from the default catalog on the local computer (FILE-NAME=\*ALL).
- SELECT: restricts the selection of files within those with the specified FILE-NAME. File attributes are used as selection criteria. Only the files which have the specified file attributes will be selected from the file set defined by FILE-NAME. Default value: the complete file set defined by FILE-NAME (SELECT=\*ALL).

Temporary files must be addressed using the tempfile prefix (# or @).

If wildcards are used in the catalog number, only files on locally imported pubsets are displayed.

The command supports structured output in S variables (see "[Output in S variable](#)").

#### *Privileged functions*

By default, systems support (TSOS privilege) can obtain information on the temporary or permanent files belonging to any user ID. However, if SECOS is used it is possible to restrict TSOS co-ownership of a user ID for permanent files.

Wildcards are supported within the user ID. Please note the following:

- Files in nonlocal pubsets are not displayed, even if they can be accessed through an MSCF or RFA connection.
- If no catalog ID is specified, information is supplied about files in the associated default pubsets of the selected user IDs.

In interactive mode, INFORMATION=\*PAR(PASSWORDS=\*YES) causes passwords to be displayed explicitly.

## Overview of functions

Function / Meaning	Level 1 operands	Level 2/3 operands
File name of the file whose catalog entries are to be output.	FILE-NAME =	
Scope of information to be output	INFORMATION =	
File name and reserved storage space	INFORMATION = *NAME-AND-SPACE	
Total occupied, reserved and free storage space for all selected files	INFORMATION = *SPACE-SUMMARY	
Total catalog entry	INFORMATION = *ALL-ATTRIBUTES

```

---

## Operands

### **FILE-NAME = \*ALL / <filename 1..54 with-wild(80)>**

The name of the file(s) for which information is to be output. If the SHOW-FILE-ATTRIBUTES command is issued without selection operands or with the default values (FILE-NAME=\*ALL, SELECT=\*ALL), the output will show the storage space reservation and path name for all (permanent) files under the user's own user ID, in alphabetical order. If a user ID for which the user is listed as co-owner is specified (see "Privileged functions" in the CREATE-FILE command), information can be requested for all permanent files. If a "foreign" user ID is specified, the only files for which information can be requested are those which the catalog entry shows the user is authorized to access (see USER-ACCESS, BASIC-ACL, GUARDS, and PROTECTION-ACTIVE).

If the FILE-NAME operand identifies a file generation group, only information about the group entry will be output and none about the individual generations. The latter information will only be output if the operand GENERATIONS=\*YES is also specified (under SELECT=\*BY-ATTRIBUTES). This also applies to FILE-NAME=\*ALL.

With the special prefix characters (# or @) for temporary files, the user can request information on all the temporary files for the current job. The special prefix character is replaced in the SYSOUT or SYSLST log by the name component used internally by the system.

For files addressed by an alias or the defined ACS prefix, the actual name from the file catalog appears in the output (see the ACS functions described in the LOAD-ALIAS-CATALOG and SET-FILE-NAME-PREFIX commands).

### **FILE-NAME = \*ALL**

The storage space reservation and file name will be output, in alphabetical order, for all the files recorded in the default catalog on the local computer under the user's own user ID.

### **FILE-NAME = <filename 1..54 with-wild(80)>**

FILE-NAME specifies the files or file generation groups for which information is required. The user can obtain information on either permanent files or temporary files (by specifying the tempfile prefix), but not both.

### **INFORMATION = \*NAME-AND-SPACE / \*SPACE-SUMMARY / \*ALL-ATTRIBUTES / \*PARAMETERS(...) / \*STATISTICS / \*MINIMUM**

The type of information to be shown on output to SYSOUT (see [OUTPUT](#) operand).

### **INFORMATION = \*NAME-AND-SPACE**

For the selected files, the number of PAM pages used will be output with the file name, in alphabetical order of file name.

### **INFORMATION = \*SPACE-SUMMARY**

Provides information on the storage space usage of the files and file generations identified in the current SHOW-FILE-ATTRIBUTES command, because GEN=\*YES applies implicitly. The output shows separate details for public and private volumes.

### **INFORMATION = \*ALL-ATTRIBUTES**

For the selected files, outputs all the information held in the catalog (\*NAME-AND-SPACE, \*PARAMETERS). In the table "[File attribute output fields for the SHOW-FILE-ATTRIBUTES command](#)" the output fields are shown in alphabetical order, with further explanation of their possible values.

### **INFORMATION = \*PARAMETERS(...)**

Returns only the selected information for the files in question. The information from the catalog is logically arranged into information blocks. Only those information blocks which are explicitly selected by the user are output. Total lines with the overall storage space allocation for each selected file are shown at the end of the returned information (see INFORMATION=\*SPACE-SUMMARY).

---

**STANDARD = \*NO / \*YES**

Specifies whether standard information is to be output.

**i** The STANDARD operand is only supported for compatibility reasons. It is not offered in guided dialog. STANDARD=\*YES is equivalent to INFORMATION=\*PARAMETERS ( ORGANIZATION=\*YES , ALLOCATION=\*YES ).

**PROTECTION = \*NO / \*YES**

Specifies whether information concerning the file protection and expiration date is to be output.

**i** The PROTECTION operand is only supported for compatibility reasons. It is not offered in guided dialog. PROTECTION=\*YES is equivalent to INFORMATION=\*PARAMETERS ( ORGANIZATION=\*YES, SECURITY=\*YES, BACKUP=\*YES ).

**FILE = \*NO / \*YES**

Output: storage space used in PAM pages, and file attributes.

**i** The FILE operand is only supported for compatibility reasons. It is not offered in guided dialog. FILE=\*YES is equivalent to INFORMATION=\*PARAMETERS ( ORGANIZATION=\*YES , ALLOCATION=\*YES ).

**PASSWORDS = \*NO / \*YES**

Specifies whether the information on passwords is to be output. A header line with the title "PASSWORDS" and a line with the information on file passwords (which corresponds to the first information line of the security block) are output.

**PASSWORDS = \*NO**

No PASSWORD information is to be output.

**PASSWORDS = \*YES**

The first line of the security block is output.

This line provides information on the types of password which protect a file or file generation group. The passwords themselves are not shown to the nonprivileged user. If a user forgets a file password, only the system administrator can help him (see "[Privileged functions](#)"). The following attributes are output:

Header line with the word "PASSWORDS"

*EXEC-PASS* protection with execution password

*READ-PASS* protection with read password

*WRITE-PASS* protection with write password

**ALLOCATION = \*NO / \*YES**

Outputs the allocation block for the selected files, i.e. all file attributes that affect the allocation of storage space. The allocation block contains the following attributes:

Header line with the word "ALLOCATION"

*DEVICE-TYPE* device type for volume

---

*EXTENTS* total number of extents for the file  
*HIGH-US-PA* highest used PAM page  
*NUM-OF-EXT* Number of extents  
*S-ALLOC* secondary allocation for file extension  
*SUPPORT* type of volume  
*VOLUME* volume serial number

**BACKUP = \*NO / \*YES**

Outputs the backup block for the selected files, i.e. all file attributes that affect backups. The backup block contains the following attributes:

Header line with the word "BACKUP"

*BACK-CLASS* backup level for ARCHIVE or HSMS

*#BACK-VERS* Maximal number of file versions in the version backup archive

*MAN-CLASS* HSMS storage management class

*MIGRATE* indicates whether the file may be migrated

*SAVED-PAG* indicates whether the file must always be fully saved

*STOR-LEVEL* indicates the storage level for migrated files

*VERSION* internal attribute for incremental saving with the ARCHIVE or HSMS utility routine

**HISTORY = \*NO / \*YES**

Outputs the history block for the selected files, i.e. all file attributes related to the file history. The history block contains the following attributes:

Header line with the word "HISTORY"

*ACC-COUNT* access counter

*ACC-DATE* date of last access

*ACC-TIME* time of last access

*CHANG-DATE* date the file was last changed (written to)

*CHANG-TIME* time the file was last changed (written to)

*CRE-DATE* creation date

*CRE-TIME* time of creation

*S-ALLO-NUM* number of secondary allocations

---

**ORGANIZATION = \*NO / \*YES**

Outputs the organization block for the selected files, i.e. all file attributes related to the structure of the file. The organization block contains the following attributes:

<i>ADM-INFO</i>	systems support information
<i>AVAIL</i>	availability
<i>BLK-CONTR</i>	Block control information
<i>BLK-COUNT</i>	block counter (tape files)
<i>BLK-OFFSET</i>	block offset (tape files)
<i>BUF-LEN</i>	block type (standard or nonstandard block)
<i>COD-CH-SET</i>	coded character set (CCS) with XHCS support
<i>NET-COD-CH-SET</i>	Only for node files: character set with which the file is created on Net-Storage
<i>CODE</i>	code specification for tape files
<i>DISK-WRITE</i>	suitability of file for processing in a volatile cache
<i>F-PREFORM</i>	preferred file format
<i>FILE-SEQ</i>	file sequence number (tape file)
<i>FILE-STRUC</i>	access method when the file was created
<i>IO(PERF)</i>	performance requirement for file processing
<i>IO(USAGE)</i>	type of I/O operations for performance requirement
<i>KEY-LEN</i>	Length of ISAM key
<i>KEY-POS</i>	position of ISAM key
<i>LABEL</i>	standard version of labels (tape file)
<i>LOG-FL-LEN</i>	length of logical ISAM flag
<i>PROPA-VAL</i>	propagation of ISAM flag
<i>REC-FORM</i>	Record format
<i>REC-SIZE</i>	Record length
<i>STOR-CLASS</i>	Storage class
<i>S0-MIGR</i>	specifies whether the file may be migrated on processing level
<i>USER-INFO</i>	user information
<i>VAL-FL-LEN</i>	length of ISAM value flag

---

*WORK-FILE* work file attribute

The information block for file generation groups begins with the header line "GENERATION-INFO" and contains the following attributes:

*BASE-NUM* base value for relative generation numbers  
*DEVICE-TYPE* device type for volume  
*EXTENTS* total number of extents for the file  
*FIRST-GEN* oldest existing file generation  
*LAST-GEN* most recent or last cataloged file generation  
*MAXIMUM* maximum number of simultaneously cataloged generations  
*OVERFL-OPT* overflow option when maximum number is reached  
*VOLUME* volume serial number

**SECURITY = \*NO / \*YES**

Outputs the security block for the selected files, i.e. all file attributes related to the file security. The security block contains the following attributes:

Header line with the word "SECURITY"

*ACCESS* type of access (standard access control)  
*ACL* file protection with ACL (only supported for reasons of compatibility)  
*AUDIT* file monitoring  
*DESTROY* data automatically destroyed on deletion  
*ENCRYPTION* encryption method  
*EXEC-PASS* protection with execution password  
*EXPIR-DATE* date on which the file may be changed again  
*EXPIR-TIME* time relative to EXPIR-DATE  
*FREE-DEL-D* free-for-deletion date  
*FREE-DEL-T* time relative to free-for-deletion date  
*GUARD-READ* read protection using a guard  
*GUARD-WRIT* write protection using a guard  
*GUARD-EXEC* protection with execute guard  
*GROUP* access rights of user class "group" (BASIC-ACL)  
*OTHERS* access rights of user class "others" (BASIC-ACL)

---

<i>OWNER</i>	access rights of file owner (BASIC-ACL)
<i>READ-PASS</i>	protection with read password
<i>SP-REL-LOCK</i>	protection against release of storage space
<i>USER-ACC</i>	shareability attribute (standard access control)
<i>WRITE-PASS</i>	protection with write password

**INFORMATION = \*STATISTICS**

Returns information on storage space allocation for all selected files. The storage space allocations for files and file generation groups are output separately and include additional information for each type of volume (public disks, private disks, and tapes). Files for which no entry has been made in the volume list are indicated in a separate line with "NO VSN".

**INFORMATION = \*MINIMUM**

Outputs a line of information with the most important file attributes in summarized form for each selected file. This line contains brief information on the FILE-STRUCTURE, passwords, highest activated access protection level, the number of reserved PAM pages, and the file name (there may be a line break if the file name is of maximum length). The brief information is indicated as follows:

- the access method with which the file was created: indicated by the first letter in the value of FILE-STRUCTURE;
- information for read, write, and execute passwords: shown in each case with "Y" or "N" to indicate whether the corresponding password was assigned;
- information on the highest activated access control method: see the PROTECTION-ACTIVE operand. When standard access control is the highest protection:
  - USER-ACCESS with "Y" for ALL-USERS or SPECIAL; "N" for OWNER-ONLY
  - ACCESS with "W" for write access or "R" for read access only.

When basic access control list (BASIC-ACL) is the highest protection: the access rights assigned for each of the user groups OWNER, GROUP and OTHERS are shown ("RWX" or "-" for an access right that has not been set).

When access control via GUARDS is the highest protection: the value "GUARDS" and the protected access mode ("RWX" or "-" for an access mode not granted) are shown.

**SELECT = \*ALL / \*BY-ATTRIBUTES(...)**

The file selection criteria.

**SELECT = \*ALL**

Returns information on all the files which the user is authorized to access.

**SELECT = \*BY-ATTRIBUTES(...)**

Restricts the files selected from the set specified by FILE-NAME to those which satisfy the following specifications. The default values \*ANY or ANY for an attribute mean that the file set is not to be restricted to particular values of that attribute.

**CREATION-DATE = \*ANY / \*TODAY(...)/ \*YESTERDAY(...)/ <integer -99999..991231>(…)/ <date>(…)/ \*INTERVAL(...)/ \*NONE**

Returns information on files and FGGs on the basis of their creation date (CREATION-DATE); range specifications are inclusive of the limit values. It is meaningless to specify a CREATION-DATE which lies in the future!

---

**CREATION-DATE = \*ANY**

The creation date is not to be used as a selection criterion.

**CREATION-DATE = \*TODAY(...)**

Returns information for files which have today's date entered as the CREATION-DATE in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified creation date.

**TIME = \*INTERVAL(...)**

Returns information on files that were created on the specified day within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of creation >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of creation <= the specified time.

**CREATION-DATE = \*YESTERDAY(...)**

Returns information for files which have yesterday's date entered as the CREATION-DATE in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified creation date.

**TIME = \*INTERVAL(...)**

Returns information on files that were created on the specified day within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of creation >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of creation <= the specified time.

**CREATION-DATE = <integer -99999..991231>(…)**

Returns information on files which were created on the specified date. Here, the user can specify the creation date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0)

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified creation date.

**TIME = \*INTERVAL(...)**

Returns information on files that were created on the specified day within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of creation >= the specified time.

---

**TO = 23:59:59 / <time>**

Selects files for which the time of creation <= the specified time.

**CREATION-DATE = <date>(…)**

Returns information on files which were created on the specified date.

The user can specify the creation date in the form [yy]yy-mm-dd.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of files to a time interval related to the specified creation date.

**TIME = \*INTERVAL(…)**

Returns information on files that were created on the specified day within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of creation >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of creation <= the specified time.

**CREATION-DATE = \*INTERVAL(…)**

Returns information on files which were created within the specified time period. The upper and lower limits are both included in the range specified. See also the explanation of how dates are specified in the EXPIRATION-DATE=<integer ...> operand. It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = 1950-01-01 / <integer -99999..991231>(…) / <date>(…) / \*TODAY(…) / \*YESTERDAY(…)**

Returns information on files which were created after the specified date (i.e. CREATION-DATE >= specified date).

**FROM = <integer -99999..991231>(…)**

Returns information on files which were created after the specified date (i.e. CREATION-DATE >= specified date).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files created at or after the specified time are selected.

**FROM = <date>(…)**

Returns information on files which were created after the specified date (i.e. CREATION-DATE >= specified date).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files created at or after the specified time are selected.

**FROM = \*TODAY(…)**

Returns information on files which were created after the specified date (i.e. CREATION-DATE >= current date).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files created at or after the specified time are selected.

---

**FROM = \*YESTERDAY(...)**

Returns information on files which were created after the specified date (i.e. CREATION-DATE >= date of preceding day).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files created at or after the specified time are selected.

**TO = \*TODAY(...)/ \*YESTERDAY(...)/ <integer -99999..991231>(…)/ <date>(…)**

Returns information on files which were created before the specified date (i.e. CREATION-DATE <= specified date).

**TO = \*TODAY(...)**

Returns information on files which were created before the specified date (i.e. CREATION-DATE <= current date).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files created at or before the specified time are selected.

**TO = \*YESTERDAY(...)**

Returns information on files which were created before the specified date (i.e. CREATION-DATE <= date of preceding day).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files created at or before the specified time are selected.

**TO = <integer -99999..991231>(…)**

Returns information on files which were created before the specified date (i.e. CREATION-DATE <= specified date).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files created at or before the specified time are selected.

**TO = <date>(…)**

Returns information on files which were created before the specified date (i.e. CREATION-DATE <= specified date).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files created at or before the specified time are selected.

**CREATION-DATE = \*NONE**

Returns information on files for which no creation data is entered in the catalog entry.

**EXPIRATION-DATE = \*ANY / \*TOMORROW(...)/ \*TODAY(...)/ \*YESTERDAY(...)/ <integer -99999..991231>(…)/ <date>(…)/ \*INTERVAL(...)/ \*NONE**

The EXPIRATION-DATE operand requests information on the file/FGG as a function of the “expiration date”, i. e. the date from which write accesses to the file are allowed. It is meaningful to specify a date in the future if retention periods are being queried.

