

FUJITSU Software

# BS2000 OSD/BC V11.0 Commands

User Guide

Edition June 2020

---

## Comments... Suggestions... Corrections...

The User Documentation Department would like to know your opinion on this manual. Your feedback helps us to optimize our documentation to suit your individual needs.

Feel free to send us your comments by e-mail to: [bs2000services@ts.fujitsu.com](mailto:bs2000services@ts.fujitsu.com).

## Certified documentation according to DIN EN ISO 9001:2015

To ensure a consistently high quality standard and user-friendliness, this documentation was created to meet the regulations of a quality management system which complies with the requirements of the standard DIN EN ISO 9001:2015.

# Table of Contents

<b>Commands</b> .....	<b>19</b>
<b>1 General Part</b> .....	<b>20</b>
<b>1.1 Preface</b> .....	<b>23</b>
1.1.1 Objectives and target groups of this manual .....	25
1.1.2 Summary of contents .....	26
1.1.3 Changes since the last edition of the manual .....	28
1.1.4 Notational conventions .....	35
<b>1.2 General Topics</b> .....	<b>36</b>
1.2.1 Format of the SDF command language .....	37
1.2.2 Conventions for input .....	39
1.2.3 SDF syntax representation .....	41
1.2.4 Input compression .....	57
1.2.4.1 Abbreviation of names .....	58
1.2.4.2 Default values .....	60
1.2.4.3 Positional operands .....	61
1.2.4.4 Compressing structures .....	62
1.2.5 Replacing expressions in the input .....	64
1.2.6 Language for SDF output .....	70
1.2.7 Return codes .....	71
1.2.7.1 Structure of command return codes .....	72
1.2.7.2 General command return codes .....	74
1.2.8 Conditional expressions (job variables) .....	76
1.2.9 System files .....	79
1.2.10 Job switches .....	84
1.2.11 Device type table .....	88
1.2.12 DMS volume types .....	90
1.2.12.1 Volume type for Net-Storage .....	91
1.2.12.2 Device types for DMS tape processing .....	92
1.2.13 Information services of device management: Meanings of the output values of SHOW commands .....	94
1.2.14 Time limits in BS2000 .....	113
1.2.15 Overview of test privileges .....	115
1.2.16 Working with S variables .....	119
1.2.16.1 General notes on command output .....	120
1.2.16.2 Command output in S variables .....	121
1.2.16.3 Command overview .....	136
1.2.16.4 Notes on conventions used in the tables .....	140

1.2.17 SDF-P-BASYS .....	145
1.2.17.1 Structured procedure format (S procedures) .....	146
1.2.17.2 Block-oriented error recovery .....	147
1.2.17.3 Variables concept (S variables) .....	148
1.2.17.4 Builtin functions .....	155
1.2.17.5 INSTALLATION-PATH( ) - Output path name .....	156
1.2.17.6 IS-CATALOGED-JV( ) - Interrogate job variable .....	158
1.2.17.7 IS-INITIALIZED( ) - Check variable initialization .....	160
1.2.17.8 IS-SDF-P( ) - Check whether SDF-P is loaded .....	161
1.2.17.9 JV( ) - Interrogate job variable .....	163
1.2.17.10 MAINCODE( ) - Interrogate error code .....	165
1.2.17.11 MSG( ) - Output message text .....	166
1.2.17.12 SDF-P-VERSION( ) - Interrogate SDF-P version .....	168
1.2.17.13 SUBCODE1( ) - Interrogate subcode1 .....	169
1.2.17.14 SUBCODE2( ) - Interrogate subcode2 .....	170
1.2.17.15 Commands supported by SDF-P-BASYS .....	171
1.2.17.16 Subsystem installation .....	172
<b>1.3 Overviews .....</b>	<b>174</b>
1.3.1 Overview of main functions of the BS2000 commands .....	175
1.3.2 Domains .....	192
1.3.3 Commands and their privileges .....	211
1.3.4 Command aliases .....	238
1.3.5 Commands of internal components .....	243
<b>1.4 Related publications .....</b>	<b>246</b>

# 1 General Part

- Preface
  - Objectives and target groups of this manual
  - Summary of contents
  - Changes since the last edition of the manual
  - Notational conventions
- General Topics
  - Format of the SDF command language
  - Conventions for input
  - SDF syntax representation
  - Input compression
    - Abbreviation of names
    - Default values
    - Positional operands
    - Compressing structures
  - Replacing expressions in the input
  - Language for SDF output
  - Return codes
    - Structure of command return codes
    - General command return codes
  - Conditional expressions (job variables)
  - System files
  - Job switches
  - Device type table
  - DMS volume types
    - Volume type for Net-Storage
    - Device types for DMS tape processing
  - Information services of device management: Meanings of the output values of SHOW commands
  - Time limits in BS2000
  - Overview of test privileges

- 
- Working with S variables
    - General notes on command output
    - Command output in S variables
      - S variable stream mechanism (SYSINF, SYSMSG and SYSVAR)
      - Declaring S variables
      - Assigning S variable streams
      - S variable format
      - Accessing S variables
      - Re-using S variables
    - Command overview
    - Notes on conventions used in the tables
      - Conventions used in the tables
      - S variable data types
      - Explanation of the columns
  - SDF-P-BASYS
    - Structured procedure format (S procedures)
    - Block-oriented error recovery
    - Variables concept (S variables)
      - Variable name
      - Variable type
      - Scope
      - Declaration
      - Expressions
    - Builtin functions
      - INSTALLATION-PATH( ) - Output path name
      - IS-CATALOGED-JV( ) - Interrogate job variable
      - IS-INITIALIZED( ) - Check variable initialization
      - IS-SDF-P( ) - Check whether SDF-P is loaded
      - JV( ) - Interrogate job variable
      - MAINCODE( ) - Interrogate error code
      - MSG( ) - Output message text
      - SDF-P-VERSION( ) - Interrogate SDF-P version
      - SUBCODE1( ) - Interrogate subcode1
      - SUBCODE2( ) - Interrogate subcode2
    - Commands supported by SDF-P-BASYS
    - Subsystem installation

## 1.1 Preface

The SDF command language (System Dialog Facility) supports entries in interactive mode, during the execution of procedures and in batch operation. SDF offers entry via an interactive menu interface (three levels), syntax check with subsequent correction dialog and the use of user-specific commands. SDF performance features are also available when entering program statements, provided the program utilizes the SDF interface.

The performance features of the SDF interface are explained in detail in the “SDF Dialog Interface” manual [15]. A brief description can be displayed using the HELP-SDF command. Further information concerning job-specific control options of the SDF interface is provided in the descriptions of the MODIFY-SDF-OPTIONS and SHOW-SDF-OPTIONS commands.

In BS2000 OSD/BC V1.0 and higher the SDF command language has replaced the ISP command language. Commands from the old command language ISP continue to be supported for the sake of compatibility. The full functionality of SDF can be exploited only with commands and statements employing the SDF syntax (ISP commands are checked only with regard to their names).

The “Commands” manual contains a general part and various command overviews, as well as a command section with all commands of the SDF command language for the operating system BS2000 OSD/BC (basic configuration). In addition, it contains commands which can only be used in conjunction with a specific software product. In such cases, the command description includes a note to this effect. These commands are also described in the relevant product manuals.

### **Software configuration described**

This description is valid for BS2000 OSD/BC V11.0. Where functions or commands are described which are only available when supplementary software products or components are used, a note to this effect is provided. The associated component is specified for each command in the “Component”.

---

**Valid for**

ACS V20.0B	MIP V20.0B
AIDSYSA V20.0B	openSM2 V11.0B
ASE V1.0C	POSIX-BC V11.0A
BLSSERV V2.9A	RESLOG V1.8B
BS2000 OSD/BC V11.0B	RFA V20.0B
CALENDAR V20.0B	SDF V4.8A
CCOPY V10.0C	SDF-P-BASYS V2.5G
CONV2PDF V1.0B	SHOW-FILE V17.1B
CPR V20.0B	SPOOL V4.9A
DCAM V13.3A	SPOOLSYS V3.0A
DSSM V4.3D	SRPMNUC V20.0A
GCF V2.0B	STATUS V15.2A
IMON-GPN V3.3B	SYSFILE V20.0B
IOFCOPY V19.0A	TIAM V13.2A
JV V15.1B

### 1.1.1 Objectives and target groups of this manual

The “Commands” manual is designed for both privileged and nonprivileged users of the BS2000 command interface.

Users of nonprivileged commands need to be familiar with:

- the basics of the SDF dialog interface, as presented in the “SDF Dialog Interface” manual [15].
- the basics of the Data Management System (DMS), as presented in the “Introductory Guide to DMS” [13].

Users of privileged commands need to be familiar with systems support duties. These duties are presented in the “Introductory Guide to Systems Support” [14].

The additional commands and functions included here are described in detail in the manuals for the individual software products.

---

## 1.1.2 Summary of contents

The "Commands" manual is divided into the following chapters:

- [General Part](#)
- [ACTIVATE-SNAPSHOT - DECRYPT-FILE](#)
- [DELETE-ALTERNATE-INDEX - LOGOFF](#)
- [MAIL-FILE - MOVE-TASK-TO-CATEGORY](#)
- [OPEN-VARIABLE-CONTAINER - SHOW-DSSM-INFORMATION](#)
- [SHOW-FILE - SHOW-PUBSET-SPACE-DEFAULTS](#)
- [SHOW-RESOURCE-ALLOCATION - WRITE-TEXT](#)

### Components of a command description

A command description consists of the following components:

- **Command name plus brief description**
- **Component**  
Name of the component to which the command belongs.
- **Functional area**  
Name of the functional group to which the command is assigned (see the [section "Overview of main functions of the BS2000 commands"](#))
- **Domain**  
Name of one or more SDF domains (application areas) to which the command is allocated. In guided dialog the command is offered on the selection menu for these domains.
- **Privileges**  
To execute the command the user needs one of the privileges listed here. Nonprivileged BS2000 users have the STD-PROCESSING privilege. This means that they can run any command allocated the STD-PROCESSING privilege.  
  
Systems support duties are associated with various different privileges. These privileges and their default associations with system IDs are described in the "Introductory Guide to Systems Support" [14].  
  
Note the following with regard to "security manager" and "audit file management" duties:  
The SECURITY-ADMINISTRATION, SAT-FILE-MANAGEMENT and SAT-FILE-EVALUATION privileges which are associated with these duties restrict the use of certain commands to procedure mode. This is a feature of the security concept intended among other things to prevent the security officer directly calling procedures and programs unrestrictedly.
- **Routing code (where appropriate)**  
Privileged users (system operators) can enter the command only at consoles to which this routing code is allocated.
- **Function**  
A general description of the command's functionality. If the command is available to both privileged and nonprivileged users, functions which are available only to privileged users are described in a separate section. Numbers down the left-hand side of the "Overview of functions" (if present) refer you to the appropriate page of the operand descriptions.  
  
Use of some operating commands is restricted to specific operating workstations. Such restrictions are indicated in the relevant command descriptions.  
  
Detailed information on operating is contained in the "Introductory Guide to Systems Support" [14].

- 
- **Format (syntax diagram)**  
The syntax diagram describes the format in which to enter the command (see also [section "Conventions for input"](#)).
  - **Operands (describes the operands if the command has any)**
  - **Return codes**
  - **Output format (optional in the case of SHOW commands)**
  - **Output in S variable (optional in the case of SHOW commands)**
  - **Notes (optional)**
  - **Examples (optional)**

## Related publications

Literature references are given in the text in abbreviated form. The full titles of all publications referred to can be found under "Related publications".

## Readme file

The functional changes to the current product version and revisions to this manual are described in the product-specific Readme file.

Readme files are available to you online in addition to the product manuals under the various products at <http://bs2manuals.ts.fujitsu.com>. You will also find the Readme files on the Softbook DVD.

### *Information under BS2000*

When a Readme file exists for a product version, you will find the following file on the BS2000 system:

```
SYSRME.<product>.<version>.<lang>
```

This file contains brief information on the Readme file in English or German (<lang>=E/D). You can view this information on screen using the `SHOW-FILE` command or an editor.

The `/SHOW-INSTALLATION-PATH INSTALLATION-UNIT=<product>` command shows the user ID under which the product's files are stored.

### *Additional product information*

Current information, version and hardware dependencies, and instructions for installing and using a product version are contained in the associated Release Notice. These Release Notices are available online at <http://bs2manuals.ts.fujitsu.com>.

### 1.1.3 Changes since the last edition of the manual

The table below contains the most important changes to the existing commands.

Command	Change / Operand	Operand value	Function / Comment
ADD-FILE-LINK	BLOCK-CONTROL-INFO=	Note NK-ISAM files	if there is no explicit specification of the block format, the new system parameter ISBLKCTL is evaluated when an ISAM file is created. By default, ISAM files are created as NK-ISAM files on K disks as well.
	STREAMING-MODE=		Operand omitted
ADD-IO-UNIT	TYPE=	*IBS(...)	Operand value omitted
ADD-USER	NET-CODED-CHAR-SET=		new operand: net coded character set (NETCCS) to be used for node files on Net-Storage
ASSIGN-SYSLST	TO=	<filename> / *LIBRARY-ELEMENT(...)	Notes on the behavior in case of insufficient storage space
ASSIGN-SYSOUT	TO=	<filename> / *LIBRARY-ELEMENT(...)	Notes on the behavior in case of insufficient storage space
ATTACH-DEVICE	Note		FastDPAV support (as of BS2000 OSD/BC V11.0B)
CHECK-DISK-MOUNT	Note		Note regarding SHC-OSD added
COPY-FILE	Note		File attribute NUM-OF-BACKUP-VERS when copying
CREATE-FILE	NET-CODED-CHAR-SET=		new operand: file attribute net coded character set (NETCCS) to be used for node files on Net-Storage
	NUM-OF-BACKUP-VERS		new operand (as of BS2000 OSD/BC V11.0B): file attribute NUM-OF-BACKUP-VERS defines the maximal number of file versions kept in the version backup archive
CREATE-PAGING-FILE	VOLUME=	*PUBSET(...)	new operand value: specifies all paging files on the volumes of an SF pubset

	SIZE=		Value range expanded
DELETE-PAGING-FILE	VOLUME=	*PUBSET(...)	new operand value: specifies all paging files on the volumes of an SF pubset
	FORCE=		new operand: forces the deletion if below the minimum size of the paging area of the home pubset
DETACH-DEVICE	Note		FastDPAV support (as of BS2000 OSD/BC V11.0B)
ENCRYPT-FILE	Software dependency		changed: useful usage of the command when the CRYPT subsystem is loaded.
ENTER-JOB	SYSLST-LIMIT=		changed: in the case of SYSLST, SYSOUT records are not taken into account
ENTER-PROCEDURE	SYSLST-LIMIT=		changed: in the case of SYSLST, SYSOUT records are not taken into account
EXPORT-NODE-FILE	FILE-STRUCTURE=		new operand value: enables file selection via the access method
EXTEND-PAGING-AREA	VOLUME=	*PUBSET(...)	new operand value: specifies all paging files on the volumes of an SF pubset
FORCE-DESTROY-CACHE	CACHE-MEDIUM=	*GS	operand value omitted:cache medium not supported
FORCE-PUBSET-EXPORT	Logging on console		command execution is logged on console
HOLD-JOB	Notes		Notes regarding repeat job
IMPORT-NODE-FILE	FILE-STRUCTURE=	*SAM	new operand value:supports SAM node files
IMPORT-PUBSET	EXTRA-LARGE-CAT-CONV=		Operand omitted
	ACTUAL-JOIN=	*NONE	Operand value omitted
LOAD-EXECUTABLE-PROGRAM	RESIDENT-PAGES=		Value range expanded at MINIMUM and MAXIMUM

MODIFY-FILE-ATTRIBUTES	NET-CODED-CHAR-SET=		new operand: file attribute net coded character set (NETCCS) to be used for node files on Net-Storage
	NUM-OF-BACKUP-VERS		new operand (as of BS2000 OSD/BC V11.0B): file attribute NUM-OF-BACKUP-VERS defines the maximal number of file versions kept in the version backup archive
MODIFY-HEL-CHECK	ATTRIBUTE=	*DALTA-RESPONSIBLE	Operand value omitted
MODIFY-HEL-LOGGING	ATTRIBUTE=	*DALTA-RESPONSIBLE	Operand value omitted
MODIFY-JOB	SYSLST-LIMIT=		changed: in the case of SYSLST, SYSOUT records are not taken into account
MODIFY-JOB-OPTIONS	SYSLST-LIMIT=		changed: in the case of SYSLST, SYSOUT records are not taken into account
MODIFY-MEMORY-PARAMETERS	EXTEND-BIG-PAGES=		new operand: defines if and in which situation big pages are expanded
MODIFY-PAGING-AREA-ATTRIBUTES	VOLUME=	*ALL / *PUBSET (...)	new operand value: specifies all paging files or all paging files on the volumes of an SF pubset
MODIFY-PUBSET-CACHE-ATTRIBUTES	CACHE-MEDIUM=	*GS(...)	operand value omitted: cache medium not supported
MODIFY-SYSTEM-PARAMETERS	dynamically changeable system parameter		expanded by: ISBLKCTL, MIGHOST, NBLOGT0  as of BS2000 OSD/BC V11.0B: new system parameter NUMBACK as a default value for the NUM-OF-BACKUP-VERS file attribute
MODIFY-USER-ATTRIBUTES	NET-CODED-CHAR-SET=		new operand: file attribute net coded character set (NETCCS) to be used for node files on Net-Storage
MODIFY-USER-PUBSET-ATTRIBUTES	CODED-CHARACTERSET=		new operand: file attribute coded character set (CCS) of the file

	NET-CODED-CHAR-SET=		new operand: file attribute net coded character set (NETCCS) to be used for node files on Net-Storage
REDUCE-PAGING-AREA	VOLUME=	*PUBSET(...)	new operand value: specifies all paging files on the volumes of an SF pubset
SET-DISK-PARAMETERS	SYSTEM-ALLOCATION=	*ALL / *SHARE	Operand values omitted
SET-LOGON-PARAMETERS	SYSLST-LIMIT=		changed: in the case of SYSLST, SYSOUT records are not taken into account
SET-PUBSET-ATTRIBUTES	ALTERNATE-MASTER=		new operand: controls for the IMPORT-PUBSET whether the BACKUP-MASTER becomes owner of the pubset if the set owner/master is not (yet) available.
SHOW-ADDRESS-SPACE-STATUS	S variables		now also supports output in S variable
SHOW-AUDIT-STATUS	Information output		expanded: additional activity states
SHOW-CONSOLE-STATUS	CONSOLE=	*ALL(...)	operand expanded: selection criteria
	TYPE=		new operand: selection by type
	STATE=		new operand: selection by status
SHOW-DEVICE-CONFIGURATION	INFORMATION=	*PATH/*INNER	Output to SYSOUT and in S variable changed
	ATTRIBUTE=	*ENABLED / *DISABLED	new operand values (as of BS2000 OSD /BC V11.0B): selection of FastDPAV alias devices
	Output / S-variables		as of BS2000 OSD/BC V11.0B: displaying FastDPAV alias devices or output in new S-variables
SHOW-DEVICE-STATUS	ATTRIBUTE=	*ENABLED / *DISABLED	new operand values (as of BS2000 OSD /BC V11.0B): selection of FastDPAV alias devices
SHOW-FILE-ATTRIBUTES	LAST-BYTE-POINTER=		new operand: selection criterion last-byte pointer

	VERSION-BACKUP		new operand (as of BS2000 OSD/BC V11.0B): selection criterion for the NUM-OF-BACKUP-VERS file attribute
	Output fields		new output field (as of BS2000 OSD/BC V11.0B): #BACK-VERS for displaying the NUM-OF-BACKUP-VERS file attribute
	S variables		new S variables for last-byte pointer and net coded character set;  as of BS2000 OSD/BC V11.0B: new S-variable for the NUM-OF-BACKUP-VERS file attribute
SHOW-MEMORY-CONFIGURATION	Information output		expanded: setting for expansion of the big page memory
	S variables		now also supports output in S variable
SHOW-MEMORY-POOL-STATUS	S variables		now also supports output in S variable
SHOW-PAGING-CONFIGURATION	VOLUME=	*PUBSET(...)	new operand value: specifies all paging files on the volumes of an SF pubset
	S variables		now also supports output in S variable
SHOW-PENDING-MSG	Information output		new S variable contains the text of the response message
SHOW-PUBSET-ATTRIBUTES	Information output		expanded: alternate master to SYSOUT and in S variable RAID indicators omitted
SHOW-PUBSET-CACHE-ATTRIBUTES	Information output		Output information to the cache medium GS omitted; the corresponding S variables are without meaning (display only for reasons of compatibility)
SHOW-PUBSET-CONFIGURATION	Information output		RAID indicators omitted
SHOW-SYSTEM-INFORMATION	INFORMATION=	*BS2000-IDENTIFICATION	some output values changed
SHOW-SYSTEM-PARAMETERS	Information output		new system parameters  as of BS2000 OSD/BC V11.0B: new system parameter NUMBACK as a default value for the NUM-OF-BACKUP-VERS file attribute

SHOW-USER-ATTRIBUTES	NET-CODED-CHAR-SET=		new operand: net coded character set (NETCCS) as selection criterion
	Information output		expanded: NETCCS on SYSOUT and in S variable
START-EXECUTABLE-PROGRAM	RESIDENT-PAGES=		Value range expanded at MINIMUM and MAXIMUM

Table 1: Changes

## Omitted commands and functions

From BS2000 OSD/BC V11.0 onwards, the components GSMAN, GSVOL and SPACEPRO are omitted. Consequently, the commands for these components are omitted as well (commands with the partial name “GS” or “SPACEPRO”, e.g. ATTACH-GS-UNIT or MODIFY-SPACEPRO-PARAMETERS) and therefore no longer described in the manual.

The commands MODIFY-LIVE-MIGRATION-DEFAULTS and SHOW-LIVE-MIGRATION-DEFAULTS are no longer supported.

Since BS2000 OSD/BC only supports connection via Fibre Channel from V11.0 onwards, the operation of SPD disks is no longer supported (SPD disks were only supported on the type S channel).

---

## Notes on the SE server

The released versions of the BS2000 operating system supports the SE server's Server Units

Name of the Server Unit	Architecture	Periphery type
Server Unit /390 (SU /390)	/390 architecture	Channel peripherals
Server Unit x86 (SU x86)	x86-64 architecture	Bus peripherals

On the SE server the device peripherals are only supported via Fibre Channel. Type 2 and type S channels are not supported (exception: virtual console on SU /390).

SE servers have no global storage.

## General information

The name of the BS2000 basic configuration has changed and from version V10.0 becomes: BS2000 OSD/BC. Previous versions will be referred to by the previous name BS2000/OSD-BC.

In the command descriptions, the name of the component to which the command belongs is indicated without information on the version. The version overview for the commands has been omitted.

The device type table for BS2000 OSD/BC is also contained in the "System Installation" manual [46]. The devices currently supported are specified in the BS2000 OSD/BC Release Notice.

An overview over all system parameters (privileged and nonprivileged) is included with the description of the SHOW-SYSTEM-PARAMETERS command.

---

## 1.1.4 Notational conventions

The following notational conventions are used:

Draws your attention to important information relating to the preceding passage.

### *Note*

The word "Note" ahead of an indented paragraph shows that the following paragraph contains important information.

### "Cross-reference"

Cross-references to chapters, sections or other publications are placed within double quotes. Cross-references to pages begin with the tape number.

### [1]

Numbers in square brackets refer to the corresponding item in the section "[Related publications](#)".

### [K2]

Keyboard names in square brackets refer to the corresponding BS2000 function key.

## **Boldface**

In explanations of syntax diagrams, the lines currently being explained are printed in boldface. Similarly, in examples input characters which appear on the screen are shown in boldface. Note the significance of boldface in the "[SDF syntax representation](#)".

### SYNTAX/Example

Syntax diagrams and examples of input and output are shown in a different font for emphasis. Syntax diagrams are also surrounded by a frame.

### [ ]

Square brackets in syntax or format diagrams: the characters within the brackets are optional. Note the significance of square brackets in the "[SDF syntax representation](#)".

### { }

Braces in syntax and format diagrams: one of the parameters within the braces is required.

### option<sub>1</sub> / option<sub>2</sub> / option<sub>i</sub>

If you can choose between multiple options the options are separated by a slash.

### Inner running header

Within lengthy operand description sections, the inner running header refers to the first-level operand currently being described.

---

## 1.2 General Topics

The "General Topics" section contains the following sections:

- Format of the SDF command language
- Conventions for input
- SDF syntax representation
- Input compression
- Replacing expressions in the input
- Language for SDF output
- Return codes
- Conditional expressions (job variables)
- System files
- Working with S variables
- Job switches
- Device type table
- Assignment of volume type code to volume type (Device type table)
- Information services of device management: Meanings of the output values of SHOWcommands
- Time limits in BS2000
- Overview of test privileges
- SDF-P-BASYS

---

### 1.2.1 Format of the SDF command language

The syntax description of SDF commands and statements is contained in the syntax files (see “SDF syntax files” in the “SDF Dialog Interface” manual [15]):

- Commands begin with a slash which in dialog mode is set by the system. SDF expects command input from the logical system file SYSCMD.
- SDF statements, i.e. statements intended for programs with SDF interface, begin with two slashes which in dialog mode are set by the system. SDF expects statement input from the logical system file SYSSTMT, which has the same assignment as system file SYSDTA.

Input data, i.e. data, parameters and statements read in by programs without SDF interface, are not analyzed by SDF. Such programs expect input data from the logical system file SYSDTA.

Commands/statements consist of the following elements:

- command/statement name
- operand names
- possible operand values (keywords and variable values)
- additional help texts explaining the command/statement and its operands.

Command/statement names, operand names and keyword values are contained as keywords in the syntax description. Keywords are specified as such (see [section "Input compression"](#)). Variable operand values are described by means of data types (see [table "Data types" \(SDF syntax representation\)](#)). The data type defines the character set and the rules used to form an operand value. SDF checks whether the specification for a variable operand value lies within the range of permissible values as defined by the data type. A variable value may also be defined as a dedicated (constant) value of a data type. Then instead of the data type the syntax description gives the appropriate constants (such as the names of the S variable streams in the ASSIGN-STREAM command: STREAM-NAME = SYSVAR / SYSMMSG / SYSINF).

Keywords usually consist of several portions (or subnames) connected by hyphens. As a rule, the respective names are taken from the ordinary English-language environment. They are chosen in such a way that analogous facts are described by means of identical keywords throughout the command set. Commands always start with a verb. They are followed by the associated object to which the activity is to be applied, e.g. MODIFY-FILE-ATTRIBUTES causes the attributes of a file to be modified.

There are also pairs of opposite activities; for example:

CREATE-XY and DELETE-XY for the creation/deletion of an object XY.

Commands are assigned to different domains (application areas), depending on their respective uses. A command may occur in more than one domain.

Every operand has a name and at least one possible value. Operands may be hierarchically subordinate to an operand value. In this case this operand value initiates a structure which contains all the lower-ranking operands. The operands of a structure are enclosed in parentheses. Further structures may be initiated within a structure, this phenomenon is referred to as structure nesting.

---

### *Example of a structure*

Format (excerpt from SHOW-FILE-ATTRIBUTES):

```
,SELECT = *ALL / [*BY-ATTRIBUTES](...)  
    [*BY-ATTRIBUTES](...  
        | ,FILE-STRUCTURE = *ANY / list-poss(5): *PAM / *SAM / *ISAM / *BTAM / *NONE
```

Input:

```
/show-file-attributes select=*by-attributes(file-structure=( *sam,*isam )
```

The FILE-STRUCTURE operand defines a specific file attribute and is subordinate to the operand value (the structure) \*BY-ATTRIBUTES.

Concurrent specification of several operand values (in the form of a list) may be permissible. Operand values permitted as list elements are enumerated following "listposs(n):" (see [table "Metasyntax" \(SDF syntax representation\)](#)), where n indicates the maximum number of list elements allowed.

### *Example of a list*

Format:

```
FILE-STRUCTURE = *ANY / list-poss(5): *PAM / *SAM / *ISAM / *BTAM / *NONE
```

Input:

```
/show-file-attributes select=*by-attributes(file-structure=( *sam,*isam )
```

The FILE-STRUCTURE operand defines the file attributes SAM and ISAM

Most operands are preset with a default value (in the example \*ANY). This operand value is used if no explicit specification is made (see ["Default values"](#)).

---

## 1.2.2 Conventions for input

The following should be noted when entering commands and statements:

- SDF interprets inputs in accordance with the standard code table **EBCDIC.DF.03** (e.g. uppercase/lowercase conversion).

XHCS1 permits the use of extended character sets (CCS, Coded Character Set). The coding of dollar sign (\$), number sign (#), commercial at (@), exclamation mark (!), circumflex (^), parentheses and brackets, the greater than and smaller than signs, asterisk (\*), slash (/), colon, comma, semicolon, apostrophe and quotation mark (") in an extended character set must comply with the coding in the standard code table. SDF interprets additional characters of an extended character set only within the data types <c-string> and <text>, i.e. uppercase /lowercase conversion makes use of an XHCS-supplied code table for that extended character set. SDF rejects all additional characters used within any of the other data types and reports a syntax error.

**i** The XHCS (eXtended Host Code Support) subsystem supports 8-bit code processing.

The following distinctions are made when using an extended character set:

- Input at the data display terminal: The CCS from the user entry is used for command input, provided 8-bit mode has been activated with the command `MODIFY-TERMINAL-OPTIONS`. For statement input, the CCS specified in the relevant macro call (`CMDRST` or `RDSTMT`, `CMDTST` or `TRSTMT`, or `CMDCST` or `CORSTMT`) is used. If no CCS has been specified, the same applies as for command input.
- Input from a file or PLAM library member: For command input, the CCS of the input file is used, or the CCS of the PLAM library member, provided `SYSDTA` has been assigned with the `ASSIGN-SYSDTA` command. For statement input, the CCS specified in the relevant macro call must be identical with the CCS for `SYSDTA` inputs. The statement will be rejected if the two CCS are not identical. During a procedure interrupt, the CCS selected for input at the data display terminal is used.
- Input from an S variable: If `SYSDTA` is assigned to a compound S variable, the CCS selected for input at the data display terminal is used in dialog mode. The CCS **EDF03IRV** is used in batch mode.
- The macro calls `CMD` and `TRCMD` do **not** support extended character sets.
- The first character of a command input is the slash "/"; a statement is preceded by two slashes "//". In the event of input at the display terminal, the slash(es) appear(s) automatically as a system prompt. In the event of input from a procedure file, the slash(es) must be included in the input records.
- A label may be placed between slash and command name. They identify the command line as a branch destination within procedures. At least one blank must separate the label from the command name. Labels have different formats for S and non-S procedures:
  - The S label consists of a name with up to 255 characters (corresponding to <structured-name 1..255>) which is followed by a colon. S labels do not belong to the command. They are evaluated by SDF-P only and can only be used in S procedures.
  - The non-S label consists of a leading period and a name with up to 8 characters (corresponding to <name 1..8>).
- The command/statement name must be separated from the ensuing operand(s) by at least one blank.
- Operands have to be separated from each other by a comma.
- Operand values within a list must be separated by a comma. If several list elements are specified, the enumeration must be enclosed in parentheses.

- 
- Operands may be entered either as keyword operands or as positional operands. In keyword operands, an equals sign links operand name and operand value. In positional operands, only the operand value is specified. The assignment being determined via the relative position of the operand within the input stream (see "[Positional operands](#)").
  - Further blanks between keywords, variable operand values, commas and equals signs are possible for documentation purposes and are ignored.
  - Strings enclosed in quotes are interpreted as comments and ignored. Comments can be used in the same way as further blanks, but they are not permitted in front of labels.
  - End-of-line comments: In S procedures the character string `&*` introduces an end-offline comment, i.e. all subsequent characters up to the end of the line are ignored. This means especially that continuation characters, semicolons and `&`-expressions lose their special meaning.
  - Continuation lines: A hyphen as the last character of an input record (with any number of trailing blanks) is interpreted as a continuation character. The ensuing input line thus becomes the continuation line of the preceding command or statement. If input is from the display terminal, the system issues `"/"` or `"/"` as a prompt requesting continuation of input. If commands/statements are entered from procedure/ENTER files, the continuation line must start with `"/"` or `"/"`. The continuation character must be written within the range of columns 2 to 72 if `CONTINUATION=*NEW-MODE` has been set (see `SHOW-SDF-OPTIONS` or `MODIFY-SDF-OPTIONS`). In the case of `CONTINUATION=*OLD-MODE` the continuation character can only be in column 72. Any characters following after column 72 are ignored. The maximum total length of a command (including any continuation lines) may be 16364 bytes including any blanks and comments. The total length of ISP commands (which are still supported) is 4096 bytes.

Input records for a statement may be longer than 72 characters and may have a continuation character in any column as of column 2. The maximum length of a statement is 16364 bytes.

In interactive mode (terminal input) the input record length and the position of any continuation character depends on the size of the input buffer of the display terminal, but may not exceed 16364 bytes.

In S procedures, the `SET-PROCEDURE-OPTIONS INPUT-FORMAT=*FREE-RECORD-LENGTH` can be used to freely define the length of command input records, as long as it does not exceed the maximum length of 16364 bytes. The continuation character may be entered in any column as of column 2.

- For input from non-S procedure files or ENTER files, keywords must be in uppercase format. The same is true of the values of procedure parameters, S variables and job variables if they are to replace part of the input.
- Using a semicolon between two commands permits the simultaneous input of a number of commands within one input record (with the possibility of continuation lines). This option exists in interactive mode and *S procedures* only.

### 1.2.3 SDF syntax representation

The following example shows the representation of the syntax of a command in a manual. The command format consists of a field with the command name. All operands with their legal values are then listed. Operand values which introduce structures and the operands dependent on these operands are listed separately.

HELP-SDF	Alias: HPSDF
<b>GUIDANCE-MODE</b> = <u>*NO</u> / *YES	
,SDF-COMMANDS = <u>*NO</u> / *YES	
,ABBREVIATION-RULES = <u>*NO</u> / *YES	
,GUIDED-DIALOG = <u>*YES</u> (...)	
<u>*YES</u> (...)	
<b>SCREEN-STEPS</b> = <u>*NO</u> / *YES	
,SPECIAL-FUNCTIONS = <u>*NO</u> / *YES	
,FUNCTION-KEYS = <u>*NO</u> / *YES	
,NEXT-FIELD = <u>*NO</u> / *YES	
,UNGUIDED-DIALOG = <u>*YES</u> (...) / *NO	
<u>*YES</u> (...)	
<b>SPECIAL-FUNCTIONS</b> = <u>*NO</u> / *YES	
,FUNCTION-KEYS = <u>*NO</u> / *YES	

This syntax description is valid for SDF V4.8. The syntax of the SDF command/statement language is explained in the following three tables.

#### *"Metasyntax" table*

The meanings of the special characters and the notation used to describe command and statement formats are explained in [table "Data types"](#).

#### *"Data types" table*

Variable operand values are represented in SDF by data types. Each data type represents a specific set of values. The number of data types is limited to those described in the table.

The description of the data types is valid for the entire set of commands/statements. Therefore, only deviations (if any) from the attributes described in the table are explained in the relevant operand descriptions.

---

### "Suffixes for data types" table

Data type suffixes define additional rules for data type input. They contain a length or interval specification and can be used to limit the set of values (suffix begins with *without*), extend it (suffix begins with *with*), or declare a particular task mandatory (suffix begins with *mandatory*). The following short forms are used in this manual for data type suffixes:

case-sensitive	case-sens
cat-id	cat
completion	compl
correction-state	corr
digits	dig
generation	gen
lower-case	low
manual-release	man
odd-possible	odd
path-completion	path-compl
separators	sep
special-characters	spec
temporary-file	temp-file
underscore	under
user-id	user
version	vers
wildcard-constr	wild-constr
wildcards	wild

The description of the 'integer' data type in table "Suffixes for data types" contains a number of items in italics which are not part of the syntax. They are only used to make the table easier to read. For special data types that are checked by the implementation, the table "Suffixes for data types" contains suffixes printed in italics (see the *special* suffix) which are not part of the syntax.

The description of the data type suffixes is valid for the entire set of commands/statements. Therefore, only deviations (if any) from the attributes described this table are explained in the relevant operand descriptions table "Suffixes for data types".

### Metasyntax

Convention	Meaning	Examples
UPPERCASE	Uppercase letters denote keywords (command, statement or operand names, keyword values) and constant operand values. Keyword values begin with *.	<b>HELP-SDF</b> <b>SCREEN-STEPS = *NO</b>
<b>UPPERCASE</b> in boldface	Uppercase letters printed in boldface denote guaranteed or suggested abbreviations of keywords.	<b>GUIDANCE-MODE = *YES</b>

=	The equals sign connects an operand name with the associated operand values.	<b>GUIDANCE-MODE = *NO</b>
< >	Angle brackets denote variables whose range of values is described by data types and suffixes (see " <a href="#">Data types</a> " and " <a href="#">Suffixes for data types</a> ").	<b>SYNTAX-FILE = &lt;filename 1..54&gt;</b>
<u>Underscoring</u>	Underscoring denotes the default value of an operand.	<b>GUIDANCE-MODE = *NO</b>
/	A slash serves to separate alternative operand values.	<b>NEXT-FIELD = *NO/ *YES</b>
(...)	Parentheses denote operand values that initiate a structure.	<b>,UNGUIDED-DIALOG = *YES (...)/ *NO</b>
[ ]	Square brackets denote operand values which introduce a structure and are optional. The subsequent structure can be specified without the initiating operand value.	<b>SELECT = [*BY-ATTRIBUTES](...)</b>
Indentation	Indentation indicates that the operand is dependent on a higher-ranking operand.	<b>,GUIDED-DIALOG = *YES (...)</b> <b>*YES(...)</b> <b>  SCREEN-STEPS = *NO/</b> <b>  *YES</b>
	A vertical bar identifies related operands within a structure. Its length marks the beginning and end of a structure. A structure may contain further structures. The number of vertical bars preceding an operand corresponds to the depth of the structure.	<b>SUPPORT = *TAPE(...)</b> <b>*TAPE(...)</b> <b>  VOLUME = *ANY(...)</b> <b>  *ANY(...)</b> <b>    ...</b>
,	A comma precedes further operands at the same structure level.	<b>GUIDANCE-MODE = *NO/ *YES</b> <b>,SDF-COMMANDS = *NO/ *YES</b>
list-poss(n):	The entry "list-poss" signifies that a list of operand values can be given at this point. If (n) is present, it means that the list must not have more than n elements. A list of more than one element must be enclosed in parentheses.	list-poss: <b>*SAM / *ISAM</b> list-poss(40): <b>&lt;structured-name 1..30&gt;</b> list-poss(256): <b>*OMF / *SYSLST(...)/ &lt;filename 1..54&gt;</b>
Alias:	The name that follows represents a guaranteed alias (abbreviation) for the command or statement name.	<b>HELP-SDF</b> <b>Alias: HPSDF</b>

---

Table 2: Metasyntax

## Data types

Data type	Character set	Special rules
alphanum-name	A..Z 0..9 \$, #, @	
cat-id	A..Z 0..9	Not more than 4 characters; must not begin with the string PUB
command-rest	freely selectable	
composed-name	A..Z 0..9 \$, #, @ \$, #, @ hyphen period	Alphanumeric string that can be split into multiple substrings by means of a period or hyphen. If a file name can also be specified, the string may begin with a catalog ID in the form :cat: (see data type filename).
c-string	EBCDIC character	Must be enclosed within single quotes; the letter C may be prefixed; any single quotes occurring within the string must be entered twice.
date	0..9 Structure identifier: hyphen	Input format: yyyy-mm-dd  yyyy: year; optionally 2 or 4 digits mm: month dd: day
device	A...Z 0..9 hyphen	Character string, max. 8 characters in length, corresponding to a device type available in the system. In guided dialog, SDF displays the valid operand values. For notes on possible device types, see the relevant operand description.
fixed	+, - 0..9 period	Input format: [sign][digits].[digits]  [sign]: + or - [digits]: 0..9  must contain at least one digit, but may contain up to 10 characters (0..9, period) apart from the sign.
filename	A...Z 0..9 \$, #, @ hyphen period	Input format: [:cat:][\$user.]{ file/ file(nr) / group / group{ (*abs) / (+rel) / (-rel) } }

:cat:

optional entry of the catalog identifier;  
character set limited to A..Z and 0..9;  
maximum of 4 characters; must be enclosed in colons;  
default value is the catalog identifier assigned to the user ID, as specified in the user catalog.

\$user.

optional entry of the user ID;  
character set is A..Z, 0..9, \$, #, @;  
maximum of 8 characters; first character cannot be a digit; \$ and period are mandatory; default value is the user's own ID.

\$. (special case)

system default ID

file

file or job variable name;  
may be split into a number of partial names using a period as a delimiter: name<sub>1</sub>.[name<sub>2</sub>[...]]  
name<sub>1</sub> does not contain a period and must not begin or end with a hyphen;  
file can have a maximum length of 41 characters; it must not begin with a \$ and must include at least one character from the range A..Z.

#file (special case)

@file (special case)

# or @ used as the first character indicates temporary files or job variables, depending on system parameter TEMPFILE.

file(no)

tape file name  
no: version number;  
character set is A...Z, 0...9, \$, #, @.  
Parentheses must be specified.

group

name of a file generation group  
(character set: as for "file")

group { (\*abs) / (+rel) / (-rel) }

(\*abs)

absolute generation number (1-9999);  
\* and parentheses must be specified.

		(+rel) (-rel)  relative generation number (0-99); sign and parentheses must be specified.
integer	0..9, +, -	+ or -, if specified, must be the first character.
name	A..Z 0..9 \$, #, @	Must not begin with 0..9.
partial-filename	A..Z 0..9 \$, #, @ \$, #, @ hyphen	Input format: [:cat:][user.][partname.]  :cat: see filename \$user. see filename  partname  optional entry of the initial part of a name common to a number of files or file generation groups in the form: name <sub>1</sub> . [name <sub>2</sub> . [...]] name <sub>1</sub> see filename.  The final character of "partname" must be a period. At least one of the parts :cat:, \$user. or partname must be specified.
posix-filename	A..Z 0..9 special characters	String with a length of up to 255 characters; consists of either one or two periods or of alphanumeric characters and special characters. The special characters must be escaped with a preceding \ (backslash); the / is not allowed. Must be enclosed within single quotes if alternative data types are permitted, separators are used, or the first character is a ?, ! or ^. A distinction is made between uppercase and lowercase.
posix-pathname	A...Z 0...9 special characters structure identifier: slash	Input format: [/]part <sub>1</sub> /.../part <sub>n</sub> where part <sub>i</sub> is a posix-filename; max. 1023 characters; must be enclosed within single quotes if alternative data types are permitted, separators are used, or the first character is a ?, ! or ^. 

product-version	A..Z 0..9 period single quote	Input format: <code>[[C]][V][m]m.naso[ ]</code>  where m, n, s and o are all digits and a is a letter. a = release status o = correction status  Whether the release and/or correction status may/must be specified depends on the suffixes to the data type (see suffixes without-corr, without-man, mandatory-man and mandatory-corr in <a href="#">table "Suffixes for data types"</a> ). product-version may be enclosed within single quotes (possibly with a preceding C). The specification of the version may begin with the letter V.
structured-name	A..Z 0..9 \$, #, @ hyphen	Alphanumeric string which may comprise a number of substrings separated by a hyphen. First character: A..Z or \$, #, @
text	freely selectable	For the input format, see the relevant operand descriptions.
time	0..9 structure identifier: colon	Time-of-day entry:  Input format:  { hh:mm:ss / hh:mm / hh }  hh: hours mm: minutes ss: seconds  Leading zeros may be omitted.
vsn	a) A..Z 0..9	a) Input format: pvsid.sequence-no 6 characters;  pvsid: 2-4 characters; PUB must not be entered  sequence-no: 1-3 characters
	b) A..Z 0..9 \$, #, @	b) Max. 6 characters; PUB may be prefixed, but must not be followed by \$, #, @.
x-string	Hexadecimal: 00...FF	Must be enclosed in single quotes; must be prefixed by the letter X. There may be an odd number of characters.
x-text	Hexadecimal: 00...FF	Must not be enclosed in single quotes; the letter X must not be prefixed. There may be an odd number of characters.

Table 3: Data types

## Suffixes for data types

Suffix	Meaning
<i>x..y unit</i>	<p>With data type "integer": interval specification</p> <p><i>x</i> Minimum value permitted for "integer". <i>x</i> is an (optionally signed) integer.</p> <p><i>y</i> Maximum value permitted for "integer". <i>y</i> is an (optionally signed) integer.</p> <p><i>unit</i> Additional units. The following units may be specified:  <i>days, hours, minutes, seconds, and milliseconds</i>  <i>byte, 2Kbyte, 4Kbyte, and Mbyte</i></p>
<i>x..y special</i>	<p>With the other data types: length specification</p> <p>For data types date, device, product-version and time the length specification is not displayed.</p> <p><i>x</i> Minimum length for the operand value; <i>x</i> is an integer.</p> <p><i>y</i> Maximum length for the operand value; <i>y</i> is an integer.</p> <p><i>x=y</i> The length of the operand value must be precisely <i>x</i>.</p> <p><i>special</i> Specification of a suffix for describing a special data type that is checked by the implementation. <i>special</i> can be preceded by other suffixes. The following units may be specified:</p> <p><i>arithm-expr</i> arithmetic expression (SDF-P)</p> <p><i>bool-expr</i> logical expression (SDF-P)</p> <p><i>string-expr</i> string expression (SDF-P)</p> <p><i>expr</i> freely selectable expression (SDF-P)</p> <p><i>cond-expr</i> conditional expression (JV)</p> <p><i>symbol</i> CSECT- or entry name (BLS)</p>
with	Extends the specification options for a data type.
-compl	<p>When specifying the data type "date", SDF expands two-digit year specifications in the form yy-mm-dd to:</p> <p>20jj-mm-dd if yy&lt;60  19jj-mm-dd if yy&gt;=60</p>
-low	Uppercase and lowercase letters are differentiated.

---

-path-compl	For specifications for the data type “filename”, SDF adds the catalog and/or user ID if these have not been specified.
-------------	--

Suffix	Meaning												
-under	Permits underscores (_) for the data type "name".												
-wild(n)	<p>Parts of names may be replaced by the following wildcards.  n denotes the maximum input length when using wildcards. Due to the introduction of the data types posix-filename and posix-pathname, SDF now accepts wildcards from the UNIX world (referred to below as POSIX wildcards) in addition to the usual BS2000 wildcards. However, as not all commands support POSIX wildcards, their use for data types other than posix-filename and posix-pathname can lead to semantic errors. Only POSIX wildcards or only BS2000 wildcards should be used within a search pattern. Only POSIX wildcards are allowed for the data types posix-filename and posix-pathname. If a pattern can be matched more than once in a string, the first match is used.</p> <table border="1"> <thead> <tr> <th>BS2000 wildcards</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>*</td> <td>Replaces an arbitrary (even empty) character string. An * appearing at the first position must be duplicated if it is followed by other characters and if the entered string does not include at least one further wildcard.</td> </tr> <tr> <td>Terminating period</td> <td>Partially qualified entry of a name. An * appearing at the first position must be duplicated if it is followed by other characters and if the entered string does not include at least one further wildcard.	Terminating period	Partially qualified entry of a name. Corresponds implicitly to the string "./**", i.e. at least one other character follows the period.	/	Replaces any single character.	<s <sub>x</sub> :s <sub>y</sub> >	Replaces a string that meets the following conditions: <ol style="list-style-type: none"> <li>If s<sub>x</sub> is shorter than or exactly as long as s<sub>y</sub>: <ul style="list-style-type: none"> <li>It is at least as long as s<sub>x</sub> and no longer than s<sub>y</sub></li> <li>In the alphabetic collating sequence it lies in the range from s<sub>x</sub> to s<sub>y</sub></li> <li>s<sub>x</sub> may be empty (=1 character with the lowest coding)</li> </ul> </li> <li>If s<sub>x</sub> is longer than s<sub>y</sub>: <ul style="list-style-type: none"> <li>It is at least as long as s<sub>y</sub> and no longer than s<sub>x</sub></li> <li>In the alphabetic collating sequence it lies in the range from s<sub>x</sub> to a string which begins with s<sub>y</sub> and is filled with characters of the highest possible coding to the length of s<sub>x</sub></li> <li>s<sub>y</sub> may be empty (=1 character with the highest coding)</li> </ul> </li> </ol>	<s <sub>1</sub> ,...>	Replaces all strings that match any of the character combinations specified by s. s may also be an empty string. Any such string may also be a range specification "s <sub>x</sub> :s <sub>y</sub> " (see <sx:sy>).
BS2000 wildcards	Meaning												
*	Replaces an arbitrary (even empty) character string. An * appearing at the first position must be duplicated if it is followed by other characters and if the entered string does not include at least one further wildcard.												
Terminating period	Partially qualified entry of a name. Corresponds implicitly to the string "./**", i.e. at least one other character follows the period.												
/	Replaces any single character.												
<s <sub>x</sub> :s <sub>y</sub> >	Replaces a string that meets the following conditions: <ol style="list-style-type: none"> <li>If s<sub>x</sub> is shorter than or exactly as long as s<sub>y</sub>: <ul style="list-style-type: none"> <li>It is at least as long as s<sub>x</sub> and no longer than s<sub>y</sub></li> <li>In the alphabetic collating sequence it lies in the range from s<sub>x</sub> to s<sub>y</sub></li> <li>s<sub>x</sub> may be empty (=1 character with the lowest coding)</li> </ul> </li> <li>If s<sub>x</sub> is longer than s<sub>y</sub>: <ul style="list-style-type: none"> <li>It is at least as long as s<sub>y</sub> and no longer than s<sub>x</sub></li> <li>In the alphabetic collating sequence it lies in the range from s<sub>x</sub> to a string which begins with s<sub>y</sub> and is filled with characters of the highest possible coding to the length of s<sub>x</sub></li> <li>s<sub>y</sub> may be empty (=1 character with the highest coding)</li> </ul> </li> </ol>												
<s <sub>1</sub> ,...>	Replaces all strings that match any of the character combinations specified by s. s may also be an empty string. Any such string may also be a range specification "s <sub>x</sub> :s <sub>y</sub> " (see <sx:sy>).												

-s	Replaces all strings that do not match the specified string s. The minus sign may only appear at the beginning of string s. Within the data types filename or partial-filename the negated string -s can be used exactly once, i.e. -s can replace one of the three name components: cat, user or file.
----	---

Wildcards are not permitted in generation and version specifications for file names. Only system administration may use wildcards in user IDs. Wildcards cannot be used to replace the delimiters in name components cat (colon) and user (\$ and period).

POSIX wildcards	Meaning
*	Replaces an arbitrary (even empty) character string. An * appearing at the first position must be duplicated if it is followed by other characters and if the entered string does not include at least one further wildcard.
?	Replaces any single character; not permitted as the first character outside single quotes.
[c <sub>x</sub> -c <sub>y</sub> ]	Replaces any single character from the range defined by c <sub>x</sub> and c <sub>y</sub> , including the limits of the range. c <sub>x</sub> and c <sub>y</sub> must be normal characters.
[s]	Replaces exactly one character from string s. The expressions [c <sub>x</sub> -c <sub>y</sub> ] and [s] can be combined into [s <sub>1</sub> c <sub>x</sub> -c <sub>y</sub> s <sub>2</sub> ]
[!c <sub>x</sub> -c <sub>y</sub> ]	Replaces exactly one character not in the range defined by c <sub>x</sub> and c <sub>y</sub> , including the limits of the range. c <sub>x</sub> and c <sub>y</sub> must be normal characters. The expressions [!c <sub>x</sub> -c <sub>y</sub> ] and [s] can be combined into [!s <sub>1</sub> c <sub>x</sub> -c <sub>y</sub> s <sub>2</sub> ]
[!s]	Replaces exactly one character not contained in string s. The expressions [!s] and [!c <sub>x</sub> -c <sub>y</sub> ] can be combined into [!s <sub>1</sub> c <sub>x</sub> -c <sub>y</sub> s <sub>2</sub> ]

with-wild-constr(n)

Specification of a constructor (string) that defines how new names are to be constructed from a previously specified selector (i.e. a selection string with wildcards). See also with-wild. n denotes the maximum input length when using wildcards. The constructor may consist of constant strings and patterns. A pattern (character) is replaced by the string that was selected by the corresponding pattern in the selector. The following wildcards may be used in constructors:

wildcard	Meaning
*	Corresponds to the string selected by the wildcard * in the selector.
Terminating period	Corresponds to the partially-qualified specification of a name in the selector; corresponds to the string selected by the terminating period in the selector.

/ or ?	Corresponds to the character selected by the / or ? wildcard in the selector.
<n>	Corresponds to the string selected by the n-th wildcard in the selector, where n is an integer.

Allocation of wildcards to corresponding wildcards in the selector:

All wildcards in the selector are numbered from left to right in ascending order (global index). Identical wildcards in the selector are additionally numbered from left to right in ascending order (wildcard-specific index).

Wildcards can be specified in the constructor by one of two mutually exclusive methods:

- a. Wildcards can be specified via the global index: <n>
- b. The same wildcard may be specified as in the selector; substitution occurs on the basis of the wildcard-specific index. For example: the second “/” corresponds to the string selected by the second “/” in the selector

The following rules must be observed when specifying a constructor:

- The constructor can only contain wildcards of the selector.
- If the string selected by the wildcard <...> or [...] is to be used in the constructor, the index notation must be selected.
- The index notation must be selected if the string identified by a wildcard in the selector is to be used more than once in the constructor.  
For example: if the selector “A/” is specified, the constructor “A<n><n>” must be specified instead of “A//”.
- The wildcard \* can also be an empty string. Note that if multiple asterisks appear in sequence (even with further wildcards), only the last asterisk can be a nonempty string, e.g. for “\*\*\*\*\*” or “\*\*/\*”.
- Valid names must be produced by the constructor. This must be taken into account when specifying both the constructor and the selector.
- Depending on the constructor, identical names may be constructed from different names selected by the selector. For example: “A/\*” selects the names “A1” and “A2”; the constructor “B\*” generates the same new name “B” in both cases.  
To prevent this from occurring, all wildcards of the selector should be used at least once in the constructor.
- If the constructor ends with a period, the selector must also end with a period. The string selected by the period at the end of the selector cannot be specified by the global index in the constructor specification.

**Examples:**

Selector	Selection	Constructor	New name
A/*	AB1 AB2 A.B.C	D<3><2>	D1 D2 D.CB
C.<A:C>/<D,F>	C.AAD C.ABD C.BAF C.BBF	G.<1>.<3>.XY<2>	G.A.D.XYA G.A.D.XYB G.B.F.XYA G.B.F.XYB
C.<A:C>/<D,F>	C.AAD C.ABD C.BAF C.BBF	G.<1>.<2>.XY<2>	G.A.A.XYA G.A.B.XYB G.B.A.XYA G.B.B.XYB
A/B	ACDB ACEB AC.B A.CB	G/XY/	GCXYD GCXYE GCXY. <sup>1</sup> G.XYC

<sup>1)</sup> The period at the end of the name may violate naming conventions (e.g. for fully-qualified file names).

without	Restricts the specification options for a data type.
-cat	Specification of a catalog ID is not permitted.
-corr	Input format: [[C]'] [V][m].na[ ' ] Specifications for the data type product-version must not include the correction status.
-dig	The file type name does not permit digits.
-gen	Specification of a file generation or file generation group is not permitted.
-man	Input format: [[C]'] [V][m].na[ ' ] Specifications for the data type product-version must not include either release or correction status.
-odd	The data type x-text permits only an even number of characters.
-sep	With the data type "text", specification of the following separators is not permitted: ; = ( ) < > 'BLANK' (i.e. semicolon, equals sign, left and right parentheses, greater than, less than, and blank).
-spec	The file type name does not permit any special characters.
-tempfile	Specification of a temporary file is not permitted (see #file or @file under filename).
-user	Specification of a user ID is not permitted.
-vers	Specification of the version (see "file(no)") is not permitted for tape files.
-wild	The file types posix-filename and posix-pathname must not contain a pattern (character).

mandatory	Certain specifications are necessary for a data type.
-corr	Input format: <code>[[C]']][V][m]m.naso[']</code> Specifications for the data type product-version must include the correction status and therefore also the release status.
-man	Input format: <code>[[C]']][V][m]m.na[so][']</code> Specifications for the data type product-version must include the release status. Specification of the correction status is optional if this is not prohibited by the use of the suffix without-corr.
-quotes	Specifications for the data types posix-filename and posix-pathname must be enclosed in single quotes.
case-sensitive	When specifications are made for the data types command-rest and text, a distinction is made between uppercase and lowercase. This also applies for specifications which are not enclosed in single quotes.

Table 4: Data type suffixes

---

## 1.2.4 Input compression

SDF offers the possibility of compressing the input of commands and statements in dialog or batch mode.

It should be noted, however, that an abbreviation which is unique today might be ambiguous in a functionally extended future BS2000 version. Users should therefore use abbreviations sparingly in automated command sequences.