**EXPIRATION-DATE = \*ANY**

The expiration date (output field *EXPIR-DATE*) is not to be used as a selection criterion.

**EXPIRATION-DATE = \*TOMORROW(...)**

Returns information on files which have tomorrow’s date entered as the EXPIRATION-DATE in their catalog entry.

---

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Returns information on files for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration <= the specified time.

**EXPIRATION-DATE = \*TODAY(...)**

Returns information on files which have today's date entered as the EXPIRATION-DATE in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Returns information on files for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration <= the specified time.

**EXPIRATION-DATE = \*YESTERDAY(...)**

Returns information on files which have yesterday's date entered as the EXPIRATION-DATE in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Returns information on files for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration <= the specified time.

**EXPIRATION-DATE = <integer -99999..991231>(…)**

Here, the user can specify the expiration date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0, TOMORROW corresponds to +1)

---

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Returns information on files for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration <= the specified time.

**EXPIRATION-DATE = <date>(…)**

Returns information on files for which exactly the specified date is entered as the EXPIRATION-DATE in the catalog entry. The user can specify the expiration date in the form [yy]yy-mm-dd.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Returns information on files for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration <= the specified time.

**EXPIRATION-DATE = \*INTERVAL(...)**

Returns information on only the files whose expiration dates lie within the period specified as the operand value, i.e. files whose retention period expires during the specified period. The upper and lower limits are both included in the range specified. See also the explanation of how dates are specified in the EXPIRATION-DATE=<integer ...> operand. It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = 1950-01-01 / <integer -99999..991231>(…) / <date>(…) / \*TOMORROW(…) / \*TODAY(…) / \*YESTERDAY(…)**

Returns information on files for which the EXPIRATION-DATE >= the specified date.

**FROM = <integer -99999..991231>(…)**

Returns information on files for which the EXPIRATION-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = <date>(…)**

Returns information on files for which the EXPIRATION-DATE >= the specified date.

---

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = TOMORROW(...)**

Returns information on files for which the EXPIRATION-DATE >= date of the next day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = \*TODAY(...)**

Returns information on files for which the EXPIRATION-DATE >= date of the current day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = \*YESTERDAY(...)**

Returns information on files for which the EXPIRATION-DATE >= date of the preceding day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*ANY / \*TODAY(...) / \*TOMORROW(...) / \*YESTERDAY(...) / <integer -99999..991231>(...) / <date>(...)**

Returns information on files for which the EXPIRATION-DATE <= the specified date.

**TO = \*ANY**

Specifies an open interval that starts with the EXPIRATION-DATE but has no upper limit.

**TO = \*TODAY(...)**

Returns information on files for which the EXPIRATION-DATE <= date of the current day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*TOMORROW**

Returns information on files for which the EXPIRATION-DATE <= date of the next day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*YESTERDAY(...)**

Returns information on files for which the EXPIRATION-DATE <= date of the preceding day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = <integer -99999..991231>(...)**

Returns information on files for which the EXPIRATION-DATE <= the specified date.

---

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = <date>(…)**

Returns information on files for which the EXPIRATION-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**EXPIRATION-DATE = \*NONE**

Returns information on files for which no expiration data has been entered in the catalog entry.

**LAST-ACCESS-DATE = \*ANY / \*TODAY(…) / \*YESTERDAY(…) / <integer -99999..991231>(…) / <date>(…) / \*INTERVAL(…) / \*NONE**

Returns information on files/file generations/FGGs as a function of the date of last access to the file. If the output fields *CRE-DATE* and *ACC-DATE* show the same date, the last access to the file was a write-access; if *CRE-DATE* < *ACC-DATE*, the last access to the file was to read it.

**LAST-ACCESS-DATE = \*ANY**

The date of last access (output field *ACC-DATE*) is not to be used as a selection criterion.

**LAST-ACCESS-DATE = \*TODAY(…)**

Returns information on files for which today's date is entered as the LAST-ACCESS-DATE in the catalog entry.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of files to a time interval related to the specified LAST-ACCESS-DATE.

**TIME = \*INTERVAL(…)**

Returns information on files that were last accessed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-ACCESS-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-ACCESS-DATE <= the specified time.

**LAST-ACCESS-DATE = \*YESTERDAY(…)**

Returns information on files for which yesterday's date is entered as the LAST-ACCESS-DATE in the catalog entry.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of files to a time interval related to the specified LAST-ACCESS-DATE.

**TIME = \*INTERVAL(…)**

Returns information on files that were last accessed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-ACCESS-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-ACCESS-DATE <= the specified time.

**LAST-ACCESS-DATE = <integer -99999..991231>(…)**

Here, the user can specify the last access date in either of two ways:

- 
1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
  2. as a *relative date value*: (6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0)

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified LAST-ACCESS-DATE.

**TIME = \*INTERVAL(...)**

Returns information on files that were last accessed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-ACCESS-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-ACCESS-DATE <= the specified time.

**LAST-ACCESS-DATE = <date>(...)**

Returns information on files for which the specified date has been entered as the LAST-ACCESS-DATE in the catalog entry. The user can specify the date in the form [yy]yymm-dd.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified LAST-ACCESS-DATE.

**TIME = \*INTERVAL(...)**

Returns information on files that were last accessed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-ACCESS-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-ACCESS-DATE <= the specified time.

**LAST-ACCESS-DATE = \*INTERVAL(...)**

Returns information on only those files which were last accessed within the specified time period. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for the LAST-ACCESS-DATE= <integer...> operand). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = 1950-01-01 / <integer -99999..991231>(...) / <date>(...) / \*TODAY(...) / \*YESTERDAY(...)**

Returns information on only those files which were accessed on or after the specified date (LAST-ACCESS-DATE >= specified date).

**FROM = <integer -99999..991231>(...)**

Returns information on files for which the LAST-ACCESS-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-ACCESS-DATE after the specified time are selected.

**FROM = <date>(...)**

Returns information on files for which the LAST-ACCESS-DATE >= the specified date.

---

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-ACCESS-DATE after the specified time are selected.

**FROM = \*TODAY(...)**

Returns information on files for which the LAST-ACCESS-DATE >= date of the current day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-ACCESS-DATE after the specified time are selected.

**FROM = \*YESTERDAY(...)**

Returns information on files for which the LAST-ACCESS-DATE >= date of the preceding day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-ACCESS-DATE after the specified time are selected.

**TO = \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..991231>(…) / <date>(…)**

Returns information on only those files which were accessed on or before the specified date (LAST-ACCESS-DATE <= specified date).

**TO = \*TODAY(...)**

Returns information on files for which the LAST-ACCESS-DATE <= date of the current day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-ACCESS-DATE before the specified time are selected.

**TO = \*YESTERDAY(...)**

Returns information on files for which the LAST-ACCESS-DATE <= date of the preceding day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-ACCESS-DATE before the specified time are selected.

**TO = <integer -99999..991231>(…)**

Returns information on files for which the LAST-ACCESS-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-ACCESS-DATE before the specified time are selected.

**TO = <date>(…)**

Returns information on files for which the LAST-ACCESS-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-ACCESS-DATE before the specified time are selected.

**LAST-ACCESS-DATE = \*NONE**

Returns information on files for which no LAST-ACCESS-DATE has been entered in the catalog entry. File generation groups are not selected.

---

**LAST-CHANGE-DATE = \*ANY / \*NONE / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..0>(...) / <date>(...) / \*INTERVAL(...)**

Returns information on files, file generations, and FGGs based on the date on which the file was last changed (accessed for writing).

**LAST-CHANGE-DATE = \*ANY**

The date of the last write access (output field *CHANG-DATE*) is not to be used as a selection criterion.

**LAST-CHANGE-DATE = \*NONE**

Returns information on files for which no LAST-CHANGE-DATE has been entered in the catalog entry.

**LAST-CHANGE-DATE = \*TODAY(...)**

Returns information on files for which today's date has been entered as the LAST-CHANGE-DATE in the catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified LAST-CHANGE-DATE.

**TIME = \*INTERVAL(...)**

Returns information on files that were changed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-CHANGE-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-CHANGE-DATE <= the specified time.

**LAST-CHANGE-DATE = \*YESTERDAY(...)**

Returns information on files for which yesterday's date has been entered as the LAST-CHANGE-DATE in the catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified LAST-CHANGE-DATE.

**TIME = \*INTERVAL(...)**

Returns information on files that were changed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-CHANGE-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-CHANGE-DATE <= the specified time.

**LAST-CHANGE-DATE = <integer -99999..0>(...)**

Here, the user can specify the date of the last write access relative to the current date (in the form -n).

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified LAST-CHANGE-DATE.

**TIME = \*INTERVAL(...)**

Returns information on files that were changed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-CHANGE-DATE >= the specified time.

---

**TO = 23:59:59 / <time>**

Selects files for which the LAST-CHANGE-DATE <= the specified time.

**LAST-CHANGE-DATE = <date>(…)**

Returns information on only those files which have exactly the specified date entered as the LAST-CHANGE-DATE in their catalog entry. The user can specify the date in the form [yy]yy-mm-dd.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of files to a time interval related to the specified LAST-CHANGE-DATE.

**TIME = \*INTERVAL(…)**

Returns information on files that were changed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-CHANGE-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-CHANGE-DATE <= the specified time.

**LAST-CHANGE-DATE = \*INTERVAL(…)**

Returns information on only those files which were last changed within the specified time period. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for the LAST-CHANGE-DATE= <integer…> operand). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = 1950-01-01 / <integer -99999..0>(…) / <date>(…) / \*TODAY(…) / \*YESTERDAY(…)**

Returns information on only those files which have been changed since the specified date (LAST-CHANGE-DATE >= specified date).

**FROM = <integer -99999..0>(…)**

Returns information on files for which the LAST-CHANGE-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE after the specified time are selected.

**FROM = <date>(…)**

Returns information on files for which the LAST-CHANGE-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE after the specified time are selected.

**FROM = TODAY(…)**

Returns information on files for which the LAST-CHANGE-DATE >= the current date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE after the specified time are selected.

**FROM = YESTERDAY(…)**

Returns information on files for which the LAST-CHANGE-DATE >= date of the preceding day.

---

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE after the specified time are selected.

**TO = TODAY(...) / \*YESTERDAY(...) / <integer -99999..0>(…) / <date>(…)**

Returns information on files that have been changed on or before the specified date (LAST-CHANGE-DATE <= specified date).

**TO = \*TODAY(…)**

Returns information on files for which the LAST-CHANGE-DATE <= the current date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE before the specified time are selected.

**TO = YESTERDAY(…)**

Returns information on files for which the LAST-CHANGE-DATE <= date of the preceding day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE before the specified time are selected.

**TO = <integer -99999..0>(…)**

Returns information on files for which the LAST-CHANGE-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE before the specified time are selected.

**TO = <date>(…)**

Returns information on files for which the LAST-CHANGE-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE before the specified time are selected.

**SUPPORT = \*ANY / list-poss(3): \*PUBLIC-DISK / \*PRIVATE-DISK / \*TAPE**

Returns information on files/ file generations/FGGs as a function of the type of volume on which they are stored. If the volume types are specified in the form of a list, the system will combine them by a logical OR.

**SUPPORT = \*ANY**

The volume type is not to be used as a selection criterion.

**SUPPORT = \*PUBLIC-DISK**

Returns information on files stored on public volumes and on Net-Storage.

**SUPPORT = \*PRIVATE-DISK**

Returns information on files etc. stored on private volumes.

**SUPPORT = \*TAPE**

Returns information on files stored on tape.

**STORAGE-TYPE = \*ANY / \*PUBLIC-SPACE / \*NET-STORAGE(…)**

Returns information on files assigned the specified storage type.

---

**STORAGE-TYPE = \*ANY**

The storage type is not a selection criterion.

**STORAGE-TYPE = \*PUBLIC-SPACE**

Returns information only on files stored on public volumes.

**STORAGE-TYPE = \*NET-STORAGE(...)**

Returns information only on files stored on Net-Storage volumes.

**FILE-TYPE = \*ANY / \*BS2000 / \*NODE-FILE**

Returns information on files on Net-Storage volumes, depending on the file type with which they are created.

**FILE-TYPE = \*ANY**

The file type is not a selection criterion.

**FILE-TYPE = \*BS2000**

Returns information only on BS2000 files on Net-Storage volumes.

**FILE-TYPE = \*NODE-FILE**

Returns information only on node files on Net-Storage volumes.

**VOLUME = \*ANY / <vsn 1..6>**

Returns information on all files/FGGs which have an entry in their volume list for the volume with the specified VSN <vsn 1..6>.

**SIZE = \*ANY / FREESIZE / <integer 0..2147483647> / \*INTERVAL(...)**

Requests information on files/file generations depending on the size of storage space reserved for them.

**SIZE = \*ANY**

The file size is not to be used as a selection criterion.

**SIZE = \*FREESIZE**

Returns information on files for which none of the reserved PAM pages has yet been used.

**SIZE = <integer 0..2147483647>**

Returns information on files with the specified number of reserved PAM pages.

**SIZE = \*INTERVAL(...)**

Returns information on files for which the number of reserved PAM pages lies within the specified range. The upper and lower limits are both included in the range specified. It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit. Information will only be returned about files for which the number of PAM pages reserved is at least equal to the FROM value and at most equal to the TO value (FROM <= SIZE <= TO).

**FROM = 0 / <integer 0..2147483647>**

Returns information only about those files for which the number of PAM pages reserved is at least the specified number (SIZE >= specified value).

**TO = STD / <integer 0..2147483647>**

Returns information only about those files for which the number of PAM pages reserved is at most the specified number (SIZE <= specified value).

---

**NUMBER-OF-EXTENTS = \*ANY / \*NOT-ZERO / <integer 0..65535> / \*INTERVAL(...)**

Returns information on disk files/FGGs depending on the number of their extents. An extent is a contiguous area on a disk, occupied by one file; the output field *EXTENTS* shows how many extents the file has.

**NUMBER-OF-EXTENTS = \*ANY**

The number of extents is not to be used as a selection criterion.

**NUMBER-OF-EXTENTS = \*NOT-ZERO**

Returns information only about those files whose number of extents is not zero.

**NUMBER-OF-EXTENTS = <integer 0..65535>**

Returns information on those files which have exactly the specified number of extents.

**NUMBER-OF-EXTENTS = \*INTERVAL(...)**

Selects all the files whose number of extents lies within the specified range. The upper and lower limits are both included in the range specified. It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit. Information will only be returned about the disk files for which the number of extents is at least equal to the FROM value and at most equal to the TO value (FROM <= NUMBER-OF-EXTENTS <= TO).

**FROM = 0 / <integer 0..65535>**

Returns information on only those files with at least the specified number of extents.

**TO = 65535 / <integer 0..65535>**

Returns information on only those files with at most the specified number of extents.

**NUMBER-OF-FREE-PAGES = \*ANY / \*ALL-ALLOCATED / \*NOT-ZERO / <integer 0..2147483647> / \*INTERVAL(...)**

Returns information on files/file generations depending on the size of their free (=reserved but unused) storage space.

**NUMBER-OF-FREE-PAGES = \*ANY**

The size of the free storage space is not to be used as a selection criterion.

**NUMBER-OF-FREE-PAGES = \*ALL-ALLOCATED**

Returns information on files whose number of free PAM pages is equal to their number of reserved PAM pages.

**NUMBER-OF-FREE-PAGES = \*NOT-ZERO**

Returns information on files with at least one unused PAM page.

**NUMBER-OF-FREE-PAGES = <integer 0..2147483647>**

Returns information on files with exactly the specified number of reserved but unused PAM pages.

**NUMBER-OF-FREE-PAGES = \*INTERVAL(...)**

Returns information on files whose number of free PAM pages lies within the specified range. The upper and lower limits are both included in the range specified.

It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range.

The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

Information will only be returned about files for which the number of free PAM pages is at least equal to the FROM value and at most equal to the TO value (FROM <= NUMBER-OF-FREE-PAGES <= TO).