---

### 1.2.4.1 Abbreviation of names

Basically, all names used (keywords) may be abbreviated:

- command/statement names
- operand names
- keyword values

Names can be abbreviated as follows:

- In compound names (name parts linked by a hyphen), portions can be omitted from right to left. The associated hyphen is omitted with a name part.
- Within a name portion or a simple name, characters can be omitted from right to left.
- A leading asterisk does not belong to the name it introduces. It is merely used to distinguish a keyword value from some other possible operand value whose range includes the string of the keyword value. The asterisk alone, even if it is unique, does not represent a valid abbreviation.
- Keyword values in guided dialog and in the syntax representation are always indicated by a leading asterisk. The leading asterisk of a keyword value can be omitted if no alternative variable operand value is possible whose value range contains the name of the keyword value. This abbreviation option can be restricted to allow for potential extensions in subsequent versions. For reasons of compatibility, operand values which were previously written without a leading asterisk are still accepted without the asterisk.
- The name or partial name of a keyword value can also contain a period (e.g. \*V4.1 or \*OSD-V2.0). The period is part of the (partial) name. If the name is abbreviated, the period must not be at the end of it.

For SDF to be able to interpret the abbreviated names correctly, the selected abbreviations must be unique in their immediate syntax environment. However, the syntax file may contain a minimum abbreviation for particular names. In this case, SDF will not accept any shorter input even if it would be unique.

Unique assignment is defined as follows:

- a command name is unique among all valid command names. If a partial name of a command is specified in full, this command is unique compared to a second command in which the specified partial name is an abbreviation of the same part of the name. With, for example, the commands START-C-COMPILER and START-COBOL-COMPILER, the input START-C-COMP can only refer to the command START-C-COMPILER.
- a statement name is unique among all valid statements of a loaded program
- an operand name is unique among all valid operands of the specified command or statement on the same structure level (for an operand name in a lower-ranking structure, only the valid operand names of this structure are considered)
- a keyword value is unique within the set of all possible values for the specified operand.

For example, the input `MOD-SDF-OPT SYN-F=*NONE, GUI=*MIN` is a possible abbreviation of `MODIFY-SDF-OPTIONS SYNTAX-FILE=*NONE, GUIDANCE=*MINIMUM`

The user manuals contain “guaranteed” abbreviations (emphasized by means of bold print in the text). These are not necessarily the shortest possible versions. However, they retain the basic meaning and will remain unique on a long-term basis. This cannot be ensured for any of the other abbreviations. Procedures should therefore contain only unabbreviated names, or guaranteed abbreviations, which also greatly enhances the clarity of the procedure.

---

In addition to the command or statement names, aliases may also be used in the manual. The defined command or statement alias is guaranteed in the long term. An alias comprises no more than 8 characters (A..Z), which are derived from the command or statement name. The alias cannot be further abbreviated. Example: MDSDFO instead of MODIFY-SDF-OPTIONS

The names listed in the manuals are also defined in the syntax files as standard names. These standard names will continue to be accepted even if the command names have been changed, albeit only in the unabbreviated form. For example, if the command name CREATE-FILE were changed to GENERATE-FILE, the entry CREATE-FILE would still be accepted, but CR-F would be rejected. For this reason, if procedures are to be completely immune against the renaming of commands, all names must be specified unabbreviated.

---

### 1.2.4.2 Default values

Specification of most operands is optional. Optional operands are preset with a default value. The default value is used for command/statement execution if no explicit specification is entered by the user. The operand values \*UNCHANGED and \*CURRENT stand for the existing setting, i.e. the present value is taken over.

Since only operand values that are not to have the default settings need to be specified explicitly, input can often be dramatically reduced.

If operands do not have default settings, or if they do not have the defaults that you require, you can define your own defaults for interactive input on a task-specific basis (for an example see the RESET-INPUT-DEFAULTS command; further details are given in the section headed “Task-specific default values” in the “SDF Dialog Interface” [15]).

For example, the entry MOD-SDF-OPT SYN=\*N, GUID=\*MIN is a possible abbreviation of:

```
MOD-SDF-OPT SYN=*NONE, GUID=*MIN, LOG=*UNCH, UT=*UNCH, PROC=*UNCH,  
CONT=*UNCH, MENU=*UNCH, MODE=*UNCH, DEFAULT-PROG=*UNCH, FUNCTION-KEYS=*UNCH,  
INPUT-HISTORY = *UNCH
```

#### *Note*

The default value of an operand should not be confused with the operand value \*STD. The operand value \*STD need not be the default value. The meaning of \*STD is given individually in each operand description. \*STD can be, for example, a value set at system installation (e.g. SPACE=\*STD in the CREATE-FILE command) or a setting dependent upon the task mode (e.g. DIALOG-CONTROL=\*STD in the DELETE-FILE command).

---

### 1.2.4.3 Positional operands

Any operand may be specified either as a keyword operand or as a positional operand. When keyword operands are entered, the operand name and the desired value are specified together in the format <operand-name>=<operand-value>. When positional operands are entered, only the operand value is specified; correct assignment is ensured via its position in the input stream as prescribed by the command/statement definition. Assignment takes place solely on the basis of the position in the input stream compared to the command/statement definitions. The following should be noted when entering positional operands:

- Whenever an operand preceding a positional operand is omitted, a comma must be entered instead.
- If an operand is entered as a keyword operand, no positional operands may be entered at the same structure level.

For example, the input `MOD-SDF-OPT *NONE, *MIN` is a possible abbreviation of `MOD-SDF-OPT SYN-F=*NONE, GUID=*MIN`.

It cannot be fully ruled out that an operand position will change in the event of a version change. For this reason, only keyword operands should be used in procedures.

---

#### 1.2.4.4 Compressing structures

The specification of structures offers the following options for input compression:

##### **STRUCTURE-IMPLICIT notation**

Specification of the structure-initiating operand is omitted and the subordinate operand is entered outside the structure parentheses. The prerequisite for this is generally that the subordinate operand is unique with respect to the entire command/statement or to a higher ranking structure. Operands for which the STRUCTURE-IMPLICIT notation is guaranteed in the long term are listed explicitly in the corresponding command or statement description.

##### *Example*

```
SHOW-FILE-ATTR ACCESS-METHOD=* ISAM
```

is the abbreviated notation for

```
SHOW-FILE-ATTR SEL=*BY-ATTR (ACCESS-METHOD=* ISAM)
```

##### *Note*

In many cases in which the STRUCTURE-IMPLICIT notation is not possible, “flat notation” as outlined below can be used.

##### **Flat notation**

The structure-initiating operand is specified. The subordinate operand, however, is entered outside the structure parentheses. The subordinate operand need not be unique with respect to the entire command/statement. It must not occur in more than one active structure. Note that a structure is activated not only explicitly but also implicitly via the default value, if an operand specification is omitted.

Flat notation is not guaranteed on a long-term basis.

##### *Example*

```
CRE-FILE FILE1 , SUP=*PRIV-DISK , VOL=ABC123 , DEV-TYPE=D3435
```

is the abbreviated notation for

```
CRE-FILE FILE1 , SUP=*PRIV-DISK (VOL=ABC123 , DEV-TYPE=D3435)
```

---

## Notation if NULL-ABBREVIATION=YES

The subordinate operand is entered within the structure parentheses, but the structure initiating operand value is reduced to a null string, i.e. omitted. The prerequisite for this is that the structure-initiating operand value has been defined with the attribute NULL-ABBREVIATION=YES in the syntax file. This attribute can be assigned only once within the set of possible operand values (if several structure-initiating operands are admitted; see the "SDF-A" manual [33]).

In the syntax representation, operand values for which the attribute NULL-ABBREVIATION is guaranteed on a long-term basis are enclosed in square brackets (see "[SDF syntax representation](#)").

### *Example*

```
MOD-FILE-ATTR FILE1 , PROTECTION= ( ACCESS= *READ )
```

is the abbreviated notation for

```
MOD-FILE-ATTR FILE1 , PROTECTION= *PARAMETERS ( ACCESS= *READ )
```

---

## 1.2.5 Replacing expressions in the input

The value of a procedure parameter, an S variable expression or a job variable can substitute a command /statement portion. The expression to be substituted is marked by a '&' character, followed immediately by the name of the procedure parameter or job variable or by an S variable expression enclosed in parentheses. SDF substitutes the actual value for the expression prior to execution of the command/statement. It performs a syntax check on the resulting input. This substitution of expressions is permissible in unguided dialog, in procedures, and in batch mode. In (temporarily) guided dialog, it is restricted to the NEXT line and to input for operand values.

### Substituting procedure parameters

In non-S procedures, expressions of the form '&parameter', when used in commands, are replaced by the value assigned to *parameter* in the command BEGIN-PROCEDURE or CALL-PROCEDURE or during prompting. Expressions are replaced in commands. When used in input data (read from SYSDTA), such expressions are replaced only if an escape character (#, @, & or \*) has been defined in the ESCAPE-CHARACTER operand of the BEGIN-PROCEDURE command and the expression begins with this character. When used in statements (read from SYSSTMT), such expressions are currently replaced as in commands. It is, however, advisable to define ESCAPE-CHARACTER='&', because the handling of such expressions may be modified.

The following restrictions apply to substituting procedure parameters:

- No substitution is possible within CJC command sequences.
- In procedures or ENTER files, procedure parameters cannot replace the slash introducing commands or the two slashes introducing statements, the period introducing non-S labels, the semicolon separating commands or the continuation character.
- Expressions cannot be nested.
- A double "&" or escape character inhibits substitution, the second "&" or escape character is ignored.

### Substituting job variables

This function requires the chargeable subsystem JV to be loaded.

Expressions to be replaced by job variables are specified as follows:

- directly via the job variable name in the form "&( jv-name )"
- indirectly via the job variable link name in the form "&( \*jv-link)". The assignment of the link name to the job variable takes place prior by means of the command SET-JV-LINK LINK-NAME = jv-link, JV-NAME = jv-name.

#### *Note*

Before job variable replacement, ACS, if required, replaces the alias of a JV by its real path name (in accordance with the alias catalog entry).

The following restrictions apply to substituting job variables:

- An expression can be replaced only by a job variable in its full length.
- Read access must have been granted to the job variable value to be substituted for the expression, otherwise, the input will be rejected as a syntax error.
- No substitution is possible within CJC command sequences.
- Job variables cannot be substituted for input data. SDF treats statements intended for programs with SDF interface like commands and not like input data.

- 
- In procedures, job variables cannot replace the slash introducing commands or the two slashes introducing statements, the period introducing non-S labels, the semicolon separating commands or the continuation character.
  - Job variables cannot be used as procedure parameters. This restriction can be circumvented, for instance, by using a link name (see example 3).
  - Expressions cannot be nested.
  - With interactive mode or S procedures, job variable substitution in the manner outlined above is effected only if no identical S variable or builtin function is known. This mechanism can be replaced, however, by the builtin function `JV()`. In this case, the appropriate entry would take the form `"&(JV(JV-NAME=<c-string 1..54>))"`. (See builtin function "[JV\(\) - Interrogate job variable](#)". If the job variable name contains the catalog and/or user ID, only job variable substitution is possible.

## Substituting S variable expressions

In dialog mode and in S procedures, expressions of the form `"&(expression)"`, when used in commands, are replaced by the value of *expression*, where *expression* may be the name of an S variable, a builtin function or a valid S variable expression. If the expression is to be substituted by an S variable whose name does not contain any period, it may also have the form `"&s-variable"`. Procedure parameters of an S procedure are S variables and are replaced in expressions also.

Expressions are replaced in commands. When used in input data (read from SYSDTA), such expressions are replaced only if an escape character (`#`, `@`, `&` or `*`) has been defined in the DATA-ESCAPE-CHARACTER operand of the SET-PROCEDURE-OPTIONS command and the expression begins with this character. When used in statements (read from SYSSTMT), such expressions are currently replaced as in commands.

Expressions may be nested.

The following restrictions apply to substituting S variable expressions:

- Control flow commands cannot be generated.
- The S variable expression to be replaced is converted to type STRING.
- S labels cannot be generated.
- No substitution is possible within CJC command sequences.
- In procedures or ENTER files, S variable expressions cannot replace the slash introducing commands or the two slashes introducing statements, the period introducing non-S labels, the semicolon separating commands or the continuation character.
- A double `"&"` or escape character inhibits substitution, the second `"&"` or escape character is ignored.

## Examples

### 1. Substituting job variables in dialog mode

```
/cre-jv jv=cmd _____ (1)
/mod-jv jv=cmd,set-value='SHOW-FILE-ATTR' _____ (2)
/&(amp;cmd) _____ (3)
```

```
%      3 :2OSG:$USER1.ALT.SYS.LOGON.USERPROC.X1
%     51 :2OSG:$USER1.ALT.SYSSDF.USER.EXAMPLE.1
%     21 :2OSG:$USER1.DATEI.1
%     48 :2OSG:$USER1.DATEI.2
%     84 :2OSG:$USER1.DATEI.3
%     66 :2OSG:$USER1.OUT.SORT1-2
%      3 :2OSG:$USER1.PROC.JV
%:2OSG: PUBLIC:      7 FILE RES=      276 FRE=      39 REL=      21 PAGES
```

```
/mod-jv jv=egon,set-value='-FILE-ATTR F-NAME=PROC.' _____ (4)
/set-jv-link link-name=walter,jv-name=egon _____ (5)
/sh&(*walter)
```

```
%      3 :2OSG:$USER1.PROC.JV _____ (6)
%:2OSG: PUBLIC:      1 FILE RES=      3 FRE=      2 REL=      0 PAGES
```

- (1) The job variable name 'CMD' is declared.
- (2) The job variable CMD is assigned the value 'SHOW-FILE-ATTR' (short for the name of the command SHOW-FILE-ATTRIBUTES).
- (3) After the command has been sent off, the variable string is replaced with the command defined in the job variable, and the command is executed.
- (4) The value of job variable EGON is changed. It now contains only part of the command name ('-FILE-ATTRIBUTES') and the partially qualified file name 'PROC.'.
- (5) Job variable EGON is assigned the link name 'WALTER'.
- (6) After the command has been sent off, the variable string is replaced with the command portion assigned to the job variable, and the command is executed. The reference to the job variable is established via the link name.

## 2. Substituting job variables and S variables in dialog mode

```
/sh-jv cmd ----- (1)
%SHOW-FILE-ATTR
/&(amp;cmd) proc.jv ----- (2)
%      3 :2OSG:$USER1.PROC.JV
%:2OSG: PUBLIC:      1 FILE RES=      3 FRE=      2 REL=      0 PAGES
/cmd='PRINT-DOCUMENT' ----- (3)
/sh-var cmd
CMD = PRINT-DOCUMENT
/&(amp;cmd) proc.jv ----- (4)
% SCP0810 SPOOLOUT FOR FILE ':2OSG:$USER1.PROC.JV' ACCEPTED. TSN: '1FAL', SPOOL
OUT-NAME: 'SDFTEST', MONJV: '*NONE'
% SCP1025 PRINT JOB ACCEPTED BY SERVER 'GH5090Y0' WITH TSN '5BXC'
/&(amp;:2osg:cmd) proc.jv ----- (5)
%      3 :2OSG:$USER1.PROC.JV
%:2OSG: PUBLIC:      1 FILE RES=      3 FRE=      2 REL=      0 PAGES
/&(amp;jv(jv-name='CMD')) proc.jv ----- (6)
%      3 :2OSG:$USER1.PROC.JV
%:2OSG: PUBLIC:      1 FILE RES=      3 FRE=      2 REL=      0 PAGES
/
```

- (1) The job variable `CMD` has the value `SHOW-FILE-ATTR`.
- (2) The command name from the job variable `CMD` is substituted i.e. `SHOW-FILE-ATTRIBUTES` is executed for the file `PROC.JV`.
- (3) The S variable `CMD` is created implicitly by being assigned the value `PRINT-DOCUMENT`.
- (4) The expression `&(CMD)` in the input is now replaced by the contents of the S variable `CMD`, i.e. the command `PRINT-DOCUMENT` is executed for the file `PROC.JV`.
- (5) The name of the job variable `CMD` is prefixed by the catalog ID in order to retain its contents during substitution.
- (6) Job variable substitution can alternatively be achieved using the builtin function `JV()`.

---

### 3. Submitting the name of the job variable to be substituted as procedure parameter of a non-S procedure

```
/BEGIN-PROC PAR=*YES (PROC-PAR= (&PARAM1)) _____ (1)
.
.
.
/SET-JV-LINK LINK-NAME=PARAM1 ,JV-NAME=&PARAM1 _____ (2)
/(& *PARAM1) ,FILE-NAME=LST.JOB _____ (3)
.
.
.
/END-PROC
```

- (1) The job variable to be specified via procedure parameter PARAM1 is to contain the current command to be executed. As the entry “&(&PARAM1)” is illegal, a link name will have to be assigned. See (4) in Example 4 for the optional use of a nested expression.
- (2) The current job variable name is inserted for procedure parameter PARAM1 and assigned the link name PARAM1.
- (3) The contents of the declared job variable are substituted for the link name PARAM1. For instance, if the job variable value is `PRINT-DOCUMENT DOCUMENT-FORMAT=*TEXT (LINE-SPACING=*BY-EBCDIC-CONTROL) , LAYOUT-CONTROL=*PAR (ROTATION=90 ,LEFT-MARGIN=10)` then the file LST.JOB is printed as specified. If the job variable value changes to `SHOW-FILE-ATTRIBUTES INFORMATION=*PAR (HISTORY=*YES ,SECURITY=*YES)` , the requested file attributes of the file LST.JOB are displayed.

4. Substituting job variables and S variables in an S procedure, the job variable name being submitted as a procedure parameter:

Contents of procedure file DO.JVTEST:

```
/      SET-PROC-OPT  JV-REPLACE=*AFTER-BUILTIN
/      DECL-PAR      JV-1(INIT=*PROMPT)
/      &(JV(JV-NAME=JV-1))  FILE-NAME=LST.JOB
/ERR:  IF-BLOCK-ERROR
/      WRITE-TEXT   C'*** Error &MC **'
/      ELSE
/      WRITE-TEXT   C'*** Command &(&(JV-1)) executed **'
/      END-IF
/END:  EXIT-PROC
```

Procedure execution:

```
/show-jv jv=cmd ----- (1)
%SHOW-FILE-ATTR
/call-proc do.jvtest,log=*yes
%      1 1 /SET-PROC-OPT  JV-REPLACE=*AFTER-BUILTIN
%      2 1 /DECL-PAR      JV-1(INIT=*PROMPT)
%JV-1: cmd ----- (2)
%      3 1 /SHOW-FILE-ATTR  FILE-NAME=LST.JOB ----- (3)
%      3 :N:$USER0001.LST.JOB
%:N:   PUBLIC:      1 FILE RES=      3 FREE=      3 REL=      3 PAGES
%      4 1 /FEHL:
%      4 1 /  IF-BLOCK-ERROR
%      6 1 /ELSE
%      7 1 /WRITE-TEXT   C'*** Command SHOW-FILE-ATTR executed **'
'*** Command SHOW-FILE-ATTR executed ** ----- (4)
%      8 1 /END-IF
%      9 1 /ENDE:
%      9 1 /  EXIT-PROC
/
```

- (1) SHOW-FILE-ATTR is displayed as the contents of job variable CMD.
- (2) After invoking the procedure DO.JVTEST, the procedure parameter JV-1 is prompted for and assigned the value CMD. The expression is replaced by the job variable value as ascertained by the builtin function JV(). The desired job variable name is passed to the builtin function via S variable JV-1.
- (3) The command SHOW-FILE-ATTRIBUTES is executed.
- (4) A nested expression is used at this point: A job variable is to be substituted, its name being derived from the expression to be substituted for S variable JV-1. As a result, the contents of job variable CMD are substituted.

---

## 1.2.6 Language for SDF output

All SDF output occurs in the language that has been set for the output of system messages. The syntax files supplied by Fujitsu Technology Solutions contain texts for the respective language codes (D=German, E=English). These texts are:

- command/statement-specific help texts
- help texts on data types
- SDF-specific messages (e.g. command input request “%KDO:” or “%CMD:”)
- identifiers used in guided dialog (names of input fields, identifiers of data types and their suffixes)

The system language is globally defined in the MSGLPRI system parameter. In addition, system administration can specify the desired language for each user ID in the user catalog; this entry supersedes the globally defined system language. Users may obtain the currently applicable setting by issuing the SHOW-USER-ATTRIBUTES command. The user may also change the system language for a particular task by means of the MODIFY-MSG-ATTRIBUTES command.

If the language code set is not defined in the syntax files activated by a task, i.e. the global information in the activated syntax files does not contain any general text for the language code set, then SDF uses the globally defined system language. It informs the user of this fact by means of message CMD0159.

If the activated syntax files do contain global information for the language code set, then SDF outputs the command/ statement-specific help texts defined for this language code. Any help texts that may not be defined for this language code are output in the globally defined system language.

---

### 1.2.7 Return codes

SDF provides the user with information on the analysis of command input and execution in the form of a command return code. This command return code is comparable to return codes at the program level. It enables users to take specific action in response to typical error situations.

---

### 1.2.7.1 Structure of command return codes

Command return codes consist of three parts:

- the **maincode**, a message code that can be specified with the HELP-MSG-INFORMATION command in order to obtain detailed information.
- **subcode 1**, which assigns the error situation to an error class that indicates how serious an error is. Subcode 1 has a *decima*/value. The following five error classes are defined in BS2000:
  - Class A: no error  
The value is zero. Processing can proceed normally.
  - Class B: syntax error  
The value is a number between 1 and 31. The command was entered with incorrect syntax. The command can be entered again after the syntax error has been corrected.
  - Class C: internal error (system error)  
The value is 32. Input can be repeated if the internal error has been recovered.
  - Class D: errors that cannot be assigned to any other error class.  
The value is a number between 64 and 127. Evaluate the maincode to determine how to proceed.
  - Class E: the command cannot be executed at the moment.  
The value is a number between 128 and 130. Command input can be repeated without modification. The wait time may be short, long or indefinite. 128 indicates a short wait time, considered practical in interactive mode. 129 indicates a long wait time, considered practical in batch mode. 130 indicates an indefinite wait time and uncertainty as to whether the error will be recovered at all.
- **subcode 2**, which can contain additional information (value is not zero). Subcode 2 has a *decima*/value. In the event of an error (subcode 1 is not zero), there are no rules regarding the use of subcode 2. The value of subcode 2 may be zero, 1 or 2 if no error has occurred.  
Subcode 2 with the value 1 indicates that the requested function was already available before the command was issued. Subcode 2 with the value 2 indicates an exception situation and should be classified as a warning.

Command return codes can only be evaluated with SDF-P resources in S procedures and dialog blocks (see the "SDF-P" manual [34]). For information on evaluation see also the descriptions of the IF-BLOCK-ERROR command and of the builtin functions MAINCODE, SUBCODE1 and SUBCODE2 in the [section "Builtin functions"](#).

---

## Representation of command return codes

Command return codes are represented in tabular form in the order: subcode 2, subcode 1, maincode, meaning. A subcode 2 with the value zero (i.e. no additional information present) is not listed in the table. If messages are guaranteed in a table for a specific command return code, the heading “Meaning” is supplemented by “/Guaranteed messages”, and the message codes of the guaranteed messages are given after the meaning. The user can output the meanings of these message codes with the HELP-MSG command.

### *Example*

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command terminated without errors
1	32	CMD0500	Incorrect syntax description in current syntax file Guaranteed message: CMD0500
	64	CMD0554	Command execution not successful. Guaranteed message: CMD0300, CMD0302, CMD0490, CMD0508, CMD0509, CMD0552, CMD0554, CMD0555, CMD0579

### 1.2.7.2 General command return codes

Command return codes which a BS2000 command may pass upon execution are part of the respective command descriptions. The table below contains general command return codes that are automatically passed by SDF if

- SDF senses an error prior to command execution (e.g. syntax error)
- the command cannot be executed
- the command, i.e. the execution module itself, does not pass a command return code. In this case, the command description does not contain any specific command return codes.

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	0	CMD0002	Command executed with warning <sup>4)</sup>
1	0	CMD0026	Command no longer supported
2	0	CMD0093	Procedure ended in test mode <sup>1)</sup>
2	0	CMD0201	End of file reached <sup>1)</sup>
2	0	CMD0214	End of program <sup>3)</sup>
	1	CMD0211	SDF transfer area too small
	1	CMD0202	Syntax error <sup>5) 6)</sup>
	1	CMD0205	SPIN-OFF <sup>1) 2)</sup>
	1	CMD2201	Internal parameter error
	2	CMD0200	Command presently not available
	2	CMD2202	Subsystem not defined
	3	CMD2203	Installation error
	32	CMD0221	Internal SDF error
	32	CMD2009	Error during output to variables
	32	IMO9101	Internal error in IMON-GPN
	64	CMD0216	Requisite privilege missing
	64	IMO9100	Installation unit, version or logical name not found, etc.; the cause can be found in the SYSOUT message
	65	CMD2241	Subsystem not loaded
	66	CMD2242	Subsystem not connected
	128	CMD2280	Subsystem not available for a short period

	129	CMD2281	Subsystem not available for a long period
	130	CMD2282	Subsystem not available for an indefinite period
	130	NBR0748	After /SHUTDOWN, the only command that can be entered at the console is /SHOW-PENDING-MSG

- 1) Command return codes CMD0093, CMD0201 and CMD0205 are not possible if the command is issued via the CMD macro.
- 2) Command return code CMD0205 is passed if spin-off was initiated. Example: end of program with TERM macro call with UNIT=STEP, and no command return code has been set with the CMDRC macro call during the program run.
- 3) Command return code CMD0214 cannot be passed to the calling program by the CMD macro because the program has been terminated by CMD macro execution.
- 4) Command return code CMD0002 is passed by SDF if a command triggers spin-off despite error-free execution. This compatibly supports the previous spin-off behavior of commands (and thus error handling in non-S and ENTER procedures). In S procedures in which ERROR-MECHANISM=\*BY-RETURNCODE applies (see the SET-/MODIFY-PROCEDURE-OPTIONS command), error recovery is not initiated automatically since the related subcode 1 has the value zero.
- 5) Command return code CMD0202 is passed by SDF if a command does not initiate spin-off on incorrect execution. CMD0202 indicates syntactical and semantic errors detected during command execution. This compatibly supports the previous spinoff behavior of commands (and thus error handling in non-S and ENTER procedures). In S procedures in which ERROR-MECHANISM=\*BY-RETURNCODE applies (see the SET-/MODIFY-PROCEDURE-OPTIONS command), error recovery is initiated since the related subcode 1 has a value other than zero.
- 6) Command return code CMD0202 is passed by SDF from the execution module for both syntactical and semantically errors.

#### *Notes*

- In user programs the CMDRC macro call can be used to set a command return code. This return code is retained up to the next CMDRC macro call. On program termination the current command return code from the program is passed to the caller and triggers error recovery in S procedures for subcode 1 with a value other than zero if ERROR-MECHANISM=\*BY-RETURNCODE was specified (see the SET-/MODIFY-PROCEDURE-OPTIONS command).
- Return codes set within the program can be evaluated like command return codes after each statement (see the BEGIN-BLOCK command in [section "Builtin functions"](#)).

## 1.2.8 Conditional expressions (job variables)

A conditional expression is used to render the processing of commands ADD-CJC-ACTION, SKIP-COMMANDS or WAIT-EVENT dependent on job variable values. A conditional expression may be “true” or “false”. It consists of one or more relational expressions <relation.expr>, which have the following structure. Alternative expressions are separated by “/”; freely selectable specifications are enclosed in square brackets. The use of special job variables in conditional expressions is permitted only with the SKIP-COMMANDS command.

<relation.expr>	::=	(<term> <comparative-op> <term>)											
<term>	::=	<jvid> / <jv-substring-def> / <const>											
<comparative-op>	::=	<	/	>	/	=	/	<=	/	>=	/	<>	/
		LT	/	GT	/	EQ	/	LE	/	GE	/	NE	
<jvid>	::=	<jvname> / <*jvlink> / <#jvname> / <special-jvname> As CJC compares at most 64 bytes, <jvid> is equivalent to specifying (<jvid>,1,64).											
<jvname>	::=	Name of a permanent user job variable											
<*jvlink>	::=	Link name of a user job variable with leading asterisk(*)											
<#jvname>	::=	Name of a temporary user job variable											
<special-jvname>	::=	Name of a special job variable without a catalog ID, but with the user ID SYSJV specified											
<jv-substring-def>	::=	(<jvid> [, [<start>] [, <length>]])											
<start>	::=	<integer 1..256>									Default value = 1		
<length>	::=	<integer 1..64> (<start> + <length> <= 257)									Default value = 64		
<const>	::=	<c-string 1..64> / <x-string 1..128> for example:  C'HALLO' or 'HALLO' or X'00FF' or X'0FF'											

### Note

If required ACS replaces the alias of a JV specified in <jv-name> by its real path name (in accordance with the alias catalog entry).

The operators LT, GT, EQ, LE, GE and NE must be separated by a blank from constants, JV names or link names. It should be noted in particular that uppercase and lowercase letters are retained in conditional expressions.

Complex conditional expressions are formed by combining relational expressions with the help of logical operators:

<cond.expr>	::=	(<relation.expr> <logical.op> <relation.expr> / <cond.expr> <logical.op> <cond.expr> / NOT <cond.expr>					
<logical.op>	::=	AND	/	OR	/	XOR	
		logical and		logical or		exclusive or	

---

## Example

```
(JV1=C'START')  
  
((JV2=C'O.K.') AND (*LINK<=C'12'))  
  
(((JV4,10,3)=C'NEU') OR (#TEMP.JV=C'Y') AND (*LINK2=X'00'))
```

## Note

A conditional expression is evaluated “from the lowest to the highest level” within the parentheses. At the same level within the parentheses, the logical operations are performed in the following order:

1. NOT
2. AND
3. OR
4. XOR

The following expression, for instance,

```
(NOT (JV1=C'ABC') OR (JV2=C'Z') AND (JV3<>JV4))
```

is evaluated as if it had been expressed as follows

```
((NOT (JV1=C'ABC')) OR ((JV2=C'Z') AND (JV3<>JV4)))
```

When comparing job variable values, a few special aspects have to be taken into account:

- The evaluation of relational expressions proceeds by byte from left to right. The result of a comparison is determined by the EBCDIC bit pattern for the given values. Thus, for example, the printable digits 0 to 9 (X'F0' to X'F9') are “greater” than the letters A ... Z (X'C1' ... X'E9'), and uppercase letters are greater than lowercase letters.
- If the comparison value lies completely outside the defined range of a job variable or the job variable is empty (e. g. after declaration), the results of comparison are “false” in every case, even if the test was for “not equal” (<>). As a result, the WAIT-EVENT command, for example, will always switch to wait state in these instances; it will then recognize if the required JV range is written and defined at a later point.
- If the reference value lies partly inside the defined range of a JV, its length is reduced to the currently defined part of the JV. Example: If the job variable X contains the value C'123456', the substring (X,3,8) is evaluated as if it was (X,3,4). Therefore, the comparison (X,3,8) = C'3456' will have the result “equal”, despite the fact that a comparison between an 8 byte string and a 4 byte value may appear syntactically impossible.

## Example

The following expressions are “true”

```
C' ' < C'A'  
C'a' < C'A'           X'81' < X'C1'  
C'A' < C'B'           X'0123' < X'0124'  
C'B' < C'BB'          X'C1' < X'C100'  
C'GUTEN ABEND' < C'GUTEN MORGEN'  
C'ZZZZZZZZ' < C'0'      (!)      X'F0F0F0F0' < X'F1'  
C'8' < C'9'  
C'899999999' < C'9'      (!)      X'3FFF' < C' '
```

The response to the following queries is “false”.

```
(IN)      CALL-PROC PROC.JV  
(IN)      /BEG-PROC LOG=*ALL  
(IN)      /CRE-JV JV=JV1  
(IN)      /SKIP-COMMAND TO-LABEL=END,IF=JV(COND=((JV1,11,1) NE '2'))  
(OUT)     % CJC0011 SKIP-COMMANDS: CONDITION = FALSE  
(IN)      /MOD-JV JV=(JV-NAME=JV1,POS=1,LENGTH=5),SET-VALUE=C'12345'  
(IN)      /SKIP-COMMAND TO-LABEL=END,IF=JV(COND=((JV1,6,2) EQ 'A1'))  
(OUT)     % CJC0011 SKIP-COMMANDS: CONDITION = FALSE  
(IN)      /SKIP-COMMAND TO-LABEL=END,IF=JV(COND=((JV1,6,2) NE 'A1'))  
(OUT)     % CJC0011 SKIP-COMMANDS: CONDITION = FALSE  
(IN)      /.END END-PROC
```

A conditional expression will be rejected in the following cases:

- A JV to which reference is made cannot be accessed (catalog destroyed).
- A JV to which reference is made is not present in the specified catalog.
- The user does not have authorization to access a password-protected or nonshareable JV.

---

## 1.2.9 System files

The (standard) file names SYSDTA, SYSSTMT, SYSCMD, SYSIPT, SYSLST, SYSLST01, SYSLST02, ..., SYSLST99, SYSOPT and SYSOUT designate (system) files used by the operating system for data and command input to the operating system and for data output by the operating system. These files are created in each case by the task and initially designate (primary) specified input or output areas.

Users may cancel the primary assignment and assign their own cataloged files or complex S variables (when the SDF-P software product is used) to the (standard) file names.

The following **system files** are available to a job for **input**:

- SYSCMD** Commands given by users to control the execution of their jobs are expected from SYSCMD. During the processing of the commands, i.e. in command mode (system mode), SYSCMD is active.
- SYSDTA** The system file SYSDTA is used for the input of input data, i.e. data, parameters and statements, which a program reads in without the SDF interface (see the CMDRST or RDATA macro in the “Executive Macros” manual [22]). SYSDTA is active the moment a program begins execution, i.e. in program mode.
- SYSIPT** This system file is only still available for reasons of compatibility and is consequently no longer described.
- SYSSTMT** This system file is used for the input of statements to programs. The statements must be defined in a syntax file (see the “SDF-A” manual [33]).  
The allocation made for the system file SYSDTA also applies for system file SYSSTMT. The continuation lines, continuation characters and comments used when entering SYSSTMT statements must comply with the rules for SYSCMD command entry.

The following **system files** are available to a job for **output**:

- SYSOUT** The system directs logging messages and error messages arising during the currently executing job to SYSOUT. Utility routines and compilers also use SYSOUT in this way.  
File name on primary allocation: *S.OUT.tsn.yyyy-mm-dd.hhmmss.nnnn*  
If the system parameter SSMMILOG=Y is set during allocation to a PLAM library member then the output records are also written to the file *S.OUT.lib.elem.tsn.nnnn*.
- SYSLST** In general larger data sets, such as memory dumps and listings generated by utility routines and compilers, are written to the system file SYSLST. In addition, SYSLST may contain records from the SYSOUT system file, if desired (specify LOGGING in the SET-LOGON-PARAMETERS or MODIFY-JOB-OPTIONS command).  
File name on primary allocation: *S.LST.tsn.yyyy-mm-dd.hhmmss.nnnn*  
If the system parameter SSMMILOG=Y is set during allocation to a PLAM library member then the output records are also written to the file *S.LST.lib.elem.tsn.nnnn*.

SYSLST01, SYSLST02, ..., SYSLST99

Unlike the system file SYSLST, these system files do not have their own EAM area for storing output data. They are used for buffering and are operative only when cataloged files are assigned to them.

- SYSOPT** This system file is only still available for reasons of compatibility and is consequently no longer described.

---

Meaning of the file name parts:

tsn	TSN of the task (4 characters)
yyyy-mm-dd	File creation date, where mm=month, dd=day of the month, yyyy=4-digit year specification
hhmmss	File creation time, where hh=hours, mm=minutes and ss=seconds
nnnn	4-digit counter
lib	First 7 characters of the PLAM library
elem	First 7 characters of the element name

The system files for output are normally output when a job is ended (EXIT-JOB or LOGOFF command) if no cataloged file or a complex S variable has been assigned to them and output was not suppressed on job termination. Depending on the setting of the system parameter SSMOUT, the files are output to printer or sent by email. If they cannot be sent by email, they are output to printer. Before the job has been completed, the system file can be output to printer using the PRINT-DOCUMENT command or sent by email using the MAIL-FILE command. Using the COPY-SYSTEM-FILE command, the system file SYSLST can also be copied to a file if SYSLST has the primary assignment.

In the PRINT-DOCUMENT and DELETE-SYSTEM-FILE commands, the (standard) file names SYSOUT and SYSLST may also be specified when cataloged files or complex S variables have been assigned to them. SYSLST and SYSOUT are rejected in the MAIL-FILE command if an S variable is assigned to them.

## Accessing system files

With the help of system files, user programs can input and output data. The system file SYSCMD represents an exception; it is accessible only to the system via privileged macros. The following table lists the macros and statements required to access system files.

System file	Macros that access system files	Language statements referring to system files:			
	Assembler	COBOL	FORTRAN	PL/I	RPG3
SYSCMD	privileged	-	-	-	-
SYSDTA	RDATA	ACCEPT dataname FROM TERMINAL	READ (1,... READ (5,... READ (97,...	GET without FILE option	(DEVICE=) READER, no explicit statement
SYSSTMT	CMDRST <sup>1)</sup> RDSTMT	1)	1)	-	-
SYSIPT <sup>2)</sup>	-	-	-	-	-
SYSOUT	WROUT	DISPLAY dataname UPON TERMINAL	WRITE (2,...	DISPLAY dataname (without REPLY)	DSPLY
SYSLST	WRLST	DISPLAY dataname; DISPLAY dataname UPON SYSLST	WRITE (6,... WRITE (99,...	PUT without FILE option	(DEVICE=) PRINTER, no explicit statement
SYSOPT <sup>2)</sup>	-	-	-	-	-

Table 5: Accessing system files

- 1) There exists a High-Level Languages program interface for the programming languages C, COBOL and FORTRAN. The functions of the most important SDF macros (such as RDSTMT, CORSTMT and TRSTMT) are supported in function calls (see the “SDF-A” manual [33]).
- 2) The system files SYSIPT and SYSOPT are only still available for reasons of compatibility.

## Primary assignment and redirection of system files

In general, a specific assignment for the system files is preset. With the help of commands, this primary assignment can be changed; the following table provides an overview of this. Examples may be found in the descriptions of the commands involved.

System file	Primary assignment	Further assignments	Commands for changing the assignment
SYSCMD	in dialog: terminal  in batch: spooling file (S.IN.), spooled in via magnetic tape device or ENTER file.	cataloged disk file (SAM/ISAM), library member or complex S variable	CALL-PROCEDURE: assignment to a cataloged file, a library member or a complex S variable End of procedure: assignment in effect when the last procedure was exited.
SYSDTA	same as SYSCMD primary assignment	cataloged file (SAM/ISAM), library member, complex S variable	ASSIGN-SYSDTA: assignment to a cataloged file, to a library member, to a complex S variable, to SYSCMD or back to the primary assignment. End of procedure: assignment in effect when the last procedure was exited.
SYSSTMT	same as SYSDTA primary assignment	same as SYSDTA	same as SYSDTA
SYSIPT	This system file is still provided for reasons of compatibility.	-	-
SYSOUT	in dialog: terminal  in batch: temporary spoolout file (S.OUT.) which at the end of the job is printed out or sent by email and then deleted	cataloged file (SAM/ISAM), library member or complex S variable; no automatic printout or transfer by email	ASSIGN-SYSOUT: assignment to a cataloged file, to a library member, to a complex S variable, to SYSCMD or back to the primary assignment. End of procedure: assignment in effect when the last procedure was exited.
SYSLST	temporary spoolout file (S.LST.) which at the end of the job is printed out and then deleted (created only when needed)	cataloged file (SAM), library member or complex S variable; no automatic printout or transfer by email	ASSIGN-SYSLST: assignment to a cataloged file, to a library member, to a complex S variable, to SYSCMD or back to the primary assignment. End of procedure: assignment in effect when the last procedure was exited.

System file	Primary assignment	Further assignments	Commands for changing the assignment
SYSLST01 ... SYSLST99	current assignment of SYSLST	same as SYSLST; also possible between each other	same as SYSLST
SYSOPT	This system file is still provided for reasons of compatibility.	-	-

Table 6: Primary assignment and redirection of system files

Termination of the procedure and the resultant change in assignment can be explicitly effected by means of an EXIT-PROCEDURE, CANCEL-PROCEDURE or END-PROCEDURE command (only non-S procedures). A procedure is implicitly terminated on reaching end of file (EOF condition).

---

## 1.2.10 Job switches

Every job in BS2000 has available to it job-specific switches, which can only be changed or queried when that job is executing (note in this regard: user switches are user-ID-specific, see the MODIFY-USER-SWITCHES command). There are 32 job switches (numbered 0 to 31) available per job. Each of these switches may be given a value of 0 or 1. At the beginning of the job, all job switches are cleared (setting: 0). While the job is executing, these switches can be changed:

- **explicitly**, using the MODIFY-JOB-SWITCHES command
- **implicitly**, using the SET-JOB-STEP command (resets switches 16 to 31) or using utility routines (software products)

At the end of the job, all job switches are cleared again.

The following table shows which software products normally use job switches:

Software product	Job switches
ARCHIVE	30, 31
BCAMDEF	1, 4, 5, 20, 31
DAMP	5, 30
EDT	4 to 7
EDTU	4 to 8
FMS	5
LMS (ISP)	1, 4, 9
LMS (SDF)	4, 31
PRSERVE	0, 2, 3
SDF-A	15
SHOW-FILE	5
TSOSLNK	4

Table 7: Job switches used by software products

The following applies here:

Setting switch 4 causes the BLS0500 message from the binder loader to be suppressed.

---

## ARCHIVE

Information regarding the course of the process may be obtained from the setting of the switches that ARCHIVE sets during/after the run.

*Switch 30 set by ARCHIVE: Warning message in procedures*

Switch 30 is set by ARCHIVE when the ARCHIVE statement was executed but a warning message was issued.

*Switch 31 set by ARCHIVE: Errors in procedures*

Switch 31 is set by ARCHIVE when an error was detected but the ARCHIVE statement was nevertheless executed.

## BCAMDEF

Switches 0, 4, 5, 31 are used:

Within the BCAMDEF procedure, switches 0, 4, 5, 31 are set and then cleared again.

## DAMP

*Switch 5 set for DAMP*

Before the DAMP program is called, task switch 5 must be set in the procedure.

If, in procedure mode, a DAMP statement is followed by a system command that is not permitted at the DAMP program level, DAMP switches from procedure mode to interactive mode and resets task switch 5. The last DAMP output screen is then displayed on the screen. In batch mode, a system command which is not permitted causes the job to be aborted.

*Switch 30 set for DAMP*

Suppresses a dump (user dump) if DAMP terminates in case of a program or system error:

- In interactive mode, a message is issued asking whether a dump should be generated.
- In batch mode, no dump is generated.

## EDT

*Switch 4 set for EDT: Suppress start and end messages*

Setting this switch causes the message BLS0500 following the loading of EDT to be suppressed. When EDT is terminated, message EDT8000 and, where applicable, messages EDT0900 and EDT0904 are also suppressed. In batch mode, the message @LOG NONE is suppressed.

*Switch 5 set for EDT: Activate edit-only mode*

When this switch is set, EDT reads via RDATA and not via WRTRD, i.e. EDT operates in edit-only mode.

---

*Switch 6 set for EDT: 160 print positions per line*

If this switch is set, EDT writes, to SYSLST, 160 print positions in one line, and writes any remainder in the following record. Normally, EDT uses 132 print positions and writes any remainder in the following record.

*Switch 7 set for EDT: Excess memory space is not released*

Setting switch 7 prevents the automatic release by EDT of excess initially allocated memory space that was defined as free and therefore redundant during its processing.

Normally, EDT releases unoccupied memory space. Since this switch is checked during the EDT run, the switch change becomes effective immediately

## **EDTU**

The switches 4 to 7 are evaluated as in EDT.

*Switch 8 set for EDTU set: Redirect outputs to SYSOUT*

Setting switch 8 redirects the messages and outputs of a series of statements (e.g. @STATUS) going to SYSLST in batch mode to SYSOUT.

## **FMS**

Switch 5 set for FMS: FMS suppresses interactive queries

## **LMS**

*Switch 1 set for LMS (ISP only): Alternative input of statements*

In interactive mode, unless otherwise specified, statements to LMS are read from the interactive terminal by means of the WRTRD macro. When switch 1 is set, statements are read with the RDATA macro, from the file assigned to the SYSDTA system file.

*Switch 4 set for LMS: Suppress start and end messages*

Setting switch 4 causes the LMS start and end messages to be suppressed. At the same time, the runtime log of LMS is reduced to the minimum.

*Switch 9 set for LMS (ISP only): Request additional memory space*

Setting switch 9 makes it possible to process up to 1200 records of different length in one comparison, and to continuously sort larger directories with the TOC function.

*Switch 31 set for LMS: Set test condition for diagnostic purposes (see the "LMS" manual [21]).*

---

## PRSERVE

*Switch 0 set for PRSERVE: Suppress output of the character frame*

Setting switch 0 causes output of the secondary statement indicator (character frame) to SYSOUT to be suppressed. However, this is unrelated to the screen display, produced by means of the DISPLAY statement.

*Switch 2 set for PRSERVE: Suppress output of the LOOP record*

Setting switch 2 causes the output of the LOOP record (following a CHECK statement) in interactive mode to be suppressed.

*Switch 3 set for PRSERVE: Suppress information regarding the current mode of operation*

Unless otherwise specified, the user receives from PRSERVE an error message and information regarding the currently active operational status after an incorrect PRSERVE statement has been entered. By setting switch 3, output of the information is suppressed.

## SDF-A

*Switch 15 set for SDF-A: Process syntax files in the old format*

Syntax files in the old format (supported by SDF V1.4) are processed without being automatically converted into the new format. However, this means that only the syntax and functionality of SDF-A V1.0D are available.

**i** By default, reference syntax files are not assigned, i.e. \*NO applies rather than \*CURRENT. Only reference syntax files in the old format can be explicitly assigned. It is not possible to generate new system syntax files or output syntax file objects.

## TSOSLNK

*Switch 4 set for TSOSLNK: Suppress page feed*

Setting switch 4 causes all page feeds to be omitted when the linkage editor listing is output on SYSLST.

---

### 1.2.11 Device type table

The manual „System Installation“ [46] contains a device type table with all codes which are required for the BS2000 operating system. For information on which devices are currently supported, please refer to the Release Notice.

## Volume type table

Volume type code	Volume type	Meaning
A9	NETSTOR	Net-Storage volume in DMS commands and macros(there is no device type code for this)
B4	T6250 / T9G	(Emulated) long tape with recording density of 6250 bpi (CD, DVD or file) (device type code: E8)
B7	TAPE-C5	128-track tape cartridge (device type code: C5)
BB	TAPE-C3	36-track tape cartridge (device type code: C4)
BC	TAPE-C4	36-track tape cartridge, compressed (device type code: C4)
BF	TAPE-C6	256-track tape cartridge (device type code: C6)
C7	TAPE-U4E	896-track tape cartridge, data is written in encrypted form, see the "MAREN" manual [23] (device type code: CE)
C8	TAPE-U5E	1280-track tape cartridge, data is written in encrypted form, see the "MAREN" manual [23] (device type code: CF)
C9	TAPE-U6E	2176-track tape cartridge, data is written in encrypted form, see the "MAREN" manual [23] (device type code: D1)
CA	TAPE-U7E	3584-track tape cartridge, data is written in encrypted form, see the "MAREN" manual [23] (device type code: D2)
CB	TAPE-U1	384-track tape cartridge (device type code: CB)
CC	TAPE-U2	512-track tape cartridge (device type code: CC)
CD	TAPE-U3	704-track tape cartridge (device type code: CD)
CE	TAPE-U4	896-track tape cartridge, data is written in unencrypted form, see the "MAREN" manual" [23]. (device type code: CE)
CF	TAPE-U5	1280-track tape cartridge, data is written in unencrypted form, see the "MAREN" manual" [23]. (device type code: CF)
D1	TAPE-U6	2176-track tape cartridge, data is written in unencrypted form, see the "MAREN" manual" [23]. (device type code: D1)
D2	TAPE-U7	3584-track tape cartridge, data is written in unencrypted form, see the "MAREN" manual" [23]. (device type code: D2)

Table 8: Assignment of volume type code to volume type

---

### 1.2.12 DMS volume types

During file processing, DMS requests the required volumes using the VSN and device type in device management. Strictly speaking, the device type which is used in DMS specifies the volume type.

For a requested volume type the device management provides a device of the appropriate device type. In the case of tapes/MTCs, the volume is mounted on the device provided. In the case of disks, the volume is already “mounted” on the device (here the volume and device type are identical).

---

### 1.2.12.1 Volume type for Net-Storage

Net-Storage is made available to the BS2000 system by means of one or more Net-Storage volumes which extend a subset. While the Net-Storage volume on the net server corresponds to a directory in the file system released for BS2000, from the BS2000 viewpoint it is a disk.

In contrast to “normal” BS2000 disks, in BS2000 no device exists on which a Net-Storage volume could be mounted. Consequently, Net-Storage volumes are not generated.

The volume type NETSTOR (internal type A9) must be specified in the DEVICE-TYPE (or TYPE) operand for a Net-Storage volume.

### 1.2.12.2 Device types for DMS tape processing

When tape files are processed, device requests are made via the volume type specification in the DEVICE-TYPE operand. Device management then supplies a device that supports the specified volume type. The following values can be specified in the DEVICE-TYPE (or TYPE) operand:

Command	Permissible specifications for the volume type in the DEVICE-TYPE or TYPE operand:		
	TAPE T6250	WORK	TAPE-C3/C4/ U1/U2/U3/U4/U4E/U5/U5E/U6/U7/U7E
CREATE-FILE	X	X	X
CREATE-FILE-GENERATION	X	X	X
CREATE-TAPE-SET	X		X
EXTEND-TAPE-SET	X		X
MODIFY-FILE-ATTRIBUTES	X		X
MODIFY-FILE-GENERATION-SUPPORT	X		X
IMPORT-FILE	X		X
SECURE-RESOURCE-ALLOCATION	X	X	X

Table 9: Device types for DMS tape processing

The overview below indicates which devices (see device table for device types) can be assigned to the various volume types.

#### *Volume types for magnetic tape devices*

- T6250      9-track tape devices which support a recording density of 6250 bpi (bytes per inch); (T9G is a synonymous volume type)
- TAPE      9-track tape devices independent of the supported recording density: same device types as for T6250
- WORK      9-track tape devices independent of the supported recording density: same device types as for T6250 A device on which a work tape is mounted is assigned (assignment of a VSN can only be performed by the operator). A work tape is not normally archived, and it is therefore a good idea to only use it for output data that is no longer required after processing. *No* owner entered the VOL1 label, i.e. the volume is not protected against unauthorized access.

---

*Volume types of magnetic tape cartridge devices (MTC)*

TAPE-C3	MTC (device type 3590E) 36-track, uncompressed recording
TAPE-C4	MTC (device type 3590E) 36-track, compressed recording MTC (device type 3590E) 128-track, emulated
TAPE-U1	MTC (device type LTO-U1) 384-track
TAPE-U2	MTC (device type LTO-U2) 512-track
TAPE-U3	MTC (device type LTO-3) 704-track
TAPE-U4	MTC (device type LTO-U4) 896-track, Data is written in unencrypted form, (see the “MAREN” manual [23])
TAPE-U4E	MTC (device type LTO-U4E) 896-track, Data is written in encrypted form, (see the “MAREN” manual [23])
TAPE-U5	MTC (device type LTO-U5) 1280-track, Data is written in unencrypted form, (see the “MAREN” manual [23])
TAPE-U5E	MTC (device type LTO-U5E) 1280-track, Data is written in encrypted form, (see the “MAREN” manual [23])
TAPE-U6	MTC (device type LTO-U6) 2176-track, Data is written in unencrypted form, (see the “MAREN” manual [23])
TAPE-U6E	MTC (device type LTO-U6) 2176-track, Data is written in encrypted form, (see the “MAREN” manual [23])
TAPE-U7	MTC (device type LTO-U7) 3584-track, Data is written in unencrypted form, (see the “MAREN” manual [23])
TAPE-U7E	MTC (device type LTO-U7) 3584-track, Data is written in unencrypted form, (see the “MAREN” manual [23])

An overview of the devices which are supported by the current version of BS2000 operating system is contained in the device table in the “System Installation” manual [46]. For information on which devices are currently supported, please refer to the Release Notice.

---

### 1.2.13 Information services of device management: Meanings of the output values of SHOW commands

The NDM information services provide the operator with certain output fields appropriate to the specified command and the desired scope of information. The various output formats are described with the command concerned. The meaning of the output fields is described below in alphabetical order.

Information is supplied for the following commands:

<b>Command</b>	<b>Abbreviated name used in the table</b>
SHOW-DEVICE-CONFIGURATION	SH-DEV-CONF
SHOW-DEVICE-DEPOT	SH-DEV-DEPOT
SHOW-DEVICE-STATUS	SH-DEV-STA
SHOW-DISK-DEFAULTS	SH-DISK-DEF
SHOW-DISK-STATUS	SH-DISK
SHOW-MOUNT-PARAMETER	SH-MOUNT
SHOW-RESOURCE-ALLOCATION	SH-RES
SHOW-RESOURCE-REQUESTS	SH-RES-REQ
SHOW-TAPE-STATUS	SH-TAPE

Keyword	Meaning	Used in command																				
ACCESS	<p>WRITE = Read and write access to the disk is permitted.</p> <p>ALL = The disk is not yet allocated. Only when the disk is allocated is ACCESS=WRITE set.</p>	SH-DISK (INF=PAR)																				
ACTION	<p>Shows which (re)mount operation is being performed for a volume by volume monitoring. This can have been initiated by one of the following actions:</p> <ul style="list-style-type: none"> <li>• operator intervention(inadvertently dismounting a volume that is in use)</li> <li>• commands (DETACH-DEVICE, CHANGE-DISK-MOUNT ACTION=MOVE...)</li> <li>• Device Error Recovery (DER) e.g. with INOP</li> <li>• user request (mount message for volumes that have not yet been mounted)</li> </ul> <p>The following states are possible:</p> <table border="1" data-bbox="326 804 1313 1793"> <tbody> <tr> <td data-bbox="326 804 521 905">CANCELLED:</td> <td data-bbox="521 804 1313 905">The tape or disk is permanently locked; the interrupt is not cleared.</td> </tr> <tr> <td data-bbox="326 905 521 1047">DISMOUNT:</td> <td data-bbox="521 905 1313 1047">A remount message has not been received for the same volume on another device, or a remount, mount or premount message has not been received for another volume on the same device.</td> </tr> <tr> <td data-bbox="326 1047 521 1110">INOP:</td> <td data-bbox="521 1047 1313 1110">The device is temporarily unavailable (inoperable).</td> </tr> <tr> <td data-bbox="326 1110 521 1215">MOUNT:</td> <td data-bbox="521 1110 1313 1215">The response to a mount message is not yet sent for the relevant volume.</td> </tr> <tr> <td data-bbox="326 1215 521 1283">NO ACTION:</td> <td data-bbox="521 1215 1313 1283">No interrupt.</td> </tr> <tr> <td data-bbox="326 1283 521 1459">NO DEVICE:</td> <td data-bbox="521 1283 1313 1459">There no longer exists a device allocation for a volume owing to a previous reconfiguration command (DETACH-DEVICE, REMOVE-DEVICE-CONFIGURATION); processing of the volume is interrupted until a standby device is provided.</td> </tr> <tr> <td data-bbox="326 1459 521 1522">POSITION:</td> <td data-bbox="521 1459 1313 1522">The tape in use is being repositioned.</td> </tr> <tr> <td data-bbox="326 1522 521 1627">PREMOUNT:</td> <td data-bbox="521 1522 1313 1627">The response to a PREMOUNT message has not been received for the relevant volume.</td> </tr> <tr> <td data-bbox="326 1627 521 1732">RECOVER:</td> <td data-bbox="521 1627 1313 1732">An interrupt procedure which is not specified in more detail is being carried out for the volume in use.</td> </tr> <tr> <td data-bbox="326 1732 521 1793">REMOUNT:</td> <td data-bbox="521 1732 1313 1793">The volume is being remounted.</td> </tr> </tbody> </table>	CANCELLED:	The tape or disk is permanently locked; the interrupt is not cleared.	DISMOUNT:	A remount message has not been received for the same volume on another device, or a remount, mount or premount message has not been received for another volume on the same device.	INOP:	The device is temporarily unavailable (inoperable).	MOUNT:	The response to a mount message is not yet sent for the relevant volume.	NO ACTION:	No interrupt.	NO DEVICE:	There no longer exists a device allocation for a volume owing to a previous reconfiguration command (DETACH-DEVICE, REMOVE-DEVICE-CONFIGURATION); processing of the volume is interrupted until a standby device is provided.	POSITION:	The tape in use is being repositioned.	PREMOUNT:	The response to a PREMOUNT message has not been received for the relevant volume.	RECOVER:	An interrupt procedure which is not specified in more detail is being carried out for the volume in use.	REMOUNT:	The volume is being remounted.	SH-RES SH-DEV- STA SH-DISK SH-TAPE
CANCELLED:	The tape or disk is permanently locked; the interrupt is not cleared.																					
DISMOUNT:	A remount message has not been received for the same volume on another device, or a remount, mount or premount message has not been received for another volume on the same device.																					
INOP:	The device is temporarily unavailable (inoperable).																					
MOUNT:	The response to a mount message is not yet sent for the relevant volume.																					
NO ACTION:	No interrupt.																					
NO DEVICE:	There no longer exists a device allocation for a volume owing to a previous reconfiguration command (DETACH-DEVICE, REMOVE-DEVICE-CONFIGURATION); processing of the volume is interrupted until a standby device is provided.																					
POSITION:	The tape in use is being repositioned.																					
PREMOUNT:	The response to a PREMOUNT message has not been received for the relevant volume.																					
RECOVER:	An interrupt procedure which is not specified in more detail is being carried out for the volume in use.																					
REMOUNT:	The volume is being remounted.																					

	<table border="1"> <tr> <td>SVL-UPDATE:</td> <td>The system allocation log is being stored on disk.</td> </tr> <tr> <td>SNATCHED:</td> <td>The allocation which was passed to another task has been revoked by the device owner.</td> </tr> <tr> <td>UNLOCK:</td> <td>An UNLOCK job for the removal of a system ID stored in the SVL is being executed.</td> </tr> <tr> <td>WP-MISSING:</td> <td>The write-enable ring for a tape is to be mounted or the write protection for a disk is to be canceled.</td> </tr> </table>	SVL-UPDATE:	The system allocation log is being stored on disk.	SNATCHED:	The allocation which was passed to another task has been revoked by the device owner.	UNLOCK:	An UNLOCK job for the removal of a system ID stored in the SVL is being executed.	WP-MISSING:	The write-enable ring for a tape is to be mounted or the write protection for a disk is to be canceled.	
SVL-UPDATE:	The system allocation log is being stored on disk.									
SNATCHED:	The allocation which was passed to another task has been revoked by the device owner.									
UNLOCK:	An UNLOCK job for the removal of a system ID stored in the SVL is being executed.									
WP-MISSING:	The write-enable ring for a tape is to be mounted or the write protection for a disk is to be canceled.									
ADMISSION-TIME	Date and time of day at which the task entered the secure queue (yyyy-mm-dd hh:mm:ss)	SH-RES-REQ								
ALIAS1 ALIAS2 ALIAS3 ... ALIAS7	Shows the mnemonic alias name of a PAV device in the format <mnemonic>-xy. Up to three alias names are possible. The status indicator xy means: x = P for “preferred” devices, F for FastDPAV devices or ‘-’ for other devices y = A for “active”, R for “ready” or N for “not ready”	SH-DEV-CONF (INF=PAV)								
ALLOC	Indicates whether the disk is allocated. <ul style="list-style-type: none"><li>• YES: Disk is allocated.</li><li>• NO: Disk is not currently allocated.</li></ul>	SH-DISK								
ALLOCATE-TAPE	Indicates whether the system will execute the allocation of tapes already online without the support of the operator (without a mount message). <ul style="list-style-type: none"><li>• YES: Premount, mount and remount messages are answered automatically by the system, provided the tape is recognized as online.</li><li>• NO: Premount, mount and remount messages must be answered by the operator.</li></ul>	SH-MOUNT								
ASS[IGN]-TIME	For a private disk in the USE=DMS mode, this shows the time at which it is allocated or released (SH-DISK INF=PAR).  For SH-DISK-DEF, the value for ASSIGN-TIME shows the time of disk allocation or release for all disks for which this value has not been set explicitly.	SH-DISK (INF=PAR) SH-DISK-DEF								
ATT[ACH]	Number of devices in the “attached” state belonging to the device type specified in the output (independent of allocation)	SH-DEV-STA (INF=SUM)								
AVAIL	Number of devices of the device type defined in the output which are still free (available)	SH-DEV-STA (INF=SUM)								

Keyword	Meaning	Used in command
BASE	<p>Shows the mnemonic base name of a PAV device in the format &lt;mnemo-name&gt;-xy. The status indicator xy means:  x = P for “preferred” devices, F for FastDPAV devices or '-' for other devices  y = A for “active”, R for “ready” or N for “not ready”</p>	SH-DEV-CONF (INF=PAV)
CAR	<p>Shows the state of the CARTRIDGE-LOADER of the MTC devices from the point of view of BS2000. The state ascertained last is displayed. It is updated at ATTACH or during device selection.</p> <p>The device's control panel may indicate a different operating mode, e.g. because device management sets its internal state to MANUAL when dismounting the magazine, or because the magazine has not been locked after mounting.</p> <p>The following states are possible:</p> <p>AUT Automatic Mode</p> <p>MAN Manual Mode</p> <p>ON Devices of type 3590E: Device with volume stacker; the stacker is active</p> <p>OFF Devices of type 3590E: Device with volume stacker; the stacker is not active</p> <p>RAN Random Access Mode</p> <p>SEQ Sequential Access Mode</p>	SH-TAPE (INF=CAR)
CONF-STATE	<p>Configuration state of the specified device; serves as an indicator of the availability of the device. The following states are possible:</p> <p>ATTACHED:</p> <p>The device is available to the system for input/output. A distinction is made between ATT(EXplicitly) and ATT(IMplicitly).</p> <p>ATTACHED *:</p> <p>The device is attached but not assigned. The ROBAR product decides on the basis of the displayed state whether the mount request for a volume is to be permitted or rejected.</p> <p>DETACHED:</p> <p>The device is not available to the system for input/output. A distinction is made between DET(EXplicitly) and DET(IMplicitly).</p> <p>DISABLED:</p> <p>The FastDPAV alias device is not activated. It cannot be used for input/output.</p>	

Keyword	Meaning	Used in command	SH-DEV-STA SH-DEV-CONF
CTL CHPID CUU	Inner virtual connection of the device via the controller (CTL) to the channel (CHPID).	SH-DEV-CONF (INF=PATH)	
CUU	Path addresses (CHN, CTL, DVC) to a device.	SH-DEV-CONF (INF=PATH)	
DET	Number of generated devices of the specified type which are not available as they are in the configuration state "detached".	SH-DEV-CONF (INF=PATH)	
DET-P	Number of devices of the particular type which are still required by the system for user requests and which are to assume the "detached" state after their release. Reallocation of these devices is not possible.	SH-DEV-STA (INF=SUM)	
DEV-A	<p>Type of device allocation:(See VOL-A for meaning of values):</p> <p>FREE      The device is not yet allocated; it is available for allocation.</p> <p>DMS        The specified device is implicitly allocated by a DMS application on the private disk mounted on it.</p> <p>PUBLIC      The device is implicitly allocated by an active public disk mounted on it.</p> <p>PAGING    The disk is used exclusively for paging.</p> <p>DMS-PAG   The disk is used for paging and is also allocated as shareable by tasks.</p> <p>DRV        The device is explicitly allocated by an action initiated by DRV.</p>	SH-DEV-STA SH-DISK SH-TAPE	

	<p>DMS- DRV The device is implicitly allocated by a DMS application on the private disk mounted on it as a DRV disk.</p> <p>PUB- DRV The device is implicitly allocated as a DRV disk by an active public disk mounted on it.</p> <p>DRV- PAG: The device in question is implicitly allocated as a DRV disk by an active paging disk mounted on it.</p> <p>=tsn TSN of the job that exclusively allocates the device</p> <ul style="list-style-type: none"> <li>• In the case of a disk device, it was requested with SECURE-RESOURCE-ALLOCATION UNIT=... or the occupying job is using the allocated disk for a USE= SPECIAL application (PHASE=IN-USE/MOUNT)</li> <li>• In case of tape devices, the occupying task is using the allocated tape in any allocation mode (DMS, SPECIAL, WORK; PHASE=PREMOUNT/MOUNT/IN-USE).</li> <li>• For all other devices (e.g. printers), no distinction is made between USE modes.</li> </ul>	
DEV-TYPE	Device type of generation (D3480, 3590E,...) or volume type (tape processing) specified by the user for device allocation (e.g. TAPE-C4).	SH-RES SH-DEV-STA
DISABLED ALIAS	Shows the number of FastDPAV alias devices in the DISABLED state.	SH-DEV-CONF (INF=PAV)
DISK-MOUNT	Indicates whether the operator is ready to perform disk mount operations. <ul style="list-style-type: none"> <li>• YES: The operator is ready to execute disk mount requests.</li> <li>• NO: Requests for the mounting of new private disks are automatically rejected by the system.</li> </ul>	SH-MOUNT
DVC	Mnemonic device name of a specified hardware unit.	SH-DEV-CONF (INF=PATH)
ENABLED ALIAS	Shows the number of FastDPAV alias devices in the ENABLED state.	SH-DEV-CONF (INF=PAV)
FRMT	Indicates the disk format: <ul style="list-style-type: none"> <li>• 2KB: NK2 disk: the minimum transfer unit of the disk is 2KB.</li> <li>• 4KB: NK4 disk: the minimum transfer unit of the disk is 4KB.</li> </ul>	SH-DISK (INF=SYS)

Keyword	Meaning	Used in command
FPAV ALIAS CTL	Shows the mnemonic alias name of any FastDPAV alias device in format <mnemo-name>-xy. The status indicator xy means: x = F for FastDPAV devices, P for “preferred” devices or '-' for others. y = A for “active”, R for “ready” or N for “not ready”.	SH-DEV-CONF (INF=PAV)
FPAV BASE CTL	Shows the mnemonic basic name of any FastDPAV device in format <mnemo-name>-xy. The status indicator xy means: x = F for FastDPAV devices, P for “preferred” devices or '-' for others. y = A for “active”, R for “ready” or N for “not ready”.	SH-DEV-CONF (INF=PAV)
INNER CONNECTION	Describes the availability of created connections from the specified unit to all associated internal units (from CPU perspective). The following states are possible: <ul style="list-style-type: none"> <li>• INCLUDED: The connection (path) is available to the system for input/output. The WWPN of the port is also displayed for a channel of the type FC.</li> <li>• REMOVED: The path is not available to the system for input/output. A distinction is made between REM (EXplicitly) and REM (IMplicitly).</li> <li>• REM-PENDING: The path is declared unavailable by the system after end of usage.</li> </ul>	SH-DEV-CONF (INF=INNER)
LABEL	Describes the type of volume label (see SVL). The following values are possible: <ul style="list-style-type: none"> <li>• STD: The volume uses standard labels.</li> <li>• TAPE-MARK: The tape starts with a tape mark.</li> <li>• NON-STD: The label has neither of the above attributes.</li> </ul>	SH-TAPE
LOC[ATION]	Provides information on the name of a depot (eight alphanumeric characters).	SH-DEV-DEPOT SH-DEV-STA SH-MOUNT SH-RES
MAX USED	Shows the maximum number of FastDPAV alias devices simultaneously used at alias control.	SH-DEV-CONF (INF=PAV)

---

MNEM	This field contains the mnemonic name of a device as defined at generation time.	SH-RES SH-DEV-STA SH-DISK SH-TAPE SH-DEV- CONF
------	--	---

Keyword	Meaning	Used in command
NAME/ID	Provides information on the job name of the job referred to or on the user ID under which it is running.	SH-RES
OP-CTL OPERATOR- CONTROL	Specifies whether the operator wishes to be informed of new disk allocations by tasks (with the possibility of rejecting such allocation requests). The suffix "(D)" indicates that the data was taken from the DISK-DEFAULTS.	SH-DISK (INF=PAR) SH-DISK-DEF
OUTER CONNECTION	Describes the configuration state of the generated connections from the specified unit to all outer units directly connected to it (in the direction of the terminal). Possible values: see INNER CONNECTION.	SH-DEV- CONF (INF=OUTER /ALL)
PAMKEY	For disks, indicates whether use of the PAMKEY is permitted. <ul style="list-style-type: none"> <li>• YES: Use of PAMKEY is permitted.</li> <li>• NO: Use of PAMKEY is not permitted.</li> </ul>	SH-DISK (INF=SYS)
PATH	Describes the availability of a complete input/output path (from CHN via CTL to the device). <p>AVAIL: Input/output path is available.</p> <p>N.AV: Input/output path is not available.</p> <p>N.OP: Input/output path is not operational.</p>	SH-DEV- CONF (INF=PATH)
PHASE	Describes the monitoring mode for tapes and disks. The following states are possible: <p>ONLINE:</p> <p>The volume is mounted without being allocated.</p> <p>PREMOUNT:</p> <p>The state exists only for tapes. The volume is allocated; for this volume a device allocation exists for a previous or later usage. This state is initiated by:</p> <ul style="list-style-type: none"> <li>• /SECURE-RESOURCE-ALLOCATION for implicit or explicit tape reservation with device allocation</li> <li>• /ADD-FILE-LINK; exists up to OPEN time</li> <li>• CLOSE macro; exists up to release of the TFT entry</li> </ul> <p>If the tape is not yet mounted on a suitable device, the operator receives a premount request (see also ACTION).</p> <p>MOUNT:</p>	SH-DEV-STA SH-DISK SH-TAPE SH-RES

	<p>The volume is already allocated but must still be mounted by the operator.</p> <p><b>IN-USE:</b></p> <p>The volume is released for usage (except for ACTION=CANCELLED). For both of the allocation states IN-USE and PREMOUNT, volume monitoring takes place (a volume is always monitored if a valid allocation exists for it). Volume monitoring has the following functions:</p> <ul style="list-style-type: none"> <li>• it guarantees a device allocation for tapes in the PREMOUNT state;</li> <li>• it requests the operator to make a volume available again which has been allocated but is currently not accessible (INOP);</li> <li>• it instigates clearing of a NO-DEVICE state once a device of the required type becomes free;</li> <li>• it initiates automatic repositioning of tapes in the event of illegal operator intervention (e.g. unloading the wrong tape device).</li> </ul> <p><b>INVENTORY:</b></p> <p>Only for cartridge volumes in the magazine of an MTC device that can be operated in random access mode at the BS2000 system. Device management is taking stock of the cartridges in the magazine. No allocation will be made until stocktaking is complete.</p> <p><b>IN-CAR:</b></p> <p>Only for cartridge volumes in the magazine of an MTC device that can be operated in random access mode at the BS2000 system. The cartridge has been assigned to the magazine and is currently in the magazine or drive.</p> <p><b>OFF-CAR:</b></p> <p>Only for cartridge volumes in the magazine of an MTC device that can be operated in random access mode at the BS2000 system. The cartridge has been assigned to the magazine but is currently not in the magazine or drive.</p>	
PID	Device address for input/output. The PID (Physical device ID) is updated at ATTACH.	SH-DEV-CONF
PM	PATH-MASK	SH-DEV-CONF

POOL	<p>Defines the availability of a device in relation to several systems:</p> <p>NO:</p> <p>This device is only available from the home system. Access to a volume mounted there is not possible from another system. Unit record devices are only generated with this POOL attribute.</p> <p>SH: (shareable)</p> <p>This device is usually generated for multiple systems and possesses a multiprocessor connection. It offers hardware attributes suitable for the parallel use of multiple systems. Disks are generated as shareable by default.</p>	SH-DEV-STA SH-DEV-CONF
PRE-USE/ IN-USE	Specifies the number of devices of the type defined which have been reserved implicitly by volumes of the relevant phase: PREMOUNT, MOUNT, IN-USE	SH-DEV-STA (INF=SUM)
PREMOUNT-MSG	Specifies whether and how the premount message (NKVT012) for a tape volume is to be output.	SH-MOUNT
RES-BY-MN	Specifies the number of devices of the type concerned which a user has reserved with the command SECURE-RESOURCE-ALLOCATION UNIT=mn.	SH-DEV-STA (INF=SUM)
RES-BY-TYPE	Specifies how many free devices of the type specified are needed to handle reservation and allocation requests already granted (e.g. /SEC-RES DEVICE= (TYPE=TAPE-C4,NUMBER=2)).	SH-DEV-STA (INF=SUM)
RESOURCES REQUESTED/ COLLECTED	List of devices or volumes specified with SEC-RES or list of devices and volumes already reserved by the collector task	SH-RES-REQ
RTC	Specifies the routing code of the depot (see LOCATION)	SH-DEV-DEPOT
SVL-ALLOC	Specifies the mode (system-shareable or system-exclusive) in which the disk is allocated (actual allocation); it does not have to conform to the presetting made by the operator by means of the command SET-DISK VOL=vsn,SYS=....	SH-DISK (INF=SYS)

SVL-RECORDING-MODE	<p>Defines the recording mode in which the disk was last used and whether the flag indicating a recorded inconsistency is set in the SVL. The possible values are:</p> <p>SRV: The disk is allocated in SRV mode (single recording by volume). Data is recorded on one disk.</p> <p>DRV: The disk is allocated in DRV mode (dual recording by volume); recording of data for a logical volume (visible at the user interface) generally takes place on two physical (mirror) disks.</p> <p>SRV (INCONS): The disk is allocated in SRV mode (single recording by volume) and the inconsistency flag is set in the SVL (possible, for example, during formatting or initialization; this flag remains set if formatting or initialization of the disk is prematurely terminated with VOLIN).</p> <p>DRV (INCONS): The disk is allocated in DRV mode (dual recording by volume) and the inconsistency flag is set in the SVL (e.g. indicating failure of one of the DRV disks or termination by means of a command).</p> <p>To remedy the inconsistent state: Reinitialize the disk or read in FDDRL backup copy.</p>	SH-DISK (INF=SYS)
SYSTEMS	System IDs of the systems occupying the disk. Allocation is stored on the disk's SVL.	SH-DISK (INF=SUM)
SYS-ALLOC	<p>Value specifying in which mode a private disk is to be used by the home system in relation to other systems when USE=DMS applies. Possible modes:</p> <p>EXCL[USIVE]: Other systems are excluded from simultaneous use of this disk.</p> <p>ALL: The system allocation mode of a private disk is not determined until allocation (/SET-DISK-PAR SYS-ALLOC=... command).</p> <p>An "(A)" following the above indicates the generation attribute (ALL) of the device.</p>	SH-DISK (INF=PAR)
TAPE-MNEMONICS	Contains the location of the assigned tape devices.	SH-DEV-DEPOT

TAPE-MOUNT	<p>Indicates whether the operator is ready to perform tape mount operations.</p> <ul style="list-style-type: none"> <li>• YES: Allocation requests for new tapes to be mounted lead to mount messages.</li> <li>• NO: Allocation requests for new tapes to be mounted are automatically rejected by the system.</li> </ul>	SH-MOUNT
TAPE-SELECT	<p>Specifies how tapes are selected:</p> <p><b>BEST-GENERATED:</b></p> <p>Default. The first suitable free device is selected from the device table at system generation time.</p> <p><b>LEAST-RECENTLY-USED:</b></p> <p>From all the suitable free devices the one selected is the one which has been out of use the longest.</p> <p><b>BY-CONTROLLER:</b></p> <p>From all the suitable free devices the one selected is the one with the controller with the lightest load.</p>	SH-MOUNT
TASKS-WITH-RESERVATIONS	List of tasks with the number of devices of the specified type occupied /reserved by them.	SH-DEV-STA (INF=TASK /ALL)
TIME-STAMP	Specifies the exact date and time of day at which the SVL of the disk last registered an initial allocation (date/time of day of the first system ID stored in the SVL). This time stamp is used, in addition to the VSN, for disk identification.	SH-DISK (INF=SYS)
TIME-WEIGHT	Provides information on the wait time which was set by the START-RESOURCE-COLLECTION command and which is a factor in calculating the weighting by the system for the collector task.	SH-RES-REQ
TSK-PRIO	Priority of the relevant job.	SH-RES-REQ
TSK-TYPE	Informs the operator whether the task is a batch or interactive task or has been generated by RFA on the remote computer (SECURE requests were issued by another computer).	SH-RES-REQ
TSN	4-digit task sequence number assigned when a task is created.	SH-RES SH-DISK (INF=TASK)

TYPE	<p>Specifies the device type of the volume from which information is requested. The device type can be influenced not only by a user request (CREATE-FILE, SECURE-RESOURCE-ALLOCATION, etc.) but also by the following events:</p> <p>online-event:</p> <p style="padding-left: 40px;">The activation interrupt assigns the volume to a device whose device type determines the device type of the volume in the event of a VSN request.</p> <p>SET-DISK-PAR:</p> <p style="padding-left: 40px;">If the device type is predefined with this command then it is possible to specify the type before any volume allocation. If the device type is not predefined, it is defined implicitly when the disk is allocated</p>	SH-DISK (INF=PAR) SH-RES SH-DEV-STA
UN-CLASS	<p>Device class to which the specified unit belongs.</p> <ul style="list-style-type: none"> <li>• DVC defines an end-user device (disk, tape, printer,...)</li> <li>• CTL defines a controller</li> <li>• CHN defines a channel</li> <li>• CPU defines a central processing unit</li> </ul>	SH-DEV-CONF
UN-TYPE	<p>Generic term for “device type”. It covers not only the set of all possible device types but also the values of all controller, channel and CPU types.</p>	SH-DEV-CONF
UNLOAD-RELEASED-TAPE	<p>Indicates whether tapes are unloaded following their release, provided they have not been unloaded by the user.</p> <p>ACCORDING-TO-USER-REQ:</p> <p style="padding-left: 40px;">Default; tape and MTC devices are only unloaded on release if the user so requests.</p> <p>REGARDLESS-OF-USER-REQ (ALL):</p> <p style="padding-left: 40px;">Tape and MTC devices are automatically unloaded on release, irrespective of any user request.</p> <p>REGARDLESS-OF-USER-REQ (MBK):</p> <p style="padding-left: 40px;">MTC devices are automatically unloaded on release, irrespective of any user request. Tape devices are only unloaded if the user so requests.</p> <p>IGNORE-USER-REQ:</p> <p style="padding-left: 40px;">For tape devices, a user request to unload is ignored. For MTC devices, a request to unload is ignored if the device is being operated in MANUAL mode, otherwise the device is unloaded at the request of the user.</p>	SH-MOUNT

USE	<p>Provides information on:</p> <ul style="list-style-type: none"> <li>• the usage mode in which a mounted volume is to be operated;</li> <li>• the resultant degree of monitoring;</li> <li>• the scope of checking when the assignment is performed by the monitors.</li> </ul> <p>The following values are possible:</p> <p>DMS:</p> <p>The volume is occupied by one or more DMS applications. Only readable volumes are accepted for allocation, i.e.:</p> <ul style="list-style-type: none"> <li>• disks can only be processed with an STD label;</li> <li>• tapes can be processed with or without an STD label as long as they are uniquely identifiable.</li> </ul> <p>The standard task allocation mode for USE=DMS is task-shareable for private disks and task-exclusive for tapes. Each operator intervention during PHASE=IN-USE results in a REMOUNT-RECOVER and, in the case of tapes, in repositioning. It is ensured that only one volume with a particular VSN is allocated in the DMS usage mode.</p> <p>SPECIAL:</p> <p>The volume is occupied by a special application (privileged application, e.g. VOLIN, INIT, test and debugging programs, FDDRL,...). The task and system allocation mode is EXCLUSIVE. Checks carried out upon allocation (VOLIN, INIT) or monitoring functions such as repositioning or MOVE (organized by online FDDRL itself) can be deactivated by the special application. There is no check to determine whether the VSN is unique.</p> <p>WORK:</p> <p>The tape mounted is used as a work tape (it is made available to the DMS user for the processing of work files).</p>	SH-DISK SH-TAPE
USER-ALLOC [ATION]	<p>Specifies which allocation requests issued by the user (task-shareable, task-exclusive) are allowed for a private disk working with USE=DMS. The suffix "(D)" indicates that the data was taken from the DISK-DEFAULTS.</p>	SH-DISK (INF=PAR) SH-DISK-DEF

VM-ASSIGN	<p>Shows which device assignments or possible assignments exist to a VM:</p> <p>BY-GUEST      The device is implicitly assigned to its own VM.</p> <p>BY-VM-ADMIN      The device is explicitly assigned to its own VM.</p> <p>BY-GUEST-POSS      The device is no assigned to its own VM, but implicit assignment is possible.</p> <p>In the following cases the device is not assigned to its own VM and an implicit assignment is not possible:</p> <p>VM-INHIBITED      The VM is not authorized for implicit assignment.</p> <p>DEV-INHIBITED      The implicit assignment is not permitted for the device.</p> <p>ELSEWHERE      The device is exclusively assigned to a different VM.</p>	SH-DEV-CONF (INF=VM2000)
-----------	--	-----------------------------

<p>VM-USAGE</p>	<p>Shows which type of usage is being used for the device by VM2000. The meaning depends on VM-ASSIGN.</p> <p><i>If VM-ASSIGN = BY-GUEST / BY-VM-ADMIN:</i></p> <p>EXCL    The device id explicitly assigned to its own VM.</p> <p>SH(D)    The device is assigned to its own VM as shared with direct I/O processing (only a VM sharer).</p> <p>SH(I)    The device is assigned to its own VM as shared with indirect I/O processing.</p> <p><i>If VM-ASSIGN = BY-GUEST-POSS:</i></p> <p>EXCL    The device is explicitly assigned to a different VM, however, an assignment is possible due to the KEEP status of the device (MTC).</p> <p>SH(D)    The device is assigned to its own VM as shared with direct I/O processing (only a VM sharer).</p> <p>SH(I)    The device is assigned to a different VM as shared with indirect I/O processing.</p> <p>NONE    The device is not assigned.</p> <p><i>If VM-ASSIGN = VM-INHIBITED / DEV-INHIBITED:</i></p> <p>EXCL:    The device is exclusively assigned to a different VM.</p> <p>SH(D):    The device is assigned to a different VM as shared with direct I/O processing (only a VM sharer).</p> <p>SH(I):    The device is assigned to a different VM as shared with in direct I/O processing.</p> <p>NONE:    The device is not assigned.</p> <p><i>If VM-ASSIGN = ELSEWHERE:</i></p> <p>EXCL:    The device is exclusively assigned to a different VM.</p>	<p>SH-DEV-CONF (INF=VM2000)</p>
-----------------	--	-------------------------------------

VOL-A	<p>For public disks, this field merely indicates whether the mounted disk is the system disk SYSRES, a shareable disk, a paging disk or a “normal” public disk without any special attributes.</p> <p>For private volumes (exclusive disks), it provides information on the allocation of the volume by the user:</p> <p><b>PAGING</b> The disk is part of the allocated pubset and is used for paging.</p> <p><b>PUBLIC:</b> The disk is part of the allocated pubset.</p> <p><b>SHARE:</b> The disk is shareable and already occupied by one or more jobs. Requests from other users are permitted.</p> <p><b>CANCEL:</b> Use of the disk was canceled.</p> <p><b>FREE:</b> Currently no user is accessing the volume.</p> <p><b>EXCL:</b> The private volume is exclusively allocated to a user job (other users cannot work with this volume).</p>	SH-RES SH-TAPE SH-DISK																								
	<p>The values PAGING, PUBLIC and SHARE have the following meanings in connection with the values output for DEV-A:</p> <table border="1" data-bbox="370 919 1284 1598"> <thead> <tr> <th>DEV-A</th> <th>VOL-A</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>PUBLIC</td> <td>PUBLIC</td> <td>The disk is IMCATed and is not used for paging</td> </tr> <tr> <td>PUBLIC</td> <td>PAGING</td> <td>The disk is IMCATed and is used for paging.</td> </tr> <tr> <td>PAGING</td> <td>PAGING</td> <td>The disk is used exclusively for paging.</td> </tr> <tr> <td>PUB-DRV</td> <td>PAGING</td> <td>The disk is IMCATed as a DRV volume and is used for paging.</td> </tr> <tr> <td>DRV-PAG</td> <td>PAGING</td> <td>One disk of the DRV pair is allocated for paging in DRV mode.</td> </tr> <tr> <td>DRV-PAG</td> <td>(empty)</td> <td>The other disk of the DRV pair is not used by paging.</td> </tr> <tr> <td>DMS-PAG</td> <td>SHARE</td> <td>The disk is used for paging and is also allocated by shareable tasks</td> </tr> </tbody> </table>	DEV-A	VOL-A	Meaning	PUBLIC	PUBLIC	The disk is IMCATed and is not used for paging	PUBLIC	PAGING	The disk is IMCATed and is used for paging. DRV-PAG	PAGING	One disk of the DRV pair is allocated for paging in DRV mode.	DRV-PAG	(empty)	The other disk of the DRV pair is not used by paging.	DMS-PAG	SHARE	The disk is used for paging and is also allocated by shareable tasks	
DEV-A	VOL-A	Meaning																								
PUBLIC	PUBLIC	The disk is IMCATed and is not used for paging																								
PUBLIC	PAGING	The disk is IMCATed and is used for paging.																								
PAGING	PAGING	The disk is used exclusively for paging.																								
PUB-DRV	PAGING	The disk is IMCATed as a DRV volume and is used for paging.																								
DRV-PAG	PAGING	One disk of the DRV pair is allocated for paging in DRV mode.																								
DRV-PAG	(empty)	The other disk of the DRV pair is not used by paging.																								
DMS-PAG	SHARE	The disk is used for paging and is also allocated by shareable tasks																								

VSN	<p>"Name" of a volume: the "VOLUME SERIAL NUMBER" of a volume (VOLIN, INIT) defined when a volume is initialized. If the volume does not have a readable label or if no VSN was included in the volume request, synonyms can also be displayed.</p> <p>The following values are possible:</p> <p>&lt;vsn&gt;: The VSN of a volume specified with VOLIN or INIT, see VOLUME operand of the CREATE-FILE, SECURE-RESOURCE-ALLOCATION commands.</p> <p>*UNKNO[WN]: The volume does not have a standard BS2000 label.</p> <p>*SCRAT[CH]: The volume request is not accompanied by a VSN (e.g. for tapes CREATE-FILE without a VOLUME operand or VOLUME=*NO/*ANY).</p> <p>*WORK: The tape concerned was requested with /CREATE-FILE with the SUPPORT=TAPE(DEVICE=WORK) operand.</p> <p>The following values are also possible with SH-RES, SH-DEV and SH-DISK:</p> <p>F-&lt;mn&gt;: What is known as a substitute VSN is displayed for foreign disks which have no BS2000 label. This is formed from the prefix "F" and the mnemonic device name &lt;mn&gt; of the foreign disk.</p>	SH-RES SH-DEV-STA SH-DISK SH-TAPE
VTOC-SYS	Catalog ID of the system which currently holds the VTOC lock for the disk and thus temporarily excludes other systems from space and catalog operations on this disk. The VTOC system is stored in the SVL of the disk.	SH-DISK (INF=SYS)
WAIT-TIME	Time the specified task has already waited for the release of the requested resources (hh:mm:ss).	SH-RES-REQ
#PHYS-HALF-PAGES	Displays the capacity of the disk in PAM pages (Number of Physical Half Pages).	SH-DISK (INF=SYS)

---

## 1.2.14 Time limits in BS2000

In BS2000 there are three different time limits which are of relevance to time-sharing users: These are specific to user IDs, tasks and program runs respectively.

A user-ID-specific time limit is defined by systems support in the user entry. At task termination the accounting system in BS2000 deducts the CPU time used from this time allotment.

For a task, the maximum CPU time (task time limit, TTL) can be specified at start time. The maximum CPU time that can be specified is the minimum possible from the time allotment in the user entry and from the maximum value from the job class definition. If no maximum CPU time is specified, the default value from the job class definition or, if applicable, the lower time allotment in the user entry is taken over as the maximum CPU time for the task. The TSOS user ID and users having the privilege No-Time-Limit in their user entry can start tasks without any time limit (NTL tasks). In a job class in whose job class definition, the default value for the maximum CPU time is not restricted (CPU-LIMIT is displayed with DEFAULT=NO-LIMIT and MAXIMUM=NO-LIMIT in the output from the SHOW-JOB-CLASS command), users can start tasks without any restriction on time even if there is no corresponding user entry.

Since the time allotment in the user entry is not updated until the task has terminated, the maximum CPU time (and possibly the CPU time actually used) for two or more tasks of one user ID may together exceed the time allotment.

When a program is loaded or started, a maximum program run time can be specified for the relevant program run (program time limit, PTL).

Interactive and batch jobs behave differently in respect of the maximum CPU time for the task (TTL) and the maximum program run time (PTL). The description below initially examines the normal case, i.e. the CPU time for an interactive job is not limited by the system parameter DIATTTL (= presetting DIATTTL=N).

### *TTL reached in batch job*

The user can specify a task time limit (TTL) in the ENTER-JOB or ENTER-PROCEDURE command when starting a batch job. Once the batch job has used its maximum CPU time, message EXC0070 is displayed on the operator terminal (console). Systems support now has a maximum of 20 minutes in which to raise the batch job's TTL using the CHANGE-TASK-CPU-LIMIT command. This is a way of preventing important batch jobs being terminated prematurely because they have exceeded their TTL.

If the maximum CPU time for the batch job is not increased within the wait time of 20 minutes, the batch job is terminated. A distinction must be drawn between two cases:

1. If the TTL is reached during processing of BS2000 commands, the task terminates with message CMD1011.
2. If the TTL is reached during a program run, message EXC0072 is output and, where applicable, an STXIT routine is executed, but this may use no more than 30 CPU seconds. After execution of the STXIT routine or when 30 CPU seconds have elapsed, the program terminates with message EXC0073. Then the task terminates.

### *PTL reached in a batch job*

If the PTL is reached during a program run in a batch job, message EXC0072 is output and, where applicable, an STXIT routine defined for the purpose is executed, but this may use no more than 30 CPU seconds. After execution of the STXIT routine or when 30 CPU seconds have elapsed, the program terminates with message EXC0073 and spin-off is triggered. If an error handling mechanism has been defined, further processing starts at the next SET-JOB-SET or IF-BLOCK-ERROR command. If not, processing ends at the next EXIT-JOB or LOGOFF command.

---

### *PTL or TTL reached in an interactive job*

The user can specify a time limit in the SET-LOGON-PARAMETERS command. The user can basically continue working if a time limit is exceeded. If the TTL is exceeded and no program is loaded, message EXC0067 is output and the user can continue working for 30 CPU seconds until this process is repeated. If a program is loaded and the TTL or PTL is exceeded, the following applies: In procedure mode, message EXC0068 is output and execution continues. The time limit is incremented by 100 CPU seconds, i.e. the process is then repeated. In interactive dialog, message EXC0075 is output. The user can specify whether he wishes to continue or terminate execution. If he continues execution, the process is repeated after 30 CPU seconds.

### **Behavior when the default of the system parameter DIATTTL is modified**

The DIATTTL=Y and DIATTTL=Q settings enable systems support to limit the CPU time for an interactive task. These settings cause the following changes to the behavior described above:

#### *DIATTTL=Y*

The interactive task is terminated when Task-Time-Runout is reached.

If the TTL is exceeded, first the message EXC0076 is issued. If a program run STXIT for timeout exists, this STXIT routine will be started after the time specified with the message has elapsed. By default, the STXIT routine is granted another 30 CPU seconds.

#### *DIATTTL=Q (quick and quiet)*

As with DIATTTL=Y, the interactive job is terminated when Task-Time-Runout is reached.

Furthermore, both for an interactive job and for a batch job the additional times or wait times which otherwise apply for TTL and PTL are shortened to one second ("quick"). In addition, in the case of a batch job message EXC0070 is suppressed on the console ("quiet").

---

### 1.2.15 Overview of test privileges

The test privileges control the executability of software and hardware diagnostic activities in BS2000. The main user is the debugger AID.

The test privileges are split into read and write privileges. A user's write privilege may not be greater than his/her read privilege. Read and write privileges are defined hierarchically from 1 (low) to 9 (high):

A privilege with the value  $n$  implicitly covers the access permissions on the lower privilege levels 1 to  $n-1$ .

Systems support defines the maximum test privileges for a user ID using the ADD-USER or MODIFY-USER ATTRIBUTES command. System-wide maximum values for the read and write privileges can be defined using the system parameters RDTESTPR and WRTESTPR. These are set for a specific task using the MODIFY-TEST-OPTIONS command.

## Test privileges with AID

If data is loaded (dynamically) from a read-protected file and if the read password was not specified, an “execute only” situation exists. Testing with AID is not possible in an “execute only” situation, regardless of the test privileges set.

### *Read test privileges for AID read accesses*

Value	Characteristics
1	<ul style="list-style-type: none"> <li>• Access to the pages in the user’s own user address space<sup>1</sup> and in the system addressspace<sup>2</sup> which are readable with the access rights of the normal user and are not secret pages<sup>3</sup></li> <li>• Access to the user PCBs of the user’s own task</li> </ul>
2	<ul style="list-style-type: none"> <li>• Additional access to the TCB of the user’s own task</li> </ul>
3	<ul style="list-style-type: none"> <li>• Additional access to the secret pages in the user’s own user address space which are readable with the access rights of the normal user</li> </ul>

5	<ul style="list-style-type: none"> <li>• Not assigned</li> </ul>
6	<ul style="list-style-type: none"> <li>• Additional access to the pages in the user’s own user address space which are only readable with the access rights of the operating system and are not secret pages</li> <li>• Additional access to the system PCBs of the user’s own task and to the XVT</li> </ul>
7	<ul style="list-style-type: none"> <li>• Not assigned</li> </ul>
8	<ul style="list-style-type: none"> <li>• Additional access to all pages in the system address space, all secret pages and all pages of other tasks</li> <li>• Additional access to the user PCBs, system PCBs and TCBs of other tasks</li> </ul>
9	<ul style="list-style-type: none"> <li>• Not assigned</li> </ul>

Table 10: Read test privileges for AID read accesses

- 1 Program space and data spaces of the user
- 2 System space and data spaces of the system
- 3 Pages protected against diagnostic accesses

*Write test privileges for AID write accesses*

Value	Characteristics
1	<ul style="list-style-type: none"> <li>• Access to the pages in the user's own user address space<sup>1</sup> which can be written using the access rights of the normal user and are not secret pages<sup>2</sup></li> <li>• Additional access to the user's local task pages in the user's own program space which are "only readable"<sup>3</sup> with the access rights of the normal user and are not secret pages or "trusted UTM"<sup>4</sup> pages</li> <li>• Access to the user PCBs of the user's own task</li> </ul>
2	<ul style="list-style-type: none"> <li>• Not assigned</li> </ul>
3	<ul style="list-style-type: none"> <li>• Additional access to the secret pages in the user's own user address space which can be written using the access rights of the normal user</li> <li>• Additional access to the user's local task secret pages in the user's own program space which are "only readable" with the access rights of the normal user and are not "trusted UTM" pages</li> </ul>
4	<ul style="list-style-type: none"> <li>• Not assigned</li> </ul>
5	<ul style="list-style-type: none"> <li>• Not assigned</li> </ul>
6	<ul style="list-style-type: none"> <li>• Additional access to the pages in the user's own user address space which can be written using the access rights of the operating system and are not secret pages</li> </ul>
7	<ul style="list-style-type: none"> <li>• Not assigned</li> </ul>
8	<ul style="list-style-type: none"> <li>• Additional access to all pages in the system address space<sup>5</sup>, all secret pages and all pages of other tasks</li> <li>• Additional access to the XVT and to the user PCBs, system PCBs and TCBs of all tasks</li> </ul>

9	<ul style="list-style-type: none"> <li>• Not assigned</li> </ul>
---	--

Table 11: Write test privileges for AID write accesses

- 1 Program space and data spaces of the user
- 2 Pages protected against diagnostic accesses
- 3 The page attribute “only readable” is ignored by AID in this case
- 4 Pages of user jobs which run with the system privilege SECURE-OLTP
- 5 System space and data spaces of the system

*Note on OWN-UID-DEBUGGING*

The “static AID test with low test privilege” can be permitted for other tasks which run under the user’s own user ID by means of the OWN-UID-DEBUGGING operand in the MODIFY-TEST-OPTIONS command. If this is the case, the same privileges as for accessing your own user address space are sufficient for the read accesses to this task’s user address space.

A write privilege of at least 2 is required for write accesses to this task’s user address space. In addition, the same test privileges apply as for write accesses to the user address space of the user’s own task. In the case of write accesses to these tasks’ memory pool pages, write privilege 8 is always required.

**Test privileges for the other software diagnostic products**

*Read test privileges*

Value	Product	Characteristics
3	CDUMP	<ul style="list-style-type: none"> <li>• System dump may be taken under a normal user ID</li> </ul>
8	ANITA	<ul style="list-style-type: none"> <li>• Active system may be diagnosed with DAMP and other user programs which use ANITA</li> </ul>

---

## 1.2.16 Working with S variables

In conjunction with the chargeable product SDF-P, the output of certain SHOW commands can be passed to structured S variables.

**i** Without SDF-P this functionality is only available with SDF-P-BASYS in compiled S procedures.

---

### 1.2.16.1 General notes on command output

The output of SHOW commands can be sent to the system files SYSOUT and/or SYSLST and, in the case of commands which support this, also in S variables.

SYSOUT and SYSLST output consists of constant labels and items of variable information. In order for current parts of the full set of information to be further processed in procedures, the output must be redirected to a file. Then the individual items can be selected by string processing. This calls for precise understanding of the output layout. As SYSOUT and SYSLST output is subject to change from version to version, user-defined procedures need to be continually updated to match.

With structured output in S variables, each item of information can be stored as the contents of an S variable. The names of the S variables allow the user to access the required individual item of information in the SHOW command, regardless of the output layout. The names of the S variables are preset for each SHOW command and are guaranteed for subsequent versions; in other words, they are not subject to change.

---

### 1.2.16.2 Command output in S variables

- S variable stream mechanism (SYSINF, SYSMSG and SYSVAR)
- Declaring S variables
- Assigning S variable streams
- S variable format
- Accessing S variables
- Re-using S variables

---

## S variable stream mechanism (SYSINF, SYSMMSG and SYSVAR)

SDF-P supports a mechanism known as “streams for structured variables” (henceforth referred to as S variable streams). S variable streams are an alternative or a supplement to output in system files. SDF-P is responsible for controlling the S variable streams. By default, the operating system supplies three S variable streams: SYSINF, SYSMMSG and SYSVAR. If necessary, users can also declare and name their own S variable streams.

### The SYSINF, SYSMMSG and SYSVAR S variable streams

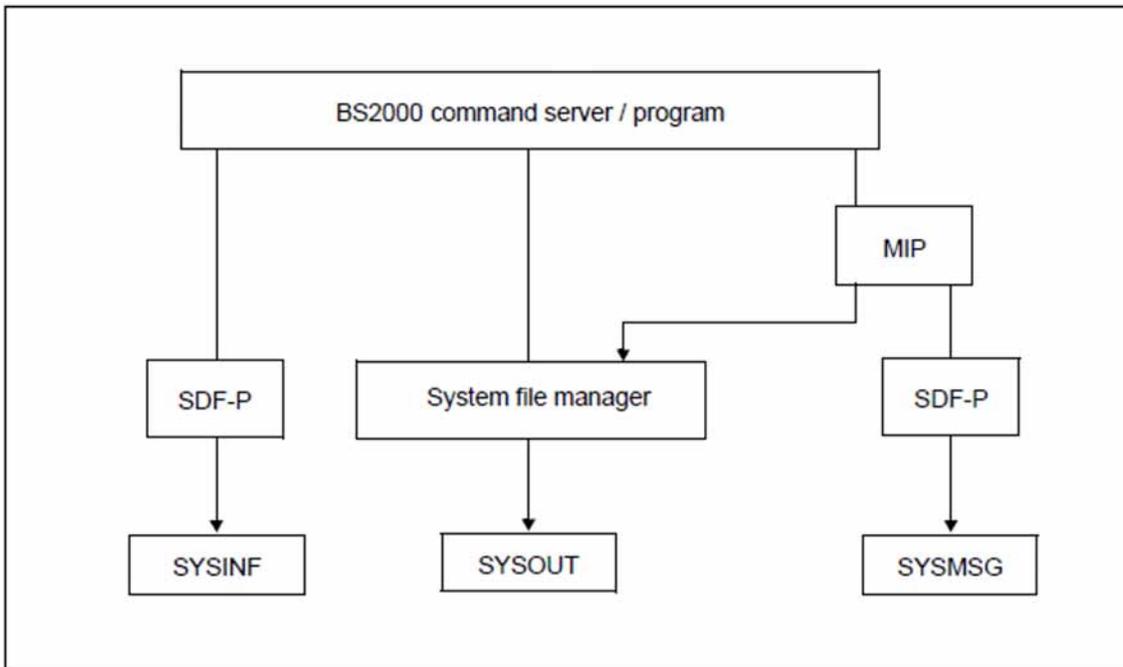

**SYSINF:** Structured output from commands and programs is passed to the assigned S variables.

**SYSMMSG:** Guaranteed messages are passed to the assigned S variables in structured output format.

**SYSVAR:** Both structured command and program output and guaranteed messages are passed to the assigned S variables. SYSVAR subsumes SYSINF and SYSMMSG.

For further information on S variable streams refer to the “SDF-P” manual [34].

The following diagram illustrates both output to SYSOUT by the system file manager and redirection of output information to the SYSINF and SYSMMSG S variable streams under the control of SDF-P.

Command and program output to the SYSINF and SYSMMSG S variable streams or to SYSOUT

### SYSINF

Working with S variables generated in the structured output of specific SHOW commands is discussed in detail in [section "Declaring S variables"](#) and the following subsections, starting on.

### SYSMMSG

The format and contents of the S variables generated for guaranteed messages by the system component MIP are briefly discussed here. For further information on the subject refer to the “Introduction to System Administration” manual [14].

---

SDF-P is responsible for controlling the SYSMMSG S variable stream, which serves to redirect guaranteed messages to S variables. In guaranteed messages, the message ID and the numbering and meaning of the inserts are constant message components.

The following actions are required in order for guaranteed messages to be output in a structured S variable:

1. The user must declare a list variable of type STRUCTURE.

```
/DECLARE-VARIABLE VAR-NAME=<var-name> ( TYP= *STRUCTURE ) ,  
                MULTIPLE-ELEMENT=*LIST
```

2. The user must assign the SYSMMSG S variable stream for structured output in S variables. One of the following declarations is required:

*On command level:*

- a. Using the EXECUTE-CMD command: structured output in S variables is declared for one command.

```
/EXEC-CMD ( <cmd-name> ) ,MSG-STRUCTURE-OUTPUT=<var-name>
```

- b. Using the ASSIGN-STREAM command: the assignment of the S variable stream remains valid for all subsequent commands until it is explicitly canceled (ASSIGN-STREAM SYSMMSG,TO=\*STD).

```
/ASSIGN-STREAM STREAM-NAME=SYSMMSG ,TO= *VARIABLE ( <var-name> )
```

*On program level:*

The CMD macro declares structured output in S variables for a number of commands.

```
CMD ' <cmd-name> ' , . . . ,VER=4 ,MSGVAR@=<add> ,MSGVARL=<length> , [ ,MSGEXT=YES ]
```

<add> is the symbolic address of the location containing the name of the S variable. For details of the CMD macro refer to the “Executive Macros” manual [22].

3. The message output destination must be defined in the MSG7X macro. If DESTINATION=SYSOUT is specified, guaranteed messages will always be output in S variables, provided that the user has declared an S variable. In addition, the BUFFER operand can be assigned a user-specific storage area, and BUFFUSE=EXTERNAL can be assigned. On the MSG7X macro refer to the “Executive Macros” manual [22].
4. Using the MSGMAKER utility, the message must be identified as guaranteed (also refer to the “Utility Routines” manual [9]). MIP generates the following S variables for guaranteed messages:

MSG-ID: contains the message ID.

REPLY: contains the reply to the message if it expects an answer from the user.

I0 through I14: default insert names; I0 through I14 are the defaults used by MIP as names for S variables. If the user defines names for inserts with the MSGMAKER utility, these names (in uppercase) are used as S variable names.

MSG-TEXT: contains the message text inclusive of all replaced inserts.

*Note*

The S variables that MIP generates are of the data type STRING.

The completed S variable that MIP outputs is composed of the S variable name declared by the user and the S variable name generated by MIP. These two subnames, separated by a dot, form the actual name of the S variable. Each S variable that exists for a guaranteed message is associated with an element of a list. Each additional guaranteed message is incorporated as a new list element.

---

## Declaring S variables

Before an S variable stream is assigned to an S variable, it must be declared. This is done by using the `DECLARE-VARIABLE` command to declare a compound S variable of type `STRUCTURE`, with the structure being defined as an element of a list. The name of this S variable is freely selectable within the terms of the SDF-P naming conventions. The defined structure should be dynamically extensible (`DEFINITION=*DYNAMIC` is the default setting).

```
/DECLARE-VARIABLE VAR-NAME=OUT ( TYPE=*STRUCTURE ) , MULTIPLE-ELEMENTS=*LIST
```

### *Note*

The S variable name declared here is `OUT`. This is also the name used in the tables listing the S variables for each `SHOW` command.

For further information on the `DECLARE-VARIABLE` command refer to the “SDF-P” manual [34].

---

## Assigning S variable streams

The `ASSIGN-STREAM` or `EXECUTE-CMD` commands allow to specify that you require structured output in an S variable.

For further information on these commands refer to the “SDF-P” manual [34].

### ASSIGN-STREAM

You use `ASSIGN-STREAM` to request structured output to an S variable for all subsequent commands. As long as this assignment remains in force, the S variable will be added to accordingly for each `SHOW` command that is issued which supports structured output in S variables.

#### *Example*

The S variable `OUT` is declared as described above. The `SHOW-STREAM-ASSIGNMENT` command is then used to display the current assignments of the `SYSINF`, `SYSMSG` and `SYSVAR` S variable streams. `SYSINF` and `SYSMSG` are by default assigned to `SYSVAR`; the assignment of `SYSVAR` is `*DUMMY`, which means that neither command output nor guaranteed messages are assigned to an S variable stream.

```
/SHOW-STREAM-ASSIGNMENT
```

#### *Output to SYSOUT*

```
STREAM-NAME   = SYSINF
  ASSIGN-LEVEL = 0
  DESTINATION  = SYSVAR
STREAM-NAME   = SYSMSG
  ASSIGN-LEVEL = 0
  DESTINATION  = SYSVAR
STREAM-NAME   = SYSVAR
  ASSIGN-LEVEL = 0
  DESTINATION  = *DUMMY
```

The `ASSIGN-STREAM` command specifies that structured command output is to be routed via the `SYSINF` S variable stream and written to S variable `OUT`.

```
/ASSIGN-STREAM STREAM-NAME=SYSINF, TO=*VAR( VAR-NAME=OUT)
```

The `SHOW-STREAM-ASSIGNMENT` command can now be used to display the current assignment of `SYSINF`. This command also supports structured output in S variables, so its output is already being written to the `VAR` S variable.

```
/SHOW-STREAM-ASSIGNMENT
```

---

### *Output to SYSOUT*

```
STREAM-NAME = SYSINF
  ASSIGN-LEVEL = 0
  DESTINATION = *VARIABLE
    VARIABLE-NAME = OUT
      VAR-MODE = *EXTEND
        RETURN-VARIABLE-NAME = *NONE
          CONTROL-VAR-NAME = *NONE
            RET-CONTROL-VAR-NAME = *NONE
STREAM-NAME = SYSMSG
  ASSIGN-LEVEL = 0
  DESTINATION = SYSVAR
STREAM-NAME = SYSVAR
  ASSIGN-LEVEL = 0
  DESTINATION = *DUMMY
```

The `SHOW-FILE-ATTRIBUTES` command likewise supports structured output in S variables. The information on storage space usage is output separately for public and private volumes. The data is written to `OUT` as an additional list element.

```
/SHOW-FILE-ATTRIBUTES *ALL, INF=*SPACE-SUM
```

### *Output to SYSOUT*

```
%:2OSG: PUBLIC: 396 FILES RES= 9006 FRE= 1805 REL= 867 PAGES
%:2OSG: PUB/S2: 50 FILES RES= 10872 FRE= 1936 REL= 1867 PAGES
```

The contents of `OUT` are displayed with the `SHOW-VARIABLE` command.

```
/show-var inf=*par(list-index-number=*yes)
```

```
OUT#1.STREAM-NAME = SYSINF      <-----structured output of SHOW-STREAM-ASSIGNMENT
OUT#1.ASS-LEV = 0
OUT#1.SERVER-NAME =
OUT#1.SERVER-INFO =
OUT#1.VAR-NAME = OUT
OUT#1.VAR-MODE = *EXT
OUT#1.RET-VAR-NAME = *NONE
OUT#1.RET-VAR-MODE =
OUT#1.CONTR-VAR-NAME = *NONE
OUT#1.CONTR-VAR-MODE =
OUT#1.RET-CONTR-VAR-NAME = *NONE
OUT#1.RET-CONTR-VAR-MODE =
OUT#1.DEST = *VAR
OUT#2.STREAM-NAME = SYSMMSG
OUT#2.ASS-LEV = 0
OUT#2.SERVER-NAME =
OUT#2.SERVER-INFO =
OUT#2.VAR-NAME =
OUT#2.VAR-MODE =
OUT#2.RET-VAR-NAME =
OUT#2.RET-VAR-MODE =
OUT#2.CONTR-VAR-NAME =
OUT#2.CONTR-VAR-MODE =
OUT#2.RET-CONTR-VAR-NAME =
OUT#2.RET-CONTR-VAR-MODE =
OUT#2.DEST = SYSVAR
OUT#3.STREAM-NAME = SYSVAR
OUT#3.ASS-LEV = 0
OUT#3.SERVER-NAME =
OUT#3.SERVER-INFO =
OUT#3.VAR-NAME =
OUT#3.VAR-MODE =
OUT#3.RET-VAR-NAME =
OUT#3.RET-VAR-MODE =
OUT#3.CONTR-VAR-NAME =
OUT#3.CONTR-VAR-MODE =
OUT#3.RET-CONTR-VAR-NAME =
OUT#3.RET-CONTR-VAR-MODE =
OUT#3.DEST = *DUMMY
OUT#4.PUBSET-ID = 20SG         <-----structured output of SHOW-FILE-ATTRIBUTES
OUT#4.PUBSET.NUM-OF-F = 396
OUT#4.PUBSET.REL = 867
OUT#4.PUBSET.RESERVED = 9006
OUT#4.PUBSET.FREE = 1805
OUT#4.MIGRATE-S1.NUM-OF-F = 0
OUT#4.MIGRATE-S1.REL = 0
OUT#4.MIGRATE-S1.RESERVED = 0
OUT#4.MIGRATE-S1.FREE = 0
OUT#4.MIGRATE-S2.NUM-OF-F = 50
OUT#4.MIGRATE-S2.REL = 1867
OUT#4.MIGRATE-S2.RESERVED = 10872
OUT#4.MIGRATE-S2.FREE = 1936
OUT#4.PRIV.NUM-OF-F = 0
OUT#4.PRIV.REL = 0
OUT#4.PRIV.RESERVED = 0
OUT#4.PRIV.FREE = 0
OUT#4.TAPE.NUM-OF-F = 0
```

---

Next the command `ASSIGN-STREAM SYSINF, TO=*STD` is used to re-assign the S variable stream to its default setting. This terminates structured output to S variable `OUT`.

## EXECUTE-CMD

To restrict structured output to a single command you use the `EXECUTE-CMD` command to invoke a `SHOW` command, specifying that the structured output is to be passed to the S variable `OUT` that you have already declared (see [section "Declaring S variables"](#)).

```
/EXECUTE-CMD CMD=(SHOW-USER-ATTR INF=*ATTR), STRUCTURE-OUTPUT=OUT,  
TEXT-OUTPUT=*NONE
```

`TEXT-OUTPUT=*NONE` suppresses output to `SYSOUT`.

---

## S variable format

A structure is defined for an object (such as a file: `SHOW-FILE-ATTRIBUTES FILE-NAME=name`) specified in the `SHOW` command. If a number of objects are specified (using a wildcard, for example: `SHOW-FILE-ATTRIBUTES FILE-NAME=nam*`), or if a number of command outputs are written to a single S variable (see `ASSIGN-STREAM`, "[Assigning S variable streams](#)"), a list of structures is created. For each item of information relating to the object (e. g. catalog ID, file size), an S variable is defined as an element of the structure and assigned the information item as its contents.

### Example 1

```
/declare-var var-name=var(type=*structure),multiple-elements=*list
/execute-cmd cmd=(show-file-attr file-name=job*,inf=*name-and-space),
             text-output=*none,structure-output=out
/show-var inf=*par(list-index-number=*yes)
OUT#1.F-NAME = :2OSG:$USER1.JOBA
OUT#1.CAT-ID = 2OSG
OUT#1.USER-ID = USER1
OUT#1.SHORT-F-NAME = JOBA
OUT#1.F-SIZE = 3
OUT#2.F-NAME = :2OSG:$USER1.JOBB
OUT#2.CAT-ID = 2OSG
OUT#2.USER-ID = USER1
OUT#2.SHORT-F-NAME = JOBB
OUT#2.F-SIZE = 3
OUT#3.F-NAME = :2OSG:$USER1.JOBC
OUT#3.CAT-ID = 2OSG
OUT#3.USER-ID = USER1
OUT#3.SHORT-F-NAME = JOBC
OUT#3.F-SIZE = 3
```

### Key to Example 1

The user-defined S variable `OUT` contains the entire output. The string `(#i)` indicates that `OUT` is a list variable that may contain many elements. In this example there are three elements ( $i = 1$  to  $3$ ).