---

**FROM = 0 / <integer 0..2147483647>**

Returns information on only those files which have at least as many free PAM pages as specified (NUMBER-OF-FREE-PAGES >= specified value).

**TO = 2147483647 / <integer 0..2147483647>**

Returns information on only those files which have at most as many free PAM pages as specified (NUMBER-OF-FREE-PAGES <= specified value).

**HIGHEST-USED-PAGE = \*ANY / <integer 0..2147483647> / INTERVAL(...)**

Selects all files for which the specified number of PAM pages have been written. (Last Page Pointer points to the specified page).

**HIGHEST-USED-PAGE = \*ANY**

The number of PAM pages written (output field *HIGH-US-PA*) is not to be used as a selection criterion.

**HIGHEST-USED-PAGE = <integer 0..2147483647>**

Selects all files for which the specified number of PAM pages have been written. (Last Page Pointer points to the specified page).

**HIGHEST-USED-PAGE = \*INTERVAL(...)**

Selects all files for which the number of pages written lies within the specified range.

**FROM = 0 / <integer 0..2147483647>**

Selects all files for which the number of pages written >= the specified number.

**TO = 2147483647 / <integer 0..2147483647>**

Selects all files for which the number of pages written <= the specified number.

**BLOCK-COUNTER = \*ANY / <integer 0..2147483647> / \*INTERVAL(...)**

Returns information on all tape files that occupy the specified number of tape blocks.

**BLOCK-COUNTER = \*ANY**

The number of occupied tape blocks is not to be used as a selection criterion.

**BLOCK-COUNTER = <integer 0..2147483647>**

Returns information on all tape files which occupy exactly the specified number of tape blocks.

**BLOCK-COUNTER = \*INTERVAL(...)**

Returns information on all tape files for which the occupied number of tape blocks falls within the specified interval which follows.

**FROM = 0 / <integer 0..2147483647>**

Returns information on all tape files for which the number of occupied tape blocks >= the specified number.

**TO = 2147483647 / <integer 0..2147483647>**

Returns information on all tape files for which the number of occupied tape blocks <= the specified number.

**ACCESS = \*ANY / \*READ / \*WRITE**

Returns information on files/file generation depending on their access type.

**ACCESS = \*ANY**

The ACCESS value is not to be used as a selection criterion.

---

**ACCESS = \*READ**

Returns information on only those files to which writing is prohibited by ACCESS=READ, i.e. to which only read access is permitted.

**ACCESS = \*WRITE**

Returns information on only those files to which write access is permitted.

**PASSWORD = \*ANY / list-poss(4): \*NONE / \*READ-PASSWORD / \*WRITE-PASSWORD / \*EXEC-PASSWORD**

Returns information on files/file generation groups depending on the password protection defined. If several types of password are specified as a list, the system will link them by logical Or, and will return information on all the files which satisfy any one of the specified conditions.

**PASSWORD = \*ANY**

Password protection is not to be used as a selection criterion.

**PASSWORD = \*NONE**

Returns information on files which have no password protection.

**PASSWORD = \*READ-PASSWORD**

Returns information on files which are protected by a read password; the actual passwords will not be output.

**PASSWORD = \*WRITE-PASSWORD**

Returns information on files which are protected by a write password; the actual passwords will not be output.

**PASSWORD = \*EXEC-PASSWORD**

Returns information on files which are protected by an execute password; the actual passwords will not be output.

**USER-ACCESS = \*ANY / \*OWNER-ONLY / \*ALL-USERS / \*SPECIAL**

Returns information on files/file generation groups depending on whether they are shareable. If a user ID other than the user's own is specified, then implicitly USER-ACCESS=ALL-USERS.

**USER-ACCESS = \*ANY**

The access authorization is not to be used as a selection criterion.

**USER-ACCESS = \*OWNER-ONLY**

Returns information on files which only the file owner may access.

**USER-ACCESS = \*ALL-USERS**

Returns information on files which may be also be accessed under other user IDs.

**USER-ACCESS = \*SPECIAL**

Returns information on files which may also be accessed under all user IDs and the maintenance IDs (user IDs with HARDWARE-MAINTENANCE privilege).

**BASIC-ACL = \*ANY / \*NONE / \*YES / \*PARAMETERS(...)**

Selects all files whose BASIC-ACL entry matches the specified values.

**BASIC-ACL = \*NONE**

Returns information on files that have no BASIC-ACL entry in the catalog.

**BASIC-ACL = \*YES**

Returns information on files that have a BASIC-ACL entry in the catalog.

---

**BASIC-ACL = \*PARAMETERS(...)**

Selects all files for which the specified access rights are defined in the BASIC-ACL entry. NO-ACCESS means that no access rights have been defined.

**OWNER = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights must already be defined for the owner.

**OWNER = \*PARAMETERS(...)**

Access rights that must be present for the owner (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**GROUP = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for the owner's user group.

**GROUP = \*PARAMETERS(...)**

Access rights that must be present for the owner's user group (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**OTHERS = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for all other users.

**OTHERS = \*PARAMETERS(...)**

Access rights that must be present for all other users (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**GUARDS = \*ANY / \*NO / \*YES / \*PARAMETERS(...)**

Returns information on files for which access is controlled using GUARDS (see the CREATE-FILE or MODIFY-FILE-ATTRIBUTES command).

**GUARDS = \*ANY**

Access control with GUARDS is not to be used as a selection criterion.

**GUARDS = \*NO**

Returns information on files that are not protected by GUARDS against unauthorized access.

**GUARDS = \*YES**

Returns information on files that are protected by GUARDS against unauthorized access, i.e. files for which access is controlled via the GUARDS subsystem.

**GUARDS = \*PARAMETERS(...)**

Returns information on files which are protected by GUARDS against unauthorized access as specified, i.e. files for which access control is implemented using GUARDS: Access to the file is controlled by a guard, i.e. a special object which contains all the conditions under which a user is granted access authorization, e.g. date, time, user ID. The GUARDS function unit of the chargeable software product SECOS (see the “SECOS” manual [35]) must be installed in order to create and maintain a guard.

Each access mode can be controlled by a separate guard. If no guard (\*NONE) is defined for a given access mode, no corresponding access is permitted. If a defined guard is not accessible, the mode of access protected by it is not permitted. If the GUARDS subsystem is not available at the time of accessing the job variable, no access of any kind is allowed for the job variable.

**READ = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Returns information on files which are protected against unauthorized read access by the specified “guard”. The default value \*ANY means that the selection of files is not based on read protection with a guard. \*NONE selects files for which no read guard was defined, i.e. files for which no read access is permitted.

**WRITE = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Returns information on files which are protected against unauthorized write access by the specified “guard”. The default value \*ANY means that the selection of files is not based on a guard. \*NONE selects files for which no guard was defined, i.e. files for which no write access is permitted.

**EXEC = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Returns information on files which are protected against unauthorized execution by the specified “guard”. The default value \*ANY means that the selection of files is not based on execute protection with a guard. \*NONE selects files for which no guard was defined, i.e. files which cannot be executed.

**PROTECTION-ACTIVE = \*ANY / list-poss(3): \*LEVEL-0 / \*LEVEL-1 / \*LEVEL-2**

Returns information on files for which the specified protection level is the highest activated access control. When the file is accessed, the highest activated protection level applies. The following table shows the method used for access control, the protection attributes, and the job variable protection hierarchy (protection levels):

Access control	Protection attribute	Prot. level
Standard access control	ACCESS and USER-ACCESS	0
Basic access control list	BASIC-ACL	1
Access control via guards	PASSWORD	2

Table 103: Hierarchy of access control methods

All other protection attributes of the file (e.g. passwords) are evaluated independently, without regard to the implemented protection level.

**PROTECTION-ACTIVE = \*ANY**

The access control method is not to be used as a selection criterion.

---

**PROTECTION-ACTIVE = \*LEVEL-0**

Returns information on files for which access is controlled via standard access control.

**PROTECTION-ACTIVE = \*LEVEL-1**

Returns information on files for which access is controlled via a basic access control list (BASIC-ACL protection).

**PROTECTION-ACTIVE = \*LEVEL-2**

Returns information on files for which access is controlled via an access control list (ACL) or by GUARDS.

**STATUS = \*ANY / \*PARAMETERS(...)**

Returns information on files/file generations based on the current file status.

**STATUS = \*ANY**

The file status is not to be used as a selection criterion.

**STATUS = \*PARAMETERS(...)**

Returns information on files which have the specified status. The following selection criteria are possible:

**i** The selection criteria within the \*PARAMETERS(...) structure are logically ORed.

**CLOSED-OUTPUT = \*ANY / \*YES / \*NO**

Specifies whether the "file closed" status is to be used as a selection criterion.

**CLOSED-OUTPUT = \*YES**

Returns information on the output files which have already been closed.

**CLOSED-OUTPUT = \*NO**

Returns information on output files which have been opened (OPEN OUTIN, INOUT or OUTPUT) in a program, and about files which were not closed in an earlier system run or because a job was aborted. GENERATIONS=\*YES applies implicitly.

**CACHED = \*ANY / \*YES / \*NO**

Specifies whether file processing via a cache is to be used as a selection criterion.

**CACHED = \*ANY**

Returns information on files regardless of whether or not they are cached.

**CACHED = \*YES**

Returns information on the files/file generations which are currently cached.

**CACHED = \*NO**

Returns information on the files/file generations for which no data has been cached.

**REPAIR-NEEDED = \*ANY / \*YES**

Specifies whether files which were not closed in an earlier system run and not reconstructed with REPAIR-DISK-FILES are to be selected.

**REPAIR-NEEDED = \*ANY**

Returns information on files regardless of whether or not they need to be repaired.

**REPAIR-NEEDED = \*YES**

Returns information on only those files which were not closed in an earlier system run and which are not yet reconstructed.

---

**OPEN-ALLOWED = \*ANY / \*YES / \*NO**

Specifies whether files which could not be opened due to data inconsistency are to be selected.

**OPEN-ALLOWED = \*ANY**

Returns information on files regardless of whether or not they can be opened.

**OPEN-ALLOWED = \*YES**

Returns information on the files that can be opened.

**OPEN-ALLOWED = \*NO**

Returns information on files which cannot be opened due to data inconsistency.

**DEFECT-REPORTED = \*ANY / \*YES**

Specifies whether files which may contain defective disk blocks are to be used as a selection criterion.

**DEFECT-REPORTED = \*ANY**

Returns information on files regardless of whether they may contain defective disk blocks.

**DEFECT-REPORTED = \*YES**

Returns information on files which contain defective disk blocks.

**CACHE-NOT-SAVED = \*ANY / \*YES**

Specifies whether to select files for which updates have not been written out from the cache.

**CACHE-NOT-SAVED = \*ANY**

Returns information on files regardless of whether there are updates which have not been written out from the cache.

**CACHE-NOT-SAVED = \*YES**

Returns information on files for which updates have not been written out from the cache.

**FILE-STRUCTURE = \*ANY / list-poss(5): \*PAM / \*SAM / \*ISAM / \*BTAM / \*NONE**

Returns information on files which were created with the specified access method.

**FILE-STRUCTURE = \*ANY**

The access method is not to be used as a selection criterion.

**FILE-STRUCTURE = \*PAM**

Returns information on PAM files.

**FILE-STRUCTURE = \*SAM**

Returns information on SAM files.

**FILE-STRUCTURE = \*ISAM**

Returns information on ISAM files.

**FILE-STRUCTURE = \*BTAM**

Returns information on BTAM files.

**FILE-STRUCTURE = \*NONE**

Returns information on files which have been cataloged, but which contain no data i.e. files which have not yet been opened, or files for which storage space has been released (logically deleted) by using the OPTION=\*DATA operand in a DELETE-FILE command.

---

**BLOCK-CONTROL-INFO = \*ANY / list-poss(9): \*NONE / \*NO / \*WITHIN-DATA-BLOCK / \*WITHIN-DATA-2K-BLOCK / \*WITHIN-DATA-4K-BLOCK / \*PAMKEY / \*NK / \*NK2 / \*NK4**

Returns information on files, depending on the block format with which data was stored in the file (defined by the BLOCK-CONTROL-INFO operand in an ADD-FILE-LINK command).

**BLOCK-CONTROL-INFO = \*ANY**

The BLOCK-CONTROL information is not to be used as a selection criterion.

**BLOCK-CONTROL-INFO = \*NONE**

Returns information on files for which no BLOCK-CONTROL-INFORMATION value has yet been entered, i.e. which have not yet been opened.

**BLOCK-CONTROL-INFO = \*NO**

Returns information on files which were created with BLOCK-CONTROL-INFO=\*NO i.e. files created without a PAM key.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-BLOCK**

Returns information on files which were created with BLOCK-CONTROL-INFO= \*WITHIN-DATA-BLOCK, i.e. whose block control information is held in a block control field at the start of and within the data block.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-2K-BLOCK**

Returns information on NK-ISAM files which were created with BLOCK-CONTROL-INFO=\*WITHIN-DATA-2K-BLOCK, i.e. files for which block control information is located at the start of each 2K block.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-4K-BLOCK**

Returns information on NK-ISAM files which were created with BLOCK-CONTROL-INFO=\*WITHIN-DATA-4K-BLOCK, i.e. files for which block control information is located at the start of each 4K block.

**BLOCK-CONTROL-INFO = \*PAMKEY**

Returns information on files which were created with BLOCK-CONTROL-INFO= \*PAMKEY, i.e. whose block control information is contained in a separate PAM key outside the PAM block.

**BLOCK-CONTROL-INFO = \*NK**

Returns information on NK files, i.e. files which can also be stored on volumes (NK2 and NK4).

**BLOCK-CONTROL-INFO = \*NK2**

Returns information on files which can also be stored on NK2 volumes but not on NK4 volumes.

**BLOCK-CONTROL-INFO = \*NK4**

Returns information on files which can also be stored on NK4 volumes.

**LAST-BYTE-POINTER = \*ANY / \*NO / \*YES / \*ZERO / \*NOT-ZERO**

Returns information on files depending on the attribute of the last-byte pointer (LBP).

**LAST-BYTE-POINTER = \*ANY**

The last-byte pointer is not to be used as a selection criterion.

**LAST-BYTE-POINTER = \*NO**

Returns information on files which do not have a valid last-byte pointer.

**LAST-BYTE-POINTER = \*YES**

Returns information on files which do have a valid last-byte pointer.

**LAST-BYTE-POINTER = \*ZERO**

Returns information on files which have a valid last-byte pointer with the value zero.

---

**LAST-BYTE-POINTER = \*NOT-ZERO**

Returns information on files which have a valid last-byte pointer with a value that is not zero.

**BACKUP-CLASS = \*ANY / list-poss(5): \*A / \*B / \*C / \*D / \*E**

Returns information on files/FGGs whose ARCHIVE or HSMS backup level is the same as the specified operand value. Several backup levels may be specified as a list. In this case, all the files/FGGs which satisfy one of the listed conditions will be selected (logical ORing).

**BACKUP-CLASS = \*ANY**

The BACKUP-CLASS level is not to be used as a selection criterion.

**BACKUP-CLASS = \*A**

Returns information on files/FGGs with the attribute *BACK-CLASS = A*.

**BACKUP-CLASS = \*B**

Returns information on files/FGGs with the attribute *BACK-CLASS = B*.

**BACKUP-CLASS = \*C**

Returns information on files/FGGs with the attribute *BACK-CLASS = C*.

**BACKUP-CLASS = \*D**

Returns information on files/FGGs with the attribute *BACK-CLASS = D*.

**BACKUP-CLASS = \*E**

Returns information on files/FGGs with the attribute *BACK-CLASS = E*.

**MIGRATE = \*ANY / list-poss(3): \*ALLOWED / \*INHIBITED / \*FORBIDDEN**

Returns information for all the files whose catalog entry contains the specified MIGRATE value. This entry is evaluated by the Hierarchical Storage Management System (HSMS) when files are being migrated (CREATE... / MODIFY... command, MIGRATE operand). If multiple attributes are specified in the form of a list, all files that satisfy one of the conditions are selected.

**MIGRATE = \*ANY**

The entry for MIGRATE is not to be used as a selection criterion.

**MIGRATE = \*ALLOWED**

Returns information for only those files whose catalog entry shows *MIGRATE = ALLOWED*, i.e. files which may be migrated to storage level S1 or S2.

**MIGRATE = \*INHIBITED**

Returns information for only those files for which *MIGRATE = INHIBITED* was defined in the catalog entry, i.e. files which may only be migrated for a brief period, e.g. for reorganization purposes (normal migration lock).

**MIGRATE = \*FORBIDDEN**

Returns information for only those files for which *MIGRATE = FORBIDDEN* was defined in the catalog entry, i.e. files which must never be migrated (intensified migration lock).

**VERSION-BACKUP = \*ANY / list-poss(2): \*ENABLED / \*DISABLED**

Returns information on files according to the value of the NUM-OF-BACKUP-VERS file attribute (output field #BACK-VERS). It is evaluated by the Hierarchical Storage Management System (HSMS) during the version backup and defines the maximal possible number of file versions kept in the version backup archive (CREATE... / MODIFY-..., Operand NUM-OF-BACKUP-VERS).

**VERSION-BACKUP = \*ANY**

The value of NUM-OF-BACKUP-VERS is not used as a selection criterion.

---

**VERSION-BACKUP = \*ENABLED**

Returns information only on files participating in version backup, i.e. files for which NUM-OF-BACKUP-VER > 0 was defined.

**VERSION-BACKUP = \*DISABLED**

Returns information only on files ignored by version backup, i.e. files for which NUM-OF-BACKUP-VER = 0 was defined.

**STORAGE-LEVEL = \*ANY / list-poss(3): \*S0 / \*S1 / \*S2**

Returns information on files which are currently held at the specified hierarchical storage level (see the "HSMS" manual [18]). HSMS supports the following hierarchical storage levels: When HSMS (Hierarchical Storage Management System) is being used, files on public storage space may be held at any of three storage levels:

- S0: This comprises all pubsets which the user is authorized to access, according to his/her user entry. These are implemented as fast access disk storage (online processing).
- S1: This comprises disks on which HSMS has stored files which have been migrated from the S0 level. When DMS requires to access them, they are fetched back to the processing level, S0. Implemented as high capacity disk storage (background level, available online).