A structure composed of various separate items of information is generated for each object selected by `FILE-NAME=JOB*`. Each item is stored in a separate S variable, such that the S variable `OUT(#i).CAT-ID`, for example, contains the catalog ID.

## Example 2

```
/execute-cmd cmd=(show-file-attr file-name=job*,inf=*par(alloc=*yes)),
text-output=*none,structure-output=out
/show-var var,inf=*par(list-index-number=*yes)
OUT#1.F-NAME = :2OSG:$USER1.JOBA
OUT#1.CAT-ID = 2OSG
OUT#1.USER-ID = USER1
OUT#1.SHORT-F-NAME = JOBA
OUT#1.F-SIZE = 3
OUT#1.SUP = *PUB
OUT#1.HIGHEST-USED-PAGES = 1
OUT#1.SEC-ALLOC = 24
OUT#1.BLOCK-COUNT = 0
OUT#1.EXT#1.VOL = GVS2.2
OUT#1.EXT#1.DEV = D3435
OUT#1.EXT#1.NUM-OF-EXT = 1
OUT#1.NUM-OF-EXT = 1
OUT#2.F-NAME = :2OSG:$USER1.JOBB
OUT#2.CAT-ID = 2OSG
OUT#2.USER-ID = USER1
OUT#2.SHORT-F-NAME = JOBB
OUT#2.F-SIZE = 3
OUT#2.SUP = *PUB
OUT#2.HIGHEST-USED-PAGES = 1
OUT#2.SEC-ALLOC = 24
OUT#2.BLOCK-COUNT = 0
OUT#2.EXT#1.VOL = GVS2.3
OUT#2.EXT#1.DEV = D3435
OUT#2.EXT#1.NUM-OF-EXT = 1
OUT#2.NUM-OF-EXT = 1
OUT#3.F-NAME = :2OSG:$USER1.JOBC
OUT#3.CAT-ID = 2OSG
OUT#3.USER-ID = USER1
OUT#3.SHORT-F-NAME = JOBC
OUT#3.F-SIZE = 3
OUT#3.SUP = *PUB
OUT#3.HIGHEST-USED-PAGES = 1
OUT#3.SEC-ALLOC = 24
OUT#3.BLOCK-COUNT = 0
OUT#3.EXT#1.VOL = GVS2.0
OUT#3.EXT#1.DEV = D3435
OUT#3.EXT#1.NUM-OF-EXT = 1
OUT#3.NUM-OF-EXT = 1
```

## Key to Example 2

The user-defined list variable `OUT` from Example 1 again holds three elements in Example 2. The argument `INF=*PAR(ALLOC=*YES)` causes all file attributes relating to space allocation to be output for the selected files. The attributes `F-NAME`, `CAT-ID`, `USER-ID`, . . . , `EXT` form the elements of the structure. The `EXT` element is in turn a list composed of the elements `VOL`, `DEV` and `NUM-OF-EXT`.

---

If information for an object can be further subdivided hierarchically (see the `EXT` element), a compound S variable is defined as an element of the higher-ranking structure for each hierarchy. A hierarchically lower-ranking S variable may be a simple S variable (see `VOL`, `DEV`, `NUM-OF-EXT`), a structure or a list of simple S variables and/or structures.

### **S variable name components**

The names of the list elements (e.g. `F-NAME`, `F-SIZE`) are preset for each `SHOW` command. They are appended to the S variable name declared by the user. The names match the corresponding operand names as closely as possible. If the information on this level is further subdivided hierarchically, further names are appended, preceded by a dot as separator.

### **S variable contents**

The contents of S variables match the corresponding operand values as closely as possible. The data type of the S variable governs the range of characters of which the contents are composed.

### **S variable data types**

S variables have a fixed data type: String, Integer or Boolean.

---

## Accessing S variables

The string (\*LIST) appears only if you output the S variable with the SHOW-VARIABLE command (if the element number #i is displayed instead of (\*LIST), the LIST-INDEX-NUMBER=\*YES operand must be specified). Access to specific items of information is achieved with the string #i, where i is the i-th element of the list.

### *Example 3*

```
/show-var var#3.sec-alloc -----(1)
VAR(*LIST).SEC-ALLOC = 24
/show-var var#3.ext#1.vol -----(2)
OUT#3.EXT#1.VOL = GVS2.0
/show-var var#3.ext#.vol -----(3)
OUT#3.EXT#1.VOL = GVS2.0
```

### *Key to Example 3*

Example 3 is based on the structured output of Example 2.

- (1) `var#3.sec-alloc` directly accesses the “Secondary Allocation” item which is an attribute of file JOBC. The attributes of JOBC form the third element in the output list.
- (2) `var#3.ext#1.vol` causes the first element of list variable EXT to be output.
- (3) Has the same effect as (2). To refer to the first list element it is sufficient to specify `var#3.ext#.vol`.

## Re-using S variables

### Example 4

```
/write-text 'There are &(var#3.F-SIZE) PAM pages reserved for
file &(var#3.SHORT-F-NAME)'
There are 3 PAM pages reserved for file JOBC
```

Example 4 is based on the structured output of Example 2.

The contents of S variables `var#3.SHORT-F-NAME` and `var#3.F-SIZE` can be re-used by means of expression substitution.

### Example 5

The contents of S variable `FILES` are to be re-used in S procedure `proc.s-var`.

#### S procedure `proc.s-var`

```
/DECL-VAR FILES(TYPE=*STRUCTURE),MULTIPLE-ELEM=*LIST----- (1)
/DECL-VAR INCR(TYPE=*STRUCTURE)----- (2)
/DECL-VAR FILES-OLD,MULTIPLE-ELEM=*LIST----- (3)
/
/WRITE-TEXT '*****'
/WRITE-TEXT '** This procedure lists all files which have      **'
/WRITE-TEXT '** not been modified for over 365 days          **'
/WRITE-TEXT '*****'
/
/
/EXEC-CMD (SHOW-FILE-ATTR *ALL,INF=*PAR(HIST=*YES),
/         SELECT=*BY-ATTR(LAST-ACCESS-DATE=*INTERVAL(TO=-365))),
/         STRUCTURE-OUTPUT=FILES,TEXT-OUTPUT=*NONE ----- (4)
/
/WRITE-TEXT 'The following files have not been modified in the last 365 days:'
/FOR INCR=*LIST(FILES)
/  WRITE-TEXT 'FILE: &(INCR.SHORT-F-NAME)' ----- (5)
/  MODIFY-FILE-ATTRIBUTES FILE-NAME=&(INCR.SHORT-F-NAME),
/  NEW-NAME=&('OLD.'//INCR.SHORT-F-NAME) ----- (6)
/  IF-CMD-ERROR ----- (7)
/    WRITE-TEXT 'Error renaming file: -
/              &(INCR.SHORT-F-NAME)'
/  END-IF
/  ELSE
/    SET-VAR FILES-OLD='&('OLD.'//INCR.SHORT-F-NAME)',WRITE-MODE=*EXTEND --- (8)
/  END-IF
/END-FOR
/WRITE-TEXT 'List of all files with the prefix OLD'
/SHOW-VAR FILES-OLD,INF=*PAR(LIST-INDEX-NUMBER=*YES) ----- (9)
```

- (1) S variable `FILES` is declared as a structured list variable.
- (2) An incrementing variable is declared for the subsequent FOR loop; this must also be of type `STRUCTURE`.
- (3) `FILES-OLD` is declared as a list variable. Here all the file names starting with the prefix “OLD” will be stored.

- (4) The EXECUTE-CMD command causes the output of SHOW-FILE-ATTRIBUTES INF=\*PAR(HIST=\*YES) to be stored in the FILES S variable. Output to SYSOUT is suppressed by TEXT-OUTPUT=\*NONE. The SELECT operand selects all files last modified over 365 days ago.
- (5) Each file that has not been modified for over 365 days is listed under its file name as stored in the INCR.SHORT-F-NAME S variable.
- (6) The MODIFY-FILE-ATTRIBUTES command adds the prefix "OLD." to the names of the selected files.
- (7) If an error occurs while MODIFY-FILE-ATTRIBUTES is executing, it is handled by the IF-CMD-ERROR block.
- (8) The SET-VARIABLE command assigns the new file name with the prefix "OLD." to the FILES-OLD S variable. The MODE=\*EXTEND argument causes FILES-OLD to be extended by one list element each time the rename loop iterates.
- (9) The contents of FILES-OLD are output by the SHOW-VAR command.

*Execution log*

**/call-proc proc.s-var**

```

*****
** This procedure lists all files which have          **
** not been modified for over 365 days              **
*****
The following files have not been modified in the last 365 days:
FILE: ISAM
FILE: MESSAGEMAKER
FILE: MSE1
FILE: MSE2
FILE: MSG.OUTPUT
FILE: MSG.PROC
FILE: README.RZ
FILE: README.RZ.ISAM
FILE: README.RZ.OLD
FILE: VAR.PROC
List of all files with the prefix OLD
FILES-OLD#1 = OLD.ISAM
FILES-OLD#2 = OLD.MESSAGEMAKER
FILES-OLD#3 = OLD.MSE1
FILES-OLD#4 = OLD.MSE2
FILES-OLD#5 = OLD.MSG.OUTPUT
FILES-OLD#6 = OLD.MSG.PROC
FILES-OLD#7 = OLD.README.RZ
FILES-OLD#8 = OLD.README.RZ.ISAM
FILES-OLD#9 = OLD.README.RZ.OLD
FILES-OLD#10 = OLD.VAR.PROC

```

---

### Example 6

Example 6 builds on the S procedure described in Example 5. If you want to restore the original file names of all files with the prefix "OLD.", you can do so interactively using the following commands:

```
/decl-var restore(type=struct),mult-elem=*list
/exec-cmd (show-file-attr old.*,inf=*all),struc-output=restore,text-output=*none
/decl-var y(type=struct)
/for y=*list(restore)
%FOR/mod-fi-attr &(y.SHORT-F-NAME),&(substring(y.SHORT-F-NAME,5))
%FOR/end-for
```

---

### 1.2.16.3 Command overview

The table below lists all the SHOW commands for which the S variables are described in this manual. For detailed command descriptions refer to the product manuals listed in the right-hand column.

A command description may also be looked up in the mentioned product manuals.

Table 12: Commandos with S variables

---

#### 1.2.16.4 Notes on conventions used in the tables

The S variable tables are sorted according to the names of the S variables in the second column; this column has a gray background.

In the S variable tables, the entries in the columns “Name of the S variable”, “T” and “Contents” are represented using conventions explained on the following pages.

*Example*

Output information	Name of the S variable	T	Contents	Condition
Name of guard with shown access conditions	var(*LIST).GUARD-NAME	S	" <filename 1..40>	INF=ADM
Scope of use for a guard: *HOST-SYS: anyone may use the guard *USER-GROUP: members of the owner's user group may use the guard *USER-ID: only the owner may use the guard	var(*LIST).SCOPE	S	" *HOST-SYS *USER-GROUP *USER-ID	INF=ALL /ATT

---

## Conventions used in the tables

Convention	Meaning	Examples
UPPERCASE	Uppercase letters are used for the following: <ul style="list-style-type: none"><li>• names of S variables</li><li>• S variable data types</li><li>• keywords</li><li>• the list structure identifier</li></ul>	<ul style="list-style-type: none"><li>• GUARD-NAME</li><li>• S</li><li>• *NO, ACTIVE</li><li>• (*LIST)</li></ul>
lowercase	Lowercase letters are used for the following: <ul style="list-style-type: none"><li>• the name of the variable declared by the user</li><li>• contents of S variables</li></ul>	<ul style="list-style-type: none"><li>• var</li><li>• &lt;filename 1..54&gt;</li><li>• &lt;integer&gt;</li><li>• &lt;host-name&gt;</li></ul>
< >	Angle brackets enclose the contents of S variables.	<integer> <host-name>
(*LIST)	An S variable with the (*LIST) extension is an element in a list.	var(*LIST)

## S variable data types

The “T” column of the S variable tables denotes the data type: S(string), I(integer) or B(Boolean). The table below contains the character set which belongs to each data type and the notation used for S variable contents in the “Contents” column of the S variable tables.

Data type	Character set	Notes
String	all EBCDIC characters	<p>Strings in the table are shown without quotes. The following string contents are possible:</p> <ul style="list-style-type: none"><li>• an SDF data type, e.g. &lt;name 1..8&gt;, &lt;c-string 1..8&gt;, &lt;filename 1..54&gt; In this case the applicable character set is as described in the SDF syntax diagram (see <a href="#">table "Data types" (SDF syntax representation)</a>).</li><li>• a descriptive name, e.g. &lt;tsn&gt;, &lt;host-name&gt;, &lt;server-name&gt;</li><li>• numbers</li><li>• keywords with and without the leading asterisk (*), e.g. *LEFT-TO-RIGHT or ACTIVE</li><li>• a null string "</li></ul>
Integer	[+-] 0..2147483647	<p>Integers in the table are shown as follows:</p> <ul style="list-style-type: none"><li>• SDF data type with range, e.g. &lt;integer 0..255&gt;</li><li>• SDF data type without range &lt;integer&gt;</li></ul>
Boolean	FALSE TRUE	Boolean values in the table are shown as TRUE and FALSE.

## Explanation of the columns

The columns of the S variable tables are:

Output information	Name of the S variable	T	Contents	Condition
--------------------	------------------------	---	----------	-----------

### *Column: Output information*

This column provides notes on the contents of the S variable. If the contents and name of the S variable are self-explanatory, the notes are often restricted to one or two key terms. If the relationship between the contents and name of the S variable is not sufficiently obvious, more information is given about the contents of the S variable. If the possible contents of an S variable are \*YES or \*NO, the explanation may be formulated as a question, which can be answered with Yes or No.

### *Column: Name of the S variable*

This column contains the alphabetically arranged names of the S variables. The order within the S variable table is governed by this column.

The names of the S variables consist of at least two subnames. In this manual the first subname is consistently given as var(\*LIST); the actual name can be freely selected by the user within the terms of the SDF-P naming conventions. This S variable must always be declared as a list variable.

The full name of the S variable is composed of var(\*LIST) and the command-specific preset S variable name. These names match the corresponding operand names or unique abbreviations as closely as possible. The subnames are separated by a dot. The preset S variable name may in turn comprise several subnames, similarly separated by dots. If the structure elements on this level form a list, the subname is also given the extension (\*LIST).

**i** The extension (\*LIST) indicates that the S variable is an element in a list. (\*LIST) appears when the contents of the S variable are displayed with the SHOW-VARIABLE command. For assignments, the user must replace (\*LIST) by a particular list index. On request, the command SHOW-VARIABLE shows the value instead of (\*LIST) in its output.

Example:

```
/SHOW-VARIABLE OPS
OPS(*LIST).F-NAME = :2OSH:$TSOS.X.OUT
OPS(*LIST).CAT-ID = 2OSH
OPS(*LIST).USER-ID = TSOS
OPS(*LIST).SHORT-F-NAME = X.OUT
OPS(*LIST).F-SIZE = 3

/SHOW-VARIABLE OPS, INF = *PAR(NAME = *FULL-NAME(LIST-INDEX-NUMBER = *YES))
OPS#1.F-NAME = :2OSH:$TSOS.X.OUT
OPS#1.CAT-ID = 2OSH
OPS#1.USER-ID = TSOS
OPS#1.SHORT-F-NAME = X.OUT
OPS#1.F-SIZE = 3
```

### *Column: T*

The possible values are: This column indicates the data type of the S variable.

S: String

---

I: Integer

B: Boolean

The data type specifies the character set from which the contents of an S variable come (see the table in section “[Notes on conventions used in the tables](#)”).

*Column: Contents*

This column lists the contents of the S variable. These contents match the corresponding operand values or unique abbreviations as closely as possible. The notational conventions are partly based on the customary SDF data type notation (e.g. <filename 1..54>, see [table “Data types ” \(SDF syntax representation\)](#)) and partly make use of names descriptive of the contents of the S variables (such as <tsn>). For further conventions refer to the table in section “[Notes on conventions used in the tables](#)”, “Notes” column.

*Column: Condition*

With some commands there is an operand (usually INFORMATION) which identifies the S variables which are to be assigned values on output. These operand conditions are either noted directly in this column or are referenced there by means of a code number and/or letter. The association between this code and the corresponding operand value is explained above the S variable table.

---

### 1.2.17 SDF-P-BASYS

The software product SDF-P extends the BS2000 command language to the status of a programming language which enables structured programming in a manner analogous to higher programming languages. SDF-P incorporates the following major elements:

- Structured procedure format (S procedures)
- data structures, data types
- Variables concept (S variables)
- function calls (builtin functions)
- block-oriented error handling
- control structures
- source and object procedures

The software product SDF-P comprises the nonchargeable subsystem SDFPBASY and the chargeable subsystem SDF-P. The following sections describe the scope of SDF-P as it affects the subsystem SDFPBASY. A detailed description of the chargeable SDF-P capabilities and how to use them can be found in the “SDF-P” manual [34].

The following description is valid for SDF-P V2.5.

#### **Coexistence of SDF-P and SDF-P-BASYS**

SDFPBASY subsystem can run with earlier SDF-P versions. In other words, migration of SDFPBASY does not necessarily require the chargeable subsystem SDF-P to be migrated.

New SDF-P versions require the same or a higher version of SDFPBASY. In other words, migration of the chargeable subsystem SDF-P requires the free subsystem SDFPBASY to be migrated.

---

### 1.2.17.1 Structured procedure format (S procedures)

S procedures consist of a procedure header and a procedure body. Logically associated blocks can be defined in both parts. The first record in an S procedure must be a command.

The procedure header normally begins with the SET-PROCEDURE-OPTIONS command, which is used to define the procedure attributes. If no explicit specifications are made, the default values for this command apply implicitly. Once the procedure attributes have been defined, the DECLARE-PARAMETER command can be used to define symbolic parameters, which are replaced by the values of the like-named S variables during execution.

Processing of the commands, SDF statements and input data is terminated by the CANCEL-PROCEDURE or EXIT-PROCEDURE command or by the last record. If an error occurs, SDF error recovery is triggered (see [section "Block-oriented error recovery"](#)).

## Compiled procedures

Two different procedure formats are possible:

- Source procedure  
The S procedure is available in the original text form. The full range of SDF-P functions is available only if the chargeable subsystem SDF-P is loaded when the procedure is called. In libraries, element type J should be used for source procedures. (If SDF-P is not loaded, all SDF-P commands in source procedures are subjected to a syntax analysis, with the exception of chargeable control flow commands and the COMPILE-PROCEDURE command. All chargeable commands and functions are not rejected until execution time.)
- Object procedure  
With the aid of the COMPILE-PROCEDURE command, a source procedure can be compiled in an intermediate format. The COMPILE-PROCEDURE command is part of the chargeable SDF-P subsystem. The object procedure can utilize the full functionality of SDF-P (apart from the COMPILE-PROCEDURE command) irrespective of whether the SDF-P subsystem is currently available or not. In libraries, element type SYSJ (the default for COMPILE-PROCEDURE) should be used for source procedures.

---

### 1.2.17.2 Block-oriented error recovery

In contrast to non-S procedures, problem-specific error recovery is possible in S procedures, namely at command level.

Error recovery in S procedures is block-oriented, i.e. it is implemented on block level. In the case of nested blocks, error recovery can be performed for each block level. However, it can also be called exclusively for higher-ranking, surrounding blocks. In this case, the errors detected in inner blocks are passed to these blocks and processed there.

In SDF-P-BASYS the IF-BLOCK-ERROR command makes it possible to initiate block oriented error recovery in an *S procedure*. The command block initiated in this way must be terminated by an END-IF command.

When error recovery is initiated, control branches in SDF-P-BASYS to the next IF-BLOCK-ERROR command (only the current command block or, in the case of nested blocks, also the higher-ranking command blocks are searched in the direction of the end of the procedure file). If no IF-BLOCK-ERROR is found, the procedure terminates when the end of the procedure file is reached. The error is passed to the caller. The error situation ends when an IF-BLOCK-ERROR block is encountered or when procedure level zero is reached.

For reasons of compatibility, the error situation is ended when a SET-JOB-STEP command is reached. In *non-S procedures* error recovery is still controlled via spin-off (see error recovery with the SET-JOB-STEP command).

#### *Type of error recovery*

The type of error recovery in an S procedure depends on what is specified in the ERROR-MECHANISM operand of the SET-PROCEDURE-OPTIONS command.

If nothing has been specified in the procedure with regard to ERROR-MECHANISM or if ERROR-MECHANISM=\*SPIN-OFF-COMPATIBLE has been defined, SDF-P triggers error recovery if a command returns spin-off. In this case, error recovery is not dependent on the command return code. This error mechanism is preset and means that S procedures do not change their error behavior if commands in the procedures return a command-specific return code in a follow-up version for the first time.

If ERROR-MECHANISM=\*BY-RETURNCODE has been set, SDF-P triggers error recovery if a command returns a return code with a subcode not equal to zero. In this case, error recovery is **not** dependent on the command's spin-off behavior. This error mechanism must be defined explicitly.

---

### 1.2.17.3 Variables concept (S variables)

An S variable is a named data object that can be addressed via its name and whose value can be modified. A distinction is made between *simple* S variables and *composite* S variables. Composite S variables are made up of two or more S variables under the same name in the form of a list, an array or a structure. Only *simple* S variables are possible under SDF-P-BASYS (see the “SDF-P” manual [34]).

An S variable is uniquely identified by its name, the variable type and the scope.

---

## Variable name

The following applies to simple S variables:

```
variablename = <structured-name 1..20>
```

The following applies to composite S variables:

```
variablename = <composed-name 1..255>
```

The name is formatted in accordance with the SDF data type <composed-name>. The following restrictions should be borne in mind:

- Names of structured S variables are formed in accordance with <structured-name> and can be up to 20 characters long.
- SDF-P only supports special characters in variable names internally. The dollar sign (\$) is reserved as the first character for TPR variables (task-privileged) and the hash character (#) is reserved as the identifier for composite variables (arrays and lists).
- The string **SYS** at the start of a name is reserved for system components.
- Keywords which are used as operators or Boolean constants are not permitted as variable names. This applies to:  
AND, DIV, EQ, FALSE, GE, GT, LE, LT, MOD, NE, NO, NOT, OFF, ON, OR, TRUE, XOR and YES

---

## Variable type

A simple S variable can be one of the following three types:

- STRING with the value range <c-string 0..4096>
- INTEGER with the value range <integer -2147483648..2147483647>
- BOOLEAN with the value TRUE or FALSE

These three types are subject to a rigid set of type rules: a variable type can only be converted to a different type by means of builtin functions (see the “SDF-P” manual [34]).

In addition, there is also the variable type ANY. In this case, the variable is given the same type as the value assigned to it. The current type can be changed at any time by means of an assignment.

---

## Scope

There are three scopes for S variables:

- **INCLUDE:**  
Variables declared within an S procedure called with INCLUDE-PROCEDURE are only valid within this procedure (component of the chargeable subsystem SDF-P).
- **PROCEDURE:**  
The variables can be used locally in procedures or in interactive mode. Procedure parameters of an S procedure called with CALL-PROCEDURE are automatically local for that procedure. If the procedure is interrupted (e.g. by [K2]), the local variables of the procedure can also be accessed and modified in interactive mode.
- **TASK:**  
The variables are defined as task-local and can be processed in all procedures and in interactive mode (only available with SDF-P).

---

## Declaration

When first declared, an S variable is created in class 5 memory. Its lifespan is determined by its scope. For example, a procedure-local variable ceases to exist when the procedure is terminated. At the most, an S variable continues to exist until the task is terminated. The contents of a variable can be stored permanently in a job variable (chargeable component) or in a variable container (available with SDF-P-BASYS).

An S variable can be declared implicitly or explicitly.

Implicit declaration means that the S variable is created automatically by assigning it a value. This is possible only if `IMPLICIT-DECLARATION=*YES` has been specified (see the `SET-PROCEDURE-OPTIONS` command). Variables declared implicitly are of the type `ANY`.

S variables are declared explicitly (as procedure parameters) by means of the `DECLARE-PARAMETER` command in the procedure header of an S procedure. The `DECLARE-VARIABLE` command declares S variables explicitly.

---

## Expressions

An expression defines how a new value is calculated from existing values. An expression is created by linking base terms with operators. Base terms can be:

- <c-string>
- <x-string>
- Boolean constants with ON, TRUE, YES for Boolean one and with OFF, FALSE, NO for Boolean zero
- the name of an S variable
- the function call of a builtin function

Depending on what operators are used, a distinction is made between:

- string expressions
- arithmetic expressions
- comparison expressions
- logical expressions

Only comparison expressions and logical expressions (negation only) are possible with SDF-P-BASYS. The other expressions are described in the “SDF-P” manual [34].

Comparison expressions have the format:

( expression<sub>1</sub> operator expression<sub>2</sub> )

*expression<sub>1</sub>* or *expression<sub>2</sub>* can be any expressions (base term or a permissible expression), but they must be of the same type. If they are not, an error message is issued and SDF-P error recovery is triggered.

The following *operators* are possible:

LT	or	<	less than
LE	or	<=	less than or equal to
EQ	or	= or ==	equal to
NE	or	<>	not equal to
GT	or	>	greater than
GE	or	>=	greater than or equal to

The complete expression must be enclosed in parentheses. Operators must be enclosed in blanks.

The result of a comparison is of the type BOOLEAN, i.e. it is either TRUE or FALSE.

Strings are compared byte by byte and from left to right. The comparison is based on the position of the characters in EBCDIC code. The result is determined by the first non-match. No further characters are compared after that. If no differences are detected up to the final character in the shorter of the operands, the longer operand is larger. Operands are equal if all of their characters match up.

*Example*

A = 'ABC'		
B = 'ABCDE'		
(B > A)	->	result TRUE
('A' = X'C1')	->	result TRUE
(B > '1')	->	result FALSE
C = (A = B)	->	variable C has FALSE

A logical operator links expressions of the type BOOLEAN. Only the logical operator NOT is available with SDF-P-BASYS; this returns the negation of an expression as the result:

NOT( expression<sub>1</sub> )

*Example*

A = 'AB'		
B = 'ABCD'		
(B > A)	->	result TRUE
NOT(B > A)	->	result FALSE

*Note*

The term "string expression", which is used as a parameter in builtin functions, can have the following values:

- a string enclosed in apostrophes (<c-string>)
- the name of a variable containing a string (<composed-name>)
- an expression returning a string as the result

*Example*

/JV-NAME = 'MY-JV'		
/MY-VAR = JV('JV-NAME')	->	Value of the job variable JV-NAME
/MY-VAR = JV(JV-NAME)	->	Value of the job variable MY-JV
/MY-VAR = JV('&JV-NAME')	->	Value of the job variable MY-JV
/MY-VAR = JV(JV(JV-NAME))	->	Value of the job variable whose name is stored in the job variable MY-JV

---

#### 1.2.17.4 Builtin functions

SDF uses builtin functions (predefined functions) both for editing S variables and character strings and for determining environment information. A builtin function forms precisely one return value from input parameters (if available) and environment information. With certain builtin functions, the type of return value is dependent on the input parameters.

Calling a builtin function without parameters: `function( )`

Specification of the parentheses is optional. If they are omitted, however, *function* must not be an S variable name, as otherwise the value of the like-named S variable will be returned.

Calling a builtin function with parameters:

```
function(sympar1 =value1 , ...,symparn =valuen )
```

where *sympar<sub>i</sub>* (*i* = 1...*n*) is the name of the *i*-th parameter and *value<sub>i</sub>* is the value of the *i*-th parameter. An expression can also be specified as a parameter value. Parameters can be specified as keyword parameters or as positional parameters. Parameter names (i.e. keywords) can be abbreviated as desired as long as they remain unambiguous. Function names, on the other hand, can only be abbreviated if this is explicitly described in the builtin function.

The builtin functions available with the subsystem SDF-P-BASYS are described below. For a description of all available builtin functions and how to use them, see the “SDF-P” manual [34].

The following overview lists all builtin functions available with SDF-P-BASYS:

Name of the builtin function	Function
INSTALLATION-PATH( )	Output path name
IS-CATALOGED-JV( )	Interrogate job variable
IS-INITIALIZED( )	Check variable initialization
IS-SDF-P( )	Check whether SDF-P is loaded
JV( )	Interrogate job variable
MAINCODE( )	Interrogate error code
MSG( )	Output message text
SDF-P-VERSION( )	Interrogate SDF-P or SDF-P-BASYS version
SUBCODE1( )	Interrogate subcode1
SUBCODE2( )	Interrogate subcode2

---

### 1.2.17.5 INSTALLATION-PATH( ) - Output path name

Domain:     **Environment information**

The INSTALLATION-PATH( ) function outputs the path name that has been assigned from the SCI for the logical name of a file (installation item) that belongs to a particular product version.

The assignment of a path name to a logical name is only available if the file is a component of a product that was installed with IMON. The assignment can also be entered into the SCI by systems support using the SET-INSTALLATION-PATH command. For more details, see the “IMON” manual [19].

An expression must be specified in the DEFAULT-PATH-NAME operand which is returned as an alternative result if no path name has been assigned (the product is not registered in the SCI or no file exists for the logical name specified).

#### Format

INSTALLATION-PATH( )
LOGICAL-ID = string_expression
,INSTALLATION-UNIT = string_expression
,VERSION = *STD / string_expression
,DEFAULT-PATH-NAME = string_expression

#### Result type

STRING

#### Input parameters

**LOGICAL-ID = string\_expression**

Designates the logical name of the file (installation item) whose path name is to be output (e.g. SYSPRG).

**INSTALLATION-UNIT = string\_expression**

Designates the product name (name of the installation unit).

**VERSION = \*STD / string\_expression**

Designates the product version (up to 8 characters). A version can be specified explicitly in the *[V][m]m.naso* format (see also SDF data type composed-name). If the specified version does not exist in the SCI, the function call is aborted without returning a result (or an alternative character string).

**DEFAULT-PATH-NAME = string\_expression**

Determines the alternative character string (e.g. a path name that definitely exists) that is output if no assigned path name is available (product or installation item is not registered in the SCI).

#### Result

A string conforming to the rules for the SDF data type <filename 1..54>.

---

## Error messages

```
SDP0469    INVALID PARAMETER '(&00)' SPECIFIED
SDP0470    INTERNAL ERROR RETURNED BY GETINSP/GETINSV INTERFACE. RETURN CODE
           '(&00)' RECEIVED
SDP0489    Warning: Installation-Unit '(&00)' not found in IMON Software
           Inventory. Default value assumed
SDP0490    Installation-Unit '(&00)' version '(&01)' not found
SDP0491    Warning: Logical-id '(&00)' not found in Installation-Unit '(&01)'
           version '(&02)'. Default value assumed
```

## Examples

```
/A = INSTALLATION-PATH(LOGICAL-ID='SYSLNK',INSTALLATION-UNIT='EDT',
DEFAULT-PATH-NAME='*** no pathname available! ***)
/SHOW-VARIABLE A
A = :2OSH:$TSOS.SYSLNK.EDT.171
```

The path name of the load module library for the product EDT is output. Subsequently, it is checked whether there exists a readme file:

```
/A = INSTALLATION-PATH(LOGICAL-ID='SYSRME.D',INSTALLATION-UNIT='EDT',
DEFAULT-PATH-NAME='*** no readme file available! ***)
% SDP0491 Warning: Logical-id 'SYSRME.D' not found in Installation-Unit
'EDT' version '*STD'. Default value assumed
/SHOW-VARIABLE A
A = *** no readme file available! ***
```

---

### 1.2.17.6 IS-CATALOGED-JV( ) - Interrogate job variable

Domain:     **Job variables**

The IS-CATALOGED-JV( ) function checks whether a catalog entry exists for the specified job variable names, i.e. whether the specified job variable exists. This function can only be used if the JV subsystem has been loaded in the system. For more detailed information on job variables see the “Job Variables” manual [20].

#### Format

```
IS-CATALOGED-JV( )
```

```
IS-CAT-JV( )
```

```
JV = string_expression
```

```
,ERROR-REPORTING = *PROC-ERROR-MECHANISM / *RETURN-FALSE
```

```
,ERROR-VARIABLE = *NONE / string_expression
```

#### Result type

BOOLEAN

#### Input parameters

**JV = string\_expression**

Designates a job variable. When a JV name is specified directly it must be enclosed in quotes.

**ERROR-REPORTING =**

In the event of an error, you can define whether error processing is triggered or the message code is stored in an S variable.

**ERROR-REPORTING = \*PROC-ERROR-MECHANISM**

In the event of an error, error processing is triggered (see [section "Block-oriented error recovery"](#)).

**ERROR-REPORTING = \*RETURN-FALSE**

In the event of an error, the result *FALSE* is output. An error message is not output. The message code of the error message is written to the variable specified in ERROR-VARIABLE = ... .

**ERROR-VARIABLE =**

An S variable can be defined for the message code. The message code is only written to the variable if in the function call ERROR-REPORTING=\*RETURN-FALSE is specified in the function call.

**ERROR-VARIABLE = \*NONE**

No S variable is specified.

---

## **ERROR-VARIABLE = string\_expression**

The name of the S variable where the message code of the error message is written. Note the following:

- If the variable name is directly specified, it must be enclosed in quotes. Otherwise, the contents of the variable are interpreted as the variable name.
- Message codes are only written to the S variable if an error occurs (result=FALSE) and ERROR-REPORTING=\*RETURN-FALSE was specified. Example of possible error codes: SDP0439, SDP0440 or DMSxxxx.
- If an error occurs when writing to the S variable, the corresponding error message is output to SYSOUT, regardless of the specification in ERROR-REPORTING and the S variable contains no return value.

## **Result**

*TRUE*

The job variable designated in the JV parameter has been cataloged.

*FALSE*

The job variable designated in the JV parameter has not been cataloged or an error occurred when calling with ERROR-REPORTING=\*RETURN-FALSE.

## **Error message**

```
SDP0495      '(&00)' NOT A CORRECT JV NAME
SDP1054      JOB VARIABLE ERROR: JVS ERROR CODE '(&00)' WHILE ACCESSING JOB
              VARIABLE '(&01)'. IN SYSTEM MODE: /HELP-MSG JVS(&00)
```

## **Example**

```
/IF (IS-CATALOGED-JV(JV='PS'))
/WRITE-TEXT 'EXISTS'
/ELSE
/WRITE-TEXT 'CREATE'
/END-IF
```

Output:

CREATE

---

### 1.2.17.7 IS-INITIALIZED( ) - Check variable initialization

Domain: **Variable access / test functions**

The IS-INITIALIZED( ) function checks whether the specified variable has been initialized, i.e. whether its contents are valid. Even a null string is valid as the contents. A variable cannot be initialized unless it has been declared.

#### Format

IS-INITIALIZED( )
VARIABLE-NAME = string_expression

#### Result type

BOOLEAN

#### Input parameters

##### **VARIABLE-NAME = string\_expression**

Designates a variable. The variable name must be enclosed in apostrophes if it is specified directly, i.e. as a literal. A list variable must be identified in the form 'listenname#'. Individual list elements can be specified in the form 'listenname#elementindex'.

#### Result

*TRUE*

The variable designated by the VARIABLE-NAME parameter has been initialized.

*FALSE*

The variable designated by the VARIABLE-NAME parameter has not been initialized.

#### Error message

SDP1101 SYNTAX ERROR IN VARIABLE NAME

---

### 1.2.17.8 IS-SDF-P( ) - Check whether SDF-P is loaded

Domain: **Test functions**

The IS-SDF-P( ) function checks whether SDF-P has been loaded in the system. If it has, the result TRUE is returned. The result FALSE is returned in the following cases:

- SDF-P has not been loaded.
- SDF-P is loaded but SDF-P-BASYS functionality is currently being simulated in the task (FUNCTIONALITY=\*BASIC setting in the MODIFY-PROCEDURE-TEST-OPTIONS command, see “SDF-P” manual [34]).

If SDF-P has been loaded (i.e. the result is TRUE), it is possible to use functions or commands of the chargeable subsystem SDF-P in an IF branch (see example). However, this does not apply to chargeable control flow commands such as FOR, WHILE, REPEAT, since control flow commands are checked as part of pre-analysis, i.e. before the builtin function is called. If SDF-P is not loaded or SDF-P-BASYS functionality is being simulated, using the control flow command FOR, for example, will always result in an error.

#### Format

IS-SDF-P( )

#### Result type

BOOLEAN

#### Input parameters

None

#### Result

*TRUE*

SDF-P has been loaded in the system.

*FALSE*

SDF-P has not been loaded in the system or SDF-P-BASYS functionality is being simulated in the task.

#### Error message

None

#### Example 1

```
/A = IS-SDF-P
/SHOW-VAR A
A = TRUE
```

---

## Example 2

```
/SET-PROCEDURE-OPTIONS
.
.
.
/  IF  (IS-SDF-P)
/      "In this IF branch, all commands and builtin"
/      " functions of SDF-P can be used."
/      "However, SDF-P control flow commands cannot"
/      " be used (e.g. FOR, WHILE, REPEAT)."
```

---

### 1.2.17.9 JV() - Interrogate job variable

Domain:     **Job variable functions**

The JV function supplies the contents of the specified job variable or of a subarea defined by the START and LENGTH parameters. The chargeable subsystem JV must be loaded and the user must have read authorization for the job variable.

#### Format

JV()
JV-NAME = string_expression
,START = <u>1</u> / arithm_expression <sub>1</sub>
,LENGTH = <u>*REST-LENGTH</u> / arithm_expression <sub>2</sub>

#### Result type

STRING

#### Input parameters

##### **JV-NAME = string\_expression**

Designates a job variable; "string\_expression" must therefore be a valid job variable name or a JV link name identified by a preceding asterisk (\*).

##### **START = 1 / arithm\_expression<sub>1</sub>**

Designates the start position of the subarea to be extracted. The default value is the first character. arithm\_expression<sub>1</sub> must be a positive integer value which is less than the length of the JV value. If the value specified for arithm\_expression<sub>1</sub> is not valid, a null string will be returned.

##### **LENGTH = \*REST-LENGTH / arithm\_expression<sub>2</sub>**

Designates the length of the subarea to be extracted. The default value \*REST-LENGTH indicates that the subarea to be extracted begins at the position specified by START and extends to the end. If arithm\_expression<sub>2</sub> specifies a length differing from this which is too long, LENGTH = \*REST-LENGTH is assumed implicitly.

#### Result

Contents of the job variable designated by "string\_expression" or the part of it designated by "arithm\_expression<sub>1</sub>" and "arithm\_expression<sub>2</sub>".

---

## Error messages

```

              JOB VARIABLE'...'. IN SYSTEM MODE: /HELP-MSG DMS...
```

---

### 1.2.17.10 MAINCODE( ) - Interrogate error code

Domain: **Return codes**

The MAINCODE function returns the value of the maincode of the current return code. The maincode contains a message code which can be used to output the contents of the message. Output of the message contents can be initiated with the HELP-MSG-INFORMATION command or with the builtin function MSG( ). If subcode1 is equal to zero, SDF-P does not report an error. In this case, a return code cannot be interpreted unless it has been saved with the SAVE-RETURNCODE command.

MAINCODE( ) or return codes in general cannot be interrogated outside of dialog blocks and procedures.

#### Format

MAINCODE( )
MC( )

#### Result type

STRING (<string 7..7>)

#### Input parameters

None

#### Result

The value of the maincode is returned as the result in the form of a message code.

---

### 1.2.17.11 MSG( ) - Output message text

Domain: **Return codes** (messages)

The MSG( ) function supplies the message text assigned to the specified message code; this is done in the specified language and in the specified output format.

For some SDF-P commands, the message code may have been previously requested from the command return code, using the MAINCODE( ) function.

#### Format

```
MSG( )  
  
MSG-IDENTIFICATION = string_expression  
,LANGUAGE = *STD / *ENGLISH / *GERMAN  
,INSERT-00 = *NONE / string_expression  
,INSERT-01 = *NONE / string_expression  
      :           :           :  
,INSERT-29 = *NONE / string_expression  
,MSG-STRUCTURE-OUTPUT = *NONE / *SYSMSG
```

#### Result type

STRING (<string>)

#### Input parameters

##### MSG-IDENTIFICATION = string\_expression

string\_expression contains the 7-byte message code in the following format:

Bytes 1-3: Letters identifying the message class

Bytes 4-7: Digits 0-9, letters A-F as the hexadecimal representation of the exact error number

##### LANGUAGE = \*STD / \*ENGLISH / \*GERMAN

The message text is output in English or German. The default setting is \*STD, i.e. the text is output in the language set for the task. The (former) operand values \*E for \*ENGLISH and \*D for \*GERMAN are still supported for reasons of compatibility.

##### INSERT-*nn* = \*NONE / string\_expression

Designates the additional content of a message.

##### MSG-STRUCTURE-OUTPUT =

Specifies whether variables for the output of messages must be created and sent on.

---

### MSG-STRUCTURE-OUTPUT = \*NONE

Variables for the output of messages are not sent on via S variable stream SYSMSG. The message text is not supplied by the command /HELP-MSG-INFORMATION MSG-ID=\*LAST.

### MSG-STRUCTURE-OUTPUT = \*SYSMSG

If messages are guaranteed, variables for the output of messages are sent on via S variable stream SYSMSG. The message text can be obtained by the command /HELP-MSG-INFORMATION MSG-ID=\*LAST.

## Result

Message text in the form of a string.

Null string (") means, that no text has been assigned to this message code.

## Error messages

```
SDP0413  ILLEGAL LENGTH
```

```
SDP0418  INVALID MSG-IDENTIFICATION
```

## Example

```
/A=MSG(MSG-IDENTIFICATION='SDP1018',"This message is guaranteed" -
/      INSERT-00='MY-VARIABLE', -
/      MSG-STRUCTURE-OUTPUT = *SYSMSG)
/B=MSG(MSG-IDENTIFICATION='SDP1010',"This message is NOT guaranteed" -
/      INSERT-00='MY-SECOND-VARIABLE', -
/      MSG-STRUCTURE-OUTPUT = *SYSMSG)
/SHOW-VARIABLE *ALL
A = %   SDP1018 VARIABLE 'MY-VARIABLE' ALREADY EXISTS BUT WITH OTHER
ATTRIBUTES
B = %   SDP1010 VARIABLE 'MY-SECOND-VARIABLE' HAS NO VALUE
*END-OF-CMD
```

---

### 1.2.17.12 SDF-P-VERSION( ) - Interrogate SDF-P version

Domain:     **Procedure information**

The SDF-P-VERSION( ) function provides information on the installed version of the (chargeable) subsystem SDF-P or on the current version of the subsystem SDF-P-BASYS contained in the basic configuration.

#### Format

SDF-P-VERSION( )
FUNCTION-RANGE = <u>*STD</u> / *BASIC

#### Result type

STRING

#### Input parameters

##### **FUNCTION-RANGE = \*STD**

Current version of the (chargeable) subsystem SDF-P, if this is loaded, otherwise the current SDF-P-BASYS version.

##### **FUNCTION-RANGE = \*BASIC**

Current version of the subsystem SDF-P-BASYS contained in the basic configuration.

#### Result

Version information in the form of a string.

#### Error messages

None

#### Example

```
/A = SDF-P-VERSION
/B = SDF-P-VERSION(FUNCTION-RANGE=*BASIC)
/SHOW-VARIABLE (A,B)
A = V02.5E10
B = V02.5E10
```

---

### 1.2.17.13 SUBCODE1() - Interrogate subcode1

Domain: **Return codes**

The SUBCODE1 function supplies the value of subcode1 of the current return code.

A subcode1 not equal to zero means that an error has occurred, in which case SDF-P branches to the next IF-BLOCK-ERROR or IF-CMD-ERROR command (see corresponding descriptions). If subcode1 is equal to zero, SDF-P does not report an error. In this case, a return code cannot be interpreted unless it has been saved with the SAVE-RETURNCODE command.

SUBCODE1( ) is not available outside of procedures and dialog blocks.

#### Format

SUBCODE1( )
SC1( )

#### Result type

INTEGER (<integer 0..255>)

#### Input parameters

None

#### Result

Designation of the error class in the form of an integer value <integer 0..255>

0

No error has occurred in the current procedure or the return code was saved with /SAVE-RETURNCODE after an error-free command.

---

### 1.2.17.14 SUBCODE2( ) - Interrogate subcode2

Domain: **Return codes**

The SUBCODE2 function supplies the value of subcode2 of the current return code. Subcode2 can contain additional information. If subcode1 is equal to zero, SDF-P does not report an error. In this case, a return code cannot be interpreted unless it has been saved with the SAVE-RETURNCODE command.

SUBCODE2( ) is not available outside of procedures and dialog blocks.

#### Format

SUBCODE2( )
SC2( )

#### Result type

INTEGER (<integer 0..255>)

#### Input parameters

None

#### Result

Value of subcode2 as an integer value (<integer 0..255>)

### 1.2.17.15 Commands supported by SDF-P-BASYS

The following table contains all SDF-P commands which are available with the nonchargeable subsystem SDF-P-BASYS. The commands are described in this “Commands” manual.

Command	Brief description
ASSIGN-STREAM	Assign S variable stream
BEGIN-PARAMETER-DECLARATION	Initiate declaration of procedure parameters in procedure header
CALL-PROCEDURE	Start command sequence
CLOSE-VARIABLE-CONTAINER	Close variable container
DECLARE-PARAMETER	Declare procedure parameters
DECLARE-VARIABLE	Declare variable
DELETE-VARIABLE	Delete a variable
ELSE	Initiate ELSE branch in IF block
END-IF	Terminate IF block
END-PARAMETER-DECLARATION	Terminate declaration of procedure parameters
EXIT-PROCEDURE	Terminate procedure
GOTO	Branch to marker
IF	Initiate IF block
IF-BLOCK-ERROR	Initiate block error recovery
MODIFY-PROCEDURE-OPTIONS (only with the SUPPRESS-SDP-MSG operand)	Modify procedure options during program execution
OPEN-VARIABLE-CONTAINER	Open variable container stored as PLAM library element
SAVE-RETURNCODE	Save current command return code
SAVE-VARIABLE-CONTAINER	Save variable container
SET-PROCEDURE-OPTIONS	Define procedure attributes
SET-VARIABLE	Assign value to variable
SHOW-VARIABLE	Output contents of variable

### 1.2.17.16 Subsystem installation

The following files are delivered along with SDF-P-BASYS V2.5:

File name	Contents
SIPLIB.SDF-P-BASYS.025	Library for privileged interfaces
SKMLNK.SDF-P-BASYS.025	Independent part of SDF-P-BASYS, which is loaded automatically at startup (for SU x86)
SYSLIB.SDF-P-BASYS.025	SDF-P-BASYS Assembler macros
SYSLNK.SDF-P-BASYS.025	Independent part of SDF-P-BASYS, which is loaded automatically at startup (for SU /390 and S servers)
SYSMES.SDF-P-BASYS.025	Message file containing SDF-P messages
SYSPRC.SDF-P-BASYS.025	Procedures for SDF-P-BASYS (e.g. FHDR)
SYSRMS.SDF-P-BASYS.025	RMS delivery sets for SDF-P-BASYS
SYSSDF.SDF-P-BASYS.025	Syntax file containing only commands which SDF-P-BASYS executes itself
SYSSII.SDF-P-BASYS.025 <sup>1)</sup>	Structure and installation information file of IMON
SYSSSC.SDF-P-BASYS.025	SSCM catalog which defines the SDF-P-BASYS subsystem

<sup>1)</sup> After SYSSII files have been successfully installed on the target system they are deleted. They are, however, saved in the \$SYSSAG.SOLLIB.IMON.SYSSII library as X elements.

---

*IMON installation information for SDF-P-BASYS*

<b>Logical IMON name</b>	<b>Default file name</b>
SIPLIB	\$TSOS.SIPLIB.SDF-P-BASYS.025
SYSLIB	\$TSOS.SYSLIB.SDF-P-BASYS.025
SYSLNK	\$TSOS.SYSLNK.SDF-P-BASYS.025
SYSLNK	\$TSOS.SKMLNK.SDF-P-BASYS.025
SYSTEMS	\$TSOS.SYSTEMS.SDF-P-BASYS.025
SYSPRC	\$TSOS.SYSPRC.SDF-P-BASYS.025
SYSREP	\$TSOS.SYSREP.SDF-P-BASYS.025
SYSRMS	\$TSOS.SYSRMS.SDF-P-BASYS.025
SYSSDF	\$TSOS.SYSSDF.SDF-P-BASYS.025
SYSSII	\$TSOS.SYSSII.SDF-P-BASYS.025 <sup>1)</sup>
SYSSSC	\$TSOS.SYSSSC.SDF-P-BASYS.025

<sup>1)</sup> After SYSSII files have been successfully installed on the target system they are deleted. They are, however, saved in the \$SYSSAG.SOLLIB.IMON.SYSSII library as X elements.

---

## 1.3 Overviews

This chapter contains the following overviews:

- Overview of main functions of the BS2000 commands
- Domains
- Commands and their privileges
- Command aliases
- Commands of internal components

---

### 1.3.1 Overview of main functions of the BS2000 commands

The following tables show the commands collected in functional groups. Basically, the allocation of the commands to one of the functional groups is based on the assignments of the commands to the SDF domains. However, in the present case, subfunctions were taken into account within individual groups and a number of commands have been assigned to various groups.

The following functional groups have been formed:

- Accounting system control
- AUDIT mode control
- Job processing
- Operator terminal control
- User management
- Caching media control
- File processing
- Data communication control
- Error logging
- Device management
- Job variables
- Editing command files
- Message processing
- Net-Storage administration
- Operator function control
- POSIX administration and application
- Program control
- Procedures
- Pubset and MRSCAT management
- SDF control
- Controlling spoolout job
- Subsystem management
- System control and optimization

---

## **Accounting system control**

### 1.3.2 Domains

The commands are assigned to application areas known as domains according to their function. A command can be contained in more than one domain. An overview of all domains can be displayed in the SDF user interface and the desired command can be selected by way of the domain. Domains containing commands for the user are not displayed.

#### Overview of domains

Domain	Meaning
ACCOUNTING	Outputs information about the user ID and inserts data into accounting records
ALL-COMMANDS <sup>1)</sup>	Contains all the commands that are allocated to an domain
AUTOMATED-OPERATING	Commands for automating operator tasks
CONSOLE-MANAGEMENT	Console control and management
DATA-BASE	Database management and administration
DCAM	Controls transaction mode (DCAM)
DEVICE	Outputs information on devices and volumes
ERROR-LOGGING	Manages error logging files (hardware and software errors)
FILE	Manages files
FILE-GENERATION-GROUP	Manages file generation groups
FILE-TRANSFER	Transfers files between systems via network connections
JOB	Job control
JOB-VARIABLES	Manages job variables
MESSAGE-PROCESSING	Manages message files
MULTI-CATALOG-AND-PUBSET-MGMT <sup>2)</sup>	Controls file access in the local BS2000 computer network and handles pubset management
NETWORK-MANAGEMENT	Manages networking functionality
PREVENTIVE-DIAGNOSTIC-SUPPORT	Supports diagnostic aids
PROCEDURE	Controls command procedures
PROGRAM	Controls program runs
PROGRAMMING-SUPPORT	Calls compilers and programming tools
SDF	Commands for managing the SDF interface

SECURITY-ADMINISTRATION	Manages access authorizations and auditing
SNAPSET	Manages Snapsets, data backup and restoration
SPOOL-PRINT-ADMINISTRATION <sup>3)</sup>	Manages spool and print resources
SPOOL-PRINT-SERVICES <sup>4)</sup>	Spool and print functions for all users
STORAGE-MANAGEMENT	Manages external storages
SYSTEM-MANAGEMENT <sup>5)</sup>	Dynamic control of subsystem configuration
SYSTEM-TUNING	System monitoring and optimization
USER-ADMINISTRATION	User administration
UTILITIES	Calls utility routines
VM2000-VIRTUAL-MACHINE	Manages the virtual machine system

Table 13: Overview of domains

- 1 The domain includes all the commands that can be entered in dialog mode.
- 2 The domain is a long-term replacement for the MULTI-CATALOG domain.
- 3 The domain is a long-term replacement for the RSO-SPOOL-ADMNISTRATION domain.
- 4 The domain is a long-term replacement for the SPOOL domain.
- 5 The domain is a long-term replacement for the SUBSYSTEM-MANAGEMENT domain.

---

## Domains and the associated commands

The following overview groups the commands that are described in this manual under the domains to which they are allocated. Domains which do not contain any of the commands described in the manual are not listed.

### ACCOUNTING

- CHANGE-ACCOUNTING-FILE
- CHANGE-RESLOG-FILE
- MODIFY-ACCOUNTING-PARAMETERS
- SHOW-ACCOUNTING-STATUS
- START-ACCOUNTING
- START-RESLOG-EVALUATION
- STOP-ACCOUNTING
- WRITE-ACCOUNTING-RECORD

### CONSOLE-MANAGEMENT

- ADD-CONSOLE-FILTER
- ASSIGN-SYSEVENT
- MODIFY-MSG-SUBSCRIPTION
- RELEASE-OPERATOR-ROLE
- REQUEST-OPERATOR-ROLE
- RESET-MSG-SUPPRESSION
- SET-MSG-SUPPRESSION
- SHOW-CMD-ATTRIBUTES
- SHOW-CONSOLE-FILTER
- SHOW-CONSOLE-STATUS
- SHOW-MSG-SUBSCRIPTION
- SHOW-MSG-SUPPRESSION
- SHOW-OPERATOR-ATTRIBUTES
- SHOW-OPERATOR-ROLE
- SHOW-PENDING-MSG
- SHOW-SYSEVENT-LOG
- SHOW-SYSEVENT-LOG-ATTRIBUTES

---

### 1.3.3 Commands and their privileges

The table below contains all the commands which are described in this manual.

The last two columns show the routing code (RC) of the operator commands in accordance with the system parameter NBCONOPI (see the "Introduction to System Administration" [14]).

The following abbreviations are used in the table:

Abbreviation	Meaning
AC	ACS-ADMINISTRATION
HW	HARDWARE-MAINTENANCE
HS	HSMS-ADMINISTRATION
PO	POSIX-ADMINISTRATION
PR	PRINT-ADMINISTRATION
SAE	SAT-FILE-EVALUATION
SAM	SAT-FILE-MANAGEMENT
SEC	SECURITY-ADMINISTRATION
STD	STD-PROCESSING
SUB	SUBSYSTEM-MANAGEMENT
MO	SW-MONITOR-ADMINISTRATION
TP	TAPE-ADMINISTRATION
TS	TSOS-PRIVILEG
US	USER-ADMINISTRATION
OP	OPERATING
BN	BS bei NBCONOPI=N
BY	BS bei NBCONOPI=Y

Command	Privileges																
	AC	HW	HS	PO	PR	SAE	SAM	SEC	STD	SUB	MO	TP	TS	US	OP	BN	BY
ACTIVATE-SNAPSHOT													X		X	R	R
ADAPT-SNAPSET-ACCESS			X										X				
ADD-ACS-SYSTEM-FILE	X																
ADD-ALIAS-CATALOG-ENTRY	X					X	X	X	X								
ADD-ASE-ELEMENT													X				
ADD-CATALOG-FILE													X				
ADD-CHANGE-DATE													X				
ADD-CJC-ACTION		X				X	X	X	X								
ADD-CONSOLE-FILTER															X	@	@
ADD-CRYPTO-PASSWORD		X				X	X	X	X								
ADD-DEVICE-DEPOT															X	T	T
ADD-FILE-LINK		X				X	X		X							\$	E
ADD-IO-UNIT															X	G	G
ADD-ISAM-POOL-LINK									X								
ADD-MASTER-CATALOG-ENTRY													X			\$	\$
ADD-NET-STORAGE-VOLUME													X				
ADD-PASSWORD		X				X	X	X	X							\$	E
ADD-POSIX-USER													X	X			
ADD-SUBSYSTEM										X							
ADD-USER									X					X		\$	\$
AGOGO															X	E	E
ASR															X	E	E
ASSIGN-STREAM		X				X	X	X	X						X		

ASSIGN-SYSDTA		X				X	X	X	X								
ASSIGN-SYSEVENT									X						X		
ASSIGN-SYSLST		X				X	X	X	X								
ASSIGN-SYSOUT		X				X	X	X	X								
ASTOP															X	@	@
ATTACH-DEVICE															X	G	G

Table 14: Commands with privileges

- 1 With NBCONOPI = Y, the CONSOLE command has no routing code and is therefore not available.
- 2 With NBCONOPI = N, the EXIT-JOB and SET-LOGON-PARAMETERS command have no routing code and are therefore not available.

---

### 1.3.4 Command aliases

Some of the commonest commands have an additional alias name, marked “Alias” to the right of the full command name in the syntax diagram (see also [section "SDF syntax representation"](#)).

The alias consists of up to 8 characters (A..Z). An exception is made in the case of the “START commands” (for example, POSIX-SHELL is the alias for START-POSIX-SHELL). The alias is derived from the full command name, with the name elements always being abbreviated in the same way (e.g. CR for CREATE).

In some cases there may be two aliases (e.g. CL and CLP for CALL-PROCEDURE).

The defined command alias is guaranteed in the long term. The alias cannot be further abbreviated.

The following overview lists all the commands described in Volumes 2 to 7 together with their aliases.