- S2: This is a tape archive in which HSMS stores files which have been migrated from S0 on a longer-term basis. When DMS requires to access them they are fetched back to the processing level, S0, in accordance with the HSMS operating parameters which have been set and the availability of tape devices. Implemented as a magnetic tape and tape cartridge archive (background level, available offline).

Files which have been migrated are identified as follows when the catalog entry is output: The character "#" is interposed between the number of reserved PAM pages and the file name. The field *SUPPORT* contains PUB/S1 or PUB/S2. In addition, migrated files have a *STOR-LEVEL* field containing S1 or S2. If multiple attributes are specified in the form of a list, all files that satisfy one of the conditions are selected.

**STORAGE-LEVEL = \*ANY**

Returns information on the specified files, irrespective of the hierarchical storage level at which they are held.

**STORAGE-LEVEL = \*S0**

Returns information on only those files held at level S0.

**STORAGE-LEVEL = \*S1**

Returns information on only those files held at level S1.

**STORAGE-LEVEL = \*S2**

Returns information on only those files held at level S2.

**GENERATIONS = \*NO / \*YES**

File generation details. Specifies whether additional information is required about individual generations as well as that about the file generation group. Unless explicitly requested here, information on the individual file generations in any group will not be output.

**GENERATIONS = \*NO**

If the FILE-NAME operand identifies a file generation group, then only the information on the group entry will be output, but none about the individual generations in the group.

**GENERATIONS = \*YES**

Information will be output about the individual file generations in any file generation group.

GENERATIONS=\*YES is ignored unless a file generation or file generation group has been specified in the FILE-NAME operand.

The interaction between the operand GENERATIONS = \*NO or \*YES and the operand TYPE-OF-FILES = \*FILE-GROUP described below is summarized by the following table:

Operand combinations			Information provided about		
TYPE-OF-FILES = *FILE-GROUP	GENERATIONS		FGG	File generations	Files
	= *YES	= *NO			
X	X		*	*	-
X		X	*	-	-
	X		*	*	*
		X	*	-	*

x specified as a SHOW-FILE-ATTRIBUTES command operand  
 \* taken into account by the command processing  
 - not taken into account by the command processing

Table 104: Effects of the TYPE-OF-FILES operand

**TYPE-OF-FILES = \*ANY / list-poss(2): \*FILE-GROUP / \*PLAM-LIBRARY**

Specifies whether information is to be listed on the basis of the file type. The returned information can be restricted to file generations or groups or to PLAM libraries.

**TYPE-OF-FILES = \*ANY**

Returns information on files without taking their file type into account.

**TYPE-OF-FILES = \*FILE-GROUP**

Restricts the returned information to file generation groups and file generations (see GENERATIONS=\*YES). Only file generation groups will be selected from the file set identified by the specified FILE-NAME.

**TYPE-OF-FILES = \*PLAM-LIBRARY**

Returns information on PLAM libraries only.

**FROM-CATALOG = \*STD / \*PRIVATE(...) / \*NET(...) / \*LOCAL**

The FROM-CATALOG operand defines the source to be used for the information output by SHOW-FILE-ATTRIBUTES.

**FROM-CATALOG = \*STD**

If the file name (FILE-NAME operand) is specified without a catalog ID, the source of information for the SHOW-FILE-ATTRIBUTES command will be the file catalog (TSOSCAT) for the user ID's default pubset, i.e. the catalog with the default catalog ID.

If a catalog ID is specified explicitly, the information is taken from the file catalog with that catalog ID. If wildcards are used in the catalog ID, the information is taken from the file catalogs of the selected available pubsets.

**FROM-CATALOG = \*PRIVATE(...)**

The source of information for the SHOW-FILE-ATTRIBUTES command will be the directory of the private disk

---

identified by the VOLUME operand which follows. The device type for the private disk must then be specified under DEVICE. The permissible specifications for DEVICE-TYPE can also be found in the device table in [section "Device type table"](#) (device type column).

No value may be specified for the operands SUPPORT=... and VOLUME=... above.

**VOLUME = <vsn 1..6>**

The VSN of the private disk.

**DEVICE = <device>**

Device type for the private disk. If DEVICE-TYPE=? is entered in interactive mode, SDF lists the device types current known on the system.

**FROM-CATALOG = \*NET(...)**

The SHOW-FILE-ATTRIBUTES command obtains its information from the catalog of a Net-Storage volume. Only \*ANY may have been specified for the SUPPORT=, STORAGE-TYPE= and VOLUME= operands.

**VOLUME = <vsn 1..6>**

Volume serial number of the Net-Storage volume.

**FILE-TYPE = \*ANY / \*BS2000 / \*NODE-FILE**

Returns information on files on Net-Storage volumes, depending on the file type with which they are created.

**FILE-TYPE = \*ANY**

The file type is not a selection criterion.

**FILE-TYPE = \*BS2000**

Returns information only on BS2000 files on the Net-Storage volume.

**FILE-TYPE = \*NODE-FILE**

Returns information only on node files on the Net-Storage volume.

**FROM-CATALOG = \*LOCAL**

The source of information for the SHOW-FILE-ATTRIBUTES command will be the system catalogs of all the selected local subsets.

**IO-ATTRIBUTES = \*ANY / \*PARAMETERS(...)**

Returns information on files that have the specified performance attributes in the catalog entry (see the IO-ATTRIBUTES operand in the CREATE-FILE/ MODIFY-FILE-ATTRIBUTES command).

**IO-ATTRIBUTES = \*ANY**

The performance attributes are not to be used as a selection criterion.

**IO-ATTRIBUTES = \*PARAMETERS(...)**

Returns information on files for which the specified performance attributes that follow have been entered in the catalog.

**PERFORMANCE = \*ANY / list-poss(3): \*STD / \*HIGH / \*VERY-HIGH**

Returns information on files with the specified performance attribute (output field *IO(PERF)*).

If multiple attributes are specified in the form of a list, all files that satisfy one of the conditions are selected.

**PERFORMANCE = \*ANY**

The performance attribute is not a selection criterion.

---

**PERFORMANCE = \*STD**

Returns information on files which can be processed without any special performance requirements.

**PERFORMANCE = \*HIGH**

Returns information on files which should be processed via a cache (high performance priority).

**PERFORMANCE = \*VERY-HIGH**

Returns information on files containing data which should be processed via a cache and which should be permanently maintained in the cache if possible (highest performance priority).

**USAGE = \*ANY / list-poss(3): \*READ-WRITE / \*WRITE / \*READ**

Returns information on the files which have a performance attribute that applies to the specified I/O operations (output field *IO(USAGE)*). If multiple attributes are specified in the form of a list, all files that satisfy one of the conditions are selected.

**USAGE = \*ANY**

The type of I/O operations to which the performance attribute applies is not to be used as a selection criterion.

**USAGE = \*READ-WRITE**

Returns information on files for which the performance attribute applies to read-write operations.

**USAGE = \*WRITE**

Returns information on files for which the performance attribute applies to write operations only.

**USAGE = \*READ**

Returns information on files for which the performance attribute applies to read operations only.

**DISK-WRITE = \*ANY / \*IMMEDIATE / \*BY-CLOSE**

Returns information on files based on the time at which data consistency is required after a write operation (see the *DISK-WRITE* output field).

**DISK-WRITE = \*ANY**

The point at which data consistency is required is not a selection criterion.

**DISK-WRITE = \*IMMEDIATE**

Returns information on files for which data consistency is required immediately after write operations.

**DISK-WRITE = \*BY-CLOSE**

Returns information on files for which data consistency is required only after CLOSE processing.

**FREE-FOR-DELETION = \*ANY / \*NONE / \*TOMORROW(...) / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..99999>(…) / <date>(…) / \*INTERVAL(...)**

Returns information on files with the specified free-for-deletion date (date of release for deletion; *FREE-DEL-D* and *FREE-DEL-T* output fields). The selection for a specified date can be restricted to a specific period of time on the free-for-deletion date (see the TIME operands in the various structures).

**FREE-FOR-DELETION = \*ANY**

The free-for-deletion date is not used as a selection criterion.

**FREE-FOR-DELETION = \*NONE**

Returns information only on files for which no free-for-deletion date has yet been entered in the catalog.

---

**FREE-FOR-DELETION = \*TOMORROW(...)**

Only returns information on files for which the next day is specified as the free-for-deletion date in the catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the file selection to a period relative to the date of the next day.

**TIME = \*INTERVAL(...)**

Returns information only on files with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects files with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects files with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = \*TODAY(...)**

Returns information only on files with today's date recorded as free-for-deletion date in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection to a period of time relative to today's date.

**TIME = \*INTERVAL(...)**

Returns information only on files with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects files with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects files with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = \*YESTERDAY(...)**

Returns information only on files with yesterday's date recorded as free-for-deletion date in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection to a period of time relative to yesterday's date.

**TIME = \*INTERVAL(...)**

Returns information only on files with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects files with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects files with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = <integer -99999..99999>(...)**

Returns information only on files with the specified date recorded as free-for-deletion date in their catalog entry. The free-for-deletion date is specified relative to today's date (in the form -n for the past or +n for the future).

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection to a period of time relative to the specified date.

**TIME = \*INTERVAL(...)**

Returns information only on files with a free-for-deletion date which falls within the period specified next.

---

**FROM = 00:00:00 / <time>**

Selects files with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects files with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = <date>(…)**

Returns information only on files with the specified date recorded as free-for-deletion date in their catalog entry. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two-digit year specifications < 60, 19 to two-digit year specifications >= 60.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection to a period of time relative to the specified date.

**TIME = \*INTERVAL(…)**

Returns information only on files with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects files with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects files with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = \*INTERVAL(…)**

Returns information only on files with a free-for-deletion date which falls within the specified period. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for the FREE-FOR-DELETION= <integer…> operand). It is also possible to specify only the FROM operand (lower limit) or the TO operand (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = 1900-01-01 / \*TOMORROW(…) / \*TODAY(…) / \*YESTERDAY(…) / <integer -99999..99999>(…) / <date>(…)**

Returns information only on files with a free-for-deletion date >= the specified date.

**FROM = \*TOMORROW(…)**

Provides information on files whose free-for-deletion date >= the date of the next day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**FROM = \*TODAY(…)**

Returns information only on files with a free-for-deletion date >= today's date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**FROM = \*YESTERDAY(…)**

Returns information only on files with a free-for-deletion date >= yesterday's date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

---

**FROM = <integer -99999..99999>(…)**

Returns information only on files with a free-for-deletion date >= the specified date (in the form -n for the past or +n for the future).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**FROM = <date>(…)**

Returns information only on files with a free-for-deletion date >= the specified date. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two digit year specifications < 60, 19 to two digit year specifications >= 60.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**TO = \*ANY / \*TODAY(…) / \*TOMORROW(…) / \*YESTERDAY(…) / <integer -99999..99999>(…) / <date>(…)**

Returns information only on files with a free-for-deletion date <= the specified date.

**TO = \*ANY**

There is no upper limit on the selection range based on the free-for-deletion date.

**TO = \*TODAY(…)**

Returns information only on files with a free-for-deletion date <= today's date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

**TO = \*TOMORROW(…)**

Provides information on files whose free-for-deletion date <= the date of the next day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

**TO = \*YESTERDAY(…)**

Returns information only on files with a free-for-deletion date <= yesterday's date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

**TO = <integer -99999..99999>(…)**

Returns information only on files with a free-for-deletion date <= the specified date (in the form -n for the past or +n for the future).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

---

**TO = <date>(…)**

Returns information only on files with a free-for-deletion date <= the specified date. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two digit year specifications < 60, 19 to two digit year specifications >= 60.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

**STORAGE-CLASS = \*ANY / \*NONE / <composed-name 1..8>**

Returns information on files assigned the specified storage class.

**STORAGE-CLASS = \*ANY**

The storage class is not a selection criterion.

**STORAGE-CLASS = \*NONE**

Returns information only on files with no storage class assigned to them.

**STORAGE-CLASS = <composed-name 1..8>**

Returns information on files assigned the specified storage class.

**MANAGEMENT-CLASS = \*ANY / \*NONE / <composed-name 1..8>**

Returns information on files assigned the specified HSMS management class.

**MANAGEMENT-CLASS = \*ANY**

The HSMS management class is not a selection criterion.

**MANAGEMENT-CLASS = \*NONE**

Returns information only on files with no HSMS management class assigned to them.

**MANAGEMENT-CLASS = <composed-name 1..8>**

Returns information on files assigned the specified HSMS management class.

**ADM-INFORMATION = \*ANY / \*NONE / <c-string 1..8 with-low>**

Returns information on files with the specified systems support information in their catalog.

**ADM-INFORMATION = \*ANY**

The systems support information is not a selection criterion.

**ADM-INFORMATION = \*NONE**

Returns information only on files with no systems support information in their catalog.

**ADM-INFORMATION = <c-string 1..8 with-low>**

Returns information only on files with the specified string as the systems support information in their catalog.

**USER-INFORMATION = \*ANY / \*NONE / <c-string 1..8 with-low>**

Returns information on files with the specified user information in their catalog.

**USER-INFORMATION = \*ANY**

The user information is not a selection criterion.

**USER-INFORMATION = \*NONE**

Returns information only on files with no user information in their catalog.

**USER-INFORMATION = <c-string 1..8 with-low>**

Returns information only on files with the specified string as the user information in their catalog.

---

**VOLUME-SET = \*ANY / <cat-id 1..4>**

Returns information on files stored in the specified volume set.

**VOLUME-SET = \*ANY**

The volume set is not a selection criterion.

**VOLUME-SET = <cat-id 1..4>**

Returns information only on files stored in the specified volume set.

**AVAILABILITY = \*ANY / list-poss(2): \*STD / \*HIGH**

Returns information on files with the specified availability requirements.

**AVAILABILITY = \*ANY**

Availability is not a selection criterion.

**AVAILABILITY = \*STD**

Returns information only on files with no high availability requirements.

**AVAILABILITY = \*HIGH**

Returns information only on files with high availability requirements. The files are typically on disks mirrored by DRV.

**S0-MIGRATION = \*ANY / list-poss(2): \*ALLOWED / \*FORBIDDEN**

Returns information on files with the specified migration permission within the processing level (SO).

**S0-MIGRATION = \*ANY**

Migration within the processing level is not a selection criterion.

**S0-MIGRATION = \*ALLOWED**

Returns information only on files for which migration to other volume sets within the processing level is allowed.

**S0-MIGRATION = \*FORBIDDEN**

Returns information only on files for which migration to other volume sets within the processing level is forbidden.

**WORK-FILE = \*ANY / \*NO / \*YES**

Returns information on files with the specified work file attribute.

**WORK-FILE = \*ANY**

The work file attribute is not a selection criterion.

**WORK-FILE = \*NO**

Returns information only on files which are not flagged as work files.

**WORK-FILE = \*YES**

Returns information only on files which are flagged as work files.

**FILE-PREFORMAT = \*ANY / list-poss(4): \*NONE / \*K / \*NK2 / \*NK4**

Returns information only on files with the specified preferred file format.

**FILE-PREFORMAT = \*ANY**

The preferred file format is not a selection criterion.

**FILE-PREFORMAT = \*NONE**

Returns information only on files for which no preferred file format has been indicated.

---

**FILE-PREFORMAT = \*K**

Returns information only on files which are intended to be K files.

**FILE-PREFORMAT = \*NK2**

Returns information only on files which are intended to be NK files in 2K format.

**FILE-PREFORMAT = \*NK4**

Returns information only on files which are intended to be NK files in 4K format.

**ACCESS-COUNTER = \*ANY / <integer 0..2147483647> / \*INTERVAL(...)**

Returns information on all files that were accessed the specified number of times (output field *ACC-COUNT*).

**ACCESS-COUNTER = \*ANY**

The access counter is not to be used as a selection criterion.

**ACCESS-COUNTER = <integer 0..2147483647>**

Returns information on files for which the access counter exactly matches the specified value.

**ACCESS-COUNTER = \*INTERVAL(...)**

Returns information on files for which the access counter lies in the specified value range which follows.

**FROM = 0 / <integer 0..2147483647>**

Returns information on files for which the access counter >= the specified value.

**TO = 2147483647 / <integer 0..2147483647>**

Returns information on files for which the access counter <= the specified value.

**CODED-CHARACTER-SET = \*ANY / \*NONE / <name 1..8>**

Returns information on all files for which the specified coded character set (CCS) is entered in the catalog entry (output field *COD-CH-SET* if a CCS is defined; see the CREATE-FILE or MODIFY-FILE-ATTRIBUTES command for an explanation).

**CODED-CHARACTER-SET = \*ANY**

The defined character set is not to be used as a selection criterion.

**CODED-CHARACTER-SET = \*NONE**

Returns information on files for which no coded character set was explicitly defined.