Command	Alias
ADD-CRYPTO-PASSWORD	ADCPW
ADD-FILE-LINK	ADFL
ADD-PASSWORD	ADPW
BROADCAST	BCST
CALL-PROCEDURE	CL / CLP
CANCEL-JOB	CNJ
CANCEL-PROCEDURE	CNP
CANCEL-PROGRAM	CNPG
CHANGE-FILE-LINK	CGFL
COPY-FILE	CPF
COPY-JV	CPJV
COPY-POSIX-FILE	CPXF / BS2CP
COPY-SYSTEM-FILE	CPSF
CREATE-FILE	CRF
CREATE-FILE-GENERATION	CRFGN
CREATE-FILE-GROUP	CRFGP
CREATE-JV	CRJV
DECLARE-VARIABLE	DCV
DELETE-FILE	DLF
DELETE-FILE-GENERATION	DLFGN

DELETE-FILE-GROUP	DLFGP
DELETE-JV	DLJV
DELETE-SYSTEM-FILE	DLSF
EDIT-FILE-ATTRIBUTES	EDFA
EDIT-FILE-LINK	EDFL
EDIT-JOB	EDJ
EDIT-JOB-OPTIONS	EDJO
EDIT-JV	EDJV
EDIT-JV-ATTRIBUTES	EDJVA
ENTER-JOB	ENJ
ENTER-PROCEDURE	ENP
EXECUTE-POSIX-CMD	ECXCMD
HELP-MSG-INFORMATION	HP / HPMSGI
HELP-SDF	HPSDF
INFORM-PROGRAM	IFPG
LOAD-ALIAS-CATALOG	LDAC
LOAD-EXECUTABLE-PROGRAM	LDX
LOAD-PROGRAM	LDPG
MESSAGE	MSG
MODIFY-FILE-ATTRIBUTES	MD / MDFA
MODIFY-FILE-GENERATION-SUPPORT	MDFGNS

### 1.3.5 Commands of internal components

BS2000 OSD/BC contains some components which are used only for internal purposes, e.g. test purposes. Commands of these components are not described in this manual as they have not been generally released for customers. These commands are listed in the table below.

Command	Component	Function
ACTIVATE-SYSTEM-HOOK	AIDSYSA	Activate system hook testpoints
ADD-SYSTEM-HOOK	AIDSYSA	Set a system hook testpoint
DEACTIVATE-SYSTEM-HOOK	AIDSYSA	Deactivate system hook testpoints
MODIFY-SYSTEM-HOOK	AIDSYSA	Change a system hook testpoint
MODIFY-SYSTEM-HOOK-PROCESSING	AIDSYSA	Change options for system hook testpoints
REMOVE-SYSTEM-HOOK	AIDSYSA	Remove a system hook testpoint
SHOW-MAP-INFORMATION	AIDSYSA	Display information on BLS icons
SHOW-SYMBOL-INFORMATION	AIDSYSA	Display information on DSect icons of the system
SHOW-SYSTEM-HOOK-ATTRIBUTES	AIDSYSA	Display system hook testpoints
SHOW-SYSTEM-HOOK-LOGGING	AIDSYSA	Display logging data for system hook testpoints
SHOW-SYSTEM-HOOK-PROCESSING	AIDSYSA	Display options for system hook testpoints
DELETE-ORDER	ASTI	Delete request for a service
MODIFY-SERVICE-PARAMETER	ASTI	Modify service parameters (e.g. use authorization)
PROCESS-ORDER	ASTI	Fetch jobs from ASTI or return results
REQUEST-ORDER-RESULT	ASTI	Request the result of an asynchronous job
SEND-ORDER	ASTI	Send a request for a service
SHOW-ORDER-STATUS	ASTI	Display the status of requests for services
SHOW-SERVICE-STATUS	ASTI	Display the status of one or all services
START-SERVICE	ASTI	Start a service
STOP-SERVICE	ASTI	Stop a service
ADD-TELESERVICE-MSG	BS2CP	Add the specified messages to the list of messages which are displayed in the diagnostics center

Command	Component	Function
GRANT-PROP-CONNECTION	BS2CP	Internal command: PROP-XT calls operating
REMOVE-TELESERVICE-MSG	BS2CP	Remove the specified messages from the list of messages which are displayed in the diagnostics center
SHOW-TELESERVICE-MSG	BS2CP	Display the messages which are displayed in the diagnostics center
LOAD-TPR-PROGRAM	CAPRI	Load a TPR program
SHOW-TPR-PROGRAM-STATUS	CAPRI	Display information on loaded entries
START-TPR-PROGRAM	CAPRI	Start a TPR program
UNLOAD-TPR-PROGRAM	CAPRI	Unload a TPR program
END-IDIAS	IDIAS	Task is no longer the IDIAS monitor task
ADD-INSTRUCTION-STOP	IDIAS	Set IDIAS instruction stop
ADD-WRITE-STOP	IDIAS	Set IDIAS write stop
BEGIN-IDIAS	IDIAS	Task becomes IDIAS monitor task
CREATE-SYSTEM-DUMP	IDIAS	Generate IDIAS-NO-EDIT dump
LOAD-IDIAS-EXIT	IDIAS	Load IDIAS exit module
MODIFY-IDIAS-DEFAULTS	IDIAS	Modify global IDIAS parameters
MODIFY-INSTRUCTION-STOP	IDIAS	Modify IDIAS instruction stop
MODIFY-WRITE-STOP	IDIAS	Modify IDIAS write stop
REMOVE-INSTRUCTION-STOP	IDIAS	Reset IDIAS instruction stop
REMOVE-WRITE-STOP	IDIAS	Reset IDIAS write stop
RESUME-IDIAS-TEST-TASK	IDIAS	Activate IDIAS test task
SHOW-IDIAS-DEFAULTS	IDIAS	Display global IDIAS parameters
SHOW-IDIAS-STATUS	IDIAS	Display all IDIAS stops and FTT
SHOW-IDIAS-TRACES	IDIAS	Display IDIAS foreign task traces
SHOW-INSTRUCTION-STOPS	IDIAS	Display IDIAS instruction stops
SHOW-SYSTEM-DUMP-STATUS	IDIAS	Display IDIAS system dump status
SHOW-WRITE-STOPS	IDIAS	Display IDIAS write stops
TRACE-INSTRUCTIONS	IDIAS	IDIAS foreign task trace (FTT)

---

UNLOAD-IDIAS-EXIT	IDIAS	Unload IDIAS exit module
WAIT-IDIAS-EVENT	IDIAS	Wait for IDIAS stop event

Table 16: Commands of internal components

## 2 ACTIVATE-SNAPSHOT - DECRYPT-FILE

The manual "Commands" is divided into the following chapters:

- General Part
- ACTIVATE-SNAPSHOT - DECRYPT-FILE
- DELETE-ALTERNATE-INDEX - LOGOFF
- MAIL-FILE - MOVE-TASK-TO-CATEGORY
- OPEN-VARIABLE-CONTAINER - SHOW-DSSM-INFORMATION
- SHOW-FILE - SHOW-PUBSET-SPACE-DEFAULTS
- SHOW-RESOURCE-ALLOCATION - WRITE-TEXT

---

## 2.1 ACTIVATE-SNAPSHOT

Start dump generator SNAP

**Component:** BS2000 OSD/BC

**Functional area:** System control and optimization

**Domain:** SYSTEM-MANAGEMENT

**Privileges:** TSOS  
OPERATING

**Routing code:** R

### Function

The ACTIVATE-SNAPSHOT enables the SNAP dump function. Any suspended SNAP dump will be processed (i.e. it will be assigned index structures for evaluation with the DAMP program and copied to the SYSSNAP ID). The command can be executed multiple times, e.g. in order to modify the size of the system file \$TSOS.SNAPFILE.

ACTIVATE-SNAPSHOT is executed asynchronously. Message NSP4000 confirms that the command has been received correctly. The SHOW-SNAPSHOT-STATUS command enables you to check the modified settings.

**i** Manual changes to the Snapshot files can lead to undefined statuses when the SNAP dump takes place. Modifications may only be made using the ACTIVATE-SNAPSHOT and DEACTIVATE-SNAPSHOT commands.

### Format

<b>ACTIVATE-SNAPSHOT</b>
<b>FILE-SIZE</b> = <u>*UNCHANGED-OR-STD</u> / <integer 16..1024 <i>Mbyte</i> >

### Operands

**FILE-SIZE = \*UNCHANGED-OR-STD / <integer 16..1024> *Mbyte***

Determines the size of the system file \$TSOS.SNAPFILE on the home pubset.

**FILE-SIZE = \*UNCHANGED-OR-STD**

The size of the system file \$TSOS.SNAPFILE remains unchanged. If it does not yet exist, it is created with the standard size of 144 MB.

**FILE-SIZE = <integer 16..1024 *Mbyte*>**

Size of the system file \$TSOS.SNAPFILE on the home pubset. The system file is expanded or reduced as required. If it does not yet exist, a new system file is created with this size.

**i** A size of at least 144 MB is recommended.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

---

## 2.2 ADAPT-SNAPSET-ACCESS

Adapt access to Snapsets in the case of remote mirroring

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	SNAPSET MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS HSMS-ADMINISTRATION

### Function

If access to the disks of the pubset is switched dynamically between the source and target controllers (e.g. by using SHC-OSD commands), access to the Snapsets assigned to the pubset is not also switched automatically. The ADAPT-SNAPSET-ACCESS command ensures that the Snapsets assigned are still available after such a switchover without the pubset having to be exported.

When the command is called, a check is made to see whether access to the assigned Snapsets takes place in the same controller as access to the disks of the pubset. If this is not the case, the switchover is emulated for the Snapsets assigned to the pubset:

- The Snapsets currently attached are taken out of service.
- The Snapsets of the local controller are then attached.

To execute the command the pubset must be in the LOCAL-ACCESSIBLE status. In the case of shared pubsets, Snapset access is adapted for all sharers of the pubset.

### Format

<b>ADAPT-SNAPSET- ACCESS</b>
----------------------------------

<b>PUBSET</b> = <cat-id 1..4>
-------------------------------

### Operands

**PUBSET** = <cat-id 1..4>

Catalog ID of the pubset for which Snapset access is to be adapted.

---

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	32	CMD0216	User does not have the necessary privilege
	64	DMS1386	Error in the memory request
	64	DMS138B	No MRSCAT entry
	64	DMS13D5	The specified Snapset does not exist on the pubset
1	64	DMS13D7	Internal error in Snapset management: Return code of GCF
4	64	DMS13D7	Internal error in Snapset management: Return code when setting/resetting the reconfiguration lock
6	64	DMS13D7	Internal error in Snapset management: Return code of SHC-OSD
7	64	DMS13D7	Internal error in Snapset management: Return code of CCOPY
	64	DMS13D8	The pubset has no Snapsets
	64	DMS13E5	Snapset catalog does not exist

---

## 2.3 ADD-ACS-SYSTEM-FILE

Declare ACS system file

**Component:** ACS  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** ACS-ADMINISTRATION

### Function

The ADD-ACS-SYSTEM-FILE command is used by system administration to declare a new AC system file identifier, and to assign the file name and attributes to this identifier. Users who wish to load the entries from an AC system file into their virtual alias catalog can use this identifier, i.e. the symbolic name of the AC system file, to address the file. The SHOW-ACS-SYSTEM-FILES command enables the user to request that the list of available AC system files is displayed. However, the ACS administrator can specify, when setting the attributes, that output of the identifier and its associated file name is suppressed. The system administration can also specify that the identifier which is being declared is to act as the default AC system file. In this case, the entries in this file will be read if the user specifies in command LOAD-ALIAS-CATALOG the identifier as “\*STD”. The access protection of the AC system file is observed (e.g. user-ACCESS=\*OWNER-ONLY denies access to the AC system file from a foreign userid).

If the specified identifier already exists for an AC system file, the existing definition will be replaced by the new one. The declarations relating to the AC system files remain in effect until shutdown. When the subsystem is unloaded, the declarations will only be deleted if the operand SUBSYSTEM-PARAMETER = 'RESET' is specified in the STOP-SUBSYSTEM command.

### Format

#### ADD-ACS-SYSTEM-FILE

**ALIAS-CATALOG-ID** = <composed-name 1..20>

,**FILE-NAME** = <filename 1..54>

,**ATTRIBUTES** = **\*STD** / list-poss(4): **\*SYSTEM-DEFAULT** / **\*INVISIBLE** / **\*SECRET-FILE-NAME** /  
**\*PRIVILEGED**

### Operands

**ALIAS-CATALOG-ID** = <composed-name 1..20>

The symbolic name under which the AC system file can be addressed by a LOAD-ALIAS-CATALOG command.

The user can request display of a list of all the available AC system files by a SHOW-ACS-SYSTEM-FILES command.

**FILE-NAME** = <filename 1..54>

The fully qualified actual name of the AC system file, in which the entries are stored. Before the file is added into the list of AC system files, the FILE-NAME operand will, if necessary, be supplemented by the user ID and default catalog ID of the calling task.

---

**ATTRIBUTES =**

Declares the attributes to be given to the AC system file.

**ATTRIBUTES = \*STD**

Preset value: The AC system file is not to be given any of the following attributes.

**ATTRIBUTES = \*SYSTEM-DEFAULT**

The AC system file is to be used as the default AC system file. The entries from this file will then automatically be loaded into the user's alias catalog if the ALIAS-CATALOG-ID operand in the LOAD-ALIAS-CATALOG command has the value \*STD. If more than one AC system file is given the attribute SYSTEM-DEFAULT, then the last assignment will always be the one which applies. If none of the AC system files is explicitly given this attribute, it is implicitly given to the first which was declared as a system file.

**ATTRIBUTES = \*INVISIBLE**

Specifies that when the AC system files which are available to the nonprivileged user are output (SHOW-ACS-SYSTEM-FILES command), the entry for this file should not be displayed. The identifier of this AC system file can thus only be used by users to whom it has previously been notified, or who can invoke specially prepared procedures. If the SHOW-ACS-OPTIONS command is used to output the AC files which are loaded then, instead of its ID, the character '\*' will be shown for this file if the caller is not the ACS administration.

**ATTRIBUTES = \*SECRET-FILE-NAME**

Specifies that when the list of AC files which are available to nonprivileged users is output (SHOW-ACS-SYSTEM-FILES and SHOW-ACS-OPTIONS commands), instead of the file name of this AC system file the string '\*SYSTEM' is to appear. The (nonprivileged) user thus has no way of revealing the actual name of the file.

**ATTRIBUTES = \*PRIVILEGED**

Specifies that when the AC system file is used (LOAD-ALIAS-CATALOG ALIAS-CATALOG-ID = <id> command), its entries are to be copied into the virtual alias catalog of the task as **system entries**.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed normally
	32	CMD0221	Internal error
	64	ACS0013	Invalid ACSF declaration
	130	ACS0036	Resource bottleneck

---

## 2.4 ADD-ALIAS-CATALOG-ENTRY

Add entry to current alias catalog

<b>Component:</b>	ACS
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING ACS-ADMINISTRATION SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The ADD-ALIAS-CATALOG-ENTRY command adds an entry into the current alias catalog of a task. Any existing entry for the same alias in the catalog is overwritten.

If no alias catalog yet exists for the task, it is automatically set up with the first entry. The following attributes can be defined by the user for the new entry created:

- real file or job variable name to be used for the alias name
- whether the alias substitution is to be logged
- whether the entry is displayed in the output of the SHOW-ALIAS-CATALOG-ENTRY command
- whether the entry is protected against changes or deletion by the MODIFY-ALIAS-CATALOG-ENTRY or REMOVE-ALIAS-CATALOG-ENTRY command
- the range of substitution: the entry should apply only for files, only for job variables, or for both (RANGE operand)

Entries created with ADD-ALIAS-CATALOG-ENTRY are only temporarily present in the task-local alias catalog, which means they are discarded when the alias catalog is deleted (explicitly with the PURGE-ALIAS-CATALOG command or implicitly when the task is terminated). If desired, however, such entries can be saved in a file by using the STORE-ALIAS-CATALOG command.

#### *Privileged functions*

When an individual catalog entry is being created, only the ACS administrator can explicitly make a distinction between user and system entries (TYPE operand). An alias explicitly created as a system entry is subject to less rigorous checking: it is always permissible to specify a catalog ID and user ID for it (except \$SYS\* and \$TSOS).

---

## Format

### ADD-ALIAS-CATALOG-ENTRY

```
ALIAS-FILE-NAME = <filename 1..54>
, FILE-NAME = <filename 1..54> / *SAME
, ATTRIBUTES = *STD / *PARAMETERS(...)
    *PARAMETERS(...)
        | LOGGING = *NO / *YES
        | , VISIBILITY = *YES / *NO
        | , PROTECTION = *NO / *YES
, TYPE = *USER / *SYSTEM
, RANGE = *STD / *FILE / *JV / *BOTH
```

## Operands

### ALIAS-FILE-NAME = <filename 1..54>

Alias for which the actual file or job variable name is to be replaced by ACS.

Not permitted are names of temporary files or job variables, TSOS user ID files or job variables, files or job variables of a user ID beginning with *SYS* and file names containing a specification of a generation or version. The ACS administrator can impose a general inhibit on the specification of a catalog and/or user ID (see the MODIFY-ACS-OPTIONS command). Regardless of this, the user ID of the current task can always be contained in alias names.

### FILE-NAME = <filename 1..54>

Actual file or job variable name to be substituted by ACS for the alias. The name of a temporary file is not allowed, nor is it permitted to specify a generation or version. If the actual name is identical to the alias, the entry is treated as a normal alias definition (in contrast to \*SAME). The replacement of the file name is logged as ACS0000. The substitution of the job variable name is logged with ACS0049.

### FILE-NAME = \*SAME

The actual file or job variable name is the same as the alias. That is why no substitution takes place in this case. However, the entry prevents the insertion of the defined prefix (see SET-FILE-NAME-PREFIX command). The substitution of the file or job variable name is logged.

### ATTRIBUTES = \*STD / \*PARAMETERS(...)

Defines the attributes of the new entry created in the alias catalog.

### ATTRIBUTES = \*STD

Specifies that the entry in the alias catalog is to have the following attributes:

- LOGGING=\*NO
- VISIBILITY=\*YES

- 
- PROTECTION=\*NO

**ATTRIBUTES = \*PARAMETERS(...)**

Attributes of the new entry are to be defined.

**LOGGING = \*NO / \*YES**

Logs substitution of the alias names. Independently of that, logging can be requested via ACS options. For security reasons, logging takes place only if one of both settings requires it.

**VISIBILITY = \*YES / \*NO**

Prevents the entry in the alias catalog from appearing in the output of the SHOW-ALIAS-CATALOG-ENTRY command for a non-privileged user.

**PROTECTION = \*NO / \*YES**

Protects the entry in the alias catalog against changes and deletion with the MODIFY-ALIAS-CATALOG-ENTRY and REMOVE-ALIAS-CATALOG-ENTRY commands respectively.

**TYPE = \*USER / \*SYSTEM**

*This operand is available only to users with the ACS-ADMINISTRATION privilege.*

Indicates whether the specified entry is to be of the type USER or SYSTEM.

**TYPE = \*USER**

Preset value: The entry made in the catalog will be a user entry. When the virtual catalog is saved, this entry will be included in the file records.

**TYPE = \*SYSTEM**

The catalog entry is to be made as a system entry. If the catalog is saved to a nonprivileged user's file, this entry will not be included.

**RANGE = \*STD / \*FILE / \*JV / \*BOTH**

Determines the range of the entry. Alias substitution can be defined for files and/or job variables.

**RANGE = \*STD**

Default: Alias substitution takes place using the ACS setting which applies for the task (ACS option STANDARD-RANGE).

**RANGE = \*FILE**

Alias substitution is only effective for files.

**RANGE = \*JV**

Alias substitution is only effective for job variables.

**RANGE = \*BOTH**

Alias substitution is effective for both files and job variables.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed normally
	64	ACS0024	Invalid alias catalog entry
	64	ACS0029	Command is not permitted
	128	ACS0018	ACS is not available
	130	ACS0036	Resource bottleneck

## Examples

*Example 1: Load alias catalog, change entries, substitution function*

```

```

- (1) The SHOW-ACS-SYSTEM-FILE command shows the IDs of the available AC system files.
- (2) The SHOW-ALIAS-CATALOG-ENTRY command shows that no task-local alias catalog is loaded.

- (3) The LOAD-ALIAS-CATALOG command loads system entries from the \$TSOS.SYSTEM.ACS.ALL-PIVILEGE AC system file and activates the ACS replacement function.
- (4) The SHOW-ALIAS-CATALOG-ENTRY command shows that two alias name definitions have been loaded.
- (5) In the SHOW-FILE-ATTRIBUTES command, the alias name *LOAD-BIND* is replaced by the defined real file name *\$.BINDER* before the command is executed.
- (6) The ADD-ALIAS-CATALOG-ENTRY command adds to the alias catalog a definition containing the alias name *LMS* for the file *\$.LMSCONV* (user entry).  
(ADD-ALIAS-CATALOG-ENTRY for user is only allowed, if ACS was started with /START-ACS ..., SECURITY-LEVEL=\*LOW)
- (7) Shows the entries in the alias catalogs.
- (8) The ADD-ALIAS-CATALOG-ENTRY command adds to the alias catalog a definition containing the alias name *SF.SDF* for the file *\$TSOS.SYS.SDF.SYSTEM.SYNTAX* (user entry).
- (9) Shows the entries in the alias catalogs.
- (10) The ADD-ALIAS-CATALOG-ENTRY command adds to the alias catalog a definition with the alias name *BSP* for the file *LST.BSP.2* (user entry).
- (11) Shows the entries in the alias catalogs.
- (12) In the SHOW-FILE-ATTRIBUTES command the alias name *SF.SDF* is replaced by the defined real file name *\$TSOS.SYSSDF.BS2CP.210* before the command is executed.
- (13) As the specified name *SF.* does not correspond to an alias name, the SHOW-FILE-ATTRIBUTES command is used to display all files whose real file name begins with *SF.*
- (14) Shows the current ACS settings with the SHOW-ACS-OPTIONS command.
- (15) In the PRINT-DOCUMENT command, the alias name *BSP* is replaced by the defined real file name *LST.BSP.2* before the command is executed.
- (16) The LOAD-EXECUTABLE-PROGRAM command loads a program from the file *LMSCONV*. The message *BLS0500* shows that the program *LMSCONV* has been loaded.
- (17) The SHOW-JOB-STATUS command shows that the program *LMSCONV* has been loaded from the file *:SE11:\$TSOS.LMSCONV*. The name *LMS* specified in LOAD-EXECUTABLE-PROGRAM corresponds to a defined alias name. It was therefore replaced by the assigned real file name *:SE11:\$TSOS.LMSCONV* before the command was executed.

*Example 2: Save alias catalog, change entries*

```

% ACS0037 NUMBER OF ALIAS CATALOG ENTRIES: 3 (FOR SYSTEM: 0, FOR USER: 3)

```

- (1) The SHOW-ALIAS-CATALOG-ENTRY command shows all entries in the task-local alias catalog.
- (2) The STORE-ALIAS-CATALOG command saves all user entries in the alias catalog into the AC file *ACS.A1*.
- (3) Delete the entry with the alias name *LOAD-BIND*.
- (4) Delete the entry with the alias name *ASS*.
- (5) The SHOW-ALIAS-CATALOG-ENTRY command displays all entries in the task-local alias catalog. There remain only the three entries with the alias names *BSP*, *LOAD-PAMCONV*, and *SF.SDF*.
- (6) For the entry with the alias name *SF.SDF* the attribute VISIBILITY in the MODIFY-ALIAS-CATALOG-ENTRY command is removed.
- (7) On output with SHOW-ALIAS-CATALOG-ENTRY the entry with the alias name *SF.SDF* is not shown. The total line is however shown for all existing entries.
- (8) For the entry with the alias name *SF.SDF* the attribute PROTECTION und VISIBILIY is defined in the MODIFY-ALIAS-CATALOG-ENTRY command.
- (9) In the output with the SHOW-ALIAS-CATALOG-ENTRY command the entry with the alias name *SF.SDF* is flagged with the letter *P* (for PROTECTED).

- (10) The entry with the alias name *SF.SDF* is to be deleted. The REMOVE-ALIAS-CATALOG-ENTRY command is rejected due to the attribute PROTECTION .
- (11) The entry with the alias name *SF.SDF* is to be changed. The MODIFY-ALIAS-CATALOG-ENTRY command is rejected due to the attribute PROTECTION .
- (12) For the entry *BSP* a new real file name (*MAX.FILE.3*) is defined with the MODIFY-ALIAS-CATALOG-ENTRY command.
- (13) With the ADD-ALIAS-CATALOG-ENTRY command, a new entry with the alias name *MAX* is defined for the file *MAX.FILE.3*. The file *MAX.FILE.3* can now be accessed via both *MAX* and *BSP*.
- (14) Shows the user entries in the alias catalog.
- (15) The entries in the AC file *ACS.A1* are loaded into the alias catalog. All previous entries are thereby removed (MODE=\*REPLACE).
- (16) Output with the SHOW-ALIAS-CATALOG-ENTRY command shows only the three user IDs saved with STORE-ALIAS-CATALOG-ENTRY to the AC file *ACS.A1* (see 1 and 2 above). The system entries and all changes in the alias catalog made after saving have been removed.

*Example 3: Working with JV*

- (4) The SHOW-ALIAS-CATALOG-ENTRY command shows that two alias name definitions have been loaded.
- (5) The ADD-ALIAS-CATALOG-ENTRY command adds to the alias catalog a definition containing the alias name *TEST* for the file or job variable name *JOB.TEST* (user entry).

- 
- (6) The ADD-ALIAS-CATALOG-ENTRY command adds to the alias catalog a definition containing the alias name *J.JOB only* for the job variable JV.MONITOR.JOB.TEST (user entry).
  - (7) The ADD-ALIAS-CATALOG-ENTRY command adds to the alias catalog a definition containing the alias name *E.JOB only* for the file ENTER.JOB.TEST (user entry).
  - (8) The SHOW-ALIAS-CATALOG-ENTRY shows new entries.
  - (9) The alias name J.JOB is replaced by the job variable name JV.MONITOR.JOB.TEST and the message ACS0049 is sent (Attribute Logging). The content RUNNING is shown for the job variable JV.MONITOR.JOB.TEST .
  - (10) The file name J.JOB of the SHOW-FILE-ATTRIBUTES command is not replaced, because the alias definition is only set for job variables. The file J.JOB does not exist.
  - (11) The alias name E.JOB is replaced by the file name ENTER.JOB.TEST and the SHOW-FILE-ATTRIBUTES command shows the file.
  - (12) The SHOW-JV command replaces the alias name TEST with the job variable JOB.TEST and shows the content INITIAL.
  - (13) The SHOW-FILE-ATTRIBUTES command replaces the alias name TEST with JOB.TEST and shows the file.
  - (14) The SHOW-JV command does not replace the alias name E.JOB, because the alias name E.JOB was only defined for files. The job variable E.JOB does not exist.

For further examples, see the HOLD-ALIAS-SUBSTITUTION, LOAD-ALIAS-CATALOG and SET-FILE-NAME-PREFIX commands.

---

## 2.5 ADD-ASE-ELEMENT

Declare an ASE element

<b>Component:</b>	ASE
<b>Functional area:</b>	Error logging
<b>Domain:</b>	ERROR-LOGGING
<b>Privileges:</b>	TSOS

### Function

The ADD-ASE-ELEMENT command defines, for a particular set of SERSLOG events, monitoring which triggers specific actions when a defined threshold value for the occurrence of these events is reached. The set of events (RECORD-ID operand) can be defined as a

- selection of all messages, with the option of excluding message classes or messages,
- selection of one or more specified messages,
- selection of a message class, with the option of specifying limitation to one message range and/or of excluding messages.

The defined set of SERSLOG events forms an ASE element within the ASE (Auxiliary SERSLOG Extensions) subsystem for which particular criteria for monitoring and triggering actions are defined in the declaration:

- For monitoring purposes, a threshold value (THRESHOLD operand) defines the number of events which can occur before a renewed occurrence will trigger actions. It is also possible to define whether and how the repeated occurrence of the same events is to be handled (SUPPRESS-DUPLICATES, AFTER and SLEEP-TIME operands).
- The actions to be triggered (ACTION operand) which can be defined are the logging of the event in the internal buffer, output of a console message or triggering of a Teleservice call. Multiple actions can be combined.
- Monitoring can take place for all tasks or be limited to one particular task (TASK operand).

After the declaration has been made, ASE assigns a unique element ID for the ASE element. This ID enables the ASE element to be specified for deletion or for information output.

Information on ASE elements can be requested using the SHOW-ASE-ELEMENT command.

## Format

### ADD-ASE-ELEMENT

**RECORD-ID** = **\*ALL** (...) / **\*CLASS**(...) / list-poss(10): <alphanum-name 7..7>

**,SUPPRESS-DUPLICATES** = **\*NO** / **\*YES**(...)

**\*YES**(...)

| **AFTER** = **1** / <integer 1..9>

| **SLEEP-TIME** = **\*UNLIMITED** / <integer 1..999 *hours*> / <time>

**,ACTION** = list-poss(3): **\*INTERNAL-LOGGING** / **\*CONSOLE-MSG** / **\*TELESERVICE-CALL**

**,TASK** = **\*ALL** / <alphanum-name 4..4> / <c-string 4..4>

## Operands

**RECORD-ID** = **\*ALL**(...) / **\*CLASS**(...) / list-poss(10): <alphanum-name 7..7>

Determines the set of SERSLOG events which is to be monitored.

**RECORD-ID** = **\*ALL**(...)

All SERSLOG events are to be monitored. Entire message classes or individual messages can then be excluded.

**EXCLUDE-CLASS** = **\*NONE** / list-poss(10): <alphanum-name 3..3>

Specifies message classes which are to be excluded from monitoring. The default **\*NONE** means that no message classes are excluded.

**EXCLUDE-RECORD** = **\*NONE** / list-poss(10): <alphanum-name 7..7>

Specifies individual messages which are to be excluded from monitoring. The default **\*NONE** means that no messages are excluded.

**RECORD-ID** = **\*CLASS**(...)

One or all message ranges of a particular message class are to be monitored.

---

**RECORD-CLASS = <alphanum-name 3..3>**

Message class which is to be monitored.

**FROM = \*FIRST / <alphanum-name 4..4>**

Specifies the lower limit of the range. The default \*FIRST means that the range begins with the first message of the specified message class.

**TO = \*LAST / <alphanum-name 4..4>**

Specifies the upper limit of the range. The default \*LAST means that the range ends with the last message of the specified message class.

**EXCLUDE-RECORD = \*NONE / list-poss(10): <alphanum-name 4..4> / <alphanum-name 7..7>**

Specifies individual messages of the specified range which are to be excluded from monitoring. The specification <alphanum-name 4..4> contains the message code which ends with this character string. The default \*NONE means that no messages of the range are excluded.

**THRESHOLD = \*NONE / <integer 2..255>**

Specifies a threshold value which, when it is reached, causes the actions specified in the ACTION operand to be executed.

**THRESHOLD = \*NONE**

The first occurrence of a SERSLOG event from the set of record types specified in the RECORD-ID operand triggers actions.

**THRESHOLD = <integer 2..255>**

The specified number of SERSLOG events from the set specified in the RECORD-ID operand must have occurred in order to trigger actions.

**SUPPRESS-DUPLICATES = \*NO / \*YES(...)**

Defines how the repetition of SERSLOG events after the threshold value specified in the THRESHOLD operand has been reached is to be handled.

**SUPPRESS-DUPLICATES = \*NO**

Repeated events trigger actions.

**SUPPRESS-DUPLICATES = \*YES(...)**

Repeated events only trigger actions conditionally.

**AFTER = 1 / <integer 1..9>**

Determines the number of repetitions as of which the actions are to be suppressed. The default value 1 means that actions are suppressed from the first repetition on.

**SLEEP-TIME = \*UNLIMITED / <integer 1..999 hours > / <time>**

Specifies how long actions are to be suppressed. After the specified period has elapsed, the count associated with the AFTER operand is reinitialized.

**ACTION = list-poss(3): \*INTERNAL-LOGGING / \*CONSOLE-MSG / \*TELESERVICE-CALL**

Determines the actions which are to be executed when the specified trigger criteria are met. Up to three actions can be specified in a list.

**ACTION = \*INTERNAL-LOGGING**

The event is logged in an internal buffer whose content can be displayed using the SHOW-ASE-LOGGING command.

---

**ACTION = \*CONSOLE-MSG**

Console message ASE0815 is output.

**ACTION = \*TELESERVICE-CALL**

A Teleservice call is triggered (message ASE0888).

**TASK = \*ALL / <alphanum-name 4..4> / <c-string 4..4>**

Specifies the TSN of the task which is to be monitored. The default \*ALL means that all tasks are monitored.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	1	ASE0010	Syntax error
	32	CMD0221	System error
	64	ASE0011	Semantic error

---

## 2.6 ADD-CATALOG-FILE

Extend special catalog by another catalog file

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MANAGEMENT  
**Privileges:** TSOS

### Function

The ADD-CATALOG-FILE command enables systems support to extend the special catalog of an SM pubset.

When the command executes, another catalog file is created for the special catalog selected. The file name of the new catalog file has the following format:

```
:<catid>:$TSOS.TSOSCAT#xnn
```

where:

x designates the special catalog (M, J or P; see CATALOG operand)

nn consecutive numbering of the special catalog (00 through 99)

The numbering of the special catalogs never has any gaps. No file with this name may already exist.

The command can only be issued on the master processor.

### Format

<b>ADD-CATALOG-FILE</b>
<b>PUBSET-ID</b> = <cat-id 1..4> <b>,CATALOG</b> = *MIGRATED / *JV / *PRIVATE

### Operands

**PUBSET-ID = <cat-id 1..4>**

Designates the pubset for which a special catalog is to be extended.

**CATALOG = \*MIGRATED / \*JV / \*PRIVATE**

Defines which special catalog is to be extended.

**CATALOG = \*MIGRATED**

The catalog for the migrated files and the no space files is extended, i.e. a file with the format :<catid>:\$TSOS.TSOSCAT.#Mnn is created.

**CATALOG = \*JV**

The catalog for the job variables is extended, i.e. a file with the format :<catid>:\$TSOS.TSOSCAT.#Jnn is created.

---

**CATALOG = \*PRIVATE**

The catalog for the private disk and tape files is extended, i.e. a file with the format :<catid>:\$TSOS.TSOSCAT.  
#Pnn is created.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	32	CMD0221	Internal error
	64	DMS0312	Catalog not known in system
	64	DMS0501	Catalog is not available in the system
	64	DMS134C	MRSCAT cannot be determined
	64	DMS13BB	Pubset is not master or not an SM pubset
	64	DMS13BC	File of the same name already exists
	64	DMS13BE	Catalog is not known in the catalog index
	128	DMS0506	Change of master running

---

## 2.7 ADD-CHANGE-DATE

Define a new changeover time

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** TSOS

### Function

The ADD-CHANGE-DATE command defines a new future changeover time from standard daylight time to daylight saving time (and vice versa).

A valid GTIME parameter set with consistent changeover times for the past is required, see the “Introduction to System Administration” [14].

The new changeover time must satisfy the following conditions:

- It must be later than all changeover times which have already been defined
- It may not be within the next hour
- It must be at least 4 to 8 months later than the previous changeover time

**i** The ADD-CHANGE-DATE command defines the new changeover time for the current session. If required, also enter the new changeover time in the GTIME parameter set of the startup parameter file so that it is valid for future sessions.

### Format

<b>ADD-CHANGE- DATE</b>
<b>DATE</b> = <date> <b>,TIME</b> = <time>

### Operands

**DATE = <date>**

Date of the new changeover time.

**TIME = <time>**

Time of day of the new changeover time in the format hh:mm.

No seconds may be specified.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CHD0010	Syntax error in the command
	32	CMD0221	System error in the command
	64	CHD0011	Semantic error in the command

## Note

Subsequently, inserting or deleting a changeover time can alter wait times that have already started and will end after the changeover time. Examples:

- An already accepted ENTER job is started one hour too early or too late if its start time lies after the changeover time.
- An already started /WAIT-EVENT waits an hour too short or too long if its wait time ends after the changeover time.

---

## 2.8 ADD-CJC-ACTION

Declare conditional execution of command sequence

**Component:** JV

**Functional area:** Job variables

**Domain:** JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

This function is available to the user only if the chargeable software product JV has been loaded as a subsystem.

### Function

Via the ADD-CJC-ACTION command, the user can make the execution of a CJC (conditional job control) command sequence dependent on a condition. The ADD-CJC-ACTION command defines

- the condition under which the CJC command sequence is to be started (operand CONDITION)
- the name of the CJC command sequence (operand NAME)
- the time period during which the command is to be in effect (operand TIME-LIMIT)
- the maximum number of executions of the CJC command sequence (operand REPEAT)
- the address (branch destination) of the CJC command sequence to be started in the case: time elapsed and “condition not satisfied” (operand TIMEOUT-LABEL)

The user enters the CJC command sequence following the ADD-CJC-ACTION command. The sequence may contain only ENTER-JOB, ENTER-PROCEDURE- and/or MODIFY-JV commands. ENTER-PROCEDURE is only permitted in a non-S procedure. The whole CJC command sequence between ADD-CJC-ACTION and END-CJC-ACTION is initially only stored.

The following table illustrates the order in which the commands in the sequence are to be entered:

Input	Meaning
/ADD-CJC-ACTION_...	Opens a CJC command sequence; defines the condition and type of execution
/ENTER-JOB_... or /ENTER-PROCEDURE_... or /MODIFY-JV_... . . .	CJC command sequence to be started in the case “condition satisfied”; merely stored initially. ENTER-PROCEDURE is only permitted in a non-S procedure.
/.marke_ENTER-JOB_... or /.marke_ENTER-PROCEDURE_... or /.marke_MODIFY-JV_... . . .	CJC (TIMEOUT) command sequence to be started in the case “condition not satisfied”; merely stored initially. This command sequence can also be defined. If it is used, the name of the command sequence (.marke) must be the same as the branch destination defined in ADD-CJC-ACTION (TIMEOUT-LABEL=marke). ENTER-PROCEDURE is only permitted in a non-S procedure. If the command sequence begins with an ENTER-JOB or ENTER-PROCEDURE command, a job name specified in the command must be the same as the name of the command sequence (JOB-NAME=marke).
/END-CJC-ACTION	Closes and activates the CJC command sequence

Table 17: Order of commands to be entered in the CJC command sequence

Both command sequences (“condition satisfied” or “condition not satisfied”) may be specified.

The END-CJC-ACTION command concludes the CJC command sequence and activates it. Subsequent commands are again executed immediately.

If “condition satisfied” occurs within the defined time period, processing is interrupted and the corresponding CJC command sequence is started. This applies for every “condition satisfied” until the specified time has elapsed or the maximum number of repetitions of the CJC command sequence has been reached. If the condition is already satisfied when the CJC command sequence is specified, the CJC commands are executed immediately.

If the time elapses without the maximum number of “condition satisfied” events having occurred, the TIMEOUT command sequence, if one has been defined, is started. When execution of a CJC command sequence has ended, processing continues from the point at which it was interrupted. If the CJC command sequence corresponding to the command ADD-CJC-ACTION is not given, only the event that fulfills the specified condition is logged by messages.

---

## Format

### ADD-CJC-ACTION

**CONDITION** = **\*NONE** / <text 0..1800 with-low *cond-expr*>

**,NAME** = **\*NONE** / <name 1..8>

**,TIME-LIMIT** = **600** / <integer 1..65535 *seconds*>

**,TIMEOUT-LABEL** = **\*NONE** / <name 1..8>

**,REPEAT** = **1** / <integer 1..32767>

## Operands

**CONDITION** = **\*NONE** / <text 0..1800 with-low *cond-expr*>

Conditional expression (enclosed in parentheses). The CJC command sequence is executed as soon as “condition satisfied” occurs. The permissible entries are described in [section "Conditional expressions \(job variables\)"](#).

Uppercase and lowercase letters are differentiated. Special job variables are not permitted here. The default setting is \*NONE, i.e. only a TIMEOUT command sequence can be started (see the TIMEOUT-LABEL operand).

Commands before the TIMEOUT mark and a REPEAT value greater than 1 are rejected.

**NAME** = **\*NONE** / <name 1..8>

Name for the ADD-CJC-ACTION command. This name is displayed in messages beside the internal identification. The ADD-CJC-ACTION command can be referred to using this name. If the name specified is identical to the name of an ADD-CJC-ACTION command still in effect, the entry is accepted but a warning message is issued. The default is \*NONE, i.e. messages show only the identification assigned by the system. The internal identification is then the only means of referring to the ADD-CJC-ACTION command.

**TIME-LIMIT** = **600** / <integer 1..65535 *seconds*>

Time specification, in seconds. The CJC command sequence is executed only if “condition satisfied” occurs within the specified time period and the maximum number of repetitions (REPEAT operand) is not exceeded.

The countdown begins after the END-CJC-ACTION command is executed; the average precision is 200 ms. A time specification greater than 65280 seconds means “unlimited life” (but not beyond job termination).

**TIMEOUT-LABEL** = **\*NONE** / <name 1..8>

Branch destination. Name of the command with which processing is to be continued if the specified time runs out and the maximum number of “condition satisfied” events has not yet occurred (TIMEOUT command sequence).

The default value is \*NONE, i.e. no TIMEOUT command sequence is specified.

If no TIMEOUT command sequence with the specified name is defined at the time END-CJC-ACTION is entered, then

- with procedures (interactive/batch): the whole CJC command sequence is rejected.
- in dialog (without procedure): a warning is issued and END-CJC-ACTION is rejected.

**REPEAT** = **1** / <integer 1..32767>

Maximum number of repetitions of the CJC command sequence within the specified period.

## Return codes

Return codes relating to the ADD-CJC-ACTION command or the CJC command sequence commands are only returned once the CJC command sequence is terminated with END-CJC-ACTION.

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	CJC command sequence executed
	1	CMD0202	Condition incorrect, syntax error, CJC command sequence command not allowed or unknown, END-CJC-ACTION not found or timeout label does not exist
	32	CMD0221	Internal error
	130	CJC0002	JV not accessible
	130	CJC0003	Memory saturation

## Notes

- A CJC command sequence is always viewed by the system as a self-contained unit, i.e. processing must not branch to a CJC command sequence from an external source. For every branching operation to be performed (to a mark or to SET-JOB-STEP, for instance), a search is made for an END-CJC-ACTION following any ADD-CJC-ACTION detected; only then will the search for the desired branch destination be continued.
- An ADD-CJC-ACTION command becomes inoperative in the following cases:
  - The CJC command sequence has been carried out as often as was specified in the REPEAT operand.
  - The time interval specified in the TIME-LIMIT operand has elapsed and the TIMEOUT command sequence - if present - has been executed.
  - A REMOVE-CJC-ACTION command has been given.
  - The job is terminated or aborted.
  - The catalog containing a job variable involved is permanently exported.
- The starting time of a CJC command sequence depends on the mode in which the job is when the event "condition satisfied" occurs:

Program mode:	A system function called from the program is still being executed.
Command mode:	The current command is allowed to terminate.
BREAK/ESCAPE-mode:	The start is delayed until a one of the following commands is entered: CANCEL-/RESUME-PROGRAM or CANCEL-/END-/EXIT-/RESUME-PROCEDURE
WAIT mode or "condition immediately satisfied":	The start occurs immediately.

---

**i** If the start of a CJC command sequence is delayed, its definition remains known in the system. Consequently, if BREAK/ESCAPE mode lasts long enough, the first "condition satisfied" event can occur in this time and then also the "TIME-LIMIT reached" event. Correspondingly, after BREAK /ESCAPE mode has been exited, if defined the two parts of the CJC command sequence are executed one after the other:

- the part delayed so far for "condition satisfied within wait time"
- and the part for "wait time expired"

- Within the CJC command sequence, only the commands ENTER-JOB, ENTER-PROCEDURE and MODIFY-JV are permitted. ENTER-PROCEDURE is only permitted in a non-S procedure. If an invalid command is specified before the sequence is terminated by END-CJC-ACTION, it is rejected.
- Table: Order of commands to be entered in the CJC command sequence ENTER-JOB or ENTER-PROCEDURE is the first command in the TIMEOUT command sequence, any job name that is specified must match the name of the command sequence. Example: `/.ERROR ENTER-JOB JOB.A, JOB-NAME=ERROR`
- In the event of an error in ADD-CJC-ACTION or in the CJC command sequence, procedures apply (interactive /batch): The ADD-CJC-ACTION command rejected and thus is ineffective; control branches to the next of the following commands (after END-CJC-ACTION): SET-JOB-STEP, EXIT-JOB, LOGOFF, CANCEL-PROCEDURE, END-PROCEDURE or EXIT-PROCEDURE. If END-CJC-ACTION is not specified, the procedure terminates abnormally.
- The END-CJC-ACTION command is ignored if the relevant ADD-CJC-ACTION command is missing.
- CJC command sequences are automatically provided by the system with an internal identification which can be used in the REMOVE-CJC-ACTION command.
- As long as an ADD-CJC-ACTION command is effective, no checkpoint (WRCPT macro) can be written. A restart (RESTART-PROGRAM command) terminates all ADD-CJC-ACTION commands still effective.

---

## 2.9 ADD-CONSOLE-FILTER

Define filter settings for message output

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** CONSOLE-MANAGEMENT  
**Privileges:** OPERATING  
**Routing code:** @

### Function

The ADD-CONSOLE-FILTER command allows operators to define filter settings (combinations of routing codes and filter levels) for some or all routing codes to control message output at operator terminals (consoles) or from authorized user programs. Filter settings the command does not refer to stay as they are. Messages which expect a reply (response messages) and messages sent to a specific recipient (typically command result messages) cannot be suppressed. The ADD-CONSOLE-FILTER command appreciably reduces the volume of message output. It applies only to the operator terminal or authorized user program at or from which it was issued.

*Running the command in a user task with the OPERATING privilege*

Like any operator terminal, the user task can set filter levels exclusively for itself. The filter levels are effective only when the task is reading from the input stream. When the user task terminates, all the filter levels that it has set are returned to their previous settings.

This function is available regardless of system parameters.

### Format

#### ADD-CONSOLE-FILTER

**FILTER** = \*ALL / list-poss(5): <integer 1..5>

**,ROUTING-CODE** = \*ALL / list-poss(40): <alphanum-name 1..1> / \*

### Operands

**FILTER = \*ALL / list-poss(5): <integer 1..5>**

Defines which filter levels are to be set.

**FILTER = \*ALL**

Sets all filter levels. All command-independent messages which do not expect a reply are suppressed.

**FILTER = list-poss(5): <integer 1..5>**

Sets the specified filter levels.

**ROUTING-CODE = \*ALL / list-poss(40): <alphanum-name 1..1> / \***

There are 40 routing codes. The filter levels specified in the FILTER operand are set for the routing codes specified here.

---

**ROUTING-CODE = \*ALL**

All 40 routing codes are affected by the change.

**ROUTING-CODE = list-poss(40): <alphanum-name 1..1> / \***

The routing codes explicitly specified here are affected by the change.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed successfully
	1	CMD0202	Syntax error in the command
	2	CMD0198	Shutdown in progress
	64	CMD0216	User does not have the necessary privilege
	130	NBR1042	Not enough class 5 memory; cannot set filter levels

**Note**

Using the OPR parameter service, filter levels for routing codes can be defined for operator terminals and authorized user programs with generated authorization names. If this has not been done, all messages generated between the time the system is initialized and the time the ADD-CONSOLE-FILTER command is issued will be output.

Authorized user programs with dynamic authorization names have no routing codes when first connected. That means that there are no filter levels operative for them at that point.

When an authorized user program with a dynamic authorization name is disconnected, all its filter levels and routing codes are returned to their previous settings.

The REMOVE-CONSOLE-FILTER command can be used to cancel message suppression actions taken with the ADD-CONSOLE-FILTER command.

For further information on routing codes and filter levels see the manual "Introduction to System Administration" [14].

---

## 2.10 ADD-CRYPTO-PASSWORD

Enter crypto password in the crypto password table of the task

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION  
HARDWARE-MAINTENANCE

### Function

The ADD-CRYPTO-PASSWORD command supplies a job with crypto passwords, which are required to decrypt encrypted files. The crypto password table is set up for the job the first time the ADD-CRYPTO-PASSWORD is issued with the crypto passwords specified there. The table is extended each time the command is called. The crypto password table is automatically deleted at the end of the job. The /REMOVE-CRYPTO-PASSWORD command can be used to delete individual crypto password entries or all the crypto password entries from the table before the end of the job.

When an encrypted file is accessed the system searches the crypto password table for the required crypto password. If it is entered there, access is permitted.

#### *Note*

If the rare case of the command being rejected with message DMS066A should occur, this means that the caller has specified a crypto password that, for cryptographic reasons, may not be used. In this case another crypto password must be selected.

Crypto passwords can be up to 8 characters long. Crypto passwords with less than 8 characters are stored left-justified within the system and filled with binary zeros. This means that the two crypto passwords C'ABCD' and C'ABCD'BLANK"BLANK"BLANK"BLANK"' which are specified in the form of a C string are not identical, and owing to the different internal representation two different crypto passwords are calculated by the cryptographic algorithm:

<code>/add-crypto-password c'ABCD'</code>	<code>internal:</code>	<code>X'C1C2C3C400000000'</code>
<code>/add-crypto-password c'ABCD '</code>	<code>internal:</code>	<code>X'C1C2C3C440404040'</code>

All crypto passwords and crypto password specifications entered under an active task are counted. Crypto passwords which are entered more than once are ignored and not included in the count.

---

If the system threshold value for the maximum number of crypto passwords in the crypto password table which is defined with the system parameter PWACTIVE is reached when crypto passwords are entered, the message DMS0691 is output and any further crypto password entry is rejected. This applies for both normal users and systems support. The table entries can be reduced using the /REMOVE-CRYPTO-PASSWORD command and the table made ready to receive new entries.

If the system threshold value for the maximum number of crypto passwords entered into the crypto password table which is defined with the system parameter PWENTERD is reached when crypto passwords are entered under a task, the message DMS0692 is output and any further crypto password entry is rejected. This applies for both normal users and systems support.

Regardless of the setting for the system parameter ENCRYPT, crypto password are always stored in encrypted form in the crypto password table.

For information on encrypting files, see also the manual “Introductory Guide to DMS” [13].

### *REMOTE-FILE-ACCESS*

The ADD-CRYPTO-PASSWORD command is automatically forwarded to all RFA partner processes by the requesting job.

## Format

<b>ADD-CRYPTO-PASSWORD</b>	Alias: <b>ADCPW</b>
<b>PASSWORD</b> = * <b>SECRET</b> / list-poss(20): <c-string 1..8> / <x-string 1..16>	

## Operands

**PASSWORD** = \***SECRET** / list-poss(20): <c-string 1..8> / <x-string 1..16>

Passwords which are to be entered into the crypto password table. Up to 20 crypto passwords can be specified in a command. The specification is not case-sensitive.

The operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.
- The password entered is not logged.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntactical or semantic error in command
	32	DMS05C7	Unexpected error in DMS
	64	DMS066A	Specified crypto password cannot be used
	64	DMS0691	Crypto password table at maximum size
	64	DMS0692	Maximum number of crypto passwords per task reached
	64	DMS06FF	BCAM connection severed
	130	DMS0594	Not enough virtual memory available

---

## 2.11 ADD-DEVICE-DEPOT

Define assignment of tape device to depot

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** T

This command is available only in conjunction with the MAREN product; the MAREN subsystem must be loaded.

### Function

The ADD-DEVICE-DEPOT command is used to notify the device management facility (NDM) of the assignment of physical tape devices (using their mnemonics) to “depots”.

This command cannot be processed successfully unless the following conditions are satisfied:

- there is no allocation to the type of device specified in the command
- there are no allocations to a device type in an existing depot
- the MAREN subsystem is listed in the subsystem catalog

If the first two conditions are not satisfied, message NKG006 is issued to the operator; if the third is not satisfied, message NKG007 is issued.

If the MAREN subsystem is in the subsystem catalog, but is not available at command runtime, any tape devices specified in the command will be permanently inaccessible. Consequently, you should not use the command unless the MAREN subsystem is loaded. The system administration must ensure that the depots defined in the MAREN catalog match the depots specified in this command. If this is the case, BS2000 device management in conjunction with MAREN can arrive at a suitable selection of devices for a tape mounting request to be issued to the operator or to a robot-supported cartridge archive system. The definition of depots permits the reservation of devices from a specific device set, e.g. during robot operation (see also the command SECURE-RESOURCE-ALLOCATION, operand DEVICE=(...,LOCATION=...)).

Devices of the same device type assigned to exactly the same depots are administered in “device pools” within NDM. Devices that are not assigned to any depot are classified as “RESTPOOL devices”. The procedure for obtaining depot information is described under “Device management” in the “Introduction to System Administration” [14].

### Format

#### ADD-DEVICE-DEPOT

**UNIT** = list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>

,**LOCATION** = <alphanum-name 1..8>(…)

,**ROUTING-CODE** = \*UNCHANGED / <name 1..1>

---

## Operands

**UNIT = list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>**

Mnemonic names of one or more devices to be assigned to a depot. A maximum of 10 devices can be specified per command.

**LOCATION = <alphanum-name 1..8>**

Name of the depot. Up to 1024 devices can be assigned to a depot.

### *Note*

The depot (LOCATION) is determined by means of MAREN for scratch tape requests. If MAREN is not available, an attempt is made to select a tape device from the RESTPOOL (tape devices which have not been allocated to a depot).

**ROUTING-CODE =**

Controls message output. If a routing code for which no console is defined in the system is specified, messages are output at the main console.

**ROUTING-CODE = \*UNCHANGED**

The preset value for the routing code remains unchanged.

**ROUTING-CODE = <name 1..1>**

A defined routing code is specified. This enables the messages necessary for the devices assigned to this depot to be output to a specific console. The preset routing code is **T**.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
1	0	NKG0008	MAREN subsystem not available
2	0	NKG0007	MAREN subsystem not in subsystem catalog
	64	NKV0004	Command partially processed
	64	NKV0005	Command not processed for an object
	64	NKV0006	Command not processed
	130	NKVT002	Tape monitor unavailable

---

## 2.12 ADD-FILE-LINK

Create TFT entry and assign values

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT

**Routing code:** \$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The ADD-FILE-LINK command creates a TFT (Task File Table) entry for the link name specified in the LINK-NAME operand. At the same time, the command assigns values to the TFT entry. If there is already a TFT entry for the specified link name, it is overwritten by the new entry.

The command cannot create new catalog entries or modify the catalog entries of disk files. The command can, however, modify the catalog entries of tape files (using the ADD-CATALOG-VOLUME, TAPE-SET-NAME and FILE-SEQUENCE operands, for example). The command cannot be used to modify the storage space allocation of a disk file.

The command cannot modify an existing TST (Tape Set Table) entry; this is the job of the EXTEND-TAPE-SET command.

The command is rejected in the following situations:

- A value other than \*BY-PROGRAM, \*DUMMY or the name of a file which is already in the catalog has been specified in the FILE-NAME operand.
- No disk space has been reserved for the disk file specified in the FILE-NAME operand (though a tape file which is in the catalog may be specified even if the volume table in the catalog entry is empty).

### Overview of functions

Function / Meaning	Level 1 operands	Level 2/3 operands
Define the file link name for which a TFT entry is to be created	LINK-NAME =	
Name of file/file generation to which the ADD-FILE-LINK command refers	FILE-NAME =	
Access method (ISAM, SAM, BTAM ...)	ACCESS-METHOD =	
File OPEN mode	OPEN-MODE =	
File CLOSE mode	CLOSE-MODE =	

Import file attributes from the file	DATA-ATTRIBUTES =	
Record format	RECORD-FORMAT =	
Variable record format

## Operands

### **LINK-NAME = <filename 1..8 without-gen>**

A link name under which programs can open the file.

The file link name/TFT links the program and file together. A TFT entry is set up for the file link name specified here, and the remaining operands are evaluated and the values copied into this TFT entry. If there is already an entry in the TFT under the specified link name, it is overwritten by the new one.

If the old TFT entry was locked by a LOCK-FILE-LINK command, the new entry is also locked.

The old volume and device reservations are canceled; tape devices remain available to the job but can be released by a SECURE-RESOURCE-ALLOCATION command.

A TSET name cannot be used as a file link name.

### **FILE-NAME = \*BY-PROGRAM / \*DUMMY / <filename 1..54>**

Identifies the file to which the ADD-FILE-LINK command refers; FILE-NAME must not be a file generation group.

The file specified by FILE-NAME must already be cataloged. Unless it is a tape file, it must already have been allocated storage space.

Otherwise, the ADD-FILE-LINK command is rejected.

### **FILE-NAME = \*BY-PROGRAM**

The file name specified in the program is used.

### **FILE-NAME = \*DUMMY**

Creates a TFT entry for a DUMMY file under the specified link name. No devices, volumes or storage space are allocated.

DUMMY files are typically used during program debugging to simulate I/O transactions or during a restart with the RESTART-PROGRAM command to replace files which are no longer required for processing but without which the program will not run (see the RESTART-PROGRAM command description).

DUMMY file as input file: if an attempt is made to read the file, EOF processing is initiated, which means that the program acts as though the file had already been read. DUMMY file as output file: if an attempt is made to write to the file, the data is transferred to the program's buffer areas, but output to a volume is suppressed.

### **FILE-NAME = <filename 1..54>**

This is the file the ADD-FILE-LINK command refers to.

### **ACCESS-METHOD = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / \*SAM / \*ISAM / \*BTAM / \*UPAM**

Specifies the access method for file processing.

Access methods are described in the "Introductory Guide to DMS" [13].

### **ACCESS-METHOD = \*BY-DATA-ATTRIBUTES**

The access method of the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, ACCESS-METHOD defaults to \*BY-PROGRAM.

### **ACCESS-METHOD = \*BY-PROGRAM**

The access method specified in the program is used.

### **ACCESS-METHOD = \*BY-CATALOG**

The access method entered in the catalog is used (see SHOW-FILE-ATTRIBUTES command, *FILE-STRUCT* output field).

---

**ACCESS-METHOD = \*SAM**

The file specified in the FILE-NAME operand is to be processed using the SAM access method. Both disk and tape files can be processed.

**ACCESS-METHOD = \*ISAM**

The file specified in the FILE-NAME operand is to be processed using the ISAM access method. Only disk files can be processed.

**ACCESS-METHOD = \*BTAM**

The file specified in the FILE-NAME operand is to be processed using the BTAM access method. Only tape files can be processed. BTAM processing is not supported by all programming languages. BTAM-specific operands: IO-CHAINING, OPEN-MODE=\*SINOUT

**ACCESS-METHOD = \*UPAM**

The file specified in the FILE-NAME operand is to be processed using the UPAM access method. Both disk and tape files can be processed.

**OPEN-MODE = \*BY-PROGRAM / \*INPUT / \*OUTPUT / \*EXTEND / \*REVERSE / \*UPDATE / \*OUTIN / \*INOUT / \*SINOUT**

Specifies the OPEN mode for the file. This setting may be overridden by the OPEN statement in the program when the file is actually opened. The following table shows which OPEN modes are permissible for the various access methods ( D, T, X ) and which are not permissible (-).

OPEN-MODE=	Access method			
	ISAM	BTAM	SAM	UPAM
*INPUT	P	T	X	X
*EXTEND	P	-	X	-
*INOUT	P	T	-	X
*OUTIN	P	T	-	X
*OUTPUT	P	T	X	-
*REVERSE	-	T	X	-
*SINOUT	-	T	-	-
*UPDATE	-	-	P	-

Table 19: OPEN modes and access methods

The name sections have the following meanings:

P: Disk files (SUPPORT=\*DISK)

B: Tape files (SUPPORT=\*TAPE)

X: Disk and tape files

-: OPEN mode not supported

**OPEN-MODE = \*BY-PROGRAM**

The OPEN mode specified in the program is used.

**OPEN-MODE = \*INPUT**

The file specified under FILE-NAME is used as an input file (and must therefore already exist).

---

**OPEN-MODE = \*OUTPUT**

The file is created or, if it already exists, overwritten from the file start. If it is a tape file, a label is created.

**OPEN-MODE = \*EXTEND**

Extends an existing file, i.e. adds blocks to the file end or overwrites the file from a specific point onwards; only sequential writes are allowed. For tape files, labels are generated as appropriate to the LABEL-TYPE specification.

**OPEN-MODE = \*REVERSE**

The file, which is opened as an input file for sequential reading, must already exist. It is processed in reverse order, i.e. from the file end to its start. With tape files, automatic tape swapping is not possible. On completion of OPEN processing, the tape is positioned at the end of the file section.

**OPEN-MODE = \*UPDATE**

For SAM disk files only: the records in the file can be modified using the GET macro followed by the PUTX macro (possible only in move mode).

**OPEN-MODE = \*OUTIN**

The file is created or, if it already exists, overwritten from the file start. Both (nonsequential) writes and reads are allowed. Labels are written in the case of tape files.

**OPEN-MODE = \*INOUT**

Opens an existing file for nonsequential processing; both reads and writes are allowed. Tapes are positioned to start of tape on completion of OPEN processing; no labels are written.

**OPEN-MODE = \*SINOUT**

For tape files only: the file must exist, and the tape must not be positioned at the tape start; data blocks can be read or written, and no label processing is performed. Unlike \*INOUT, this mode does not position the tape.

**CLOSE-MODE = \*BY-PROGRAM / \*REWIND / \*REPOS / \*UNLOAD / \*LEAVE / \*INVALIDATE / \*KEEP-DATA-IN-CACHE**

Specifies the CLOSE mode to be used to close the file. This setting may be overridden by a CLOSE macro when the file is actually closed.

See the CLOSE macro description in the “DMS Macros” manual [12].

**CLOSE-MODE = \*BY-PROGRAM**

The CLOSE mode is defined by the CLOSE macro in the program.

**CLOSE-MODE = \*REWIND**

For tape files only: regardless of the LABEL-TYPE specification, the tape is rewound to the start once the file has been closed.

**CLOSE-MODE = \*REPOS**

For tape files only: the tape is repositioned to the start of the current file section once the file has been closed.

**CLOSE-MODE = \*UNLOAD**

For tape files only: the tape is rewound, unloaded and released once the file has been closed.

**CLOSE-MODE = \*LEAVE**

For tape files only: depending on the LABEL-TYPE specification, the tape is positioned to the logical file end once the file has been closed.

---

**CLOSE-MODE = \*INVALIDATE**

Cached writes for the file are not written out to disk. All the data in the cache is marked as invalid.

This value is useful for files for which (cached) writes are no longer needed once they have been closed. This avoids wasting time writing unsaved cache data out to disk.

Once a file has been closed with CLOSE-MODE=\*INVALIDATE, any writes for it are lost. Thereafter, the file must under no circumstances be opened with OPEN-MODE= \*INPUT or \*OUTPUT.

**CLOSE-MODE = \*KEEP-DATA-IN-CACHE**

Cached writes for the file are not written out to disk. All the data in the cache is retained there.

This value is useful for follow-up processing on the file since no time is wasted writing the cache data out to disk when the file is closed. The cache data is not invalidated, and the next time the file is opened, read accesses can again be serviced immediately from the cache without the need to read the data back into it. This special variant of PFA caching is also known as the HIPERBATCH mechanism (**H**igh-**P**erformance **B**atch Processing; see also the "Introduction to System Administration" [14]).

**DATA-ATTRIBUTES = \*STD / \*FROM-FILE(...) / \*BY-CATALOG**

Specifies whether the \*BY-DATA-ATTRIBUTES defaults of the following operands are to be the same as the corresponding file attributes of a cataloged file. The operands which support the importing of file attributes are ACCESS-METHOD, RECORD-FORMAT, RECORD-SIZE, BUFFER-LENGTH, BLOCK-CONTROL-INFO, KEY-POSITION, KEY-LENGTH, LOGICAL-FLAG-LENGTH, VALUE-FLAG-LENGTH, PROPAGATE-VALUE-FLAG, BLOCK-OFFSET, LABEL-TYPE, and CODE.

**DATA-ATTRIBUTES = \*STD**

The \*BY-DATA-ATTRIBUTES defaults are the same as the corresponding \*BY-PROGRAM operand values.

**DATA-ATTRIBUTES = \*FROM-FILE(...)**

Operands for which \*BY-DATA-ATTRIBUTES is specified are assigned the operand value corresponding to the matching file attribute of the named file. If the operand value thus imported initiates a structure, the values of the lower-level operands are likewise set to match the equivalent file attributes. This affects the PRINT-CONTROL, SIZE and DIN-REVISION-NUMBER operands.

**FILE-NAME = <filename 1..54>**

Name of the file from which the corresponding file attributes are to be imported. The caller must have the authorization to read the file's catalog entry with SHOW-FILE-ATTRIBUTES. The file must be cataloged on the same subset as the file to which the ADD-FILE-LINK command refers.

**DATA-ATTRIBUTES = \*BY-CATALOG**

The operand values are taken over as with DATA-ATTRIBUTES=\*FROM-FILE(...), namely from the file to which the ADD-FILE-LINK command refers.

**RECORD-FORMAT = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / \*VARIABLE(...) / \*FIXED(...) / \*UNDEFINED(...)**

Specifies the record format of the file identified by FILE-NAME. The block-oriented access method UPAM ignores the RECORD-FORMAT argument. BTAM is also a block-oriented access method, but it does accept specifications in the RECORD-FORMAT operand. \*UNDEFINED is treated as if it were \*VARIABLE.

The SAM and ISAM access methods interpret the record format argument, except that \*UNDEFINED is not allowed with ISAM.

Record formats are completely described in the "Introductory Guide to DMS" [13].

For the relationship between the RECORD-FORMAT and RECORD-SIZE arguments see the description of the RECORD-SIZE operand.

---

**RECORD-FORMAT = \*BY-DATA-ATTRIBUTES**

The record format of the file specified in the DATA-ATTRIBUTES operand is used. The setting of the print control byte (PRINT-CONTROL) is also copied. If DATA-ATTRIBUTES is \*STD, RECORD-FORMAT defaults to \*BY-PROGRAM.

**RECORD-FORMAT = \*BY-PROGRAM**

The record format selected in the program is used.

**RECORD-FORMAT = \*BY-CATALOG**

The record format set in the catalog is used.

**RECORD-FORMAT = \*VARIABLE(...)**

The file specified by FILE-NAME consists of variable-length records, which means that the user must bear in mind, when programming, that each record is preceded by a 4-byte field, where bytes 1-2 contain the record length in binary. The bytes 3-4 are used by the system. For input files, the record length field is specified by the system, for output files, this must be done by the user.

**PRINT-CONTROL = \*NONE / \*ASA / \*EBCDIC**

Identifies the feed control character (see the PRINT-DOCUMENT command, operand DOCUMENT-FORMAT=\*TEXT(LINE-SPACING=...)).

**PRINT-CONTROL = \*NONE**

The file specified by FILE-NAME is not a print file; therefore, it does not contain any print control characters and when printed should not be subject to control character evaluation.

**PRINT-CONTROL = \*ASA**

The first data byte in each record is to be interpreted as an ASA feed control character for the printer (print with LINE-SPACING=\*BY-ASA-CONTROL in the PRINT-DOCUMENT command).

**PRINT-CONTROL = \*EBCDIC**

The first data byte in each record is to be interpreted as an EBCDIC feed control character for the printer (print with LINE-SPACING=\*BY-EBCDIC-CONTROL in the PRINT-DOCUMENT command). With ISAM files the ISAM index is taken into account.

**RECORD-FORMAT = \*FIXED(...)**

The file specified by FILE-NAME consists of fixed-length records, which means that the user does not need to allow for record length and control fields. All the records in the file are of the same length, this length is defined in the RECORD-SIZE operand.

**PRINT-CONTROL = \*NONE / \*ASA / \*EBCDIC**

Identifies the feed control character (see the PRINT-DOCUMENT command, operand DOCUMENT-FORMAT=\*TEXT(LINE-SPACING=...)).

**PRINT-CONTROL = \*NONE**

The file specified by FILE-NAME is not a print file; therefore, it does not contain any print control characters and when printed should not be subject to control character evaluation.

**PRINT-CONTROL = \*ASA**

The first data byte in each record is to be interpreted as an ASA feed control character for the printer (print with LINE-SPACING=\*BY-ASA-CONTROL in the PRINT-DOCUMENT command).

---

**PRINT-CONTROL = \*EBCDIC**

The first data byte in each record is to be interpreted as an EBCDIC feed control character for the printer (print with LINE-SPACING=\*BY-EBCDIC-CONTROL in the PRINT-DOCUMENT command). With ISAM files the ISAM index is taken into account.

**RECORD-FORMAT = \*UNDEFINED(...)**

The file specified by FILE-NAME consists of records of “undefined” length; each data block contains a single record, the length of which is passed in a register; the value in this register is set by the system on input and by the user on output (see the RECORD-SIZE operand). RECORD-FORMAT=\*UNDEFINED converts the specification LABEL-TYPE=\*STD(DIN-REVISION-NUMBER=3) to LABEL-TYPE=\*STD(DIN-REVISION-NUMBER=2).

**PRINT-CONTROL = \*NONE / \*ASA / \*EBCDIC**

Identifies the feed control character (see the PRINT-DOCUMENT command, operand DOCUMENT-FORMAT=\*TEXT(LINE-SPACING=...)).

**PRINT-CONTROL = \*NONE**

The file specified by FILE-NAME is not a print file; therefore, it does not contain any print control characters and when printed should not be subject to control character evaluation.

**PRINT-CONTROL = \*ASA**

The first data byte in each record is to be interpreted as an ASA feed control character for the printer (print with LINE-SPACING=\*BY-ASA-CONTROL in the PRINT-DOCUMENT command).

**PRINT-CONTROL = \*EBCDIC**

The first data byte in each record is to be interpreted as an EBCDIC feed control character for the printer (print with LINE-SPACING=\*BY-EBCDIC-CONTROL in the PRINT-DOCUMENT command). With ISAM files the ISAM index is taken into account.

**RECORD-SIZE = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / <integer 0..32768>**

With RECORD-FORMAT=\*FIXED, the RECORD-SIZE operand specifies the common length of all records in bytes. With RECORD-FORMAT=\*VARIABLE, the value of RECORD-SIZE is ignored. This does not apply to ISAM file reads, where the value in RECORD-SIZE is interpreted as a maximum record length (in bytes); with RECORD-SIZE=0, the length of a logical block is used as the maximum record length. If the program reads a record which is longer than the maximum record length, only the maximum length as defined by RECORD-SIZE is transferred and error handling is initiated.

With RECORD-FORMAT=\*UNDEFINED, the value of RECORD-SIZE is interpreted as the number of a general-purpose register (2 <= register <= 12) containing the current record length. On input, the system supplies the register with the record length; on output, the user must supply the value.

With tape files there is a significant interaction with the CODE and LABEL-PROCESSING operands: when used together with CODE=\*EBCDIC or LABEL-PROCESSING= \*PARAMETERS LABEL=\*STD (DIN-REVISION-NUMBER > 1), the RECORD-SIZE operand must have a value <= 9999 (international standard).

**RECORD-SIZE = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, RECORD-SIZE defaults to \*BY-PROGRAM.

**RECORD-SIZE = \*BY-PROGRAM**

The value specified in the program is set.

**RECORD-SIZE = \*BY-CATALOG**

The record format set in the catalog is used.

---

**RECORD-SIZE = <integer 0..32768>**

Specifies the maximum record length in bytes. Note with NK-ISAM files that overflow blocks are generated if the maximum record length is utilized.

**BUFFER-LENGTH = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / <integer 1..32768> / \*STD(...)**

Defines the logical block length. A logical block is the unit of information transmitted to and from the I/O devices as seen by the user calling the access methods.

In the case of disk files, there are interactions with space allocation (CREATE-FILE/MODIFY-FILE-ATTRIBUTES command, SPACE operand) and record length (ADD-FILE-LINK command, RECORD-SIZE operand). In the case of tape files, there is an interaction with the label attributes (ADD-FILE-LINK command, LABEL-TYPE operand). See also [table "Tape files: block length and record format"](#) and [table at LABEL-TYPE = \\*STD\(...\)](#).

Disk files/tape files with standard blocks: data blocks may consist of a number of PAM pages. The system automatically links together the PAM pages which form a transmission unit.

**BUFFER-LENGTH = \*BY-DATA-ATTRIBUTES**

The logical block length of the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, BUFFER-LENGTH defaults to \*BY-PROGRAM. If the file consists of standard blocks (BUFFER-LENGTH=\*STD), the number of PAM pages (SIZE operand) is also copied from the file.

**BUFFER-LENGTH = \*BY-PROGRAM**

The value set in the program is used.

**BUFFER-LENGTH = \*BY-CATALOG**

The value set in the catalog is used.

**BUFFER-LENGTH = <integer 1..32768>**

For tape files only: defines the block length in bytes and specifies that the file consists of nonstandard blocks (i.e. blocks which are not PAM blocks). Each nonstandard block is also a logical block.

With RECORD-FORMAT=\*FIXED, all nonstandard blocks in the file are of the length specified here (buffer offset not included; see BLOCK-OFFSET operand).

With RECORD-FORMAT=\*VARIABLE/\*UNDEFINED, the nonstandard blocks may be of differing lengths, with the specified block length defining the upper limit (buffer offset included).

The ACCESS-METHOD and IO-CHAINING operand settings must also be taken into account.

**BUFFER-LENGTH = \*STD(...)**

The file consists of standard PAM pages.

**SIZE = 1 / <integer 1..16>**

For K files: each logical block consists of the number of PAM blocks specified here. For NK files: each logical block consists of the number of 2048-byte data fields specified here. With NK4 volumes (NK4 files) this number must be even; in other words, the logical block length is a multiple of 4K.

For tape files: if CODE is anything other than EBCDIC, or if BLOCK-CONTROL-INFO is set to \*WITHIN-DATA-BLOCK or \*NO, STD block specifications are converted to nonstandard block specifications.

RECORD-FORMAT operand	Effects
RECORD-FORMAT=*FIXED	BUFFER-LENGTH specifies the block length including the length of the buffer offset (see BLOCK-OFFSET operand); all blocks are of the same length
RECORD-FORMAT=*VARIABLE/*UNDEFINED	BUFFER-LENGTH specifies the maximum block length including the length of the buffer offset (see the BLOCK-OFFSET operand), so the block length (like the record length) is variable
	If RECORD-FORMAT=VARIABLE and CODE=*EBCDIC or LABEL=*STD(DIN-REV-NUM=n) (n > 1), BUFFER-LENGTH must be less than 10000 (internal conversion to record format D)

Table 20: Tape files: block length and record format

ACCESS-METHOD operand	Values allowed for BUFFER-LENGTH
SAM / BTAM	1 <= n <= 32768
UPAM	

Table 21: Tape files: block length and access method

**BLOCK-CONTROL-INFO = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / \*NO / \*WITHIN-DATA-BLOCK / \*WITHIN-DATA-2K-BLOCK / \*WITHIN-DATA-4K-BLOCK / \*PAMKEY**

Specifies the location of the block control field containing the block control information used for logical block management.

K files have the block format PAMKEY and can only be stored on K volumes.

NK files can have any of the following formats: NO, WITHIN-DATA-BLOCK, WITHIN-DATA-2K-BLOCK, and WITHIN-DATA-4K-BLOCK. They can be stored on N or NK volumes. NK files are subdivided into:

- NK2 files, which may have the following structural attributes in the catalog entry:
  - *FILE-STRUCT = ISAM* and *BLK-CONTR = DATA (2K)*
  - *FILE-STRUCT = SAM* and *BLK-CONTR = DATA* and *BUF-LEN = STD(n)*, where n is an odd number
  - *FILE-STRUCT = PAM* and *BLK-CONTR = DATA* or *NO* and *BUF-LEN = STD(n)*, where n is an odd number
NK2 files **cannot** be stored on NK4 subsets.
- NK4 files, which may have the following structural attributes in the catalog entry:
  - *FILE-STRUCT = ISAM* and *BLK-CONTR = DATA (4K)*
  - *FILE-STRUCT = SAM* and *BLK-CONTR = DATA* and *BUF-LEN = STD(n)*, where n is an even number
  - *FILE-STRUCT = PAM* and *BLK-CONTR = DATA* or *NO* and *BUF-LEN = STD(n)*, where n is an even number

**i** If the user does not specify a block format, the system parameter ISBLKCTL defines the block format for an ISAM file when the file is created. The default value is \*NONKEY; i.e. by default, ISAM files are created as NK-ISAM on K volumes as well (equivalent to specifying BLOCK-CONTROL-INFO=\*WITHIN-DATA-BLOCK). If \*PAMKEY is specified in the system, a K-ISAM file is created (equivalent to BLOCK-CONTROL-INFO=\*PAMKEY).

---

**BLOCK-CONTROL-INFO = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, BLOCK-CONTROL-INFO defaults to \*BY-PROGRAM.

**BLOCK-CONTROL-INFO = \*BY-PROGRAM**

The value specified in the program is used.

**BLOCK-CONTROL-INFO = \*BY-CATALOG**

The value set in the catalog is used.

**BLOCK-CONTROL-INFO = \*NO**

The block format does not include a PAM key, i.e. the system does not store any block control information in PAM keys.

This block format is allowed for NK files only. It is available only for PAM files and SAM tape files. For SAM disk files and ISAM, \*NO is treated in the same way as \*WITHIN-DATA-BLOCK.

Functions which used to be linked to data in the PAM key are no longer supported (this typically applies to partial backups using ARCHIVE).

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-BLOCK**

The block format does not include a PAM key, i.e. the system does not store any block control information in PAM keys. This block format is allowed for NK files only. The block control information is within the first twelve bytes of each logical block, except in NK-ISAM files. Incompatibilities arise if the maximum record length (16 PAM blocks = 32K bytes) is used up, as there is no room left for the block control information.

*Special features of NK-ISAM files*

There are two block formats:

- 2K format: The block control information is stored at the start of each 2K block (one PAM page). The 2K format can be selected explicitly using BLOCK-CONTROL-INFO=\*WITHIN-DATA-2K-BLOCK.
- 4K format: The block control information is stored at the start of each 4K block (two PAM pages). The 4K format can be selected explicitly using BLOCK-CONTROL-INFO=\*WITHIN-DATA-4K-BLOCK.

The block format used to create an NK-ISAM file (OPEN=\*OUTPUT/\*OUTIN) is governed by the format of the volume on which the file is stored:

K pubset/private disk		
NK2(6K) pubset/private disk		K format (NK2 ISAM file): catalog entry where BLK-CONTR=DATA (2K)
NK2(8K) pubset		
NK2(64K) pubset		
NK2(8K)-Pubset		4K Format (NK4 ISAM file):
NK2(64K)-Pubset		catalog entry where BLK-CONTR=DATA (4K)

Note that it is not possible to create the NK-ISAM file in 4K format unless the logical block length is a multiple of 4K. If this is not the case, any attempt to open the file is rejected as an error.

An existing NK-ISAM can be opened regardless of the block format.

---

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-2K-BLOCK**

*This is a variant of \*WITHIN-DATA-BLOCK designed for use with NK-ISAM files.* When an NK-ISAM file is created (OPEN=\*OUTPUT/\*OUTIN), 2K format is generated. Any attempt to open the file for an NK4 volume is rejected as an error. An existing NK-ISAM file can be opened only if it was created in 2K format.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-4K-BLOCK**

*This is a variant of \*WITHIN-DATA-BLOCK designed for use with NK-ISAM files.*

When an NK-ISAM file is created (OPEN=\*OUTPUT/\*OUTIN), 4K format is generated. The logical block length must be a multiple of 4K. If this is not the case, any attempt to open the file is rejected as an error. An existing NK-ISAM file can be opened only if it was created in 4K format.

**BLOCK-CONTROL-INFO = \*PAMKEY**

*This value is possible for K files only.*

A block format using PAM keys which is supported by all access methods. The block control information is stored in the PAM key.

A file may be created in PAMKEY format provided that the volume supports PAMKEY recording (K pubset or K private disk).

**NUMBER-OF-PREMOUNTS = \*STD / <integer 0..255>**

Number of volumes to be requested for premounting.

**NUMBER-OF-PREMOUNTS = \*STD**

Number of volumes to be requested depends on the volume type

- disk files: All disks are requested on which the extent of the file is existing.
- tape files: Exactly one tape is requested.

**NUMBER-OF-PREMOUNTS = <integer 0..255>**

Specifies the number of volumes to premount.

**RETENTION-PERIOD = \*BY-PROGRAM / <integer 0..32767 days >**

This operand allows users to define a retention period for their files.

When the output file is closed, the date on which the retention period expires is calculated from the current data and the length of the retention period. This date is added to the catalog entry as the expiration date. No write access (updating, deletion) to this file is possible until the retention date has been reached.

**RETENTION-PERIOD = \*BY-PROGRAM**

The value specified in the program is used.

**RETENTION-PERIOD = <integer 0..32767 days >**

The RETENTION-PERIOD operand is effective only if a TFT entry is created using the LINK-NAME operand, and file identified by the FILE-NAME operand is then opened.

The value of RETENTION-PERIOD defines the length of the retention period in days. Expiration of the retention period does not mean that the file will automatically be destroyed, merely that write access will then be granted again.

RETENTION-PERIOD=0 means that there is no retention period and the file can be updated or deleted at any time.

A retention period can also be set with the MODIFY-FILE-ATTRIBUTES command; a retention period specified with that command is added to the catalog entry immediately; but note that for tape files the retention period must be defined before the file is opened for the first time.

**SUPPORT = \*NONE / list-poss(2): \*DISK(...)/ \*TAPE(...)**

Type of volume on which the file is located.

---

**SUPPORT = \*NONE**

No device specification.

**SUPPORT = \*DISK(...)**

The file to be processed is a disk file.

**SHARED-UPDATE = \*BY-PROGRAM / \*NO / \*YES / \*WEAK**

For ISAM and UPAM disk files only: defines whether write access to the file is to be possible if other jobs open it at the same time (shared updating).

**SHARED-UPDATE = \*BY-PROGRAM**

The value specified in the program is used.

**SHARED-UPDATE = \*NO**

Once one job has opened the file in an OPEN mode other than INPUT, it is locked for all other jobs. Thus shared updating is not possible. The contents of the file remain constant for the duration of file processing. Concurrent access to the file by a number of jobs is not possible unless the file is opened as an input file, i.e. with OPEN INPUT, in all jobs. If the file has already been opened in INPUT mode, any attempt to open it in any other mode is rejected.

**SHARED-UPDATE = \*YES**

For ISAM and PAM files only: the file can be edited concurrently by a number of jobs; but SHARED-UPDATE=\*YES must be set in all jobs. With UPAM, users can protect data blocks they are processing against access by other jobs.

With ISAM, these locks are set automatically by the system as required. With NK-ISAM, files opened for shared updating must be processed in cross-task user ISAM pools. With ISAM files the WRITE-IMMEDIATE function is enabled concurrently (WRITE-IMMEDIATE operand set to \*YES).

**SHARED-UPDATE = \*WEAK**

For UPAM processing only: guarantees write but not read protection. Only one job can open the file for writing. Other jobs can use it concurrently as an input file, but allowance has to be made for the fact that the contents of the file may change.

**LOCK-ENVIRONMENT = \*BY-PROGRAM / \*HOST-SYSTEM / \*XCS**

Specifies whether the file can be open for concurrent writing by jobs from different systems, depending on the open mode (OPEN-MODE) and the shared update mode setting (SHARED-UPDATE).

**LOCK-ENVIRONMENT = \*BY-PROGRAM**

The setting specified in the program is used.

**LOCK-ENVIRONMENT = \*HOST-SYSTEM**

The file cannot be open for concurrent writing with SHARED-UPDATE=\*YES by jobs from different systems.

**LOCK-ENVIRONMENT = \*XCS**

The file can be open for concurrent writing with SHARED-UPDATE=\*YES by jobs from different systems in an XCS network.

**EXCEED-32GB = \*BY-PROGRAM / \*FORBIDDEN / \*ALLOWED**

Specifies whether the file size may exceed 32 GB during processing.

**EXCEED-32GB = \*FORBIDDEN**

The file may grow to a maximum of 32 GB.

**EXCEED-32GB = \*ALLOWED**

The file may grow beyond 32 GB.

---

**WRITE-CHECK = \*BY-PROGRAM / \*NO / \*YES**

Specifies whether records written out to disk are to be checked immediately (read-afterwrite check) so that recording errors are detected promptly. The WRITE-CHECK specification is not added to the catalog entry, so it must be repeated beforehand each time the file is processed or opened.

Read-after-write checking: checking for recording errors (-> error recovery actions). If the error is unrecoverable, control is passed to the EXLST exit ERRADR. Read-afterwrite checking slows down performance considerably on account of the extra disk rotations.

**WRITE-CHECK = \*BY-PROGRAM**

The setting specified in the program is used.

**WRITE-CHECK = \*NO**

No read-after-write checking is done.

**WRITE-CHECK = \*YES**

Read-after-write checking is done.

**IO-ATTRIBUTES = \*BY-PROGRAM / \*PARAMETERS(...)**

Specifies the performance requirements demanded by the user for input/output operations. The highest permissible performance attribute is defined in the user entry. The cache medium defined for the associated pubset governs whether and to what extent performance requirements are implemented (see the output of the SHOW-MASTER-CATALOG-ENTRY command). Read and write access is performed through a fast cache. The number of disk accesses and the access times are reduced.

**IO-ATTRIBUTES = \*BY-PROGRAM**

The value specified in the program is used (see the FCB macro description in the "DMS Macros" manual [12]).

**IO-ATTRIBUTES = \*PARAMETERS(...)**

The overall performance requirement is derived from the values specified for the PERFORMANCE and USAGE operands.

**PERFORMANCE = \*BY-PROGRAM / \*BY-CATALOG / \*STD / \*HIGH / \*VERY-HIGH / \*USER-MAXIMUM**

Specifies the file's performance attribute. It indicates the priority required for the I/O operations selected in the USAGE operand. The highest permissible performance attribute is defined in the user entry (see the output of the SHOW-USER-ATTRIBUTES command).

**PERFORMANCE = \*BY-PROGRAM**

The value set in the program is used.

**PERFORMANCE = \*BY-CATALOG**

The value specified in the catalog entry is used.

**PERFORMANCE = \*STD**

There are no special performance attributes for the file, so a cache should not be used to process it.

**PERFORMANCE = \*HIGH**

The file is to be processed through a cache (high performance priority). This specification is only possible for users who have the DMS tuning privilege CONCURRENT-USE or EXCLUSIVE-USE for the pubset (see the output field DMS-TUNING-RESOURCES in the output of the SHOW-USER-ATTRIBUTES command).

---

**PERFORMANCE = \*VERY-HIGH**

The file is to be processed through a cache. The referenced data in the file is to be kept permanently in the cache (highest performance priority). The cache data is only evicted from the cache when the file is closed. The specification is only possible for users who have the DMS tuning privilege EXCLUSIVE-USE for the pubset (see the output for the SHOW-USER-ATTRIBUTES command, output field *DMS-TUNING-RESOURCES*).

*Note*

All cache segments used for this file are locked until the file is closed. If there are many files open with this attribute at the same time, the cache memory available for normally cached files may, as a result, be so greatly restricted that data accesses to such files can no longer be implemented with an adequate level of performance.

**PERFORMANCE = \*USER-MAXIMUM**

The file is assigned the highest performance attribute contained in the user catalog for the user.

**USAGE = \*BY-PROGRAM / \*BY-CATALOG / \*READ-WRITE / \*WRITE / \*READ**

Specifies the I/O operations for which enhanced performance (caching) is required. The default setting is \*READ-WRITE, i.e. the requirements apply to read and write operations. If the file does not have a particular performance attribute (PERFORMANCE= \*STD) and if the cache area for the pubset is not defined in such a way that all existing files are served (see the operand CACHED-FILES=\*ALL for the MODIFY-PUBSET-CACHING-ATTRIBUTES command), then the USAGE operand has no effect on processing.

**USAGE = \*BY-PROGRAM**

The value specified in the program is used (see the FCB macro description in the “DMS Macros” manual [12]).

**USAGE = \*BY-CATALOG**

The value specified in the catalog entry is used.

**USAGE = \*READ-WRITE**

The performance requirements apply both to read and to write operations.

**USAGE = \*WRITE**

The performance requirements apply to write operations only.

**USAGE = \*READ**

The performance requirements apply to read operations only.

*Note*

With USAGE=\*READ-WRITE or \*WRITE, write caching is performed only if the conditions for the DISK-WRITE file attributes are met (see CREATE-FILE or MODIFY-FILE-ATTRIBUTES). For write caching with DISK-WRITE= \*IMMEDIATE, the cache medium being used must be failsafe (see the *CACHE-MEDIUM* output field of the SHOW-MASTER-CATALOG-ENTRY command with INFORMATION=\*USER).

**ISAM-ATTRIBUTES = \*BY-PROGRAM / \*PARAMETERS(...)**

Parameters relating to ISAM processing.

---

**ISAM-ATTRIBUTES = \*BY-PROGRAM**

Information relating to ISAM-specific features is taken from the program or from the file specified in the DATA-ATTRIBUTES operand.

**ISAM-ATTRIBUTES = \*PARAMETERS(...)**

Information relating to ISAM-specific features is derived from the values specified for the operands which follow.

**KEY-POSITION = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / <integer 1..32767>**

Specifies the position of the ISAM key within the record. In variable-length records, allowance must be made for a 4-byte record length and control field. There is no fixed position for ISAM keys, but the key must always be in the same position throughout a file.

**KEY-POSITION = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, KEY-POSITION defaults to \*BY-PROGRAM.

**KEY-POSITION = \*BY-PROGRAM**

The value specified in the program is used (see the FCB macro description in the “DMS Macros” manual [12]).

**KEY-POSITION = \*BY-CATALOG**

The value set in the catalog is used.

**KEY-POSITION = <integer 1..32767>**

Specifies the position of the ISAM key within the record.

**KEY-LENGTH = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / <integer 1..255>**

Length of the ISAM key in bytes. Each record in the file must use the specified key length. The sum of the lengths specified in KEY-LENGTH, LOGICAL-FLAG-LENGTH, and VALUE-FLAG-LENGTH must not come to more than 255 during processing.

**KEY-LENGTH = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, KEY-LENGTH defaults to \*BY-PROGRAM.

**KEY-LENGTH = \*BY-PROGRAM**

The value specified in the program is used.

**KEY-LENGTH = \*BY-CATALOG**

The value set in the catalog is used.

**KEY-LENGTH = <integer 1..255>**

Specifies the length of the ISAM key in bytes.

**VALUE-FLAG-LENGTH = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / <integer 0..255>**

For K-ISAM files only: defines the length (in bytes) of the value flag in the ISAM index. This flag may form part of the ISAM record index together with the ISAM key and the logical flag. The sum of the lengths specified in KEY-LENGTH, LOGICAL-FLAG-LENGTH, and VALUE-FLAG-LENGTH must not come to more than 255 during processing.

---

**VALUE-FLAG-LENGTH = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, VALUE-FLAG-LENGTH defaults to \*BY-PROGRAM.

**VALUE-FLAG-LENGTH = \*BY-PROGRAM**

The value set in the program is used.

**VALUE-FLAG-LENGTH = \*BY-CATALOG**

The value set in the catalog is used.

**VALUE-FLAG-LENGTH = <integer 0..255>**

VALUE-FLAG-LENGTH = 0: the ISAM index does not include a value flag.

There is a difference in the treatment of value flags in NK-ISAM (BLOCK-CONTROL-INFO=\*WITHIN-DATA-BLOCK) and K-ISAM (BLOCK-CONTROL-INFO=\*PAMKEY).

In K-ISAM they are evaluated block by block and propagated to the next higher index entry, as specified in the PROPAGATE-VALUE-FLAG operand.

In NK-ISAM no flags are evaluated for the index entry.

*Note*

If the “secondary key” function is used, the ISAM key must not include a value flag.

**PROPAGATE-VALUE-FLAG = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*MINIMUM / \*MAXIMUM / \*BY-CATALOG**

*For K-ISAM files only (BLOCK-CONTROL-INFO=PAMKEY):* defines how the value flag is to be propagated to the index entries.

(NK-ISAM ignores PROPAGATE-VALUE-FLAG specifications)

**PROPAGATE-VALUE-FLAG = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, PROPAGATE-VALUE-FLAG defaults to \*BY-PROGRAM.

**PROPAGATE-VALUE-FLAG = \*BY-PROGRAM**

The value specified in the program is used (see the FCB macro description in the “DMS Macros” manual [12]).

**PROPAGATE-VALUE-FLAG = \*MINIMUM**

The lowest value for the value flag within a data or index block is propagated to the next higher level.

**PROPAGATE-VALUE-FLAG = \*MAXIMUM**

The highest value of the flag in the data/index block is propagated.

**PROPAGATE-VALUE-FLAG = \*BY-CATALOG**

The value specified in the catalog entry is used.

**LOGICAL-FLAG-LENGTH = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / <integer 0..255>**

*For K-ISAM files only:* defines the length in bytes of a logical flag in the ISAM index; the maximum length is governed by the length of the ISAM key, in that the sum of the lengths specified in KEY-LENGTH, LOGICAL-FLAG-LENGTH, and VALUE-FLAG-LENGTH must not come to more than 255 during processing.

---

**LOGICAL-FLAG-LENGTH = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, LOGICAL-FLAG-LENGTH defaults to \*BY-PROGRAM.

**LOGICAL-FLAG-LENGTH = \*BY-PROGRAM**

The value specified in the program is used (see the FCB macro description in the “DMS Macros” manual [12]).

**LOGICAL-FLAG-LENGTH = \*BY-CATALOG**

The value specified in the catalog entry is used.

**LOGICAL-FLAG-LENGTH = <integer 0..255>**

LOGICAL-FLAG-LENGTH=0: The ISAM index contains no logical flag. The ISAM key in the ISAM index may be followed by a logical flag in which selection criteria are defined bit by bit and encoded in binary. In K-ISAM files, all the logical flags of a block are evaluated and the result is propagated to the next higher index entry. There is no logical flag evaluation with NK-ISAM files.

*Note*

If the “secondary key” function is used, the ISAM key must not include a logical flag.

**PADDING-FACTOR = \*BY-PROGRAM / <integer 0..99>**

*Only for ISAM files created sequentially:* the block padding factor specifies how much space to keep free in the data block for subsequent extension of the file (as a percentage of the block length defined in BUFFER-LENGTH). The PADDING-FACTOR specification thus affects the block splitting rate when a file is extended nonsequentially.

K-ISAM requests a new logical block for the current record if the free space would otherwise fall below the padding factor.

NK-ISAM does not request a new logical block until the free space has already fallen below the padding factor.

**PADDING-FACTOR = \*BY-PROGRAM**

The value specified in the program is used.

**PADDING-FACTOR = <integer 0..99>**

A PADDING-FACTOR specification has different effects on NK-ISAM and K-ISAM. For NK-ISAM the block is filled *at least* up to the specified padding limit, for K-ISAM *at most* up to the padding limit.

**POOL-LINK = \*BY-PROGRAM / <name 1..8>**

*Only for ISAM files process in ISAM pools (NK-ISAM):* specifies the pool link name to be recorded in the TFT.

The file blocks required for processing are transferred from disk to the ISAM pool and buffered there.

**POOL-LINK = \*BY-PROGRAM**

The pool link name specified in the program is used.

**POOL-LINK = <name 1..8>**

At OPEN time the pool link name is passed to NK-ISAM. This name must have been allocated using the ADD-ISAM-POOL-LINK command to an ISAM pool created with the CREATE-ISAM-POOL command.

---

**POOL-SIZE = \*BY-PROGRAM / <integer 128..1048576 2Kbyte >**

*For NK-ISAM files:*

Determines the size of the file-specific ISAM pool in units of 2048 bytes. The specification does not relate to the ISAM pool addressed with POOL-LINK.

**WRITE-IMMEDIATE = \*BY-PROGRAM / \*NO / \*YES**

Controls how updated blocks are written out to disk.

WRITE-IMMEDIATE=\*YES applies implicitly to shared updating and to cross-task ISAM pools, which means that updated blocks are always written out to disk immediately.

**WRITE-IMMEDIATE = \*BY-PROGRAM**

The value specified in the program is used.

**WRITE-IMMEDIATE = \*NO**

An updated block is not written out to disk until the contents of the associated buffer area need to be replaced or the file is closed.

**WRITE-IMMEDIATE = \*YES**

Each updated block is written out to disk immediately, thus ensuring consistency at all times between the data on disk and in virtual memory. The downside is a higher I/O frequency.

**READ-IN-ADVANCE = \*BY-PROGRAM / \*YES / \*NO**

Specifies whether I/Os should be overlapped.

**READ-IN-ADVANCE = \*BY-PROGRAM**

The setting defined in the program is used.

**READ-IN-ADVANCE = \*YES**

If a second I/O area is defined in the program, read operations can be overlapped. With NK-ISAM, “overlapped processing” means that adjacent blocks are also read into the ISAM pool. READ-IN-ADVANCED=\*YES should be used only for reads which are primarily sequential.

With K-ISAM, “overlapped processing” means that if two I/O buffers are specified in the FCB a block can be read from one buffer to the other in the course of a read operation.

**READ-IN-ADVANCE = \*NO**

Reads are not overlapped.

**DUPLICATE-KEY = \*BY-PROGRAM / \*YES / \*NO**

Specifies whether the same ISAM key is allowed to occur more than once when records are being added using PUT or STORE macros.

**DUPLICATE-KEY = \*BY-PROGRAM**

The value defined in the program is used.

**DUPLICATE-KEY = \*YES**

If a number of records have the same ISAM key, they do not overwrite each other but are written one after the other in the order of their creation. With NK-ISAM, records with identical keys have an 8-byte timestamp added to them internally. This must be allowed for when defining the record length.

See the section on overflow blocks in the “Introductory Guide to DMS” [13].

**DUPLICATE-KEY = \*NO**

If the record being added has an ISAM key which has already occurred, the PUT macro causes the program to branch to the EXLST “DUPEKY” exit, while the STORE macro causes the existing record to be overwritten.

---

**SUPPORT = \*TAPE(...)**

The file to be processed is a tape file.

**VOLUME-LIST = \*CATALOG(...)/ \*TEMPORARY (...)/ \*TAPE-SET (...)**

Specifies the volume serial numbers (VSNs) of the tapes which are to be processed. With work files (DEVICE-TYPE= \*WORK), the ADD-CATALOG-VOLUME operand is ignored and the TAPE-SET-NAME operand is rejected.

**VOLUME-LIST = \*CATALOG(...)**

The VSNs from the volume table in the catalog entry are transferred to the volume list.

**ADD-CATALOG-VOLUME = \*NONE / \*ANY (...) / list-poss(255): <alphanum-name 1..6>**

*This operand is ignored for work files (DEVICE-TYPE= \*WORK).*

As well as the VSNs from the volume table in the catalog entry, other VSNs can be added to the volume list. These VSNs are then also added to the volume table in the catalog entry.

**ADD-CATALOG-VOLUME = \*NONE**

No other VSNs are added to the volume list.

**ADD-CATALOG-VOLUME = \*ANY (...)**

The selection of VSNs is made either by the operating personnel (in response to a console message) or, where available, by the MAREN utility.

This specification is ignored for the dummy file \*DUMMY.

**NUMBER-OF-DEVICES = 1 / <integer 1..9>**

Number of extra VSNs to add to the volume list.

**ADD-CATALOG-VOLUME = list-poss (255): <alphanum-name 1..6>**

Extra VSNs to add to the volume list.

**VOL-SEQUENCE-NUMBER = \*NONE / \*FROM-START-POSITION (...)/****list-poss (255): <integer 1..255>**

Defines which VSNs from the volume list are to be added to the volume table in the TFT entry and which order to add them in. This order has a significant impact on the subsequent processing of the file.

**VOL-SEQUENCE-NUMBER = \*NONE**

All the VSNs in the volume list are added to the volume table in the TFT entry.

**VOL-SEQUENCE-NUMBER = \*FROM-START-POSITION (...)**

Indicates that VSNs from the volume table are to be added to the volume table in the TFT entry starting from a specified VSN.

**START-POSITION = <integer 1..255>**

All VSNs from the specified position onwards are added to the volume table in the TFT entry.

**VOL-SEQUENCE-NUMBER = list-poss (255): <integer 1..255>**

Selected VSNs in the volume list which are to be added to the volume table in the TFT entry. A number given here (such as 12) refers to the position of a VSN in the volume list (in this case the twelfth VSN). Thus the number entered here is the file section number.

**VOLUME-LIST = \*TEMPORARY(...)**

The volume table of the existing catalog entry remains unchanged and is ignored while the file is being processed.

---

**PROCESS-VOLUME = list-poss (255): <alphanum-name 1..6>**

Defines a temporary list of VSNs for processing. This list forms the volume list and the volume table of the generated TFT entry.

**VOLUME-LIST = \*TAPE-SET(...)**

*This operand is rejected for work files (DEVICE-TYPE=\*WORK).*

Selects the tape file VSN set which was created or extended using CREATE- or EXTEND-TAPE-SET. The catalog entry must not yet have any VSNs in its volume table. The volume list is formed from the VSNs of a TST entry. All the VSNs in the volume list are added to the volume table of the catalog entry and to the volume table of the TFT entry.

**TAPE-SET-NAME = <alphanum-name 1..4>**

A maximum of 255 VSNs from the specified TST entry is added to the volume list, starting at the current VSN. The TFT entry which is generated is linked to the specified TST entry. If this TST entry does not exist, a TST entry is created with the specified name and an empty volume list. The final tape sequence for the (output) file is not fixed until OPEN processing is initiated. A reference to a tape set is allowed only for output files with standard labels.

**FILE-SET-IDENTIFIER = \*BY-TAPE-SET / <alphanum-name 1..6>**

File set identifier of the TST entry. The VSN given here must match the file set identifier in the TST entry.

**FILE-SET-IDENTIFIER = \*BY-TAPE-SET**

The file set identifier is defined by the TST entry.

**FILE-SET-IDENTIFIER = <alphanum-name 1..6>**

The VSN given here must match the file set identifier in the TST entry.

**DEVICE-TYPE = \*ANY / <device>**

Device type for the required tapes. Only device types or volume types known within the system are accepted. In interactive mode, the possible device and volume types are displayed with DEVICE-TYPE=?. If a volume type of WORK is specified, a work tape is made available when the file is opened.

**LABEL-PROCESSING = \*BY-PROGRAM / \*PARAMETERS(...)**

Label processing options.

**LABEL-PROCESSING = \*BY-PROGRAM**

The settings specified in the program are used.

**LABEL-PROCESSING = \*PARAMETERS(...)**

The values set in the operands which follow are used.

**LABEL-TYPE = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*NO / \*NON-STD / \*STD(...)**

File label type. For existing tape files, the label standard specified in the VOL1 label always applies. For output files (OPEN OUTIN/OUTPUT) the LABEL-TYPE operand is evaluated and the label standard in the VOL1 label is defined or modified accordingly.

**LABEL-TYPE = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, LABEL-TYPE defaults to \*BY-PROGRAM.

**LABEL-TYPE = \*BY-PROGRAM(...)**

The values defined in the program are used.

**LABEL-TYPE = \*NO**

No file labels are read or written (no file label processing). If the tape has standard labels, the system processes the tape labels and checks for access authorization.

**LABEL-TYPE = \*NON-STD**

The tape file has/is given nonstandard labels; file label processing is done in the user program. If the volume has standard labels, the system performs tape label processing and checks for access authorization.

**LABEL-TYPE = \*STD(...)**

Selects standard labels for the file. The volumes containing the file must also have standard labels.

**DIN-REVISION-NUMBER = \*BY-PROGRAM / <integer 0..3>**

The file and the volume have/are given standard labels conforming to the designated interchange level of DIN standard 66029.

0:	only 2 HDR labels are generated (oldest standard label format; old BS2000 or BS1000 or IBM)
1:	DIN standard 66029 dated August 1972
2:	DIN standard 66029 dated June 1976
3:	DIN standard 66029 dated May 1979

If the tape already contains files or file sections, the value specified here must be compatible with the label standard in the VOL1 label.

	<b>LABEL=*STD(DIN-REVISION-NUMBER=...)</b>			
	<b>0</b>	<b>1</b>	<b>2</b>	<b>3</b>
DIN 66029 interchange level Edition	-	1 8/1972	2 6/1976	3 3/1978
Label standard in VOL1 label	'BLANK' (blank)	1	2	3
CODE=*ISO-7/ *OWN	not allowed	STD blocks converted to nonstandard blocks	STD blocks converted to nonstandard blocks	STD blocks converted to nonstandard blocks
		REC-FORM=V: conversion to record format D	REC-FORM=V: conversion to record format D	REC-FORM=V: conversion to record format D
		REC-SIZE> 9999 or BUF-LEN> 9999 OPEN error	REC-SIZE> 9999 or BUF-LEN> 9999 OPEN error	REC-SIZE> 9999 or BUF-LEN> 9999 OPEN error
CODE=*EBCDIC			STD blocks converted to nonstandard blocks	STD blocks converted to nonstandard blocks

Access method			SAM only	SAM only
RECORD-FORMAT = *UNDEFINED				not allowed for output files; converted to DIN-REV-NUM=2

Table 22: Effect of the LABEL=\*STD(DIN-REV-NUM=...) operand

### Restrictions

1. DIN-REVISION-NUMBER=1 is assumed for:
  - RECORD-FORMAT=\*VARIABLE and CODE=\*EBCDIC
  - BUFFER-LENGTH=\*STD(...)
  - ACCESS-METHOD=\*UPAM or ACCESS-METHOD=\*BTAM
2. If DIN-REVISION-NUMBER is 0, CODE must be \*EBCDIC.
3. If the number in the label standard indicator (VOL1 label) is lower than the number given in the DIN-REVISION-NUMBER operand, the label standard indicator number applies.
4. In all other cases: DIN-REVISION-NUMBER=3 applies (e.g. with CODE=\*ISO7 and RECORD-FORMAT=\*VARIABLE).

For a file opened in INPUT, INOUT, EXTEND or REVERSE mode, the system ignores the number specified here and refers to the number (label standard indicator) given in the volume label (VOL1). For an output file, the significant number is the number given here or, if only \*STD is specified, the most recent number; but note the following:

If the allocated volume already contains one or more files or file sections, the number must match the label standard indicator in the first volume label. Otherwise, the label standard indicator will be set according to the specified number.

This if a volume already contains one or more files or file sections and the label standard indicator in the first volume label is lower than the implicitly assumed standard version (number), the version number is taken from the volume label.

#### **BYPASS-LABEL-CHECK = \*BY-PROGRAM / \*NO-POSITIONING /**

#### **\*ABSOLUTE-POSITIONING(...)/ \*FORWARD-POSITIONING(...)/ \*BACKWARD-POSITIONING(...)**

Allows users with the appropriate authorization in their user entry (see the TPIGNORE output field of the SHOW-USER-ATTRIBUTES command) to bypass label checking so as to process tapes which were written on other operating systems or which have a structure and a label format that the system does not recognize. Code checking is also bypassed. If the tape is written in a code other than EBCDIC or ISO, the user must work with a dedicated code table (CODE= \*OWN). A BYPASS-LABEL-CHECK specification applies only for the duration of file processing; it is not added to the catalog.

#### **BYPASS-LABEL-CHECK = \*BY-PROGRAM**

The setting which applies in the program is used.

#### **BYPASS-LABEL-CHECK = \*NO-POSITIONING**

Label handling is bypassed; header labels are not read or check; the tape position is not changed.

#### **BYPASS-LABEL-CHECK = \*ABSOLUTE-POSITIONING(...)**

Absolute positioning. The tape is transported to the tape mark indicated in the next parameter. Counting from the tape start.

---

**TAPE-MARK-NUMBER = <integer 0..32767>**

Number of the tape mark to transport the tape to. TAPE-MARK-NUMBER = 0: position at the tape start.

**BYPASS-LABEL-CHECK = \*FORWARD-POSITIONING(...)**

Forward positioning. The tape is wound forward by the number of tape marks indicated in the next parameter. Counting relative to the current tape position. No label checking is done.

**NUMBER-OF-TAPE-MARKS = <integer 0..127>**

Number of tape marks by which the tape is to be forwarded when the file is opened. NUMBER-OF-TAPE-MARKS = 0: the tape is not repositioned.

**BYPASS-LABEL-CHECK = \*BACKWARD-POSITIONING(...)**

Backward Positioning. The tape is wound back by the number of tape marks indicated in the next parameter. Counting relative to the current tape position. No label checking is done.

**NUMBER-OF-TAPE-MARKS = <integer 0..127>**

Number of tape marks by which the tape is to be reversed when the file is opened. NUMBER-OF-TAPE-MARKS=0: the tape is not repositioned.

**PROTECTION-LEVEL = \*BY-PROGRAM / \*LOW(...) / \*HIGH(...)**

Protection level (level of security) that label checking is to provide. Affects file processing in batch mode only. This operand is allowed only for tape or files with standard labels.

**PROTECTION-LEVEL = \*BY-PROGRAM**

The setting selected in the program is used.

**PROTECTION-LEVEL = \*LOW(...)**

If file processing is running in batch mode under the ID of the system administrator or the tape or file owner and appropriate authorization is allocated in the user entry (see the TPIGNORE output field of the SHOW-USER-ATTRIBUTES command), certain label processing error messages are suppressed.

**OVERWRITE-PROTECTION = \*NO / \*YES**

Indicates whether any other label checks are to be performed in addition to write protection.

**OVERWRITE-PROTECTION = \*NO**

No other label checks are to be performed in addition to write protection.

**OVERWRITE-PROTECTION = \*YES**

The system performs additional checks:

- If a new tape file is placed after an existing file on the tape, the labels of the preceding file are checked.
- the expiration date of the new file must not be later than that of the preceding file.
- ACCESS=READ must not be declared for the new file if ACCESS=WRITE has been declared for the preceding file.

**PROTECTION-LEVEL = \*HIGH(...)**

Error messages are displayed on the console in batch mode. If the job is running under a user ID with TPIGNORE=YES authorization in the user catalog, operating personnel may ignore the error messages.

**OVERWRITE-PROTECTION = \*NO / \*YES**

See the PROTECTION-LEVEL=\*LOW operand.

---

**TAPE-MARK-WRITE = \*BY-PROGRAM / \*YES**

Only for tape files without standard labels: specifies whether tape marks are written, i.e. the TAPE-MARK-WRITE operand is evaluated only when a tape file with LABEL set to \*NO or \*NON-STD is opened. Tape files with LABEL set to \*STD (DIN-REV-NUM=n) are by default given tape marks after the labels.

**TAPE-MARK-WRITE = \*BY-PROGRAM**

The value set in the program is used.

**TAPE-MARK-WRITE = \*YES**

There is a tape mark after the label. Tape files without labels: the tape mark is placed at the start of the tape.

**CODE = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / \*EBCDIC / \*ISO7 / \*ISO7D / \*OWN**

For SAM or BTAM tape files: code in which the data and labels of the file are processed. Code translation is possible only for files with nonstandard blocks and may modify the record length field on output in locate mode. The value of the EBCDIC-TRANSLATION operand must be taken into account.

**CODE = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, CODE defaults to \*BY-PROGRAM.

**CODE = \*BY-PROGRAM**

The setting which applies in the program is used.

**CODE = \*BY-CATALOG**

The setting defined in the catalog entry is used.

**CODE = \*EBCDIC**

No code translation is required during processing.

*Note*

The German and international character sets use the same coding. Differences in the presentation may be caused by different character set settings of the terminal emulation. The same applies to CODE=\*ISO7.

**CODE = \*ISO7**

The tape file is written in ISO 7-bit code, which means that EBCDIC code is converted to ISO 7-bit on output and ISO 7-bit code is converted to EBCDIC on input. Code conversion is based on the international ISO table.

*Notes*

- The block length must be given in the form BUFFER-LENGTH=<integer 1..32767>, as otherwise the output blocks will be preceded by a (hexadecimal) PAM key. The same applies to CODE=\*OWN.
- For output in locate mode with variable record format (RECORD FORMAT= \*VARIABLE), the contents of the record length field (i.e. the first four bytes) are modified. In move mode, the record length field is not modified. The same applies to CODE=\*OWN.
- The German and international character sets use the same coding. Differences in the presentation may be caused by different character set settings of the terminal emulation. The same applies to CODE=\*EBCDIC.

---

**CODE = \*ISO7D**

Code conversion is as for CODE=\*ISO7. It is, however, based on the German ISO table rather than the international version.

**CODE = \*OWN**

All tape I/O is performed on the basis of user-defined code translation tables. The addresses of these tables must have been defined in the file control block (FCB) of the program (using the TRTADR and TRTADW parameters in the FCB macro call).

*Notes*

- The block length must be given in the form BUFFER-LENGTH=<integer 1..32767>, as otherwise the output blocks will be preceded by a (hexadecimal) PAM key. The same applies to CODE=\*ISO7.
- For output in locate mode with variable record format (RECORD FORMAT= \*VARIABLE), the contents of the record length field (i.e. the first four bytes) are modified. In move mode, the record length field is not modified. The same applies to CODE=\*ISO7.

**EBCDIC-TRANSLATION = \*BY-PROGRAM / \*YES / \*NO**

Only for tape files used as input files and not created using CODE= \*EBCDIC: defines how the code in the file is to be translated when the file is read.

**EBCDIC-TRANSLATION = \*BY-PROGRAM**

The setting selected in the program is adopted.

**EBCDIC-TRANSLATION = \*YES**

ISO 7-bit code or OWN code is translated to EBCDIC.

**EBCDIC-TRANSLATION = \*NO**

No translation to EBCDIC. ISO 7-bit code is translated to an 8-bit format with a leading zero.

**FILE-SEQUENCE = \*BY-PROGRAM / \*BY-CATALOG / \*UNKNOWN / \*NEW / <integer 0..9999>**

Specifies the sequence number of a tape file within a file set. If there are several files of the same name on a tape, access is under FILE-SEQUENCE control. The same applies to MF/MV sets. If the VOLUME-LIST \*TAPE-SET(...) operand is also set, only FILE-SEQUENCE=\*NEW or FILE-SEQUENCE=1 is allowed.