**CODED-CHARACTER-SET = <name 1..8>**

Returns information on files for which the specified coded character set was defined.

**SPACE-RELEASE-LOCK = \*ANY / \*NO / \*YES**

Returns information on files selected on the basis of the lock to prevent the release of unused memory space (see the *SP-REL-LOCK* output field).

**SPACE-RELEASE-LOCK = \*ANY**

The permission to release unused memory space is not used as a selection criterion.

**SPACE-RELEASE-LOCK = \*NO**

Returns information on files for which unused memory space may be released.

**SPACE-RELEASE-LOCK = \*YES**

Returns information on files for which the release of unused memory space is not permitted.

**ENCRYPTION = \*ANY / list-poss(3): \*NONE / \*AES / \*DES**

Returns information on all files in accordance with the encryption method.

---

**ENCRYPTION = \*ANY**

The encryption method is not a selection criterion.

**ENCRYPTION = \*NONE**

Returns information on unencrypted files.

**ENCRYPTION = \*AES**

Returns information on files which were encrypted using the AES method.

**ENCRYPTION = \*DES**

Returns information on files which were encrypted using the DES method.

**OUTPUT = \*SYSOUT / \*NONE / \*SYSLST(...) / \*PRINTER(...) / <filename 1..54 without-gen-vers>(…)**

The OUTPUT operand defines the output medium for the current SHOW-FILE-ATTRIBUTES command. The requested information will be output in tabular format.

**OUTPUT = \*SYSOUT**

Default value. The SHOW-FILE-ATTRIBUTES output will be routed via the SYSOUT system file, i.e. in interactive mode to the data display terminal. This is the only case where the value of the INFORMATION operand affects the type of information which is output.

**OUTPUT = \*NONE**

Suppresses the output of information. This specification is typically useful when only the command return code is to be evaluated in a procedure.

**OUTPUT = \*SYSLST(...)**

The outputs will be sent in tabular format to SYSLST. SYSLST is automatically output at the end of the job. The INFORMATION operand has no effect on the type of information which is to be output to SYSLST. The output from SHOW-FILE-ATTRIBUTES is via the system file SYSLST; the format of the output will be determined by the additional specification FORM-NAME=\*STD/\*FILE-NAME (see below). SYSLST may be assigned (beforehand) to a temporary or a permanent file by an ASSIGN-SYSLST command.

**FORM-NAME = \*STD / \*FILE-NAME**

Output format: tabular presentation or simply file names.

**FORM-NAME = \*STD**

The SHOW-FILE-ATTRIBUTES command outputs an edited list containing the following information:

<i>FILENAME</i>	File/path name
<i>PAM PAGES</i>	Reserved storage space
<i>FREE PAGES</i>	Reserved but unused storage space
<i>SEC-ALLOC</i>	Secondary allocation
<i>FCBTYPE</i>	Access method used to create the file
<i>SHARE</i>	Shareable: yes/no
<i>ACCESS</i>	Permissible access type: read/write
<i>PASSWORDS</i>	Passwords exist: yes/no
<i>BKL</i>	Backup level

---

*#EXT* Total number of extents for the file  
*VOLUME* Volume serial number of the volume

**FORM-NAME = \*FILE-NAME**

The SHOW-FILE-ATTRIBUTES command outputs an unedited list (the first byte of each output record contains X'40') of the names of the selected files, file generations and FGGs.

**OUTPUT = \*PRINTER(...)**

Requests output on a printer in tabular format (immediate SPOOL job, output with /PRINT-DOCUMENT and operand LINE-SPACING=\*BY-EBCDIC-CONTROL).

The INFORMATION operand has no effect on the type of information which is to be sent to the printer. The output from SHOW-FILE-ATTRIBUTES is routed directly to the printer; the format of the output is determined by the supplementary operand FORM-NAME=\*STD/\*FILE-NAME (see below).

**FORM-NAME = \*STD / \*FILE-NAME**

Output format: tabular presentation or simply file names.

**FORM-NAME = \*STD**

The SHOW-FILE-ATTRIBUTES command outputs an edited list containing the following information:

*FILENAME* File/path name  
*PAM PAGES* Reserved storage space  
*FREE PAGES* Reserved but unused storage space  
*SEC-ALLOC* Secondary allocation  
*FCBTYPE* Access method used to create the file  
*SHARE* Shareable: yes/no  
*ACCESS* Permissible access type: read/write  
*PASSWORDS* Passwords exist: yes/no  
*BKL* Backup level  
*#EXT* Total number of extents for the file  
*VOLUME* Volume serial number of the volume

**FORM-NAME = \*FILE-NAME**

The SHOW-FILE-ATTRIBUTES command outputs an unedited list (the first byte of each output record contains X'40') of the names of the selected files, file generations and FGGs.

**OUTPUT = <filename 1..54 without-gen-vers>(...)**

The output is written to the specified file OUTPUT=<filename ....>, and the format of the output is specified in the following operand.

The INFORMATION operand has no effect on the type of information which is to be output to a file. If the file name specified here is identical with the file name specified at the beginning of the SHOW-FILE-ATTRIBUTES command in the FILE-NAME operand, i.e. is the same as the name of the file about which information is being requested, this file (FILE-NAME=...) will be overwritten with the information output by the SHOW-FILE-ATTRIBUTES command.

---

**FORM-NAME = \*STD / \*FILE-NAME**

Output format: tabular presentation or simply file names.

**FORM-NAME = \*STD**

The SHOW-FILE-ATTRIBUTES command outputs an edited list containing the following information:

<i>FILENAME</i>	File/path name
<i>PAM PAGES</i>	Reserved storage space
<i>FREE PAGES</i>	Reserved but unused storage space
<i>SEC-ALLOC</i>	Secondary allocation
<i>FCBTYPE</i>	Access method used to create the file
<i>SHARE</i>	Shareable: yes/no
<i>ACCESS</i>	Permissible access type: read/write
<i>PASSWORDS</i>	Passwords exist: yes/no
<i>BKL</i>	Backup level
<i>#EXT</i>	Total number of extents for the file
<i>VOLUME</i>	Volume serial number of the volume

**FORM-NAME = \*FILE-NAME**

The SHOW-FILE-ATTRIBUTES command outputs an unedited list (the first byte of each output record contains X'40') of the names of the selected files, file generations and FGGs.

**OUTPUT-OPTIONS = \*PARAMETERS(...)**

**SORT-LIST = \*BY-FILENAME / \*NO**

Determines how the catalog entries/path names are sorted in the display.

**SORT-LIST = \*BY-FILENAME**

The catalog entries/path names are sorted alphabetically.

**SORT-LIST = \*NO**

The catalog entries/path names are displayed in the order in which they are contained in the catalog.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
1	0	CMD0001	Interrupted by K2 key
2	0	DMS05B6	Invalid time conversion from UTC to LT
2	0	DMS0616	Volume set in SM pubset might not be available
	1	CMD0202	Syntax or semantic error in command
	32	CMD2009	Internal error during S variable generation
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0216	Privilege errors
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset Guaranteed message: DMS051B
	64	DMS051C	User not authorized to access pubset Guaranteed message: DMS051C
	64	DMS0533	Requested file not cataloged in pubset Guaranteed message: DMS0533
	64	DMS0535	Specified file not shareable
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS05F8	DMS error reported Guaranteed message: DMS05F8
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0609	No access to system file
	64	DMS0616	Volume set not accessible in SM pubset
	64	DMS06C4	File generation group not yet cataloged
	64	DMS06CC	No file corresponding to specified operands
	64	DMS06FF	BCAM connection severed

	64	OPS0001	Space problems when generating S variables
	64	OPS0002	Interrupt (e.g. by K2 key) during S variable generation
	130	DMS0524	System address space exhausted
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0594	Not enough virtual memory available

## Meanings of the output fields

n: numeric character

a: alphanumeric character

### Header line

Output field	Format	Meaning
File size	nnnnnnnnn[x]	10-digit number; specifies how many PAM pages were reserved for the file; leading zeros are not displayed. Optionally, an additional character (x) may be displayed as an identifier for specific files. The following values are possible:  * identifier for file on private volume  # identifier for migrated file  n identifier for a file on Net-Storage volume  w identifier for work file
	:aaaa:	Specifies the catalog identifier; i.e. the ID of the subset in which the file is cataloged
	\$userid.	User ID (max. 8 characters) of the file
	filename	Name of the permanent or temporary file, file generation or file generation group for which information is being output

Table 105: Output fields in the SHOW-FILE-ATTRIBUTES header line

*File attributes*

Output field	Values	Description
ACC-DATE	yyyy-mm-dd	yyyy = year; mm = month; dd = day; date on which the file was last accessed
ACC-TIME	hh:mm:ss	hh = hours; mm = minutes; ss = seconds; Time of the last file access
	NONE	The file has not yet been opened or has been deleted using OPTION=*DATA
ACC-COUNT	nnnnnnnnnn	10-digit number which specifies how often the file was accessed. Set to 0 when the file is created, and increased by 1 each time it is opened; the maximum value is 2147483647, after which the counter is no longer updated
ACCESS	WRITE	Write access to the file is permitted
	READ	Only read access to the file is permitted, not write access
ADM-INFO	aaaaaaaa	Systems support information (output only if text has been defined)
ACL	NO YES	ACL protection is provided only for reasons of compatibility: the default is NO
AUDIT	NONE	No monitoring by system exit routines or SAT is defined for the file
	ALL	All DMS actions for the file are monitored
	SUCC	All successful DMS actions are monitored
	FAIL	All unsuccessful DMS actions are monitored
AVAIL	*STD	There are no high-availability requirements for the file
	*HIGH	The file is stored on high-availability volumes
BACK-CLASS	A	The file is saved in each backup run
	T	The file is saved in backup runs for files with the attribute BACK-CLASS= B /C/D
	C	The file is saved in backup runs for files with the attribute BACK-CLASS= C /D
	D	The file is only saved in backup runs for files with the attribute BACK- CLASS= D
	E	This file is not automatically saved by ARCHIVE

Output field	Values	Description
#BACK-VERS	nn	Maximum number of file versions in the version backup archive (the 0 value means ignoring by version backup)
BASE-NUM	nnnnn	Only for file generation groups; 5-digit number indicating which absolute generation number is currently used as the base for relative generation numbers
BLK-CONTR	DATA	The block control information is in the data block
BLK-COUNT	DATA (2K)	For NK2-ISAM files only: data format without key; block control information at the start of each 2K block
	DATA (4K)	For NK4-ISAM files only: data format without key; block control information at the start of each 4K block
	NONE	The file has not yet been opened
	NO	The file was created without any block control information
	PAMKEY	Block control information is in the PAM key
	nnnnnnn	For tape files: 7-digit number indicating the number of data blocks in the file
	BLK-OFFSET	nn
BUF-LEN	STD(1)	Standard blocks: buffer size = 1 PAM block
	STD(n)	Specifies the blocking factor (n <= 16) which has been defined for the file.
	nnnnn	Nonstandard blocks (tape files) 6-digit number; the size of the buffer, in bytes
CHANG-DATE	yyyy-mm-dd	yyyy = year; mm = month; dd = day; date on which the file was last changed
	NONE	The file has not yet been opened or has been deleted using OPTION=*DATA
CHANG-TIME	hh:mm:ss	hh = hours; mm = minutes; ss = seconds; time at which the file was last changed
	NONE	The file has not yet been opened or has been deleted using OPTION=*DATA
COD-CH-SET	aaaaaaaa	CCS name of the code table (output only if a code table has been defined)
CODE	EBCDIC/ISO7/ OWN	For tape files: specifies the code table used in creating the file
CRE-DATE	yyyy-mm-dd	yy = year; mm = month; dd = day; creation date of the file, i.e. the date of the first write access
	NONE	The file has not yet been opened or has been deleted using OPTION=*DATA
CRE-TIME	hh:mm:ss	hh = hours; mm = minutes; ss = seconds; time at which the file was created

	NONE	The file has not yet been opened or has been deleted using OPTION=*DATA
DEF-STO-CL	storage-class	For file generation groups only; default storage class; output only for the group entry if a storage class has been defined
DESTROY	NO	No automatic data destruction (overwriting with X'00')
DEVICE-TYPE	aaaaa	Specifies the device type for the volume (see device table, device type column, in <a href="#">section "Devicetype table"</a> ). The volume type NETSTOR is specified for Net-Storage volumes.
DISK-WRITE	IMMEDIATE	I/O operations are written back to disk immediately
ENCRYPTION	*NONE	No file encryption
EXEC-PASS	NONE	No execute password is defined for the file
EXPIR-DATE	yyyy-mm-dd	yy = year; mm = month; dd = day; the date until which the file is locked for write access, i.e. the file cannot be updated or deleted
EXPIR-TIME	hh:mm:ss	hh = hours; mm = minutes ; ss = seconds; time relative to EXPIR-DATE, currently always 00:00:00
EXTENTS	nnn	The number of extents for the file on the volume designated by "VSN".
F-PREFORM	*NONE	No preferred file format has been specified for the file
FILE-TYPE	BS2000	File type of a file on a Net-Storage volume: The file was created as a BS2000 file; write access is only possible from a BS2000 system
FILE-STRUC	NONE	There is only a catalog entry for the file; the file has never been opened; storage space may have been allocated for it (see CRE-DATE)
FILE-SEQ	nnnnn	For tape files; 5-digit number indicating the position of the file in an MF set.
FIRST-GEN	nnnnn	Only for file generation groups; 5-digit absolute generation number of the oldest generation cataloged for this file generation group
FREE-DEL-D	yyyy-mm-dd	yyyy = year; mm = month; dd = day; date when the file is released for deletion
FREE-DEL-T	hh:mm:ss	hh = hours; mm = minutes; ss = seconds; time when the file is released for deletion
GUARD-EXEC	guardname	Name of a GUARD that controls execute access
GUARD-READ	guardname	Name of a GUARD that controls read access
GUARD-WRIT	guardname	Name of a GUARD that controls write access
GROUP	R W X	The access authorizations specified for the "GROUP" class of users
HIGH-US-PA	nnnnnnnnnn	10-digit number indicating the number of PAM pages occupied by the file

IO(PERF)	STD	No special performance requirements
IO(USAGE)	READ-WRITE	The performance requirements given in IO(PERF) are for read and write operations
KEY-LEN	nnn	Only for ISAM files; 3-digit number indicating the length of the ISAM key in the ISAM index (in bytes).
KEY-POS	nnnnn	Only for ISAM files; 5-digit number indicating the position of the ISAM key in the record.
LABEL	(STD,n)	For tape files with standard labels; the interchange level for DIN 66029, and thus the labels with which the file was created.
LAST-GEN	nnnnn	Only for file generation groups; 5-digit absolute generation number of the youngest generation cataloged for the file generation group
LOG-FL-LEN	nnn	Only in the case of ISAM files containing a logical flag in the ISAM index. 3-digit number which specifies the length of the logical flag in the ISAM index in bytes
MAN-CLASS	hsms-class	Name of the HSMS management class (output only if a value has been defined)
MAXIMUM	nnnnn	Only for file generation groups: 5-digit number indicating the maximum number of generations which may be cataloged simultaneously for this file generation group
MIGRATE	ALLOWED	File may be migrated (HSMS)
NET-CH-SET	aaaaaaaa	CCS name of the code table for node files on Net-Storage (output only for node files)
OWNER	R W X	The access authorizations specified for the "OWNER" class of users (the file owner and system administrator).
OTHERS	R W X	The access authorizations specified for the "OTHERS" class of users (other users).
OVERFL-OPT	CYCLE-REPL	Only for file generation groups; when the MAXIMUM limit is reached, the oldest file and its catalog entry are deleted
PROPA-VAL	MIN	Only for K-ISAM files which have a value flag in the ISAM index; the lowest value flag in each data or index block is placed in the related index entry in the next higher level
READ-PASS	NONE	No read password exists for the file

Output field	Values	Description
REC-FORM		Specifies: a) the record format defined for the file, b) which printer control characters are valid
REC-SIZE	nnnnn	5-digit number which specifies the defined length in bytes of the records in this file (for REC-FORM=F) or the maximum permissible record length (for REC-FORM=V)
S-ALLOC	nnnnn	5-digit number indicating the value defined for secondary allocation
S-ALLO-NUM	nnn	3-digit number indicating how often extra storage space was requested to extend the file (number of secondary allocations)
S0-MIGR	*ALLOWED	Migration within the processing level (S0) is allowed
SAVED-PAG	COMPL-FILE	Save runs with ARCHIVE always save the entire file.
SP-REL-LOCK	NO	Storage space can be released
STOR-CLASS	storage-class	Name of the assigned storage class (output only if a storage class has been defined)
STOR-LEVEL	S1 / S2	Only for migrated files (HSMS): the file has been migrated to the specified storage level, S1 or S2
SUPPORT	PUB	The file is stored on public volumes (pubsets) or Net-Storage volumes
USER-ACC	OWNER-ONLY	The file is not shareable
USER-INFO	aaaaaaaa	User information (output only if an information text has been defined)
VAL-FL-LEN	nnn	Only for ISAM files which have a value flag in the ISAM index; 3-digit number indicating the length of the value flag in the ISAM index (in bytes).
VERSION		3-digit internal version number of the file; can only be interpreted/modifies by the utility routines ARCHIVE and HSMS (e.g. for an incremental save).
VOLUME	aaaaaa	The volume serial number (VSN) for the volume on which storage space is reserved for the file.
WORK-FILE	*YES	The file is a work file and may if necessary be deleted by systems support
WRITE-PASS	NONE	There is no write password for the file.

Table 106: Output fields of the file attributes for the SHOW-FILE-ATTRIBUTES command

Totals lines

Output field	Values	Description
:catid:	:a:	Catalog ID of the pubset on which the files are cataloged.
FRE	nnnnnnnnnn	Number of reserved but unused PAM pages on the volume.
NET	n FILES	Number of files stored on Net-Storage volumes
NO VSN	n FILES	Number of files which are cataloged in the named pubset and for which no volume has been assigned (with INFORMATION=*STATISTICS).
PRDISC	n FILES	Number of files cataloged in the specified pubset which are stored on private disks.
PRIVATE	n FILES	Number of files cataloged in the specified pubset which are stored on private disks (with INFORMATION= *STATISTICS).
PUBLIC	n FILES	Number of files cataloged in this pubset (processing level S0).
PUB/S1	n FILES	Number of files cataloged in this pubset which have been migrated to storage level S1
PUB/S2	n FILES	Number of files cataloged in this pubset which have been migrated to storage level S2
REL	nnnnnnnnnn	Number of PAM pages on the volume that could be released.
RES	nnnnnnnnnn or: nnnnnnnn T or: nnnnnnnn M	Number of PAM pages reserved on the volume. <i>With more than 2147483647 reserved PAM pages:</i> Display in thousands of PAM pages, the right-justified qualifier "T" being specified Display in millions of PAM pages, the right-justified qualifier "M" being specified
TAPE	n FILES	Number of cataloged files stored on tape (the RES, FRE and REL fields do not appear).

Table 107: Output fields of the totals line for the SHOW-FILE-ATTRIBUTES command

---

## Output in S variable

The INFORMATION operand identifies the S variables which are to be created. The following specifications are possible for INFORMATION:

Notation used in command	Abbreviated form used in table
INFORMATION = *ALL-ATTRIBUTES	1
INFORMATION = *MINIMUM	2
INFORMATION = *NAME-AND-SPACE	3
INFORMATION = *PAR(ALLOCATION=YES)	4
INFORMATION = *PAR(BACKUP=YES)	5
INFORMATION = *PAR(HISTORY=YES)	6
INFORMATION = *PAR(ORGANIZATION=YES)	7

%:20S2: TAPE   :       2 FILES
```