**FILE-SEQUENCE = \*BY-PROGRAM**

The value set in the program is used.

**FILE-SEQUENCE = \*BY-CATALOG**

If there is a file sequence number in the catalog entry, it is transferred to the TFT entry. If not, no file sequence number is added to the catalog entry, and \*BY-CATALOG is added to the TFT entry.

**FILE-SEQUENCE = \*UNKNOWN**

If there is a file sequence number in the catalog entry, it is transferred to the TFT entry. If not, no file sequence number is added to the catalog entry, and \*UNKNOWN is added to the TFT entry. The effect of this on a foreign tape file with standard labels is that, when an attempt is made to open the file, the tape is searched for the file and positioned accordingly.

---

**FILE-SEQUENCE = \*NEW**

Allowed only for files which have been opened (OPEN OUTPUT) but not yet actually created. This operand adds a new file to an existing file set. The tape is transported to the end of the file set, and the new file is written after the last existing file in the set. The system reports an OPEN error if it fails to find the end of the file set. The sequence number of the new file is the sequence number of the old last file plus 1. If there is no file on the tape at the time the file is opened, the file is made the first in the file set and accordingly assigned a file sequence number of 1.

**FILE-SEQUENCE = <integer 0..9999>**

Specifies the sequence number of a file with a file set; FILE-SEQUENCE=0, like FILE-SEQUENCE=1, designates the first file in the set. If the file has already been cataloged with the creation date, the file sequence number that the user specifies must match the number which appears in the catalog entry. If a new file is to be created, it is appended to the end of the file set, which means that the file sequence number must be 1 higher than the last existing file in the file set.

*Note*

If the sequence number of an existing file in the file set is specified, the existing file will be overwritten.

**CHECKPOINT-WRITE = \*BY-PROGRAM / \*PARAMETERS(...)**

Controls whether and when a checkpoint is automatically written at the volume end.

**CHECKPOINT-WRITE = \*BY-PROGRAM**

The setting selected in the program is adopted.

**CHECKPOINT-WRITE = \*PARAMETERS(...)****CHKPT-AT-BLOCK-LIMIT = \*BY-PROGRAM**

The setting selected in the program is adopted.

**CHKPT-AT-BLOCK-LIMIT = \*YES**

A checkpoint is written automatically when the maximum number of logical blocks per tape as defined in the BLOCK-LIMIT operand is reached.

**CHKPT-AT-FORCED-EOV = \*BY-PROGRAM**

The setting selected in the program is adopted.

**CHKPT-AT-FORCED-EOV = \*YES**

Checkpoint at forced end of the volume. A checkpoint is written automatically in response to each FEOV macro call in the Assembler program.

**RESTART-USAGE = \*BY-PROGRAM / \*DUMMY**

Indicates whether, in the event of a restart (RESTART-PROGRAM command), the file specified in the FILE-NAME operand is to continue being processed or is to be treated as a DUMMY file.

**RESTART-USAGE = \*BY-PROGRAM**

The setting selected in the program is adopted.

**RESTART-USAGE = \*DUMMY**

In the event of a restart, the file is treated as a DUMMY file.

**BLOCK-LIMIT = \*BY-PROGRAM / <integer 1..999999>**

Only when creating SAM tape files with standard labels: maximum number of logical blocks of the file per tape.

---

**BLOCK-LIMIT = \*BY-PROGRAM**

The setting selected in the program is adopted.

**BLOCK-LIMIT = <integer 1..999999>**

Specifies how many logical data blocks are allowed to be written on one tape. Once this limit is reached, tape swapping is initiated (EOV processing). The user is sent an error message if the end of the tape is reached before the number of blocks specified by BLOCK-LIMIT has been written.

**BLOCK-OFFSET = \*BY-DATA-ATTRIBUTES / \*BY-PROGRAM / \*BY-CATALOG / \*BY-HDR2 / <integer 0..99 byte >**

Only for SAM tape files with BLOCK-CONTROL-INFO=\*WITHIN-DATA-BLOCK or SAM tape files with nonstandard blocks: defines the buffer offset, i.e. the length in bytes of a field inserted at the start of each logical data block. If present, this field contains the block control information/block length field.

**BLOCK-OFFSET = \*BY-DATA-ATTRIBUTES**

The value defined for the file specified in the DATA-ATTRIBUTES operand is used. If DATA-ATTRIBUTES is \*STD, BLOCK-OFFSET defaults to \*BY-PROGRAM.

**BLOCK-OFFSET = \*BY-PROGRAM**

The value set in the program is used.

If there is no value set in the program, the following defaults apply:

- tape file with BLOCK-CONTROL-INFO=\*WITHIN-DATA-BLOCK:
  - BLOCK-OFFSET=16 applies with ACCESS-METHOD=\*SAM
  - BLOCK-OFFSET=12 applies with ACCESS-METHOD=\*UPAM
- tape file with BLOCK-CONTROL-INFO=\*NO:
  - BLOCK-OFFSET=4 applies with RECORD-FORMAT=\*VARIABLE
  - BLOCK-OFFSET=0 applies with RECORD-FORMAT=\*FIXED/\*UNDEFINED

**BLOCK-OFFSET = \*BY-CATALOG**

The value set in the catalog is used.

**BLOCK-OFFSET = \*BY-HDR2**

The BLOCK-OFFSET value is taken from the HDR2 label. If there is no HDR2 label, or if the “buffer offset” field in the HDR2 label contains blanks (X'4040'), the default is used (see \*BY-PROGRAM).

**BLOCK-OFFSET = <integer 0..99 byte >**

Specifies the length of the buffer offset.

For variable-length records (RECORD-FORMAT=\*VARIABLE) the buffer offset may have a length between 0 and 4 bytes. If BLOCK-OFFSET=4 is set, this field contains the current block length.

**TAPE-WRITE = \*BY-PROGRAM / \*DEVICE-BUFFER / \*IMMEDIATE**

Only for files on tape cartridges (CREATE-FILE/MODIFY-FILE-ATTRIBUTES command, DEVICE-TYPE operand): defines whether the output is to be buffered.

**TAPE-WRITE = \*BY-PROGRAM**

The value specified in the program is used.

**TAPE-WRITE = \*DEVICE-BUFFER**

Output is buffered by the device controller, resulting in a high data transfer rate.

**TAPE-WRITE = \*IMMEDIATE**

Output is not buffered.

**DESTROY-OLD-CONTENTS = \*BY-CATALOG / \*NO / \*YES**

The user can specify whether other files on the tape are to be destroyed by overwriting after EOF/EOV processing. The operand has the same function as the DESTROY parameter in the catalog entry, but it takes precedence over the catalog entry created by the CREATE-FILE or MODIFY-FILE-ATTRIBUTES command, DESTROY-BY-DELETE operand. Values specified for this operand are not transferred to the FCB or the catalog entry.

**DESTROY-OLD-CONTENTS = \*BY-CATALOG**

When the file is processed, the value assigned to DESTROY-BY-DELETE in the catalog entry takes effect.

**DESTROY-OLD-CONTENTS = \*NO**

The old contents are not destroyed.

**DESTROY-OLD-CONTENTS = \*YES**

The data on the remainder of the tape is destroyed once the EOF/EOV labels have been written.

**IO-CHAINING = \*BY-PROGRAM / <integer 1..16>**

Only for BTAM files and chained I/O: defines the number of logical blocks per transport unit (chaining factor specifying the of the I/O transport unit/transmission unit).

**IO-CHAINING = \*BY-PROGRAM**

The value specified in the program is used.

**IO-CHAINING = <integer 1..16>**

Designates a number of logical blocks such that the length of the transport unit is computed as (IO-CHAINING BUFFER-LENGTH). Although specifications in the program (BTAM macro, LEN operand) take precedence over the product (IO-CHAINING BUFFER-LENGTH), IO-CHAINING must be specified in the ADD-FILE-LINK command if chained I/O is used.

**FILE-CLOSE-MSG = \*STD / \*NO / \*YES**

For SAM files the user can specify whether the close message DMS0DE7 is to be written to SYSOUT on completion of CLOSE processing. If system parameter CONSDDE7=Y is set, the message is also output on the console.

**FILE-CLOSE-MSG = \*STD**

The following default applies:

- for tape disk files: FILE-CLOSE-MSG = \*NO
- for tape files: FILE-CLOSE-MSG = \*YES

**FILE-CLOSE-MSG = \*NO**

The file close message is suppressed.

**FILE-CLOSE-MSG = \*YES**

The file close message is sent.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed successfully

	1	CMD0202	Syntax or semantic error
	1	DMS0576	Invalid operand combination
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0216	Required authorization not available
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset Guaranteed messages: DMS051B, DMS0681
	64	DMS051C	User not authorized to access pubset Guaranteed messages: DMS051C, DMS0681
	64	DMS0535	Specified file not shareable
	64	DMS0585	Error detected when processing catalog or multiprocessor system.
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS060D	Invalid reference file name
	64	DMS0616	Volume set in SM pubset cannot be accessed
	64	DMS0684	File does not exist Guaranteed message: DMS0684
	64	DMS0685	File not yet allocated storage space
	64	DMS06FF	BCAM connection severed
	130	DMS0524	System address space exhausted
	130	DMS053C	No space in pubset catalog file
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system.
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	CE limit reached

## Examples

*Example 1: Creating a TFT entry with values from the catalog entry*

```
/show-file-attr savlst.hsmsmac,inf=(org=yes)
```

```
%0000000027 :20SG:$USER1.SAVLST.HSMSMAC
% ----- ORGANIZATION -----
% FILE-STRUC = SAM          BUF-LEN   = STD(1)          BLK-CONTR = PAMKEY
% IO(USAGE)  = READ-WRITE  IO(PERF)  = STD           DISK-WRITE = IMMEDIATE

% VSN/DEV           = GVS2.2/D3435
```

All the file attributes for which \*BY-CATALOG is specified in the ADD-FILE-LINK command are marked \*BY-CAT in the TFT entry. When the file named *LST.HSMSRECALL* is accessed via its link name of *EDTSAM*, these attributes will be taken from the file's catalog entry.

*Example 2: File attributes in the command*

```
/create-file max.file.1  
/show-file-attr max.file.1,org=*yes
```

```
%0000000003 :2OSG:$USER1.MAX.FILE.1  
% ----- ORGANIZATION -----  
% FILE-STRUC = NONE          BUF-LEN    = NONE          BLK-CONTR = NONE  
% IO(USAGE)  = READ-WRITE   IO(PERF)  = STD          DISK-WRITE = IMMEDIATE  
% REC-FORM   = NONE          REC-SIZE   = 0  
% AVAIL      = *STD  
% WORK-FILE  = *NO           F-PREFORM = *K          S0-MIGR   = *ALLOWED  
%:2OSG: PUBLIC:      1 FILE RES=      3 FRE=      3 REL=      3 PAGES
```

```
/add-file-link link=output1,file-name=max.file.1,acc-method=*isam,  
support=*disk(isam-attr=*par(key-pos=5,key-length=10))  
/show-file-link link=output1,inf=*par(file=*yes)
```

```
%-- LINK-NAME ----- FILE-NAME -----  
% OUTPUT1           :2OSG:$USER1.MAX.FILE.1  
% ----- FILE-CONTROL-BLOCK - GENERAL ATTRIBUTES -----  
% ACC-METH   = ISAM          OPEN-MODE  = *BY-PROG   REC-FORM   = *BY-PROG  
% REC-SIZE   = *BY-PROG     BUF-LEN    = *BY-PROG   BLK-CONTR  = *BY-PROG  
% F-CL-MSG   = STD          CLOSE-MODE = *BY-PROG  
% ----- FILE-CONTROL-BLOCK - DISK FILE ATTRIBUTES -----  
% SHARED-UPD = *BY-PROG     WR-CHECK  = *BY-PROG   IO(PERF)  = *BY-PROG  
% IO(USAGE)  = *BY-PROG     LOCK-ENV  = *BY-PROG  
% ----- FILE-CONTROL-BLOCK - TAPE FILE ATTRIBUTES -----  
% LABEL      = *BY-PROG     (DIN-R-NUM = *BY-PROG, TAPE-MARK = *BY-PROG)  
% CODE       = *BY-PROG     EBCDIC-TR = *BY-PROG   F-SEQ     = *BY-PROG  
% CP-AT-BLIM = *BY-PROG     CP-AT-FEOV = *BY-PROG  BLOCK-LIM = *BY-PROG  
% REST-USAGE = *BY-PROG     BLOCK-OFF  = *BY-PROG  TAPE-WRITE = *BY-PROG

% DUP-KEY    = *BY-PROG  PAD-FACT  = *BY-PROG  READ-I-ADV = *BY-PROG
% WR-IMMED   = *BY-PROG  POOL-SIZE = *BY-PROG
% ----- VOLUME -----
% DEV-TYPE   = *NONE     T-SET-NAME = *NONE
% VSN/DEV    = GVS2.3/D3435
```

A new file, *ABK.NEU*, is created with the *CREATE-FILE* command. For processing purposes, the new file is to have the same attributes as an existing file, *ABK.ISAM*. For this purpose *ABK.ISAM* is specified as the reference file in the *ADD-FILE-LINK* command (see *DATA-ATTRIBUTES* operand). The file attributes of the reference file specified in the *ADD-FILE-LINK* command are copied into the TFT entry. When the new file is processed by way of the link name *OUTPUT2*, these attributes are copied into the file control block.

---

## 2.13 ADD-IO-UNIT

Add input/output unit to configuration

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Device management
<b>Domain:</b>	DEVICE
<b>Privileges:</b>	OPERATING
<b>Routing code:</b>	G

### Function

Systems support can dynamically extend the input/output configuration with the ADD-IO-UNIT command. New input/output units (devices, controllers) can be defined. New input/output units have to be specified in the order channel – > controller –> device. Up to 256 devices can be added to the controller using the ADD-IO-UNIT command.

Dynamic I/O configuration change is supported for the following device classes:

- disk and tape devices
- LAN devices

The command is only accepted if the dynamic I/O configuration change was started successfully (see START-CONFIGURATION-UPDATE command).

#### *Restrictions and peculiarities*

The following procedures have to be completed before a new tape device that has been added using ADD-IO-UNIT can take up operation:

1. A depot has to be assigned to the device using the ADD-DEVICE-DEPOT command.
2. If MAREN is being used and the new device is to be subject to free tape allocation, the MARENUCP subsystem has to be stopped and restarted.
3. If the new device is being operated by a robot and if it is not contained in the ROBAR configuration file, the ROBAR-SV subsystem has to be stopped and restarted.

A new LAN device has to be configured in BCAM before or after being added.

The IOTRACE subsystem only considers new input/output units, if it is restarted after changes have been made to the configuration.

## Format

### ADD-IO-UNIT

**UNIT** = \*CHANNEL(...) / \*CONTROLLER(...) / \*DEVICE(...)

\*CHANNEL(...)

```

## Operands

**UNIT = \*CHANNEL(...)** / **\*CONTROLLER(...)** / **\*DEVICE(...)**

Specifies which input/output unit is to be added to the configuration.

**UNIT = \*CHANNEL(...)**

Specifies the channel to be added to the configuration.

**TYPE = \*IBF(...)**

A serial type FC channel is to be added.

**MODE = \*FCP**

Specifies the mode in which the IBF channel is to operate:

The channel is operated in “fibre channel” mode (for connecting controllers with FC capability). This is the default value.

**CHANNEL-PATH-ID = <x-text 2..3>**

The number of the channel.

**UNIT = \*CONTROLLER(...)**

The controller that is to be added to the configuration.

**NAME = <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device code of the controller: either two alphanumeric characters (A...Z, 0...9) or four hexadecimal digits in the range 1000 through FFFF.

**TYPE = <alphanum-name 3..6>**

Controller type.

---

**LOGICAL-ADDRESS = 0 / <integer 0..255>**

Specifies a logical address:

0 to 255 for the controller on the type FC channel (MODE=\*FCP).

The default is logical address 0.

For the controller on the fibre channel this specifies the more significant byte of the LUNs (Logical Unit Numbers) of the devices connected to this controller. The low order byte of the LUN is defined for the device by the DEVICE-ADDRESS operand.

**PATH = list-poss(8): \*CHANNEL(...)**

As many as eight input/output paths via which the controller can be accessed can be entered in a list.

**CHANNEL-PATH-ID = <x-text 2..3>**

Specifies the number of the channel to which the controller is linked.

**CONTROLLER-ADDRESS = 00 / <x-text 1..2>**

Specifies the physical controller address.

The default is address 00.

**PATH-STATE = \*INCLUDED / \*REMOVED**

Specifies whether the link between the channel and the controller is available. The default is \*INCLUDED, i.e. the connection is available.

**PORT-ID = \*NONE / <x-text 2..16>**

Specifies whether the controller is connected to a Fibre Channel.

The default is \*NONE, i.e. the controller is not connected to a Fibre Channel.

**PORT-ID = <x-text 2..16>**

When a controller is connected to a Fibre Channel the WWPN (World Wide Port Name) of the controller port (16 hexadecimal characters) must be specified. The /SHOW-DEVICE-CONFIGURATION INF=\*INNER command for the controller can then be used to output the WWPN.

**DEVICE-RANGE = list-poss(8): \*DEVICE(...)**

Lists up to eight address areas through which devices linked to the controller can be accessed. Each address area is specified by the first device address and the total number of device addresses that follow it. To determine a device address in the address area, 1 is added for each device, starting from the first address. The value of the final address must not exceed FFFF.

**FIRST-ADDRESS = 00 / <x-text 2..2>**

First device address.

**NUMBER-OF-DEVICES = 256 / <integer 1..256>**

Number of devices in the address area.

**UNIT = \*DEVICE(...)**

A device that is to be added to the configuration.

**NAME = <alphanum-name 2..2> / <x-text 4..4> / \*RANGE(...)**

Mnemonic device code of the device: either two alphanumeric characters (A...Z, 0...9) or four hexadecimal digits in the range 1000 through FFFF. A two-character alphanumeric mnemonic can always be selected for devices. A four-digit hexadecimal device mnemonic (1000 - FFFF) is permitted for all disk and tape devices and for devices of the type 6D (HNC).

A group of devices can be added with the aid of the \*RANGE operand.

---

**NAME = \*RANGE(...)**

A range of devices is added. Based on the mnemonics of the first device (FIRST-NAME operand), the mnemonics of the following devices are determined by adding 1 until the maximum number of devices defined in the NUMBER-OF-DEVICES operand is reached. The group can comprise as many as 256 devices. The maximum number has to be chosen so as not to exceed the value FFFF when the mnemonics are calculated.

**FIRST-NAME = <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device code of the first device.

**NUMBER-OF-DEVICES = <integer 2..256>**

Number of devices to be added.

**TYPE = <x-text 2..4 without-odd>**

Device type code (see "System installation" [46]).

**DEVICE-ADDRESS = <x-text 2..2>**

Device address.

For a device on the Fibre Channel this specifies the low order byte of the LUN (Logical Unit Number). The more significant byte of the LUN is defined on the controller using the LOGICAL-ADDRESS operand.

**PATH = list-poss(8): \*CHANNEL(...) / \*CONTROLLER(...)**

Up to eight input/output paths can be specified in a list, via which a device or a group of devices can be reached. The entries can refer either on the channel or on the controller. A mixed entry of both is not possible.

**PATH = list-poss(8): \*CHANNEL(...)**

As many as eight channels via which the device can be addressed can be specified in a list.

Channel-specific specifications are not currently supported on SU /390 and S servers. Devices can only be added via a controller (see PATH= \*CONTROLLER).

**CHANNEL-PATH-ID = <x-text 2..3>**

Number of the channel to which the device is linked.

**PATH-STATE = \*INCLUDED / \*REMOVED**

Specifies whether the link between the channel and the device is available or not. The default is \*INCLUDED, i.e. the connection is available.

**PATH = list-poss(8): \*CONTROLLER(...)**

As many as eight controllers via which the device can be accessed can be specified in a list.

**NAME = <alphanum-name 2..2> / <x-text 4..4>**

The device code of the controller to which the device is linked.

**PATH-STATE = \*INCLUDED / \*REMOVED**

Specifies whether the link between the controller and the device is available or not. The default is \*INCLUDED, i.e. the connection is available.

**PREFERRED-PATH = \*NO / \*YES(...)**

Specifies whether a path is to preferred on input/output if the device can be accessed via different paths. The default setting is \*NO, i.e. there is no preferred path.

**PREFERRED-PATH = \*YES(...)**

A specific input/output path is to be used with preference.

**CHANNEL-PATH-ID = <x-text 2..3>**

Designates the preferred path (Channel Path Identifier).

---

**PAV-ALIAS-DEVICE = \*NO / \*YES(...)**

Specifies whether the device is to be defined as an alias device of a PAV volume on the Fibre Channel. The default is \*NO, i.e. no alias device is defined.

**PAV-ALIAS-DEVICE = \*YES(...)**

The device is to be defined as an alias device of a PAV volume. The associated PAV base device must already be defined and it may not have a lower device number than the alias device (an assignment table with the mnemonic and device number is contained in the “System Installation” manual [46]).

**DEVICE-ADDRESS = <x-text 2..2>**

Alias address of the alias device. The address must be unique in the controller. For an alias device on the Fibre Channel the alias address must differ from the low order byte of the LUN.

Information on generating base and alias devices is provided in the “System Installation” manual [46].

**STATE = \*ATTACHED / \*DETACHED**

Specifies the status (available or not available) in which the input/output unit is added to the configuration. The default is \*ATTACHED, i.e. the new input/output unit is available. This status can be changed using the ATTACH-DEVICE or DETACH-DEVICE commands.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	1	NKR0006	Syntax error
	64	CMD0216	Insufficient authorization
1	64	NKR0169	system error
2	64	NKR0169	Wrong parameter
3	64	NKR0169	Dynamic I/O configuration change was rejected
4	64	NKR0169	Dynamic I/O configuration change not supported
6	64	NKR0169	Internal input/output unit not defined
7	64	NKR0169	Input/output unit already defined
8	64	NKR0169	Input/output unit type not supported
10	64	NKR0169	No free table entry for input/output unit
12	64	NKR0169	Dynamic I/O configuration change was not started
14	64	NKR0169	Configuration changes not made in guest system
16	64	NKR0169	Another guest system currently being started
17	64	NKR0169	Another guest system currently being stopped
18	64	NKR0169	Dynamic I/O configuration change is not supported by one or several guest systems

## Specification of controller type (UNIT=\*CONTROLLER)

For disk and tape controllers on the Fibre Channel no distinction need be made between types. A disk controller is generated with DISK01, a tape controller with TAPE02 and controller for LAN devices with TD0001.

## Example

The logical volumes with the LUNs 256 through 505 are configured on 2 ports of a disk controller with the port WWPNs 50060484360A4E8E and 50060484360A4E9A and connected to the two type FC channels with the channel numbers 38 and 3C (via an FC switch). The two controller ports are to be defined as a controller with the name 8800, the logical volumes as devices of the type D3435 with the names 8800 through 88F9. The logical volume with LUN 256 is to be operated as a PAV volume with 8800 as the base device and 88FF as the alias device.

---

## Procedure

### 1. Start configuration update:

```
/START-CONFIGURATION-UPDATE
```

### 2. Add channels:

```
/ADD-IO-UNIT UNIT=*CHANNEL (TYPE=*IBF (MODE=*FCP), CHANNEL-PATH-ID=38)  
/ADD-IO-UNIT UNIT=*CHANNEL (TYPE=*IBF (MODE=*FCP), CHANNEL-PATH-ID=3C)
```

### 3. Add controller:

```
/ADD-IO-UNIT UNIT=*CONTR (NAME=8800, TYPE=DISK01, LOGICAL-ADDR=1,  
                           PATH=( *CHANNEL(38,00,,50060484360A4E8E),  
                                *CHANNEL(3C,00,,50060484360A4E9A)),  
                           DEV-RANGE=*DEV(00,256))
```

### 4. Add devices:

```
/ADD-IO-UNIT UNIT=*DEV (NAME=*RANGE(8800,250), TYPE=A5,  
                        DEV-ADDR=00, PATH=*CONTR(8800)),  
              STATE=*DETACHED
```

### 5. Add PAV alias device:

```
/ADD-IO-UNIT UNIT=*DEV (NAME=88FF, TYPE=A5, DEV-ADDR=00,  
                        PATH=*CONTR(8800), PAV-ALIAS-DEV=*YES (DEV-ADDR=FF)),  
              STATE=*DETACHED
```

### 6. Terminate configuration update:

```
/STOP-CONFIGURATION-UPDATE IORSF-UPDATE*YES (LEVEL=n)
```

---

## 2.14 ADD-ISAM-POOL-LINK

Assign pool link name to ISAM pool

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING

### Function

The ADD-ISAM-POOL-LINK command is used to assign a pool link name to an ISAM pool for a user job and to enter this name in the task-local pool table. The job must already be linked to the specified ISAM pool (see the CREATE-ISAM-POOL command). With this pool link name, a connection can then be established via the TFT to a file, using the ADD-FILE-LINK command (with the operands LINK-NAME and POOL-LINK). The link name must be unique within a task. The user can have entries of the task-local pool table displayed by using the SHOW-ISAM-POOL-LINK command. Pool link names can be deleted from the pool table with the REMOVE-ISAM-POOL-LINK command.

For a full description of the ISAM pool see the “Introductory Guide to DMS” [13] or the “DMS Macros” manual [12].

### Format

#### ADD-ISAM-POOL-LINK

**LINK-NAME** = <name 1..8>

,**POOL-NAME** = <name 1..8>(…)

<name 1..8>(…)

| **CAT-ID** = \*DEFAULT-PUBSET / <cat-id 1..4>

| ,**SCOPE** = \*TASK / \*HOST-SYSTEM / \*USER-ID / \*USER-GROUP

### Operands

**LINK-NAME** = <name 1..8>

Link name by which the ISAM pool can be addressed (see the POOL-NAME operand). The link name must be unique within a task.

**POOL-NAME** = <name 1..8>(…)

Name of the ISAM pool to which the pool link name is to be assigned (see the LINK-NAME operand). The ISAM pool is uniquely identified by the specified name, the catalog ID (see the CAT-ID operand) and the scope (see the SCOPE operand). The job must already be linked to the ISAM pool (see the CREATE-ISAM-POOL or SHOW-ISAM-POOL-ATTRIBUTES command).

**CAT-ID** = \*DEFAULT-PUBSET / <alphanum-name 1..4>

Catalog ID of the pubset to which the ISAM pool is assigned.

The specified catalog ID must match the specification in the corresponding CREATE-ISAM-POOL command.

**CAT-ID = \*DEFAULT-PUBSET**

The ISAM pool is assigned to the catalog that was set with the ISPLDEFB system parameter (ISAM-POOL-DEFAULT-CATID):

X'00':	default catalog ID from the user entry (see the SHOW-USER-ATTRIBUTES command, output field <i>DEFAULT-PUBSET</i> )
X'01':	catalog ID of the home pubset

**CAT-ID = <alphanum-name 1..4>**

Catalog ID of the pubset to which the ISAM pool is assigned.

**SCOPE = \*TASK / \*HOST-SYSTEM / \*USER-ID / \*USER-GROUP**

Specifies the scope of the ISAM pool.

The defined scope must match the specification in the corresponding CREATE-ISAM-POOL command.

**SCOPE = \*TASK**

The pool link name is assigned to the task-local ISAM pool, i.e. the ISAM pool can only be used by its own task.

**SCOPE = \*HOST-SYSTEM**

The pool link name is assigned to the cross-task ISAM pool (POOL-NAME operand), i.e. the ISAM pool can be used by all tasks.

**SCOPE = \*USER-ID / \*USER-GROUP**

These scopes are only supported for reasons of compatibility (see the CREATE-ISAM-POOL command).

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	32	DMS0A17	Internal system error
	64	DMS0A0E	Syntax error in ISAM pool command
	64	DMS0A11	Specified catalog ID does not exist
	64	DMS0A13	Specified pool name is syntactically invalid
	64	DMS0A16	Pool link name already allocated
	64	DMS0A19	Specified ISAM pool does not exist
	64	DMS0A20	Parameters not permitted for remote BS2000 version
	64	DMS0A22	User group not present
	130	DMS0A12	Specified catalog ID not available

## Examples

*Use of an ISAM pool to process files*

**/show-isam-pool-attr pool=\*all** \_\_\_\_\_ (1)

```
%

```
%
%  CATID      POOLNAME  SCOPE                WROUT  SIZE  EXTENTS  RESIDENT
%=====
%  10SU       SDFPOOLN  TASK                 NO     128   --/--    NO
%
```

- (1) Returns information on all ISAM pools connected to the task. There is one ISAM pool named *SDFPOOLN*, and one host-specific and one task-local ISAM pool with the name *POOLAB01*. It is evident that no file has been processed via these ISAM pools as yet, since the output column *EXTENTS* does not contain any formatting information.
- (2) Creates an entry in the task-local pool table. The pool link name *POOL1* is assigned to the host-specific ISAM pool *POOLAB01*.
- (3) Returns information on all pool link names.
- (4) Catalog information on the organization of the NK-ISAM file *ABK.V100.ISAM*.
- (5) Creates a TFT entry with the link name *INPUT1* for the file *ABK.V100.ISAM*. At the same time, it also links the file with the pool link name *POOL1* (in the *POOL-LINK* operand).
- (6) Output of the TFT entry for the file *ABK.V100.ISAM* along with general information on file processing (*FILE-CONTROL-BLOCK=\*YES*).
- (7) The program *NEWWORD3* is started from the library *ASS.PLAMLIB*. This program processes individual records of an ISAM file via an ISAM pool. The name of the file to be processed is obtained from the TFT entry with the link name *INPUT1*. After running successfully, the program terminates and writes the message *\*\*\*PRGRUN OK!\*\*\** to *SYSOUT*.
- (8) The task-local ISAM pool *POOLAB01* is deleted.
- (9) The host-specific ISAM pool *POOLAB01* is to be deleted. The *DELETE-ISAM-POOL* command is rejected since there is still an entry in the task-local pool table for this pool (see step 10).
- (10) Returns information on all ISAM pools connected to the task. It is now evident that at least one NK2-ISAM file (here *ABK.V100.ISAM*) has been processed via the host-specific ISAM pool *POOLAB01*, since the ISAM pool is now formatted with 2K (see the *EXTENTS* column and step 1).
- (11) The entry with the pool link name *POOL1* is deleted.
- (12) There is now no longer entry with the pool link name *POOL1*.
- (13) A new attempt is made to delete the host-specific ISAM pool *POOLAB01*.
- (14) The host-specific ISAM pool *POOLAB01* could be deleted. The task is now only connected to the task-local ISAM pool *SDFPOOLN*.

## 2.15 ADD-MASTER-CATALOG-ENTRY

Generate entry in MRSCAT of home pubset

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS  
**Routing code:** \$

### Function

The command can be used to create MRSCAT entries both for single-feature pubsets (SF pubsets) and for system-managed pubsets (SM pubsets). The newly entered catalog is assigned the status “inaccessible”. An entry is not created if one already exists for the specified catalog ID. The catalog IDs must be unique throughout the entire network, i.e. the disks must be initialized accordingly using the VOLIN utility routine.

Unlike the IMPORT-PUBSET and EXPORT-PUBSET commands, this command does not affect the accessibility of the catalogs. With single-feature pubsets, default values are assigned for all cache attributes; with system-managed pubsets they are assigned for the cache attributes FORCE-IMPORT and SIZE-TOLERANCE only. If attributes need to be modified later, the MODIFY-PUBSET-CACHE-ATTRIBUTES command must be used (see the “Introduction to System Administration” [14]; for administration of SM pubsets see also “System-Managed Storage” [45]).

This command cannot be used to create a volume set entry. Volume set entries are generated automatically by the system when required.

### Format

#### ADD-MASTER-CATALOG-ENTRY

**ENTRY-NAME** = <cat-id 1..4>

,**PUBSET-TYPE** = **\*SINGLE-FEATURE** (...) / **\*SYSTEM-MANAGED**(...)

| **MINIMAL-SIZE** = **\*STD** / <integer 12..193536 *2Kbyte*>

| **SECONDARY-ALLOCATION** = **\*STD** / <integer 1..193536 *2Kbyte*>

| **VIRTUAL-MEMORY** = **\*STD** / <integer 0..8192 *2Kbyte*>

,**REMOTE-IMPORT** = **\*BY-CONNECTION** / **\*BY-COMMAND-ONLY**

,**XCS-CONFIGURATION** = **\*NO** / **\*YES**

,**PUBRES-UNIT** = **\*STD** / <alphanum-name 2..2> / <x-text 4..4>

## Operands

**ENTRY-NAME** = <cat-id 1..4>

Catalog ID of the pubset for which a new entry is to be generated in the MRSCAT.

**PUBSET-TYPE** = **\*SINGLE-FEATURE(...)** / **\*SYSTEM-MANAGED(...)**

Indicates the type of pubset for which a new entry is to be generated in the MRSCAT.

**PUBSET-TYPE** = **\*SINGLE-FEATURE(...)**

The pubset for which a new entry is to be generated in the MRSCAT is an SF pubset.

**START-SPEEDCAT** = **\*AUTOMATIC** / **\*NO** / **\*SPEEDCAT-TASK** / **\*OWN-TASK**

Governs whether SCA is to be available for this pubset.

---

**START-SPEEDCAT = \*AUTOMATIC**

If the SPEEDCAT function is available, SCA is started automatically when the pubset is imported under a local task, the SPEEDCAT task.

**START-SPEEDCAT = \*NO**

SCA is not to be available.

**START-SPEEDCAT = \*SPEEDCAT-TASK**

SCA is to be available, and should run under a separate task, the SPEEDCAT task.

**START-SPEEDCAT = \*OWN-TASK**

SCA should be available and run under the user's task.

**PHYSICAL-ALLOCATION = \*ADMINISTRATOR-ONLY / \*USER-ALLOWED**

Specifies whether users may directly allocate individual volumes of this pubset.

**PHYSICAL-ALLOCATION = \*ADMINISTRATOR-ONLY**

Users may not directly allocate the volumes of this pubset. This right is reserved for the privileged caller under TSOS.

**PHYSICAL-ALLOCATION = \*USER-ALLOWED**

On this pubset, nonprivileged users will also be permitted to allocate individual volumes.

**ALLOCATION = \*STD / \*PARAMETERS(...)**

Specifies whether particular allocation parameters should be set for data processing on the pubset.

**ALLOCATION = \*STD**

The setting \*STD, i.e. the value of the system parameter concerned (see the description of the \*STD operand values for the various allocation parameters below), should be specified for all allocation parameters.

**ALLOCATION = \*PARAMETERS(...)**

Specifies allocation parameters for the pubset, with the values which follow.

**SATURATION-LEVEL4 = \*STD / <integer 66..2147483647 2Kbyte >**

The value specified in the system parameter L4SPDEF is to apply.

**SATURATION-LEVEL4 = \*STD**

The standard value established at system generation (class 2 system parameter L4SPDEF) is to apply.

**SATURATION-LEVEL4 = <integer 66..2147483647 2Kbyte >**

Value of memory saturation level 4 which is to apply to this pubset.

**PRIMARY-ALLOCATION = \*STD / <integer 1..16777215 2Kbyte >**

The allocation parameter for the primary allocation when a storage space request is made (file processing) is to be set.

**PRIMARY-ALLOCATION = \*STD**

The value specified in the system parameter DMPRALL is to apply.

**PRIMARY-ALLOCATION = <integer 1..16777215 2Kbyte >**

The value to be applied for this pubset, for primary storage space allocations during file processing. This value will apply as the default value for any user who does not specify an initial allocation in a storage space request.

---

**SECONDARY-ALLOCATION = \*STD / <integer 1..32767 2Kbyte >**

The allocation parameter for secondary allocations when a storage space request is made (file processing) is to be set.

**SECONDARY-ALLOCATION = \*STD**

The value specified in the system parameter DMSCALL is to apply.

**SECONDARY-ALLOCATION = <integer 1..32767 2Kbyte >**

The value to be applied for this pubset, for secondary storage space allocations during file processing. This value will apply as the default value for any user who does not specify an initial allocation in a storage space request.

**MAXIMAL-ALLOCATION = \*STD / <integer 1..32767 2Kbyte >**

The allocation parameter for doubling the secondary allocation when a storage space request is made (file processing) is to be set.

**MAXIMAL-ALLOCATION = \*STD**

The value specified in the system parameter DMMAXSC is to apply.

**MAXIMAL-ALLOCATION = <integer 1..32767 2Kbyte >**

The value assigned to this pubset for doubling of the secondary storage space allocation during file processing. This value will be the maximum value for any user, for whom the space remains inadequate even after a secondary allocation has been made. The value for the secondary allocation will be repeatedly doubled until the specified maximum value is reached.

**PUBSET-TYPE = \*SYSTEM-MANAGED(...)**

The pubset for which a new entry is to be generated in the MRSCAT is an SM pubset.

**CONTROL-VOLUME-SET = \*NONE / <cat-id 1..4>**

Governs whether a control volume set is used.

**CONTROL-VOLUME-SET = \*NONE**

A control volume set is not to be used.

**CONTROL-VOLUME-SET = <cat-id 1..4>**

Specifies the catalog ID of the pubset that is to be used as the control volume set.

**PARTNER-NAME = \*OWN / <alphanum-name 1..8>**

BCAM name of the partner processor for remote file access.

**PARTNER-NAME = \*OWN**

No BCAM name is specified.

**PARTNER-NAME = <alphanum-name 1..8>**

BCAM name of the processor for remote file access (RFA). A processor can only be specified if no MSCF connection exists but RFA is nevertheless required.

If an MSCF connection exists and REMOTE-IMPORT=\*BY-CONNECTION is specified, the system automatically enters the name of the master computer.

**ACCESS-FAILURE = \*HOLD-JOBS / \*CANCEL-JOBS**

*Only for a shared pubset:*

Defines the behavior if the MSCF connection to the master of an imported shared pubset is lost.

---

**ACCESS-FAILURE = \*HOLD JOBS**

The pubset is set to the LOCAL-IMPORTED, QUIET state for the duration of the connection interruption.

Tasks that access the pubset enter a wait state, the duration of which is defined by the BATCH-WAIT-TIME or DIALOG-WAIT-TIME parameter (see below).

**ACCESS-FAILURE = \*CANCEL-JOBS**

The pubset is set to the INACC state for the duration of the connection interruption. Attempts to access the pubset are immediately rejected - at program level with a corresponding return code, at command level by triggering a spin-off.

**RESIDENT-BUFFERS = \*SYSTEM-STD / \*NO / \*YES**

Specifies whether resident or nonresident buffers are to be created.

**RESIDENT-BUFFERS = \*SYSTEM-STD**

The value definition of \*SYSTEM-STD depends on the specifications of the NUMBER-OF-BUFFERS operand (see there).

**RESIDENT-BUFFERS = \*NO**

Nonresident buffers are used.

**RESIDENT-BUFFERS = \*YES**

Resident buffers are used.

**NUMBER-OF-BUFFERS = \*SYSTEM-STD / <integer 1..255>**

Defines the number of buffers.

If the value \*SYSTEM-STD is specified for both RESIDENT-BUFFERS and NUMBER-OF-BUFFERS, in the MRSCAT is entered that the system parameters CATBUFR and BMTNUM should take effect.

If the value \*SYSTEM-STD is specified for only one of the two operands, this corresponds to a standard value (RESIDENT-BUFFERS = \*NO, NUMBER-OF-BUFFERS = 32).

The buffer specification is evaluated - according to the following hierarchy - only when the pubset is imported:

1. Explicit parameter specification in the IMPORT-PUBSET command.
2. Values entered in the MRSCAT.
3. Specification due to system parameters CATBUFR and BMTNUM.
4. If the value specified for NUMBER-OF-BUFFERS is less than 32, it is increased to 32.

**BATCH-WAIT-TIME = 28800 / <integer 0..2147483647 seconds >**

*Only for a shared pubset:*

Time in seconds that batch jobs are to wait for the availability of pubsets that cannot be accessed due to a connection failure. If the time specified is exceeded, command processing is aborted with an error code and the spin-off mechanism is triggered. The default value for this wait time is 28800 seconds (8 hours).

**DIALOG-WAIT-TIME = 30 / <integer 0..2147483647 seconds >**

*Only for a shared pubset:*

As with batch jobs, defines wait time for interactive jobs. If the time specified is exceeded, the interactive job receives a message and is resumed. The default value here is 30 seconds.

**SHARED-PUBSET = \*NO / \*YES**

Determines the shareability of the pubset for local processors.

---

**ACCESS-CONTROLLED = \*NO / \*YES**

Specifies whether access to the pubset is to be restricted to one user ID.

**ACCESS-CONTROLLED = \*NO**

Access to the pubset is not subject to any restrictions.

**ACCESS-CONTROLLED = \*YES(...)**

Access to the pubset is to be restricted to one user ID.

**USER-IDENTIFICATION = \*TSOS / <alphanum-name 1..8>**

Specifies the user ID which is to have access to the pubset.

**USER-IDENTIFICATION = \*TSOS**

Only the TSOS user ID has access to the pubset.

**USER-IDENTIFICATION = <alphanum-name 1..8>**

Specifies a user ID, in addition to the TSOS user ID, which is to be permitted access to the pubset.

**EAM = \*STD / \*PARAMETERS(...)**

Specifies the SYSEAM file parameters specific to this pubset.

**EAM = \*STD**

The setting \*STD, i.e. the value of the system parameter concerned (see the description of the \*STD operand values for the various SYSEAM parameters below), should be specified for all SYSEAM parameters.

**EAM = \*PARAMETERS(...)**

Specifies the SYSEAM parameters which follow for the pubset.

**MAXIMAL-SIZE = \*STD / <integer 12..193536 2Kbyte >**

This operand is only supported for reasons of compatibility and is no longer evaluated.

**MINIMAL-SIZE = \*STD / <integer 12..193536 2Kbyte >**

Specifies the minimum size (number of half pages) that the SYSEAM file may occupy in the specified pubset.

**MINIMAL-SIZE = \*STD**

The value specified in the system parameter EAMMIN is to apply.

**MINIMAL-SIZE = <integer 12..193536 2Kbyte >**

Minimum size (number of half pages) that the SYSEAM file may occupy in the pubset.

**SECONDARY-ALLOCATION = \*STD / <integer 1..193536 2Kbyte >**

Specifies the secondary allocation for the SYSEAM file, for this pubset.

**SECONDARY-ALLOCATION = \*STD**

The value specified in the system parameter EAMSEC is to apply.

**SECONDARY-ALLOCATION = <integer 1..193536 2Kbyte >**

Value of the secondary allocation for the SYSEAM file (number of half pages). This value should be a multiple of 24.

**VIRTUAL-MEMORY = \*STD / <integer 0..8192 2Kbyte >**

Specifies the number of half pages to be used in determining the size of the EAM cache area in class 4 memory. A cache area can only be created for the SYSEAM file of the home pubset. The parameter has no effect for any other pubsets.

**VIRTUAL-MEMORY = \*STD**

The size of the EAM cache area will be determined from the value of the class 2 system parameter EAMMEM.

**VIRTUAL-MEMORY = <integer 0..8192 2Kbyte >**

The number of half pages specified here determines the size of the EAM cache area.

**REMOTE-IMPORT = \*BY-CONNECTION / \*BY-COMMAND-ONLY**

Defines how the remote import status can be changed.

**REMOTE-IMPORT = \*BY-CONNECTION**

The change is made on connection setup.

**REMOTE-IMPORT = \*BY-COMMAND-ONLY**

The remote import status can only be changed by a command.

**XCS-CONFIGURATION = \*NO / \*YES**

*For shared pubset only:*

Defines whether the pubset may be automatically imported as an XCS pubset when a new XCS network is established.

**XCS-CONFIGURATION = \*NO**

The pubset must not be imported automatically as an XCS pubset. (The pubset may nonetheless be used as an XCS pubset using the SET-XCS-PUBSET command.)

**XCS-CONFIGURATION = \*YES**

The pubset is to be imported automatically as an XCS pubset by the MSCF subsystem when a new XCS network is established.

**PUBRES-UNIT = \*STD / <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device name (MN) of the pubres of the SF pubset or of the volres of the SM pubset. VM2000 requires this entry when the pubset is specified by means of its catalog ID.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
2	0	CMS0002	Disk error
	1	CMS0011	Syntax error
	1	CMS0314	Syntax error in entry name or error in wildcard specification
	32	CMD0221	Internal system error
	32	CMS0001	SLOT manager error
	32	CMS031F	MRSCAT parameter error
	32	CMS0310	Error during privilege checking
	32	CMS0317	MRSCAT is locked
	32	CMS0318	Synchronization error due to task lock manager problem

---

	64	CMS0004	MRSCAT entry already exists
	64	CMS0005	Too many entries in the MRSCAT
	64	CMS0010	Command reserved for systems support

---

## Examples

### *Example of creating entries in the local catalog and import pubsets (MPVS)*

The pubset MAX is also to be imported locally on the system with the HOME pubset FOR, and a paging file already contained on the pubset PAG is to be used. Furthermore, the pubset LUX, which is imported on the remote system XY, should be accessible via RFA.

Assuming that the disks belonging to pubsets MAX and PAG are already available, the following commands must be entered:

```
/ADD-MASTER-CATALOG-ENTRY MAX
/ADD-MASTER-CATALOG-ENTRY PAG
/ADD-MASTER-CATALOG-ENTRY LUX, PARTNER-NAME=XY
/IMPORT-PUBSET MAX
/IMPORT-PUBSET PAG
/EXTEND-PAGING-AREA PAG.00
/EXPORT-PUBSET PAG
```

The catalog directory MRSCAT in the home pubset has the following contents:

```
PUBSET FOR: LOCAL-HOME, PAGING
PUBSET LUX: INACC, HOST=XY
PUBSET MAX: LOCAL-IMPORTED
PUBSET PAG: INACC, PAGING
```

---

## 2.16 ADD-NET-STORAGE-VOLUME

Create Net-Storage volume and assign it to a local pubset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Net-Storage administration
<b>Domain:</b>	STORAGE-MANAGEMENT
<b>Privileges:</b>	TSOS

### Function

The ADD-NET-STORAGE-VOLUME command creates a directory with management files (catalog and FSL files) in the released file system of the net server and establishes the unambiguous assignment of the directory to precisely one local SF or SM pubset in the form of a Net-Storage volume. The pubset must already have been imported. No Net-Storage volume can be assigned to the home pubset.

From the viewpoint of BS2000 a Net-Storage volume is a new disk which is assigned to the pubset but which is not (as in the case of a pubset expansion) added to the pubset. The VSN of the Net-Storage volume is the same as the directory name in the Net-Storage and by default is derived from the name of the pubset, see the "Introduction to System Administration" [14]. Only if the pubset has already been assigned a Net-Storage volume with a default name must a VSN which complies with the conventions for private volumes be specified.

The IMPORT operand enables a directory which already exists on the net server to be assigned to the specified pubset as a Net-Storage volume. Renaming (VSN or directory name) is also possible.

**i** After the Net-Storage volume has been created, any files it may contain must be imported using the IMPORT-FILE command before they can be accessed.

Information on the Net-Storage available in BS2000 can be requested using the SHOW-NET-STORAGE command. Information on the Net-Storage available in the pubset can be requested using the SHOW-PUBSET-NET-STORAGE command.

Fundamental information on the use of Net-Storage in BS2000 is provided in the "Introduction to System Administration" [14]. How to work with files on Net-Storage is described in the "Introductory Guide to DMS" [13].

---

## Format

### ADD-NET-STORAGE-VOLUME

**VOLUME** = **\*STD** / <vsn 6..6>

,**PUBSET** = <cat-id 1..4>

,**DIRECTORY** = <composed-name 1..64 with-under> / <c-string 1..64 with-low>

,**SERVER** = <composed-name 1..256 with-under> / <c-string 1..256 with-low> / **\*IP-ADDRESS**(...)

**\*IP-ADDRESS**(...)

| **IP-ADDRESS** = <composed-name 7..15> / <c-string 2..39>

,**IMPORT** = **\*NO** / **\*YES**(...)

**\*YES**(...)

| **OLD-VOLUME-NAME** = **\*SAME** / <vsn 6..6>

| ,**FORCE** = **\*NO** / **\*YES**

## Operands

### **VOLUME =**

Specifies the VSN of the Net-Storage volume.

On the Net-Storage the Net-Storage volume is implemented by a directory below the released directory with a name which corresponds to the VSN.

### **VOLUME = \*STD**

The VSN of the new Net-Storage volume is derived from the name of the pubset, see the “Introduction to System Administration” [14]. If the pubset has already been assigned a Net-Storage volume with a default name, this specification is not possible and the VSN must be specified explicitly.

### **VOLUME = <vsn 6..6>**

Specifies the VSN of the Net-Storage volume explicitly. A default name cannot be specified. The VSN must consist of 6 characters and comply with the conventions for private volumes. Consequently, it may not begin with the string PUB and may not contain a period, see the “Introduction to System Administration” [14].

### **PUBSET = <cat-id 1..4>**

Specifies the name of the pubset to which the Net-Storage volume will be assigned.

### **DIRECTORY = <composed-name 1..64 with-under> / <c-string 1..64 with-low>**

Specifies the directory name of the Net-Storage released on the net server.

On the Net-Storage the Net-Storage volume is implemented by a directory below the released directory with a name which corresponds to the VSN.

### **SERVER =**

Specifies the net server which makes the Net-Storage available. Either the host name, the fully qualified domain name or the IP address of the net server is specified.

---

**SERVER = <composed-name 1..256 with-under> / <c-string 1..256 with-low>**

Host name or fully qualified domain name of the net server.

**SERVER = \*IP-ADDRESS(...)**

IP address of the net server.

**IP-ADDRESS = <composed-name 7..15> / <c-string 2..39>**

Specifies the IP address in IPv4 or IPv6 format.

**IMPORT =**

Specifies whether a new directory is to be created for the specified volume or whether the directory already exists on the Net-Storage.

**IMPORT = \*NO**

Creates a new directory on the Net-Storage for the specified volume and assigns it to the specified pubset as a Net-Storage volume.

**IMPORT = \*YES(...)**

A directory already exists on the Net-Storage for the specified volume. This is assigned to the specified pubset as a Net-Storage volume. The catalog on the Net-Storage is **not** imported here. As a result the files on the Net-Storage can be accessed only after they have been imported with IMPORT-FILE.

**OLD-VOLUME-NAME =**

Specifies whether the VSN of the Net-Storage volumes is to be retained.

**OLD-VOLUME-NAME = \*SAME**

The Net-Storage volume already has the VSN specified in the VOLUME operand. It does not have to be renamed.

**OLD-VOLUME-NAME = <vsn 6..6>**

The Net-Storage volume has so far had the VSN specified here and is to be renamed. In this case the directory which already exists on the Net-Storage and the Net-Storage volume are respectively assigned the name and the VSN which is specified in the VOLUME operand.

**FORCE = \*NO / \*YES**

Specifies whether the Net-Storage volume is to be assigned to the pubset even if inconsistencies still exist (e. g. not properly released).

The default \*NO causes the command to be rejected in this case.

**FORCE = \*YES**

In all cases the Net-Storage volume is assigned to the pubset. Any inconsistencies which still exist are ignored.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	32	CMD0221	system error
	32	DMS1CFF	System error (see SERSLOG entry)
	64	DMS1C04	Error when calling the ONETSTOR subsystem
	64	DMS1C05	Catalog ID does not exist
	64	DMS1C06	Pubset not imported
	64	DMS1C07	Error when calling the allocation function
	64	DMS1C08	Error when calling a CMS function for the TSOSCAT
	64	DMS1C09	Error when calling a CMS function on the Net-Storage volume
	64	DMS1C0A	Catalog entry of the Net-Storage volume already exists
	64	DMS1C0B	File system label already exists on the net server
	64	DMS1C0D	File system label on the net server does not match the pubset
	64	DMS1C0F	No new Net-Storage volume may be created on the slave system
	64	DMS1C11	The Net-Storage volume already exists
	64	DMS1C12	No Net-Storage volume can be created on the home pubset.
	64	DMS1C17	Net directory cannot be accessed
	64	DMS1C1A	Net-Storage volume already placed in service
	64	DMS1C20	Name of the Net-Storage volume is invalid
	64	DMS1C21	Incorrect syntax in the IP address
	64	DMS1C0F	Command not permitted on the slave

---

## 2.17 ADD-PASSWORD

Add password to password table for job

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE  
FILE-GENERATION-GROUP  
JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** \$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The ADD-PASSWORD command supplies a job with the passwords needed to access password-protected files and job variables. A password table is created for the job, and the specified passwords are entered into it. When a protected file or job variable is to be accessed, the system searches the password table for the required password. If the appropriate password is found, access is granted. In commands which access files or job variables, the required password can be specified directly with the command in some cases (e.g. when deleting files or job variables, starting up programs, etc). Entering the correct password, however, will only enable single access during command execution. In programs the password can also be specified in the file control block (FCB). The password table is deleted when the job terminates. Individual entries or all entries in it can be optionally deleted from the table before the job ends by using the REMOVE-PASSWORD command.

### *Note*

Only one entry is created in the password table of the job for each password. In other words, if an ADD-PASSWORD command is issued for a password that already exists in the password table, no new entry will be created in the password table. Existing entries can be deleted with the REMOVE-PASSWORD command. Additional REMOVE-PASSWORD commands for deleted passwords are rejected.

In outputs such as job logs, the passwords are not shown in plain text. Where a password has been specified, it is represented by the letter 'P'.

Protection by password can be extended by internal encoding of the passwords, carried out by the system. They then only appear in coded form in memory dumps, for example. Password encoding is set up by the system parameter ENCRYPT.

Password protection for files is dealt with in the "Introductory Guide to DMS" [13]; for details of password protection for job variables, see the "Job Variables" [20] manual.

## REMOTE-FILE-ACCESS

The command ADD-PASSWORD is automatically passed on by the requesting job to all processes participating in RFA (see the “RFA” manual [31]).

### Format

<b>ADD-PASSWORD</b>	Alias: <b>ADPW</b>
<b>PASSWORD</b> = * <b>SECRET</b> / list-poss(63): <x-string 1..8> / <c-string 1..4> / <integer -2147483648..2147483647>	

### Operands

**PASSWORD = \*SECRET / list-poss(63): <x-string 1..8> / <c-string 1..4> / <integer -2147483648..2147483647>**  
Passwords which are to be entered into the password table. A maximum of 63 passwords may be specified by one ADD-PASSWORD command.

The operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.
- The password entered is not logged.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	DMS0691	Password table at maximum size
	64	DMS0692	Maximum number of passwords per task reached
	64	DMS06FF	BCAM connection severed
	130	DMS0585	Error detected during catalog processing or multihost processing
	130	DMS0594	Not enough virtual memory available

### The following applies to the specification of passwords:

A file can be protected against read access, write access or execute access by three different passwords. Changes to the catalog entry and deletion of the file are classified as write accesses. This also applies to job variables, but only for read and write access, i.e. only a read password and write password are possible.