The SHOW-FILE-ATTRIBUTES command without other operands lists in alphabetical order all files for the user ID *USER1*. The number of reserved PAM pages and the complete path name (*:catid:\$userid.file*) is output for each file. PAM pages cannot be reserved for tape files (see *MAX.TAPE-FILE.1* and *MAX.TAPE-FILE.2*). Files on private disk (see *MAX.GROUP.4*) are marked with an asterisk before the catalog ID. For all files displayed, statistics are output on the number of files and their storage space utilization per volume type.

*RES* shows the total of reserved PAM pages, *FRE* shows the total of unallocated PAM pages, *REL* shows the maximum number of unallocated PAM pages that can be released. The final total lines are output for each file catalog affected, i.e. per specified catalog ID (here for the default subset of the *USER1* user ID, i.e. the catalog ID *20S2*).

Example 2: Operand *SORT-LIST=\*NO*

**/show-file-attr output-opt=(sort-list=\*no)**

```
%      30 :2OS2:$USER1.AH.LIB
%      24 :2OS2:$USER1.LST.HELP

```

The symbol *\** replaces any character string before and after the character string *FILE.*, i.e. all files are listed whose file name includes the character sequence *FILE.*. Any character string can occur before *FILE.* (even an empty string) and there is at least one character after *FILE.* (an empty character string is not possible because the file name cannot end with a period).

*Note*

The wildcard *\** at the start of a wildcard character string must be doubled if at least one other character follows and no other wildcard is used. Example: all names ending in ABC are searched for with *\*\*ABC.*

```
/show-file-attr max*
```

```
%      3 :2OS2:$USER1.MAX.FILE.1

%:2OS2: TAPE   :       2 FILES
```

All the user's files are listed. The character \* stands for any character string. Output corresponds to the default output with the presetting FILE-NAME=\*ALL.

*Example 4: Partial qualification*

```
/show-file-attr file-name=paul.
```

```
%      9 :2OS2:$USER1.PAUL.FILE.1
%      9 :2OS2:$USER1.PAUL.FILE.2
%      9 :2OS2:$USER1.PAUL.FILE.3
%:2OS2: PUBLIC:       3 FILES RES=       27 FRE=         8 REL=         3 PAGES
```

All the user's files are listed which can be accessed with the partial qualification *PAUL*.

Example 5: Catalog entry of a temporary file

```
/show-file-attr file-name=# _____ (1)
```

```
% DMS0533 REQUESTED FILE NOT CATALOGED IN PUBSET '2OS2'. COMMAND TERMINATED
```

```

```

- (1) All temporary files will be listed (tempfile prefix is set with #). Message *DMS0533* shows that no temporary files exist for the task.
- (2) CREATE-FILE creates the catalog entry for the temporary file *#HUGO.1*.
- (3) COPY-FILE copies the file *LST.ADDCMD* into temporary file *#HUGO.LST.ADDCMD*, which is thereby created.

- (4) SHOW-FILE-ATTRIBUTES for all temporary files of the task (FILE-NAME=#) shows the names of the temporary files created. Instead of the tempfile character, with which the user can access the files, the internal name section created by the system is output (here *S.152.2B4Z*).
- (5) Outputs the full catalog entry for all temporary files whose name ends with the character string *CMD*.

*Example 6a: Output with INFORMATION=\*SPACE-SUMMARY*

**/show-file-attr file-name=max.,inf=\*space-summary**

```
%:2OS2: PUBLIC:      22 FILES RES=      180 FRE=      153 REL=      144 PAGES
%:2OS2: PRDISC:      5 FILES RES=      12 FRE=      12 REL=      0 PAGES
%:2OS2: TAPE   :      2 FILES
```

Information is output for all the user's files whose name starts with *MAX*.

*Example 6b: Output with INFORMATION=\*PAR(PASSWORDS=\*YES)*

**/sh-f-attr file-name=<ah,sf>.,inf=(passwords=\*yes)**

```
%0000000030 :2OS2:$USER1.AH.LIB
% ----- PASSWORDS -----
% READ-PASS = YES          WRITE-PASS = NONE          EXEC-PASS = NONE
%00000000384 :2OS2:$USER1.SF.NEU
% ----- PASSWORDS -----
% READ-PASS = NONE        WRITE-PASS = NONE          EXEC-PASS = NONE

% EXTENTS    VOLUME    DEVICE-TYPE  EXTENTS    VOLUME    DEVICE-TYPE
%           M5658K     TAPE-C4
%:20S2: TAPE :      1 FILE
```

The complete catalog entry of the tape file *MAX.TAPE-FILE.2* is output. The file is the second file (*FILE-SEQ=2*) on a magnetic tape cartridge of volume type *TAPE-C4* with the volume serial number *D2326K*.

Example 10: Output to printer

```
/show-file-attr file-name=max.file.,output=*printer
```

```
%:2OS2: PUBLIC: 10 FILES RES= 60 FRE= 33 REL= 24 PAGES
```

A print-edited list of all files starting with *MAX.FILE.* is produced and printed out<sup>1</sup> with the spoolout name *FSTATPR7*. The user receives the following listing:

17:11:24 15-03-13 PAGE 1										
FILENAME	PAM- PAGES	FREE- PAGES	SEC- ALLOC	FCB- TYPE	SHARE	ACCESS	PASS- WORDS	BKL	#EXT	VOLUME
:2OS2:\$USER1.MAX.FILE.1	3	3	9	NONE	NO	WRITE		A	1	2OS2.O
:2OS2:\$USER1.MAX.FILE.10	9	4	9	SAM	NO	WRITE		A	1	2OS2.D
:2OS2:\$USER1.MAX.FILE.10.SORT-1	12	7	9	SAM	NO	WRITE		A	2	2OS2.F
:2OS2:\$USER1.MAX.FILE.10.SORT-2	12	7	9	SAM	NO	WRITE		A	3	2OS2.5
:2OS2:\$USER1.MAX.FILE.2	3	2	9	SAM	NO	WRITE		A	1	2OS2.O
:2OS2:\$USER1.MAX.FILE.3	3	3	9	NONE	NO	WRITE		A	1	2OS2.C
:2OS2:\$USER1.MAX.FILE.4	9	2	9	ISAM	NO	WRITE		A	1	2OS2.A
:2OS2:\$USER1.MAX.FILE.6	3	3	9	NONE	NO	WRITE		A	1	2OS2.E
:2OS2:\$USER1.MAX.FILE.7	3	1	9	ISAM	NO	WRITE		A	1	2OS2.G
:2OS2:\$USER1.MAX.FILE.9	3	1	9	ISAM	NO	WRITE		A	1	2OS2.H
PUBLIC SPACE:					10 FILES		60			

<sup>1</sup> If the print-edited list is output to a file, the first data byte in each case contains a print control character which is evaluated by the printer at the time of print output with PRINT-DOCUMENT and LINE-SPACING=\*BY-EBCDIC-CONTROL.

---

## 6.3 SHOW-FILE-LINK

Output file attributes from TFT

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT

### Function

The SHOW-FILE-LINK command enables the user to request information from the job-specific task file table (TFT) about the files and devices currently being used. For tape files, TST information can be requested (see the VOLUME operand). TFT entries can be created using the ADD-FILE-LINK command.

If the user specifies no operands in the SHOW-FILE-LINK command, he/she will receive on SYSOUT a list of the current TFT entries showing the file link names and the associated file names, sorted by the file link names.

With the operands FILE-NAME and LINK-NAME the output can be restricted to information on specific TFT entries; otherwise, the command will process the entire TFT.

The command supports structured output in S variables (see ["Output in S variables"](#)).

### *Note*

The information as to whether the creation and/or processing of large files is permitted in the TFT entry (see the EXCEED-32GB operand in the ADD-FILE-LINK command), can only be determined from the S variable output.

## Format

<b>SHOW-FILE-LINK</b>	Alias: <b>SHFL</b>
<b>LINK-NAME</b> = <b>*ALL</b> / <b>*BLANK(...)</b> / <filename 1..8 without-gen with-wild(80)> <b>*BLANK(...)</b>   <b>NUMBER</b> = <b>0</b> / <integer 0..255> <b>,FILE-NAME</b> = <b>*ALL</b> / <b>*DUMMY</b> / <filename 1..54 with-wild(80)> <b>,INFORMATION</b> = <b>*NAMES-AND-FILES</b> / <b>*ALL</b> / [ <b>*PARAMETERS</b> ](...) <b>[*PARAMETERS](...)</b>   <b>STATUS</b> = <b>*NO</b> / <b>*YES</b> / <b>*STATUS</b>   <b>,PROTECTION</b> = <b>*NO</b> / <b>*YES</b> / <b>*PROTECTION</b>   <b>,FILE-CONTROL-BLOCK</b> = <b>*NO</b> / <b>*YES</b> / <b>*FILE-CONTROL-BLOCK</b>   <b>,VOLUME</b> = <b>*NO</b> / <b>*YES</b> / <b>*VOLUME</b>	

## Operands

**LINK-NAME = \*ALL / \*BLANK(...)** / <filename 1..8 without-gen with-wild(80)>

The file link name of the TFT entry to which the SHOW-FILE-LINK command relates. The information returned will be restricted to the TFT entry identified by LINK-NAME.

**LINK-NAME = \*ALL**

All the entries created by the job currently running will be output.

**LINK-NAME = \*BLANK(...)**

Outputs details of a TFT entry whose name consists of blanks (C"BLANK"BLANK"BLANK"BLANK"BLANK"BLANK"BLANK"BLANK"). Such an entry is created if neither the link name nor the file name is defined in the FCB macro call of a program and if no appropriate ADD-FILE-LINK command is issued before the program call. The file name in this entry is the symbolic name of the FCB macro call.

See "OPEN processing" in the "DMS Macros" manual [12].

**NUMBER = 0** / <integer 0..255>

Specifies the TFT entry, whose link name consists of blanks, for which information is to be shown.

**LINK-NAME = <filename 1..8 without-gen with-wild(80)>**

The file link name of the TFT entry to which the SHOW-FILE-LINK command relates.

A wildcard sequence (of up to 8 characters) may be specified to ensure that only valid file link names are addressed.

**FILE-NAME = \*ALL / \*DUMMY** / <filename 1..54 with-wild(80)>

Only information on the TFT entry linked to FILE-NAME will be output. The file specified by FILE-NAME identifies a permanent or temporary file, or a file generation. File generations must be fully qualified and specified with the absolute generation number. For temporary files, the internal file name is shown in the SHOW-FILE-LINK output.

---

**FILE-NAME = \*ALL**

All the entries created by the job currently running will be output.

**FILE-NAME = \*DUMMY**

Only the information on TFT entries linked with DUMMY files will be output.

**FILE-NAME = <filename 1..54 with-wild(80)>**

Fully or partially qualified file name, optionally containing wildcards. Only information on the TFT entry linked to FILE-NAME will be output. A wildcard sequence may be specified to ensure that only valid file names are addressed.

**INFORMATION = \*NAMES-AND-FILES / \*ALL / \*PARAMETERS(...)**

The scope of the information to be output (\*NAMES-AND-FILES: file name and link name; \*ALL: all information; \*PARAMETERS: files with the specified attributes).

**INFORMATION = \*NAMES-AND-FILES**

Only the file link names and associated file names will be output.

*Output format*

The header line is only output once for all selected TFT entries.

- For files on public disks:

```
%-- LINK-NAME ----- FILE-NAME -----  
% linkname pfadname
```

- For files on private disks:

```
%-- LINK-NAME ----- FILE-NAME -----  
%D linkname pfadname
```

- For files on a Net-Storage volume:

```
%-- LINK-NAME ----- FILE-NAME -----  
%N linkname pfadname
```

- For files on tape:

```
%-- LINK-NAME ----- FILE-NAME -----  
%T linkname pfadname
```

- For files on a remote system (see the "RFA" manual [31]):

```
%-- LINK-NAME ----- FILE-NAME -----  
%R linkname pfadname (wie im ADD-FILE-LINK angegeben)
```

**INFORMATION = \*ALL**

In addition to the file link name and file name, all the information specified by \*PARAMETERS will be output. For each selected TFT entry, a header line is output along with file link name and file name (see INFORMATION=\*NAMES-AND-FILES).

---

**INFORMATION = \*PARAMETERS(...)**

Outputs the file link name and file name. In addition, the following extracts can be selected from the complete information held in the entries: file status, file backup, file attributes, and device characteristics. For each selected TFT entry, a header line is output along with file link name and file name (see INFORMATION=\*NAMES-AND-FILES).

**STATUS = \*NO / \*YES**

Specifies whether any information about the status of the file links is required.

**STATUS = \*NO**

No information will be output about the status of the file links.

**STATUS = \*YES**

Information will be output about the status of the file links (whether the file is being processed; whether the link name is locked; actions to be carried out when the lock is removed; how the file link was created; number of tape devices assigned). For information contained in the STATUS block, see "[Meaning of the output fields](#)".

**PROTECTION = \*NO / \*YES**

Specifies whether information concerning the file protection and expiration date is to be output.

**PROTECTION = \*NO**

No information on the file protection and expiration date are to be output.

**PROTECTION = \*YES**

Information on the file protection and retention period are to be output.

For information contained in the PROTECTION block, see "[Meaning of the output fields](#)".

**FILE-CONTROL-BLOCK = \*NO / \*YES**

Specifies whether information on file attributes defined by the ADD-FILE-LINK command is to be output.

**FILE-CONTROL-BLOCK = \*NO**

No information on file attributes will be output.

**FILE-CONTROL-BLOCK = \*YES**

The following information on file attributes is displayed. This information is subdivided into four information blocks:

- GENERAL ATTRIBUTES with general attributes from the FCB
- DISK FILE ATTRIBUTES with attributes for disk files
- TAPE FILE ATTRIBUTES with attributes for tape files
- ISAM FILE ATTRIBUTES with attributes for ISAM files

Each of the four information blocks begins with a header line.

The details contained in the individual information blocks of FILE-CONTROL-BLOCK are listed under "[Meaning of the output fields](#)".

**VOLUME = \*NO / \*YES**

Specifies whether information on device types and volumes required for the file is to be output.

**VOLUME = \*NO**

No information on device types and volumes required for the file will be output.

**VOLUME = \*YES**

Information on device types and volumes required for the file will be output.

---

For information contained in the VOLUME block, see “Meaning of the output fields” on ["Meaning of the output fields"](#).

## Return codes

(SC2)	SC1	Maincode	Meaning
0	0	CMD0001	Command executed
1	0	CMD0001	Interrupted by K2 key
	1	CMD0202	Syntactical or semantic error in command
	32	CMD2009	Internal error during S variable generation
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	DMS05E1	TFT not available or specified file not in TFT
	64	OPS0001	SDF-P reporting space problems
	64	OPS0002	Interrupt (e.g. by K2 key) during S variable generation
	130	DMS0594	Not enough virtual memory available

## Meaning of the output fields

n: numeric character

a: alphanumeric character

---

*Status of the file links*

The information block begins with the header line "STATUS".

Output field	Values	Description
STATE	ACTIVE	File is being processed
	INACTIVE	File is not being processed
ORIGIN	FILE	TFT entry was created by an ADD-FILE-LINK command or a FILE macro
	OPEN	TFT entry was created with OPEN
LOCK-F-LI	YES	Only included in the output if the link name was locked with LOCK-FILE-LINK
REM-F-LINK	YES/NO	Only included in the output if a locked link name is to be released with REMOVE-FILE-LINK
RELE-DEV	YES/NO	Only included in the output if a locked link name is to be released with REMOVE-FILE-LINK ..., RELEASE-DEVICE=*YES*/NO
UNL-R-TAPE	YES/NO	Only included in the output if a locked link name is to be released with REMOVE-FILE-LINK ..., UNLOAD-RELEASED-TAPE=*YES/*NO
NUMBER OF TAPES CONTAINING DATA OF FILE	nnn	Only output for tape files. Indicates the number of tapes that contain the data of the tape file

Table 108: Output fields for status of file links, from the SHOW-FILE-LINK command

*File protection and retention period*

The information block begins with the header line "PROTECTION".

Output field	Values	Description
RET-PER	*BY-PROG nnnnn	No retention period for the file exists Retention period in days.
PROT-LEV	*BY-PROG	Protection level not specified
	HIGH	For standard labels, high protection level for label checking
	LOW	For standard labels, low protection level for label checking
OVERW-PROT		Only output if PROT-LEV = *HIGH/*LOW
	YES	File protected against overwriting
	NO	No protection against overwriting
BYPASS	*BY-PROG	Label processing not specified
	NO	No label processing; tape position will not be changed
	ABS(nnnnn)	No label processing; the tape will be positioned to the specified tape mark, counting from the beginning of the tape
	FORW(nnnnn)	No label processing; the tape will be advanced by the specified number of tape marks
	BACK(nnnnn)	No label processing; the tape will be wound back by the specified number of tape marks
DESTROY	*BY-CAT	Deletion to end of tape not specified
	YES	After EOF/EOV labels are written, the remaining data to the end of the tape will be deleted
	NO	Deletion to end of tape not specified

Table 109: Output fields for file protection/retention period, from the SHOW-FILE-LINK command

### File attributes

The values \*BY-CAT and \*BY-PROG have been omitted in the following table. \*BY-PROG may be assumed for all the output fields except *F-CL-MSG*, it indicates that no value was specified for the corresponding operand. The value \*BY-CAT means that the appropriate attribute is taken from the catalog entry of the file (see\* the relevant operands in the ADD-FILE-LINK command with operand value \*BY-CATALOG). The use of values entered in the catalog can be defined for the following attributes:

*ACC-METH, REC-FORM, REC-SIZE, BUF-LEN, BLOCK-OFF, KEY-POS, KEY-LEN, LOGIC-FLAG, VAL-FLAG, PROPA-VAL, CODE, F-SEQ, BLK-CONTR, IO(PERF), IO(USAGE)*

More detailed explanations will be found in the descriptions of the corresponding operands for the ADD-FILE-LINK command.

The information supplied here is divided into four information blocks:

1. [GENERAL ATTRIBUTES](#) with general attributes from the FCB
2. [DISK FILE ATTRIBUTES](#) with attributes for disk files
3. [TAPE FILE ATTRIBUTES](#) with attributes for tape files
4. [ISAM FILE ATTRIBUTES](#) with attributes for ISAM files
5. The information block begins with the header line "FILE CONTROL BLOCK - GENERAL ATTRIBUTES"

Output field	Values	Description
ACC-METH	SAM ISAM BTAM UPAM	Access methods (see the ACCESS-METHOD operand in the ADD-FILE-LINK command)
OPEN-MODE	INPUT OUTPUT EXTEND REVERSE UPDATE OUTIN INOUT SINOUT	OPEN modes (see the OPEN-MODE operand in the ADD-FILE-LINK command)
REC-FORM	FIXED	File consists of fixed-length records
	VARIABLE	File consists of variable-length records
	UNDEFINED	File consists of records of undefined length
REC-SIZE	nnnnn	Record length in bytes
BUF-LEN	(STD,n)	Standard blocking with blocking factor n
	nnnnn	Block length in bytes

Output field	Values	Description
BLK-CONTR	NO	Data format includes no key
	DATA	Data format includes no key, block control information is at the start of the block
	DATA (2K)	For NK2-ISAM files only: data format without key; block control information at the start of each 2K block
	DATA (4K)	For NK4-ISAM files only: data format without key; block control information at the start of each 4K block
	PAMKEY	Data format includes a PAM key
F-CL-MSG	STD	Default setting
	YES	Close message after CLOSE
	NO	No close message after CLOSE
CLOSE-MODE		Specification for CLOSE mode:
	INVALIDATE	Blocks still in the cache are invalidated
	REWIND	Tape rewound to start of tape after CLOSE
	REPOS	Tape repositioned to logical start of file after CLOSE
	UNLOAD	Like REWIND, but tape is also unloaded and released
	LEAVE	Tape repositioned to logical end of file after CLOSE
	KEEP	Blocks still in the cache remain valid

Table 110: Output fields for file attributes

6. The information block begins with the header line "FILE CONTROL BLOCK - DISK FILE ATTRIBUTES"

Output field	Values	Description
SHARED-UPD	YES	The file can be concurrently processed by more than one job
	NO	No concurrent processing
	WEAK	For UPAM processing only: the file can be opened for writing by one job only; other jobs can open it for reading at the same time
WR-CHECK	YES	Read-after-write checking
	NO	No read-after-write checking
IO(PERF)	STD	No special performance requirements
	HIGH	The file should be processed via a cache
	VERY-HIGH	The file should be processed via a cache, and the entire file should be retained in the cache if possible
	USER-MAX	The file is processed with the highest permitted performance attribute that is entered in the user catalog
IO(USAGE)	RDWRT	The performance requirements given in IO(PERF) are for read and write operations
	READ	The performance requirements given in IO(PERF) are for read operations only
	WRITE	The performance requirements given in IO(PERF) are for write operations only
LOCK-ENV	HOST-SYS	The file cannot be opened for writing concurrently from different systems
	XCS	The file can be opened for writing concurrently from different systems in an XCS network

Table 111: Output fields for disk file attributes

7. The information block begins with the header line "FILE CONTROL BLOCK - TAPE FILE ATTRIBUTES"

Output field	Values	Description
LABEL	NO	No label processing
	STD	Standard labels
	NON-STD	Tape file with nonstandard labels
DIN-R-NUM	n	Interchange level for DIN 66029, which regulates how the labels of the file are created
TAPE-MARK	YES	Tape marks will be written
CODE	EBCDIC	No code conversion required
	ISO7	EBCDIC ISO7 conversion with international table
	ISO7D	EBCDIC ISO7 conversion with German table
	OWN	Code conversion using tables created by the use
EBCDIC-TR	YES	ISO7 or OWN codes will be converted to EBCDIC
	NO	ISO7 code will be converted to 8 bit format with a leading zero
F-SEQ	nnnnn	Sequence number of file in file set
	UNKNOWN	Starting position of file unknown
	NEW	New file at the end of the file set
CP-AT-BLIM	YES	Checkpoint automatically written when block limit is reached
CP-AT-FEOV	YES	Checkpoint automatically written at every FEOV macro call
BLOCK-LIM	nnnnn	Maximum nnnnnn data blocks per tape
REST-USAGE	DUMMY	File will be treated as a DUMMY file when a restart is carried out
BLOCK-OFF	nnn	Length of buffer offset (see BLOCK-OFFSET operand in the ADD-FILE-LINK command)
	BY-HDR2	Buffer offset determined by the HDR2 label for the file, or the default value
TAPE-WRITE STREAM	DEV-BUFFER	Buffered output to tape cartridge
	IMMEDIATE	Immediate output to tape cartridge
	YES	Streaming mode I/O

Table 112: Output fields for tape file attributes

8. The information block begins with the header line "FILE CONTROL BLOCK - ISAM FILE ATTRIBUTES"

Output field	Values	Description
KEY-POS	nnnnn	position of ISAM key
KEY-LEN	nnn	Length of the ISAM key in bytes.
POOL-LINK	aaaaaaaa	ISAM pool link name
LOGIC-FLAG	nnn	Length of a logical flag in the ISAM index, in bytes
VAL-FLAG	nnn	Length of a value flag in the ISAM index, in bytes
PROPA-VAL	MINIMUM	The lowest value of any value flag within a data or index block will be copied into the index entry for the next higher level
	MAXIMUM	Analogous to above: the highest value is copied
DUP-KEY	YES	ISAM keys may be duplicated
	NO	ISAM keys may not be duplicated
PAD-FACT	nnnnn	Block padding factor
READ-I-ADV	YES	If a second input/output area is defined in the program, read operations can be overlapped
	NO	No overlapped processing
WR-IMMED	YES	Every updated block is written back to disk immediately
	NO	No immediate writing back
POOL-SIZE	nnnnnnn	Size of the file-specific ISAM pool

Table 113: Output fields for (ISAM file) attributes

### Device types and volumes

The information block begins with the header line "VOLUME". The output fields *T-SET-SHR*, *F-SET-ID*, and *T-SET-VSN* are only shown for:

- TFT entries that are linked to a tape set (see the command `ADD-FILE-LINK . . . , SUPPORT=TAPE ( . . . , VOLUME=*BY-TAPE-SET )`)
- TFT entries created with a `CREATE-TAPE-SET` command (TFT entry for tape files with the file name `*DUMMY`; the value of the *T-SET-NAME* output field is then identical with the link name)

The output fields *NUM-OF-VOL* and *NUM-OF-DEV* are only shown if the TFT entry contains private volumes or Net-Storage volumes.

Output field	Values	Description
NUM-OF-VOL	nnn	Number of volumes for the file or the tape set (for Net-Storage volumes this value is always 1)
NUM-OF-DEV	nnn	Number of reserved devices (for Net-Storage volumes this value is 1 if the Net-Storage volume is requested, otherwise it is 0)
DEV-TYPE	aaaaa	Device type; for Net-Storage volumes the volume type NETSTOR
	*NONE	Device type not specified
T-SET-NAME	aaaa	Name of the tape set
	*NONE	TFT entry not linked to a tape set
T-SET-SHR	nnnnn	The number of TFT entries linked to the tape set
F-SET-ID	aaaaaa	VSN of the first tape of the file or tape set
VSN/DEV	aaaaaa/ aaaaaaaa	VSNs and device type codes of the volumes linked to the TFT entry (possibly several pairs of values; 3 pairs per output line) (for Net-Storage volumes the volume type NETSTOR is displayed instead of the device type code)
	*NONE	None specified
T-SET-VSN	(aaaaaa)	List of VSNs of the tape set; first current VSN in parentheses

Table 114: Output fields for device types/volumes

## Output in S variables

The INFORMATION operand identifies the S variables which are to be created. The following specifications are possible for INFORMATION:

Notation used in command	Abbreviated form used in table
INFORMATION = *ALL	1
INFORMATION = *NAMES-AND-FILES	2
INFORMATION = *PAR(FILE-CONTROL-BLOCK=YES)	3
INFORMATION = *PAR(PROTECTION=YES)	4

## Examples

For examples of the output of SHOW-FILE-LINK, see the ADD-FILE-LINK and CREATE-TAPE-SET commands.

---

## 6.4 SHOW-FILE-LOCKS

Show locks on files

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING TSOS

### Function

The SHOW-FILE-LOCKS command provides the file owner and any users who have access authorization with information about the locks currently in force on a file. This helps the user to diagnose processing problems which are due to the presence of a file lock.

The file locks shown are those which have the following causes:

- The file is currently open.
- The file has been explicitly reserved with the SECURE-RESOURCE-ALLOCATION command.
- A lock has been imposed to enable the file to be printed. A lock on a file which is to be printed can be placed explicitly in a PRINT-DOCUMENT command (LOCK-FILE=\*YES) or in a PRNT macro. A file lock can also be imposed by making YES the default value of LOCK-FILE in the SPOOL parameter file. Similarly, the WRITE-DISKETTE command or the PNCH macro can be used to impose a lock on a file to enable it to be written to a floppy disk. A file which is in the process of being output to printer or floppy disk is in any case locked until the output process has been completed.
- The file has been reserved for a file transfer (see the TRANSFER-FILE command).
- The file is a SYSLST file which is waiting to be printed following job completion.
- The file is currently being processed by a Concurrent Copy job.
- The file is the source file for a batch job which is still waiting in the queue.
- A temporary connection failure in a computer network or a system error in the local system make it impossible to reset the file lock.

File locks which are in force on the basis of the file's catalog entry are not shown (see the CREATE-FILE or MODIFY-FILE-ATTRIBUTES command). Locks of this type are shown by the SHOW-CE-LOCK command.

The command supports structured output in S variables (see "[Output in S variables](#)").

#### *Privileged functions*

Systems support (TSOS privilege) has the same access rights as the file owner (user group OWNER) and thus can request information about file locks on any files.

---

## Format

<b>SHOW-FILE-LOCKS</b>
<b>FILE-NAME</b> = <filename 1..54>

## Operands

**FILE-NAME = <filename 1..54>**

Name of the file for which lock information is required.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
2	0	DMS13EE	File is not locked
	1	CMD0221	Syntax error in command
	32	DMS13EA	Internal system error
	64	CMD2203	Error in syntax file
	64	DMS0301	Catalog not available
	64	DMS13EB	RFA connections not supported
	64	DMS13EC	Output in S variables not possible
	64	DMS13ED	Output to SYSOUT not possible
	64	DMS13EF	Metadata cannot be accessed
	64	DMS13E1	File access denied
	64	DMS13E2	No access permission for associated pubset
	64	DMS13E3	User ID does not exist
	128	DMS13E0	Resource bottleneck

## Output format

A table is displayed for the specified file, showing the locks it is subject to on the system. The output starts with a line showing the command name (SHOW-FILE-LOCKS) and the date and time of output, followed by a second line showing the file's path name. Then comes a table comprising up to 20 rows of values for up to 20 locks. The total number of locks present is indicated in a totals line at the end of the table.

The locks in force on a file can all be allocated to one of the following types:

- locks held by a job

- locks held by a system component
- locks held by the FT subsystem

*Layout for locks held by jobs*

Jobs which have caused a lock are shown. Further information on these jobs can be found by specifying the associated TSN in a SHOW-JOB-STATUS command.

```

SHOW-FILE-LOCKS                               Date: yyyy-mm-dd, Time: hh:mm:ss

```

*Key to the output columns*

Output column	Possible values	Meaning
TSN	<alphanum-name 1..4>	Task sequence number
Job name	<name 1..8>	Job name
	*NONE	Job name not known
User ID	<name 1..8>	Job user ID
	*UNKNOWN	Job user ID not known
Job type		Job type to which the lock can be allocated:
	DIALOG	Interactive job
	BATCH	Batch job
	HOLD	Batch job suspended by /HOLD-TASK
	ENTER	Type 1 batch job waiting in queue. The lock only affects the source file.
	SPOOL	Spoolout job
	SYSTEM	System job

	UNDEF	Unidentifiable job type
Lock type		Type of file lock:
	INPUT	Lock on opening the file for reading
	OUTPUT	Lock on opening the file for writing
	INPUT-Y	Lock on opening the file for reading with SHARED-UPDATE=*YES
	INOUT-Y	Lock on opening the file for writing with SHARED-UPDATE=*YES
	INPUT-W	Lock on opening the file for reading with SHARED-UPDATE=*WEAK
	INOUT-W	Lock on opening the file for writing with SHARED-UPDATE=*WEAK
	SECURE	Lock imposed by SECURE-RESOURCE-ALLOCATION command
	RES-INPUT	Lock on file modification
	MIGRATE	Lock in force while the file is being migrated by the HSMS subsystem
	EXCLUSIVE	Lock on all access
	BACKUP	Lock while Concurrent Copy backup is in progress
	RESERVE	File reserved for specific application
Host name		System the job is running on:
	<alphanum-name 1..8>	MSCF name of the host
	*OWN	Local host
	*UNKNOWN	Host name not known
XCS name		Indicates that the host is connected to a cross-coupled system
	<alphanum-name 1..8>	Name of the cross-coupled system
	*NONE	Not connected
	*UNKNOWN	Name of cross-coupled system not known

Table 115: Output columns of the SHOW-FILE-LOCKS command

## Output in S variables

The output scope varies depending on the type of lock: lock set by a job TSN (TSN lock), lock set by system component (SYS lock) or lock set for file transfer (FT lock).

Output information	Name of the S variable	T	Contents	Condition
MSCF name of the processor on which the FT job specified by the transfer ID is running	var(*LIST).LOCK-ENTRY (*LIST).FT-LOCK.HOST	S	*OWN *UNKNOWN <c-string 1..8>	FT lock
Type of file lock *BACKUP=file is saved by means of CCOPY *EXCL=file is locked against access of any kind *INOUT-WEAK=lock against opening for write access with SHARUPD=WEAK *INOUT-YES=lock against opening for write access with SHARUPD=YES *INPUT=lock against opening for read access *INPUT-WEAK=lock against opening for read access with SHARUPD=WEAK *INPUT-YES=lock against opening for read access with SHARUPD=YES *MIGR=lock during migration by means of HSMS *NONE=no lock *OUTPUT=lock against opening for write access *RESERVE=file is reserved for a particular application *RES-INPUT=lock against updating *SEC=lock by means of /SECURE-RESOURCE-ALLOCATION	var(*LIST).LOCK-ENTRY (*LIST).FT-LOCK.LOCK-TYPE	S	*BACKUP *EXCL *INOUT-WEAK *INOUT-YES *INPUT *INPUT-WEAK *INPUT-YES *MIGR *NONE *OUTPUT *RESERVE *RES-INPUT *SEC	FT lock
Type of file lock (cont.)				
Identification of the FT job	var(*LIST).LOCK-ENTRY (*LIST).FT-LOCK.TRANSFER-ID	S	<c-string 1..11>	FT lock
Name of the cross-coupled system to which the host is connected	var(*LIST).LOCK-ENTRY (*LIST).FT-LOCK.XCS-NAME	S	*NONE *UNKNOWN <c-string 1..8>	FT lock
Type or cause of the lock	var(*LIST).LOCK-ENTRY (*LIST).LOCK-CLASS	S	*FT-LOCK *SYS-LOCK *TSN-LOCK	

MSCF name of the processor on which the function unit specified by the program ID is running	var(*LIST).LOCK-ENTRY (*LIST).SYS-LOCK.HOST	S	*OWN *UNKNOWN <c-string 1..8>	SYS lock

Identification of the function unit	var(*LIST).LOCK-ENTRY (*LIST).SYS-LOCK.PROGRAM-ID	S	*C-COPY *EAM	SYS lock
Name of the cross-coupled system to which the host is connected	var(*LIST).LOCK-ENTRY (*LIST).SYS-LOCK.XCS-NAME	S	*NONE *UNKNOWN <c-string 1..8>	SYS lock
MSCF name of the processor on which the job specified by the TSN is running	var(*LIST).LOCK-ENTRY (*LIST).TSN-LOCK.HOST	S	*OWN *UNKNOWN <c-string 1..8>	TSN lock
Job name assigned to the TSN	var(*LIST).LOCK-ENTRY (*LIST).TSN-LOCK.JOB-NAME	S	*NONE *UNKNOWN <c-string 1..8>	TSN lock
Job type of the lock enforcer *BATCH=active batch job *DIALOG=dialog job *ENTER=pending batch job; only the file from which the batch job will read its commands is locked.	var(*LIST).LOCK-ENTRY (*LIST).TSN-LOCK.JOB-TYPE	S	*BATCH *DIALOG *ENTER *HOLD *SPOOL	TSN lock

*HOLD=batch job suspended by /HOLD-TASK *SPOOL=print job *SYS=system job *UNDEF=not defined			*SYS *UNDEF	
Type of file lock *BACKUP=file is saved by means of C-COPY *EXCL=file is locked against access of any kind *INOUT-WEAK=lock against opening for write access with SHARUPD=WEAK *INOUT-YES=lock against opening for write access with SHARUPD=YES *INPUT=lock against opening for read access *INPUT-WEAK=lock against opening for read access with SHARUPD=WEAK *INPUT-YES=lock against opening for read access with SHARUPD=YES *MIGR=lock during migration by means of HSMS *NONE=no lock *OUTPUT=lock against opening for write access *RESERVE=file is reserved for a particular application *RES-INPUT=lock ag. updating *SEC=lock by means of SECURE-RESOURCE-ALLOCATION	var(*LIST).LOCK-ENTRY (*LIST).TSN-LOCK.LOCK-TYPE	S	*BACKUP *EXCL *INOUT-WEAK *INOUT-YES *INPUT *INPUT-WEAK *INPUT-YES *MIGR *NONE *OUTPUT *RESERVE *RES-INPUT *SEC	TSN lock
Task sequence number to which the lock is assigned	var(*LIST).LOCK-ENTRY (*LIST).TSN-LOCK.TSN	S	*REM <c-string 1..4>	TSN lock
User ID of the owner of the TSN	var(*LIST).LOCK-ENTRY (*LIST).TSN-LOCK.USER-ID	S	*UNKNOWN <c-string 1..8>	TSN lock
Name of the cross-coupled system to which the host is connected	var(*LIST).LOCK-ENTRY (*LIST).TSN-LOCK.XCS-NAME	S	*NONE *UNKNOWN <c-string 1..8>	TSN lock
Name of the locked file	var(*LIST).PATH-NAME	S	<c-string 1..54>	

## Examples

The file ABK.ISAM is locked against opening for writing because the file transfer has not yet been completed:

**/show-file-transfer**

```
%TRANS-ID   INI STATE PARTNER DIR  BYTE-COUNT  FILE-NAME
%45709604   LOC HOLD  D016ZE07 TO   0           ABK.ISAM
%   FTR0004 FT-BS2000: INFORMATION COMPLETED
```

```
/show-file-locks abk.isam
```

```
%SHOW-FILE-LOCKS                               Date: 2014-03-14, Time: 13:10:00
%File name:  :2OSG:$USER1.ABK.ISAM
%-----
%Locks identified by File Transfer ID:
% Transfer ID                               Lock type  Host name  XCS name
% 45709604                                RES_INPUT  *OWN      *NONE
%-----
%Total number of locks is: 1
%-----
%SHOW-FILE-LOCKS                               End of display
```

The file SYSSDF.USER.1 has been opened in write mode using the SDF-A utility and so is locked against opening:

```
/show-file-locks syssdf.user.1
```

```
%SHOW-FILE-LOCKS                               Date: 2014-03-14, Time: 13:11:39
%File name:  :2OSG:$USER1.SYSSDF.USER.1
%-----
%Locks identified by TSN:
% TSN   Job name   User ID   Job type   Lock type  Host name  XCS name
% 3PBR  ALT           USER1    DIALOG     OUTPUT     *OWN      *NONE
%-----
%Total number of locks is: 1
%-----
%SHOW-FILE-LOCKS                               End of display
```

The file SYSRME.SPOOL.049.D is currently being printed. It is locked against modification until the print job has been completed:

```
/print-doc sysrme.spool.049.d,line-spacing=*by-ebcdic
```

```
% SCP0810 SPOOLOUT FOR FILE ':2OSG:$USER1.SYSRME.SPOOL.049.D' ACCEPTED. TSN:
'3PIU', SPOOLOUT-NAME: 'ALT', MONJV: '*NONE'
% SCP1025 PRINT JOB ACCEPTED BY SERVER 'GH5090Y0' WITH TSN '40VG'
```

```
/show-file-locks sysrme.spool.049.d
```

```
%SHOW-FILE-LOCKS                               Date: 2014-03-14, Time: 13:14:23
%File name:  :2OSG:$USER1.SYSRME.SPOOL.049.D
%-----
%Locks identified by TSN:
% TSN   Job name   User ID   Job type   Lock type  Host name  XCS name
% 3PIU  *UNKNOWN      *NONE    SPOOL      RES_INPUT  *OWN      *NONE
%-----
%Total number of locks is: 1
%-----
%SHOW-FILE-LOCKS                               End of display
```