The table below shows the possible combinations of password protection, and which passwords are required for any particular type of access:

<b>Password protection</b>	<b>Password specified</b>	<b>Permitted access type</b>
EXEC-PASSWORD	None specified	No access
	Execution password	Execute Read Write
READ-PASSWORD	None specified	Execute *)
	Read password	Execute Read Write
WRITE-PASSWORD	None specified	Execute Read
	Write password	Execute Read Write
EXEC-PASSWORD READ-PASSWORD WRITE-PASSWORD	None specified	No access
	Execution password	Execute *)
	Read password	Execute Read
	Write password	Execute Read Write
EXEC-PASSWORD READ-PASSWORD	None specified	No access
	Execution password	Execute *)
	Read password	Execute Read Write
EXEC-PASSWORD WRITE-PASSWORD	None specified	No access
	Execution password	Execute Read
	Write password	Execute Read Write

READ-PASSWORD WRITE-PASSWORD	None specified	Execute *)
	Read password	Execute Read
	Write password	Execute Read Write

\*) The program code is protected against dump access  
Table 23: Password specifications for each type of access

## Example

*Accessing files with read, write, and execute passwords*

```
/mod-file-attr proc.mini.1,prot=(read-pass='john',
                                write-pass='paul',exec-pass='maxi') _____ (1)
/call-proc proc.mini.1,log=*yes _____ (2)
```

```
% SDP0094 CONTAINER NOT ACCESSIBLE
% SDP0093 ERROR DURING ACCESS OF FILE/LIBRARY ':2OSG:$USERXY01.PROC.MINI.1',
  ERROR 'DMS0D91'. MORE INFORMATION: /HELP-MSG DMS0D91
% SDP0094 CONTAINER NOT ACCESSIBLE
```

```
/add-pass 'maxi' _____ (3)
/call-proc proc.mini.1,log=*yes _____ (4)
```

```
% SDP0224 LOGGING SUPPRESSED; CONTAINER ':2OSG:$USERXY01.PROC.MINI.1' IS
READ PROTECTED
** The time now is: 15:33:54 **
```

```
/print-doc proc.mini.1 _____ (5)
```

```
% SCP0860 FILE ':2OSG:$USERXY01.PROC.MINI.1' PROTECTED BY A READ OR EXEC
PASSWORD. COMMAND REJECTED
```

```
/rem-pass 'maxi' _____ (6)
/add-pass 'johnjohn' _____ (7)
/call-proc proc.mini.1,log=*yes _____ (8)
```

```
%          1 1 /WRITE-TEXT '** The time now is: 15:35:45 **'
** The time now is: 15:35:45 **
%          1 /EXIT-PROCEDURE ERROR=*NO
```

```
/mod-f-attr proc.mini.1,proc.mini.2 _____ (9)
```

```
% DMS0681 DMS ERROR '05CF' WHEN ACCESSING FILE':2OSG:$USERXY01.PROC.MINI.1'.
FOR FURTHER INFORMATION: /HELP-MSG DMS05CF
```

---

**/help-msg dms05cf** \_\_\_\_\_ (10)

```
% DMS05CF FILE PROTECTED BY (CRYPTO)PASSWORD. ADD REQUIRED (CRYPTO)PASSWORD
AND REENTER COMMAND
% ? The user tried to modify the catalog entry of a file that is
%   protected by a (crypto)password, but the required (crypto)password
%   has not yet been added to the (crypto)password table of the task.
% ! Add (crypto)password to the (crypto)password table
%   (command ADD-(CRYPTO-)PASSWORD) and reenter command.
```

**/rem-pass 'john'** \_\_\_\_\_ (11)

**/add-pass 'paul'** \_\_\_\_\_ (12)

**/mod-f-attr proc.mini.1,proc.mini.2** \_\_\_\_\_ (13)

**/call-proc proc.mini.2,log=\*yes** \_\_\_\_\_ (14)

```
%           1  1 /WRITE-TEXT '** The time now is:  15:37:42 **
%           1  /EXIT-PROCEDURE ERROR=*NO
```

- (1) The file *PROC.MINI.1* is protected by the read password *JOHN*, the write password *PAUL*, and the execute password *MAXI*. The file contains an S procedure which outputs the current time to SYSOUT.
- (2) The procedure *PROC.MINI.1* is called. The CALL-PROCEDURE command is rejected, since the required execution password is not contained in the password table of the task.
- (3) Entry of the execution password *MAXI* into the password table.
- (4) The repeated call to the procedure succeeds, but the procedure is not logged on SYSOUT, since the password required for read access is not contained in the password table.
- (5) The PRINT-DOCUMENT command is also rejected due to the missing read password.
- (6) The execute password *MAXI* is deleted from the password table.
- (7) Entry of the read password *JOHN* into the password table.
- (8) The call to the procedure succeeds, and the processing sequence is logged on SYSOUT. The read password provides authorization for reading as well as execution.
- (9) The file *PROC.MINI.1* is to be renamed. The MODIFY-FILE-ATTRIBUTES command is rejected.
- (10) The HELP-MSG-INFORMATION command returns information on the cause of the error: the password required for write access (to change the catalog entry in this case) is not contained in the password table.
- (11) The read password *JOHN* is deleted from the password table.
- (12) Entry of the write password *PAUL* into the password table.
- (13) The file *PROC.MINI.1* can now be renamed to *PROC.MINI.2* (write access).
- (14) The call to the procedure under the new name *PROC.MINI.2* succeeds, and the processing sequence is logged on SYSOUT. The write password provides authorization for read, write, and execute access.

---

## 2.18 ADD-POSIX-USER

Define POSIX user attributes

<b>Component:</b>	POSIX-BC
<b>Functional area:</b>	User management POSIX administration and application
<b>Domain:</b>	SYSTEM-MANAGEMENT
<b>Privileges:</b>	TSOS USER-ADMINISTRATION

This command can only be used if the chargeable subsystem SDF-P is loaded.

### Function

The ADD-POSIX-USER command defines all the POSIX attributes of the BS2000 user ID for a new POSIX user. The necessary preparations are also made in POSIX for this user to permit POSIX access (creating the login directory for this user).

#### *Note*

This command replaces the S procedure POSADDUS.

The POSIX user attributes of a BS2000 user ID can be modified using the MODIFY-POSIX-USER-ATTRIBUTES command. Information on the current POSIX default attributes can be obtained with the SHOW-POSIX-USER-DEFAULTS command.

### Format

#### **ADD-POSIX-USER**

```
USER-NAME = <name 1..8>  
,USER-NUMBER = *DEFAULT / <integer 0..60002>  
,GROUP-NUMBER = *DEFAULT / <integer 0..60002>  
,PROGRAM = *DEFAULT / <posix-pathname 1..1023 without-wild>  
,HOME-DIRECTORY = *DEFAULT / <posix-pathname 1..1023 without-wild>  
,RLOGIN-ACCOUNT = *NONE / <alphanum-name 1..8>
```

---

## Operands

### **USER-NAME = <name 1..8>**

BS2000 user ID whose POSIX user attributes are to be defined.

### **USER-NUMBER =**

User number which is to be defined for this BS2000 user ID.

The USER-NUMBER attribute is relevant to security as the user number indicates the privilege and determines the owner of a file.

### **USER-NUMBER = \*DEFAULT**

The user number is given the currently set default value (see the SHOW-POSIX-USER-DEFAULTS command).

### **USER-NUMBER = <integer 0..60002>**

The user number is given the specified value.

### **GROUP-NUMBER =**

Group number which is to be defined for the BS2000 user ID.

The GROUP-NUMBER attribute is relevant to security as POSIX does not check the permissibility of the combination of BS2000 user ID and group against the POSIX group catalog when you log on.

### **GROUP-NUMBER = \*DEFAULT**

The group number is given the currently set default value (see the SHOW-POSIX-USER-DEFAULTS command).

### **GROUP-NUMBER = <integer 0..60002>**

The group number is assigned the specified value.

### **PROGRAM =**

Program which is started after the *rlogin* command or after the START-POSIX-SHELL command is called.

This attribute is not relevant to security as only programs which the user is allowed to execute are started.

### **PROGRAM = \*DEFAULT**

The program to be started is determined on the basis of the currently set default value (see the SHOW-POSIX-USER-DEFAULTS command).

### **PROGRAM = <posix-pathname 1..1023 without-wild>**

The specified program is started.

### **HOME-DIRECTORY =**

Determines the absolute path name of the directory which the user is automatically directed to (login directory) after connecting with POSIX.

This attribute is not relevant to security as it only determines the content of the shell variable HOME and the initial value of the working directory. The protection attributes of files and directories cannot be bypassed in this way.

If the directory does not yet exist it is created and the owner is set to the user number and the group number of the POSIS user ID.

If the directory already exists its attributes remain unchanged and a respective message is output.

### **HOME-DIRECTORY = \*DEFAULT**

The directory determined on the basis of the currently set default value (see the SHOW-POSIX-USER-DEFAULTS command).

### **HOME-DIRECTORY = <posix-pathname 1..1023 without-wild>**

Specifies the directory.

---

**RLOGIN-ACCOUNT =**

Determines the account number for POSIX access via remote login or NFS.

**RLOGIN-ACCOUNT = \*NONE**

No account number is specified. The account number defined in the home pubset user entry thus remains unchanged for POSIX access.

**RLOGIN-ACCOUNT = <alphanum-name 1..8>**

The specified account number is entered in the home pubset user entry as the new account number for POSIX access (see the POSIX-RLOGIN-DEFAULT operand in the ADD-USER and MODIFY-USER-ATTRIBUTES commands).

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	64	SDP0018	An error has occurred in the S procedure called by the command. Information on the precise cause is provided by one of the messages POS2900 through POS2905.
	65	CMD2241	The chargeable subsystem SDF-P is not available.

---

## 2.19 ADD-SUBSYSTEM

Extend dynamic subsystem catalog

**Component:** DSSM  
**Functional area:** Subsystem management  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** SUBSYSTEM-MANAGEMENT

### Function

Using this command, the system administration can extend the current subsystem configuration during a session (maximum number: 1000 subsystems and 16000 CALL entries). The catalog specified may either be a completely new one, which includes all the entries in the previous one, or it may contain only the new subsystems which are to be added into the current catalog.

In either case, the subsystem catalog specified must have been generated using SSCM. The ('old') subsystem catalog used during system initialization is not automatically updated. For the **next** session, the system administration can either

- use the catalog generated for ADD-SUBSYSTEM during system initialization, or
- generate a completely new and updated subsystem catalog and use this for system initialization. This new catalog need not build up quantitatively on an old predecessor catalog nor qualitatively support its references and attributes.

The ADD-SUBSYSTEM command is rejected if the class 5 memory reserved for the subsystem is insufficient (on system initialization, DSSM reserves class 5 memory for subsystems defined with MEMORY-CLASS=\*LOCAL-PRIVILEGED, \*LOCAL-UNPRIVILEGED or \*BY-SLICE).

### Format

**ADD-SUBSYSTEM**

**CATALOG** = <filename 1..54 without-gen-vers>

,**TYPE** = \*EXTENDED-ACTIVE-CONFIGURATION / \*NEW-SUBSYSTEMS

### Operands

**CATALOG** = <filename 1..54 without-gen-vers>

Name of the new subsystem catalog.

**TYPE** =

Specifies whether the current catalog is to be extended or replaced.

**TYPE** = \*EXTENDED-ACTIVE-CONFIGURATION

A completely new catalog is to be activated, containing not only the entries from its predecessor, but also the new subsystems.

## TYPE = \*NEW-SUBSYSTEMS

The specified catalog contains only new subsystems, which are to be added to the old catalog. DSSM will check the catalog to ensure that the subsystems which it contains really are new. If any subsystem is found which is also listed in the catalog which is being extended, the command will be rejected.

### *Restrictions*

- The subsystems specified for generation using SSCM with RELATED-SUBSYSTEM and REFERENCED-SUBSYSTEM must be cycle-free, i.e. free of mutual dependency.
- It is not permitted to define different versions of a subsystem with the start attributes AT-SUBSYSTEM-CALL, BEFORE-SYSTEM-READY, AFTER-SYSTEM-READY, BEFORE-DSSM-LOAD, AT-DSSM-LOAD and MANDATORY-AT-STARTUP (exception: AT-SUBSYSTEM-CALL is permitted if coexistence is defined for all versions involved).

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	32	ESM0296	Abnormal termination (REQM error)
	32	ESM0350	Internal DSSM problem during processing
	64	ESM0260	File not found
	64	ESM0261	Storage space limit reached in DSSM catalog
	64	ESM0262	File is not a catalog
	64	ESM0322	Maximum number of relations exceeded
	64	ESM0325	Inconsistent with old catalog
	64	ESM0332	Incompatible version of catalog
	64	ESM0340	Reserved address-space exhausted for subsystems with MEMORY-CLASS=*BY-SLICE

## Notes

There is a problem with relations which refer to subsystems that are not defined in the current catalog (put there using the SSCM statement SAVE-CATALOG FORCED=\*YES). This problem can be circumvented during a session by using SSCM to define the relation in a new catalog and then using ADD-SUBSYSTEM to define this new catalog.

*Example for TYPE=\*EXTENDED-ACTIVE-CONFIGURATION*

Old catalog		New catalog
//START-CATALOG-CREATION old-cat		//START-CATALOG-CREATION new-cat
//SET-SUBSYSTEM-ATTRIBUTES		//SET-SUBSYSTEM-ATTRIBUTES -
// SUBSYSTEM-NAME=ss1 ,	====>	// SUBSYSTEM-NAME=ss1 , -
// RELATED-SUBSYSTEM=ss2		// RELATED-SUBSYSTEM=ss2
//SAVE-CATALOG FORCED=		//SET-SUBSYSTEM-ATTRIBUTES -
// *FOR-ADD-SUBSYSTEM		// SUBSYSTEM-NAME=ss2
		//SAVE-CATALOG

*Restrictions on the operand TYPE=\*EXTENDED-ACTIVE-CONFIGURATION*

- Subsystems with the attribute MEMORY-CLASS=\*LOCAL-PRIVILEGED, which are being added to the newly created catalog, must not exceed the size of the address space strip in user or system address space, nor may their location in the address space overlap with subsystems from the old catalog.
- The CREATION-TIME operand for any new subsystem must be chosen to be compatible with versions of the same subsystem which are already defined in the old catalog. In making this choice, the values BEFORE-SYSTEM-READY, AFTER-SYSTEM-READY, BEFORE-DSSM-LOAD, AT-DSSM-LOAD and MANDATORY-AT-STARTUP could be used, but would have no effect since the system startup time for a session which has started will already have been passed; i.e. the system administration will be given an appropriate warning, but the subsystem will not be loaded.
- In distributing subsystems to holder tasks (ASSIGN-HOLDER-TASK statement), the “stand alone” principle must be observed, i.e. subsystems from different catalogs may not be assigned to the same holder task.

*Example*

Subsystems in the old catalog:	A, B, C	
Subsystems in the new catalog:	A, B, C, D, E	
Then:		
//ASSIGN-HOLDER-TASK *SHARE-HOLDER(BY-SUB=(A,B))		is permissible
//ASSIGN-HOLDER-TASK *SHARE-HOLDER(BY-SUB=(D,E))		is permissible
but:		
//ASSIGN-HOLDER-TASK *SHARE-HOLDER(BY-SUB=(A,D,C))		not permissible

- The new catalog must be larger than its predecessor, because it not only contains the old subsystems with their attributes (relations, dependencies, loading instructions), but must also maintain details of the new subsystems.
- Linkage and dependence relations (REFERENCED-SUBSYSTEM / RELATED-SUBSYSTEM) must not go outside the bounds of the catalog: for a subsystem defined in catalog A there must be no relations in that catalog which refer to a subsystem defined in catalog B.

- 
- Once REMOVE-SUBSYSTEM has been used to delete a subsystem from the catalog, TYPE=\*EXTENDED-ACTIVE-CONFIGURATION can no longer be specified.

It is not permissible to define different

- subsystems with an identical combination of the attributes: SVC-NUMBER / FUNCTION-NUMBER / FUNCTION-VERSION.
- subsystems with an identical combination of the attributes: FUNCTION-NUMBER / FUNCTION-VERSION (if the value \*ALLOWED is set for VERSION-COEEXISTENCE or VERSION-EXCHANGE) for subsystems which are indirectly linked via System Procedure Linkage (ISL).
- versions of a subsystem with an identical combination of the attributes: SVC-NUMBER / FUNCTION-NUMBER / FUNCTION-VERSION if the value \*ALLOWED is set for VERSION-COEEXISTENCE or VERSION-EXCHANGE.
- versions of a subsystem with an identical combination of the attributes: FUNCTION-NUMBER / FUNCTION-VERSION / VERSION-COEEXISTENCE or VERSION-EXCHANGE for subsystems which are indirectly linked via System Procedure Linkage (ISL).

Overlaps of subsystems must be avoided. To prevent this, DSSM compares the values of the SIZE and START-ADDRESS operands in the SET-SUBSYSTEM-ATTRIBUTES statements.

The assignment of a holder task (by an SSCM statement) for an “old” and a new subsystem has no effect on holder task distribution.

Table of incompatibilities for relations between subsystems in the old and new catalog:

- x: this combination is not possible: neither link relations (REFERENCED-SUBSYSTEM) nor any other dependencies (RELATED-SUBSYSTEM) are permitted
- r: link relations (REFERENCED-SUBSYSTEM) are not permitted

Subsystem in the new catalog	Subsystem in the old catalog

---

## 2.20 ADD-USER

Create entry in user catalog

**Component:** SRPMNUC

**Functional area:** User management

**Domain:** USER-ADMINISTRATION

**Privileges:** STD-PROCESSING  
USER-ADMINISTRATION

**Routing code:** \$

### Function

The ADD-USER command enables systems support personnel to create an entry in the user catalog for a pubset, which means that a user catalog entry is set up for a user ID.

If an entry is created for the user catalog of the *home pubset*, the access rights to the system (e.g. user ID, accounting number, user ID password, etc.) and the assignment of a default pubset for the user must be defined. Only in the user catalog of the home pubset is a check made whether the user has observed the correct syntax in the specifications (LOGON validation).

The system support staff enters all the necessary pubset-specific information in the user catalog of the *default pubset*.

Systems support must define an upper limit for the user up to which the user may occupy storage space on this pubset. Additionally, provisions can be made for the possibility of exceeding this limit.

The name of a new user ID can be chosen freely - within the set of permissible characters. The prefix 'SYS', however, is reserved for system IDs and must not be used.

The LOCK-USER=\*YES operand can be used to set an access lock for the new user ID until all the desired attributes have been assigned and group membership has been declared. The entry must be stored on the home pubset; for data pubsets, the lock is irrelevant.

The lock is retained until an UNLOCK-USER command is issued.

#### *Restriction*

The only nonprivileged users (STD-PROCESSING privilege) authorized to issue this command are those designated as group administrators. The actions a group administrator can take are defined by systems support. On setting up and managing user groups see the "SECOS" manual [35].

## Format

### ADD-USER

**USER-IDENTIFICATION** = <name 1..8>

,**GROUP-IDENTIFICATION** = **\*OWN** / **\*UNIVERSAL** / <name 1..8>

,**PROTECTION-ATTRIBUTE** = **\*PARAMETERS** (...)

```

## Operands

### **USER-IDENTIFICATION = <name 1..8>**

Defines the user ID to be entered in the catalog of the pubset in question.

### **GROUP-IDENTIFICATION =**

Identifier of the user group to which the new user ID is to be assigned. SECOS can be used to install a hierarchy of user groups to each of which a number of user IDs can be assigned. Without this software product, all of the user IDs are subordinate to the group \*UNIVERSAL, which acts as a dummy group in the system.

### **GROUP-IDENTIFICATION = \*OWN**

The user ID is assigned to the user group of the command issuer.

If the command issuer does not belong to a user group or SECOS is not installed, \*UNIVERSAL is assumed.

### **GROUP-IDENTIFICATION = \*UNIVERSAL**

The user ID is explicitly assigned to the group \*UNIVERSAL.

If SECOS is used, this value permits a user ID to be created outside of group hierarchies.

### **GROUP-IDENTIFICATION = <name 1..8>**

Existing user group to which the new user ID is assigned.

This value can be specified only if the SECOS product is installed.

### **PROTECTION-ATTRIBUTE = \*PARAMETERS(...)**

Defines protection attributes.

### **LOGON-PASSWORD = \*NONE / <c-string 1..8> / <c-string 9..32> / <x-string 1..16> / \*SECRET**

Password protecting the user ID from unauthorized access (long password (<c-string 9..32>), see the MODIFY-USER-PROTECTION command).

### **PASSWORD-ENCRYPTION = \*YES / \*NO**

The password of the user ID is encrypted after entry or is stored in its original form. Password encryption presupposes that the system parameter ENCRYPT=Y is set in the parameter file (see the "Introduction to System Administration" [14]).

ADD-USER	parameter file	
	ENCRYPT=Y	ENCRYPT=N
PASS-ENCRYPT =*YES	Encryption	No encryption
PASS-ENCRYPT =*NO	No encryption	No encryption

### **PASSWORD-MANAGEMENT =**

Specifies the user's rights with regard to modification of his password.

! If SECOS is used, the value defined here will be ignored and the SECOS specific value \*LOGON-DEFAULT will be assigned instead.

The current meaning of this value (\*BY-USER, \*BY-ADMINISTRATOR or \*USER-CHANGE-ONLY) can be determined with the SECOS command SHOW-LOGON-DEFAULTS (see the "SECOS, Volume 1" manual [35]).

---

**PASSWORD-MANAGEMENT = \*BY-USER**

The user may define, modify or delete a password.

**PASSWORD-MANAGEMENT = \*BY-ADMINISTRATOR**

Only systems support staff may define, modify or delete the password for the user ID.

**PASSWORD-MANAGEMENT = \*USER-CHANGE-ONLY**

The user may define and modify a password. Deletion of the password, i.e. cancellation of access rights, is not permissible.

**TAPE-ACCESS =**

Defines whether error messages generated during label checking of tapes may be ignored by the operator for the user concerned.

**TAPE-ACCESS = \*STD**

Error messages must not be ignored.

**TAPE-ACCESS = \*PRIVILEGED**

The following error messages for input and output files may be ignored by the owner of the tape or by systems support staff:

- invalid VSN
- tape is write-protected
- incorrect file set identifier in the HDR1 label of the tape.

**TAPE-ACCESS = \*READ**

The user may ignore error messages relating to input files; label checking is not deactivated. The following errors may result in messages during tape processing:

- invalid volume serial number (VSN)
- invalid file name
- invalid label on tape
- invalid access method
- invalid file sequence number on tape
- tape mark instead of end-of-volume label on tape
- double tape mark instead of end-of-volume label on tape.

**TAPE-ACCESS = \*BYPASS-LABEL**

Label checking and thus any data protection for tape files is deactivated for tapes processed in INPUT or REVERSE mode. This privilege implies the TAPE-ACCESS=\*READ function.

**TAPE-ACCESS = \*ALL**

All error messages may be ignored. This privilege implies the TAPE-ACCESS=\*PRIVILEGED and TAPE-ACCESS=\*BYPASS-LABEL functions.

**FILE-AUDIT = \*NO / \*ALLOWED**

Defines whether the user is authorized to activate the AUDIT mode.

This mode serves to monitor DMS accesses to files or file generations by system exit routines or, if the SECOS software product is used, by the SAT component.

**MAILING-ADDRESS = \*NONE / <c-string 1..64 with-low> / <x-string 1..128>**

Mailing address of the user for spoolout lists.

---

**EMAIL-ADDRESS = \*NONE / <composed-name 1..1800> / <c-string 1..1800 with-low> / <x-string 1..3600>**

Specifies an email address or a list of email addresses for the users of this user ID. The addresses must be entered in the format '<local-part>@<domain>[, ...]'. Optionally an address can also be prefixed by an address name in parentheses (see "Example"). A list consists of multiple addresses separated by a comma and can only be specified as a string (c or x string).

The address or address list entered is evaluated when a file is sent by email (see the MAIL-FILE command).

**PUBLIC-SPACE-LIMIT = \*STD / \*MAXIMUM / <integer 0..2147483647 2Kbyte>**

Assigns the maximum storage space the user may occupy for his files on public volumes on the pubset allocated with the PUBSET operand. The specified value must be <= 2,147,483,647.

**PUBLIC-SPACE-LIMIT = \*STD**

By default the user is allocated 16,777,215 PAM pages.

**PUBLIC-SPACE-LIMIT = \*MAXIMUM**

The user may use the full capacity of 2,147,483,647 PAM pages.

**PUBLIC-SPACE-EXCESS =**

Defines whether the user may exceed the limit defined by the PUBLIC-SPACE-LIMIT operand for the storage space on the allocated pubset.

**PUBLIC-SPACE-EXCESS = \*NO**

The storage space limit must not be exceeded.

**PUBLIC-SPACE-EXCESS = \*TEMPORARILY-ALLOWED**

In the case of storage space requests on the user's default pubset, the storage space limit may be exceeded, provided that it had not already been exceeded at logon time. For all other pubsets, PUBLIC-SPACE-EXCESS=\*TEMPORARILY-ALLOWED has the same effect as PUBLIC-SPACE-EXCESS = \*NO.

**PUBLIC-SPACE-EXCESS = \*ALLOWED**

The storage space limit may be exceeded.

**ADDRESS-SPACE-LIMIT = \*STD / <integer 1..2147483647 Mbyte>**

Defines how much user memory a task can request under this user ID. The user memory comprises both conventional class-6 memory (program space) and (data spaces). The maximum user memory depends on the size of the virtual memory and can be less than the value specified here.

**ADDRESS-SPACE-LIMIT = \*STD**

The value of the system parameter SYSGJASL is assigned (the system parameter SYSGJASL has the default value 16 MB, see the "Introduction to System Administration" [14]).

**MAX-ACCOUNT-RECORDS =**

Defines how many user-specific accounting records for each job or program are allowed to be written into the accounting file of the system.

**MAX-ACCOUNT-RECORDS = 100**

The user is authorized to write 100 user-specific accounting records to the accounting file for each job or program. He is not allowed to write accounting records of his own.

**MAX-ACCOUNT-RECORDS = \*NO-LIMIT**

The user is authorized to write any number of user-specific accounting records and accounting records of his own in the accounting file.

---

**MAX-ACCOUNT-RECORDS = <integer 0..32767>**

Defines how many user-specific accounting records can be written in the system accounting file for each job or program. The user is not authorized to add accounting records of his own.

**PROFILE-ID =**

Determines whether the user ID is assigned an SDF-PROFILE-ID. This PROFILE-ID characterizes a (SDF) group of user IDs which use a common group syntax file. Systems support can effect direct assignment of a user ID to a group syntax file by means of a suitable entry in the SDF parameter file.

**PROFILE-ID = \*NONE**

The user ID is not assigned a profile ID and thus indirectly no group syntax file.

**PROFILE-ID = <structured-name 1..30>**

Defines the name of a profile ID which can be assigned to a group syntax file in the SDF parameter file.

**PUBSET =**

Defines the pubset whose user catalog is to accept the entry.

**PUBSET = \*HOME**

The entry is made in the user catalog of the home pubset.

**PUBSET = <cat-id 1..4>**

Catalog identifier of the pubset whose user catalog is to accept the entry.

**RESIDENT-PAGES = \*STD / \*MAXIMUM / <integer 0..2147483647 4Kbyte>**

Defines the maximum number of resident main memory pages available to the user ID.

**RESIDENT-PAGES = \*STD**

The user may use 32,767 resident main memory pages.

**RESIDENT-PAGES = \*MAXIMUM**

The user may use 2,147,483,647 resident main memory pages.

**CSTMP-MACRO-ALLOWED = \*NO / \*YES**

Determines whether the user may use the CSTMP macro in his programs. The user can use the CSTMP macro to write-protect a memory pool (in class 6 memory) that can be shared by multiple users or explicitly cancel this protection. This feature is described in detail in the "Executive Macros" manual [22].

**DEFAULT-PUBSET =**

Assigns the user ID a default pubset on which the user can store his files and request storage space. If a file belonging to the newly entered user ID is accessed under any arbitrary user ID, and if the catalog ID is not specified, the catalog ID in the path name will automatically be extended by "":catid:". Systems support can change the DEFAULT-PUBSET operand in any user catalog of an imported pubset. However, the user default pubset is determined only with the aid of the user catalog of the home pubset. For the TSOS user ID, the value of DEFAULT-PUBSET must be identical to the value of PUBSET.

**DEFAULT-PUBSET = \*HOME**

Defines the home pubset to be the user default pubset.

**DEFAULT-PUBSET = <cat-id 1..4>**

Defines a pubset to be a user default pubset by means of the catalog ID.

---

**TEST-OPTIONS = \*PARAMETERS(...)**

Defines the maximum possible privilege for testing and diagnostic analysis of programs. The test privilege is interpreted by the software products AID and DAMP as well as the access method ANITA.

Even at privilege level 2 the user has access to task-specific, sensitive data (system tables and control blocks). Higher values should be allocated only on request and for a limit period to selected user IDs. The values possible here and explanations are described in [section "Overview of test privileges"](#).

**READ-PRIVILEGE = 1 / <integer 1..9>**

Defines the maximum read privilege level.

**WRITE-PRIVILEGE = 1 / <integer 1..9>**

Defines the maximum write privilege level.

**MODIFICATION =**

Specifies whether the user requires the operator's permission to modify his/her current test privilege.

**MODIFICATION = \*CONTROLLED**

The user requires the operator's permission.

**MODIFICATION = \*UNCONTROLLED**

The user does not require the operator's permission.

**AUDIT = \*PARAMETERS (...)**

Defines user-specific audit authorization. Authorization may be assigned to users separately for hardware audit and linkage audit. System-wide availability of the audit function is defined via the AUDALLOW system parameter.

*Note*

Hardware audit is only supported on /390 architecture (SUs /390 and S servers).

**HARDWARE-AUDIT = \*ALLOWED / \*NOT-ALLOWED**

Specifies whether a user is authorized to control the hardware audit mode. The audit mode can be controlled by means of the START-, STOP-, HOLD- and RESUME-HARDWARE-AUDIT commands and via the AUDIT macro for the function states

TU (task unprivileged) and TPR (task privileged). Modifications only affect the user ID's new tasks.

**HARDWARE-AUDIT = \*ALLOWED**

The user is allowed to control the hardware audit mode, provided the audit function is available throughout the system.

**HARDWARE-AUDIT = \*NOT-ALLOWED**

The user is not allowed to control the hardware audit mode.

**LINKAGE-AUDIT = \*ALLOWED / \*NOT-ALLOWED**

Specifies whether a user is authorized to control the linkage audit mode. The audit mode can be controlled by means of the START-, STOP-, HOLD- and RESUME-LINKAGE-AUDIT commands and via the AUDIT macro for the function states TU (task unprivileged), TPR (task privileged) and SIH (system interrupt handling).

Modifications only affect the user ID's new tasks.

**LINKAGE-AUDIT = \*ALLOWED**

The user is allowed to control the linkage audit mode, provided the audit function is available throughout the system.

---

**LINKAGE-AUDIT = \*NOT-ALLOWED**

The user is not allowed to control the linkage audit mode.

**DEFAULT-MSG-LANGUAGE = \*STD / <name 1..1>**

Specifies the language in which messages are output by default.

**DEFAULT-MSG-LANGUAGE = \*STD**

The language defined using the MSGLPRI system parameter is used.

**FILE-NUMBER-LIMIT =**

Specifies the maximum number of files that may be created. This upper limit, or any lower value, may be assigned to subgroups or group members.

**FILE-NUMBER-LIMIT = \*MAXIMUM**

The maximum number of files is 16777215.

**FILE-NUMBER-LIMIT = <integer 0..16777215>**

Specifies the maximum possible number of catalog entries as an exact number.

**JV-NUMBER-LIMIT =**

Specifies the maximum number of job variables that may be created. This upper limit, or any lower value, may be assigned to subgroups or group members.

**JV-NUMBER-LIMIT = \*MAXIMUM**

The maximum number of job variables is 16777215.

**JV-NUMBER-LIMIT = <integer 0..16777215>**

Specifies the maximum possible number of job variables as an exact number.

**TEMP-SPACE-LIMIT =**

Specifies the maximum amount of temporary storage space which may be occupied on the shared volumes specified in the PUBSET operand.

**TEMP-SPACE-LIMIT = \*MAXIMUM**

The maximum amount of storage space is 2147483647 PAM pages.

**TEMP-SPACE-LIMIT = <integer 0..2147483647 2Kbyte >**

Specifies exactly the amount of temporary storage space.

**DMS-TUNING-RESOURCES =**

Specifies which performance measures may be utilized, and the form in which they may be used.

**DMS-TUNING-RESOURCES = \*NONE**

No tuning measures may be utilized.

**DMS-TUNING-RESOURCES = \*CONCURRENT-USE**

The user may reserve preferred resources, but in doing so competes with all other users who have the same authorization.

**DMS-TUNING-RESOURCES = \*EXCLUSIVE-USE**

The user may make exclusive reservations of preferred resources.

**Permitted performance measures for the home and data pubsets**

<b>PUBSET = *HOME</b>				
DMS-TUNING RESOURCES=	Resident ISAM pools	Resident FASTPAM environment	File attribute PERFORMANCE	
			HIGH	=*VERY-HIGH
*NONE	no	no	no	-
*CONCURRENT-USE	yes	no	-	-
*EXCLUSIVE-USE	yes	yes	-	-
<b>PUBSET = &lt;Data subset&gt;</b>				
DMS-TUNING- RESOURCES=	Resident ISAM pools	Resident FASTPAM environment	File attribute PERFORMANCE	
			HIGH	=*VERY-HIGH
*NONE	-	-	no	no
*CONCURRENT-USE	-	-	yes	no
*EXCLUSIVE-USE	-	-	yes	yes
Home subset	Data subset	Permitted performance measures		
*NONE	*NONE	<ul style="list-style-type: none"> <li>None</li> </ul>		
*CONCURRENT-USE	*NONE	<ul style="list-style-type: none"> <li>Resident ISAM pools</li> </ul>		
*EXCLUSIVE-USE	*NONE	<ul style="list-style-type: none"> <li>Resident ISAM pools</li> <li>Resident FASTPAM environment</li> </ul>		
*NONE	*CONCURRENT- USE	<ul style="list-style-type: none"> <li>File attribute PERFORMANCE = HIGH on data subset</li> </ul>		
*NONE	*EXCLUSIVE-USE	<ul style="list-style-type: none"> <li>File attribute PERFORMANCE = HIGH on data subset</li> <li>File attribute PERFORMANCE = VERY-HIGH on data subset</li> </ul>		
*CONCURRENT-USE	*CONCURRENT- USE	<ul style="list-style-type: none"> <li>Resident ISAM pools</li> </ul>		

*CONCURRENT-USE	*EXCLUSIVE-USE	<ul style="list-style-type: none"> <li>Resident ISAM pools</li> <li>File attribute PERFORMANCE = VERY-HIGH on data subset</li> </ul>
*EXCLUSIVE-USE	*CONCURRENT-USE	<ul style="list-style-type: none"> <li>Resident ISAM pools</li> <li>Resident FASTPAM environment</li> </ul>
*EXCLUSIVE-USE	*EXCLUSIVE-USE	<ul style="list-style-type: none"> <li>Resident ISAM pools</li> <li>Resident FASTPAM environment</li> <li>File attribute PERFORMANCE = VERY-HIGH on data subset</li> </ul>

Table 25: Permitted performance measures (ADD-USER command)

**CODED-CHARACTER-SET = \*STD / <name 1..8>**

Specifies which CODED-CHARACTER-SET (CCS) is to be used. A name should only be specified here if the one required differs from the one preset by the system (\*STD). A CCS identifies a character set (specific to a country) which is, for example, to be activated when files are being created. The specified CCS should be an EBCDIC character set.

**PHYSICAL-ALLOCATION = \*NOT-ALLOWED / \*ALLOWED**

Governs whether the user is allowed to perform physical space allocation (direct allocation) for the subset.

**PHYSICAL-ALLOCATION = \*NOT-ALLOWED**

The user is no longer allowed to perform physical space allocation for the subset.

**PHYSICAL-ALLOCATION = \*ALLOWED**

The user is now allowed to perform physical space allocation for the subset.

**CRYPTO-SESSION-LIMIT = \*STD / \*MAXIMUM / <integer 0..32767>**

Defines the maximum number of openCRYPT sessions within a BS2000 session. The number of openCRYPT sessions already used is set to 0 at the start of a BS2000.

**CRYPTO-SESSION-LIMIT = \*STD**

Defines the maximum number of 128 openCRYPT sessions.

**CRYPTO-SESSION-LIMIT = \*MAXIMUM**

Defines the maximum number of 32767 openCRYPT sessions.

**NET-STORAGE-USAGE = \*ALLOWED / \*NOT-ALLOWED**

Specifies whether the user may occupy space on Net-Storage volumes.

**NET-STORAGE-USAGE = \*ALLOWED**

The user is permitted to use Net-Storage volumes. The space occupied on the Net-Storage volume is not counted toward the user's PUBLIC-SPACE-LIMIT.

**NET-STORAGE-USAGE = \*NOT-ALLOWED**

The user is not permitted to use Net-Storage volumes.

---

**NET-CODED-CHAR-SET = \*STD / \*ISO / \*NO-CONVERSION / <name 1..8>**

Defines which Net-Storage coded character set (NETCCSN) is to be used for node files on Net-Storage. A character set conversion is only performed for SAM node files.

**NET-CODED-CHAR-SET = \*STD**

The setting is adopted from the NETCODE system parameter (see the “Introduction to System Administration” manual [14]).

**NET-CODED-CHAR-SET = \*ISO**

A suitable ISO character set is used. For details on character set conversion see the CREATE-FILE command or the “Introductory Guide to DMS” manual [13].

**NET-CODED-CHAR-SET = \*NO-CONVERSION**

There is no code conversion for SAM node files.

**NET-CODED-CHAR-SET = <name 1..8>**

Name of the character set to be used. It should be an ASCII character set.

**ACCOUNT-ATTRIBUTES = \*PARAMETERS(...)**

Specifications that are valid for only one account number of the user ID. The maximum number of account numbers per user ID is 60.

**ACCOUNT = <alphanum-name 1..8>**

Account number of the user ID, to which the following information refers.

**CPU-LIMIT = \*STD / \*MAXIMUM / <integer 0..2147483647 seconds >**

Total CPU time allocated to the user jobs under the specified account number.

**CPU-LIMIT = \*STD**

The default value set in the SYSGJCPU system parameter (see the “Introduction to System Administration” [14]) is available.

**CPU-LIMIT = \*MAXIMUM**

The time allotted the user is 2,147,483,647 CPU seconds.

**SPOOLOUT-CLASS = 0 / <integer 0..255> / STD**

Spoolout class for the first account number of the user ID

**SPOOLOUT-CLASS = \*STD**

The default value set in the SYSGJCLA system parameter (see the “Introduction to System Administration” [14]) is available.

**MAXIMUM-RUN-PRIORITY = \*STD / <integer 30..255>**

Specifies the highest priority that may be assigned jobs of the user ID (see note).

**MAXIMUM-RUN-PRIORITY = \*STD**

The default value set in the SYSGJPRI system parameter (see the “Introduction to System Administration” [14]) is available.

**MAX-ALLOWED-CATEGORY =**

This operand defines which task attributes user jobs are allowed to attain.

If the user employs the TINF macro in his/her programs, a check is made in both the job class used by the job concerned and in the user catalog to see whether the right to use the task attribute TP was assigned to the user under the specified account number.

---

**MAX-ALLOWED-CATEGORY = \*STD**

The tasks of the user can attain the task attributes BATCH and DIALOG.

**MAX-ALLOWED-CATEGORY = \*TP**

The user jobs may attain the task attributes BATCH, DIALOG and TP.

**MAX-ALLOWED-CATEGORY = \*SYSTEM**

All task attributes are permitted for the tasks of the user.

**PRIVILEGE = \*NO / \*PARAMETERS(...) / list-poss(3): \*NO-CPU-LIMIT / \*START-IMMEDIATE / \*INHIBIT-DEACTIVATION**

Job management authorization declarations.

**PRIVILEGE = \*NO**

The user ID is not given any job management privileges.

**PRIVILEGE = \*PARAMETERS(...)**

A sequence of authorizations is to be agreed upon.

**NO-CPU-LIMIT = \*NO / \*YES**

Declares whether the user receives the authorization to run batch jobs without time restrictions.

**NO-CPU-LIMIT = \*YES**

The user ID receives the authorization to run batch jobs without time restrictions under the specified account number.

This applies even if the job class assigned to the job does not permit this start attribute.

If the user specified the CPU-LIMIT=\*NO operand in the SET-LOGON-PARAMETERS or ENTER-JOB command and this function is authorized neither in the user catalog nor in the job class assigned to the job, the batch job is rejected with an error message.

In the case of tasks without a time limit, the user's CPU account is not debited.

**START-IMMEDIATE = \*NO / \*YES**

Defines whether the use is authorized to use the job express function.

**START-IMMEDIATE = \*YES**

The user is authorized to use the job express function. With this authorization batch jobs are started immediately, even if the class limit of the job class in which the job concerned is to be started has been reached.

This applies even if the definition of the job class does not permit this start attribute. If the EXPRESS function is not permitted either in the user catalog or in the job class definition, the batch job is accepted, but it is not started as an EXPRESS job.

**INHIBIT-DEACTIVATION = \*NO / \*YES**

Defines whether the user is authorized to inhibit deactivation.

**INHIBIT-DEACTIVATION = \*YES**

The user ID is authorized to inhibit deactivation.

The user's jobs are thus independent of the PRIOR function, by means of which jobs are placed in subordinate queues according to their system service requirements (macro time slice).

**PRIVILEGE = \*NO-CPU-LIMIT**

The user is authorized to run batch jobs without time limitation under the specified account number.

---

**PRIVILEGE = \*START-IMMEDIATE**

The user is authorized to use the job express function.

**PRIVILEGE = \*INHIBIT-DEACTIVATION**

The user ID is authorized to inhibit deactivation.

**POSIX-RLOGIN-DEFAULT = \*NO / \*YES**

Defines whether the designated account number is to be used for POSIX remote login session accounting (the account number may likewise be used for BS2000 session accounting).

If the user entry does not include an account number for POSIX remote login session accounting, access to the system by remote login is not possible. Systems support personnel working under the TSOS user ID have access even without an account number.

**LOGON-DEFAULT = \*NO / \*YES**

Defines whether the designated account number is to be used as the default account number for BS2000 timesharing mode if no account number is specified in the case of dialog or batch access.

**LOCK-USER =**

Defines whether the user ID is to be locked after its creation.

**LOCK-USER = \*NO**

The user ID is not locked.

The user has free access to the system after entering his ID.

**LOCK-USER = \*YES**

The user ID is locked.

The system support staff is thus able to assign all desired attributes to the user ID and block premature access by the user.

If the product SECOS is used, the system support staff can achieve integration in the group structure and the protective mechanisms for the password in this way without thereby permitting SET-LOGON-PARAMETERS on the ID in question.

The access lock must be explicitly canceled (UNLOCK-USER command) by the system support staff.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SRM6001	Command executed with a warning
	1	SRM6010	Syntax error
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error
	130	SRM6030	Command cannot temporarily be executed

## Notes

- Task scheduling priorities

The task scheduling priorities (30-255) for job control are defined:

- in the user catalog (ADD-USER command, MAXIMUM-RUN-PRIORITY operand)
- in the job class definition (JMU statement DEFINE-JOB-CLASS, RUN-PRIO operand; in addition to the default priority, a maximum priority can be defined)

If the user specifies a task scheduling priority in the SET-LOGON-PARAMETERS or ENTER-JOB command, then this priority is checked both in the user catalog and in the job class assigned to the job. An example is given below:

Priority in the SET-LOGON-PARAMETERS or ENTER-JOB command	Priority in the job class		Priority in the user catalog	Priority with which the job is started
	DEFAULT	MAXIMUM		
200	190	150	180	200
150	190	150	180	150
130	190	150	180	190
-	190	150	180	190
130	190	150	130	130
130	190	150	200	200
200	190	NO	180	200
170	190	NO	180	190
130	190	NO	180	190
-	190	NO	180	190

If the priority specified by the user in the SET-LOGON-PARAMETERS or ENTER-JOB command is **worse** than the best priority of the job class and in the user catalog (i.e. allowed either in the job class or in the user catalog), the job is started with the priority specified by the user. If the priority specified by the user in the SET-LOGON-PARAMETERS or ENTER-JOB command is **better** than the priorities of the job class and in the user catalog (i.e. not allowed either in the job class or in the user catalog), the job is given whichever is worse, the default priority of the job class or the priority in the user catalog.

If the user does not specify any priority in the SET-LOGON-PARAMETERS or ENTER-JOB command, the job is started with the default priority.

- Threshold values for files, job variables, temporary memory and address space

These threshold values are defined for the user ID using the FILE-NUMBER-LIMIT, JV-NUMBER-LIMIT, TEMP-SPACE-LIMIT and ADDRESS-SPACE-LIMIT operands. The user ID TSOS may exceed the defined limits. All other user IDs must always comply with the defined limits.

When creating or modifying a user ID, a global user administrator may specify values which exceed the group potential of these limit values.

---

## Example

```
/add-user user-id=cognibs3,prot-attr=(logon-pass='8743ryz9',
                                     pass-manag=*user-cha-only,tape-access=*read),

## 2.21 AGOGO

Continue command file

**Component:** BS2000 OSD/BC

**Functional area:** Editing command files

**Domain:** not allocated

**Privileges:** OPERATING

**Routing code:** E

### Function

The AGOGO command is used for processing a command file that has been placed in the wait state. Depending on the conditions for continuation, several AGOGO commands may be required, see the ASTOP command.

This command is intended for use in authorized user programs which need to be synchronized with the processing of a command file.

The operator should use this command only in the following situation:

If an authorized user program has been started from a command file and an error has occurred during its execution, the operator can use an AGOGO command (or several, if required) to shorten the wait time which would otherwise elapse before processing is continued. The wait time is 3 minutes, unless a different value has been set using the class 2 system parameter NBRUNWT.

The command must not be issued from a user task with the operating privilege.

The way this command works is described under “Command files for the operator” in the “Introduction to System Administration” [14].

#### *Restrictions when using the “Operator LOGON” function*

If the “Operator LOGON” function is used (incompatible mode; system parameter NBCONOPI=Y), the AGOGO command is not accepted after “SYSTEM READY” unless the originating task is running under TSOS or under the user ID which entered the RUN command. The AGOGO command is also allowed if the RUN or AGOGO command was issued by an authorized user program with generated authorization names or if the command issuer has been disconnected. In all other cases, the AGOGO command is rejected with message NBR1013.

This restriction does not apply to the CMDFILE running at “SYSTEM READY” time or to any command sequences started from it.

### Format

<b>AGOGO</b>

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
1	0	EXC0916	No command file in ASTOP state
2	0	NBR1008	Command acknowledged. Another AGOGO command expected
	64	NBR1013	No authorization

---

## 2.22 ASR

Assign routing code

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Operator terminal control
<b>Domain:</b>	not allocated
<b>Privileges:</b>	OPERATING
<b>Routing code:</b>	E

### Function

The ASR command enables the operator to carry out the following functions:

- Assign routing codes to operator terminals (consoles) or authorized user programs with generated authorization names.  
Messages with these routing codes are sent to the appropriate operator terminals or authorized user programs. Commands with these routing codes may be issued from the appropriate operator terminals or authorized user programs.
- Assign routing codes to operator terminals (consoles) or authorized user programs with generated authorization names.
- Delete the assigned routing codes for operator terminals or authorized user programs with generated authorization names.
- Output information on the assignment of routing codes and filter levels to operator terminals or authorized user programs with generated authorization names.

**i** Authorized user programs with dynamic authorization names can use ASR only to query their own set of routing codes. Assignment and deletion are done with the CREATE-OPERATOR-ROLE and DELETE-OPERATOR-ROLE commands.

### *Restrictions*

The command is available in ISP format only; in other words, there are no SDF functions (such as syntax analysis or help). The format has been subdivided into four subformats:

- **Format 1:** Output information
- **Format 2:** Assign routing codes
- **Format 3:** Cancel assignment
- **Format 4:** Reset assignment to time of system startup

The meaning of system parameters ASRSW1 and ASRSW2 depends on whether the “Operator LOGON” function is used (system parameter NBCONOPI=Y / N); see [Note 7](#).

---

## Format 1

Operation	Operanden
ASR	<b>HELP</b> [ , { <b>CONSOLE</b> ={ bn / (bn1,...) / mn / (mn1,...) / ALL } /  <b>CODE</b> ={ bs / (bs1,...) / ALL } ]

### Operands

**HELP** Gives information on the assignment of routing codes to operator terminals or authorized user programs.

without operand Gives information on the authorization name of the authorized user program or on the mnemonic name of the operator terminal from which the ASR command was issued.

### CONSOLE

=up

=(up1,...)

Outputs the following information for the user programs “up” (“up” is the 4-character authorization name of a user program):

- **CODE**=..., shows the routing codes assigned
- **INOP**, there is no connection with \$CONSOLE
- **PROCESSOR**=..., the name of the processor from which the connection was set up
- **STATION**=..., the name of the station of the authorized user program from which the connection was set up

=mn

=(mn1,...)

Outputs the following information for the operator terminals “mn” (“mn” is the mnemonic device name of an operator terminal):

- **CODE**=..., shows the routing codes assigned
- **INOP**, operator terminals “mn” not operable
- **NOINF**, receipt of information messages is suppressed
- **SWITCHED OFF**, an operator terminal has been switched over to the standby operator terminal; see the **CONSOLE** command

=ALL

Information as above is output for all operator terminals and all authorized user programs. **CONSOLE**=ALL and **CODE**=ALL are mutually exclusive.

### Note

Routing codes which are temporarily assigned to a standby operator terminal because of a main operator terminal failure are also output. If the “Operator LOGON” function is used (system parameter **NBCONOPI**=Y), the operator terminal “OFF” condition is no longer indicated. The “INACTIVE” condition is indicated for physical operator terminals at which no operator has logged on.

## CODE

- =rc  
= (rc1,...) Lists the operator terminals and authorized user programs to which the routing codes “rc” are assigned.
- =ALL Lists information on all routing codes defined in the system.  
CONSOLE=ALL and CODE=ALL are mutually exclusive.

### *Note*

The routing codes which are temporarily assigned to a standby operator terminal because of a main operator terminal failure are not output.

## Format 2

Operation	Operanden
ASR	<b>ADD</b> { <b>CODE</b> ={ bs / (bs1,...) / ALL } / <b>CONSOLE</b> ={ bn / (bn1,...) / mn / (mn1,...) / ALL }  [ , <b>CODE</b> ={ bs / (bs1,...) / ALL } ] }

### *Operands*

- ADD** Assigns a set of routing codes to operator terminals or authorized user programs with generated authorization names.

**i** This function must neither be entered by user programs with dynamic authorization names themselves nor used with reference to them. In the mode with operator LOGON (system parameter NBCONOPI=Y), it must also not be used on physical operator terminals (including Teleservice).

## CODE

- =rc  
=(rc1,...) The routing codes “rc” are assigned to the operator terminal or authorized user program from which the ASR command was issued.
- =ALL All routing codes defined in the system are assigned to the operator terminal or authorized user program from which the ASR command was issued.

## CONSOLE

- =up  
=(up1,...) For main operator terminal only: The main operator terminal assigns itself all routing codes assigned to the user programs with the generated authorization name “up”.

- =mn
- =(mn1,...) The main operator terminal assigns itself all routing codes assigned to the operator terminals “mn”.
- =ALL The main operator terminal assigns itself all routing codes assigned to other operator terminals or user programs with generated authorization names.

*Note*

The routing code assignment for the operator subterminals and user programs remains intact. The routing codes previously assigned to the main operator terminal are also retained. See also [Note 4](#).

CONSOLE=...,CODE=...

For main operator terminal only: The main operator terminal assigns the routing codes “rc” (specified in the CODE operand) to the operator terminals “mn” or the user programs “up” (specified in the CONSOLE operand). See also [Note 4](#).

### Format 3

Operation	Operanden
ASR	<b>DELETE</b> { <b>CODE</b> ={ bs / (bs1,...) / ALL } / <b>CONSOLE</b> ={ bn / (bn1,...) / mn / (mn1,...) / ALL } [ , <b>CODE</b> ={ bs / (bs1,...) / ALL } ] }

*Operands*

**DELETE** Cancels the assignment of routing codes to operator terminals or authorized user programs with generated authorization names.

**i** This function must neither be entered by user programs with dynamic authorization names themselves nor used with reference to them. In the mode with operator LOGON (system parameter NBCONOPI=Y), it must also not be used on physical operator terminals (including Teleservice).

### CODE

- =rc
- =(rc1,...) The assignment of the routing codes “rc” to the operator terminal or authorized user program from which the ASR command was issued is canceled.
- =ALL The assignment of all routing codes to the operator terminal or authorized user program from which the ASR command was issued is canceled.

CONSOLE=...,CODE=...

For main operator terminal only: The main operator terminal cancels the assignment of the routing codes specified in the CODE operand to the operator terminals or authorized user programs specified in the CONSOLE operand. See also [Note 4](#).

## Format 4

Operation	Operanden
ASR	<code>PRIMARY [ , { CODE={ bs / (bs1,...) / ALL } / CONSOLE={ bn / (bn1,...) / mn / (mn1,...) / ALL } ] }</code>

### Operands

**PRIMARY** Resets the assignment of routing codes to the state which existed at system startup.

**i** This function must neither be entered by user programs with dynamic authorization names themselves nor used with reference to them. In the mode with operator LOGON (system parameter NBCONOPI=Y), it may only be used in authorized user programs with generated authorization names and is also allowed only with reference to them. Other restrictions depend on system parameters ASRSW1 and ASRSW2 (see [Note 7](#))

without operand The assignment of all routing codes to the operator terminal or authorized user program which issued the command is reset to the state which existed at system startup.

### CODE

=rc

=(rc1,...)

For the main operator terminal only: The main operator terminal resets the assignment of the routing codes "rc" to the state which existed at system startup.

=ALL

The main operator terminal resets the assignment of all routing codes defined in the system to the state which existed at system startup. See also [Note 4](#).

### CONSOLE

=up

=(up1,...)

For main operator terminal only: The main operator terminal resets the assignment of all routing codes to the user programs "up" to the state which existed at system startup.

=mn

=(mn1,...)

The main operator terminal resets the assignment of all routing codes to the operator terminals "mn" to the state which existed at system startup.

=ALL

The main operator terminal resets the assignment of all routing codes defined in the system to the state which existed at system startup. See also [Note 4](#).

## Return codes

The following functions of the ASR command, referred to in the “Meaning” column below, were replaced by new commands in BS2000/OSD-BC V2.0 and are not included in the present command description:

ASR function	Replaced by
ASR MAIN	/REQUEST-MAIN-CONSOLE-FUNCTIONS
ASR DESTINATION	/SHOW-SYSTEM-PARAMETERS
ASR SUPPRESS,<tsn>	/RESET-MSG-BUFFER

(SC2)	SC1	Maincode	Meaning
0	0	CMD0001	Command executed successfully
1	0	NBR0823	This is the main operator terminal. “ASR MAIN” and /REQUEST-MAIN-CONSOLE-FUNCTIONS ignored
2	0	NBR1031	Command only partially executed because it includes invalid actions relating to authorized user programs with dynamic authorization names
2	0	NBR1036	This operand combination can only be partially processed because NBCONOPI=Y is set
0	1	CMD0202	Syntax error
0	2	CMD0198	Shutdown
0	2	NBR0724	“ASR SUPPRESS” is not supported with NBCONOPI=Y. Use /RESET-MSG-BUFFER
0	2	NBR1033	“ASR MAIN” is not supported with NBCONOPI=Y. Use /REQUEST-MAIN-CONSOLE-FUNCTIONS
0	2	NBR1034	“ASR DESTINATION” is not supported with NBCONOPI=Y. Use /SHOW-SYSTEM-PARAMETERS
0	64	EXC0053	The entered operand combination is valid for the main operator terminal only
0	64	NBR0722	“ASR SUPPRESS” and /RESET-MSG-BUFFER allowed only on physical operator terminals
0	64	NBR0821	“ASR MAIN” and /REQUEST-MAIN-CONSOLE-FUNCTIONS rejected by main operator terminal
0	64	NBR0822	“ASR MAIN” and /REQUEST-MAIN-CONSOLE-FUNCTIONS allowed only on physical operator terminals
0	64	NBR0898	Command allowed only on operator terminals

0	64	NBR1030	Routing code assignments may not be modified with the ASR command either for or by authorized user programs with dynamic authorization names
0	64	NBR1032	Filters for authorized user programs with dynamic authorization names may only be modified by those programs
0	64	NBR1035	This operand combination is not allowed on this operator terminal because NBCONOP1=Y is set  "ASR MAIN" and /REQUEST-MAIN-CONSOLE-FUNCTIONS in use. Try again later
0	128	EXC0056	
0	130	EXC0054	Space request error
0	130	EXC0057	Task saturation

## Notes

1. The following maximum values may be specified in the various operands of an ASR command:

in the operand CODE=(rc1,...)	12 routing codes,
in the operand CONSOLE=(mn1,...)	24 operator terminals,
in the operand CONSOLE=(up1,...)	38 authorized user programs.

2. If a keyword operand contains a mnemonic device name of an operator terminal or an authorization name of a user program which is not defined in the system, one of the following messages appears:

```
CONSOLE 'bn' NOT FOUND
```

3. If the ASR command contains a number of entries which are not defined in the system, a separate message is output for each invalid entry.

Example: CONSOLE=(K1,B3) are not defined in the system, CONSOLE=(XY,KL) are defined. The command is therefore given as follows:

```
/ASR A,CD=(A,B,C,X,Y,Z),CS=(K1,B3,XY,KL)
```

The following messages appear as a response:

```
CONSOLE K1 NOT FOUND
CONSOLE B3 NOT FOUND
NBR0740 COMMAND COMPLETED 'ASR'; RESULT: SC2=0, SC1=0, MC=CMD0001)
```

The command is still executed, but only the correct entries in the operands are taken into account. In other words, the command in the example is equivalent to

```
/ASR A,CD=(A,B,C,X,Y,Z),CS=(XY,KL)
```

4. Whether input from operator subterminals is admissible is specified with the system parameter ASRSW1 (see the "Introduction to System Administration" [14]). If input from operator subterminals is permitted, the operands are executed in so far as they affect subterminal status.

5. It is possible to influence the admissibility of an input from an authorized user program with generated authorization name by means of the class 2 system parameters ASRSW1 and ASRSW2 (see the "Introduction to System Administration" [14]).
6. The ASR command can always be input from the main operator terminal in the mode without operator LOGON. If the "Operator LOGON" function is used (system parameter NBCONOPI=Y), the main operator terminal must have the required routing code.
7. The meaning of system parameters ASRSW1 and ASRSW2 depends on whether the "Operator LOGON" function is used (system parameter NBCONOPI=Y / N). The effects of the various combinations are shown in Tables "Effect of system parameters ASRSW1 and ASRSW2 (mode with operator LOGON)" and "Effect of system parameters ASRSW1 and ASRSW2 (mode with operator LOGON)". The following considerations (not included in the tables) are generally applicable:
  - Authorized user programs with dynamic authorization names are unaffected by the settings of the system parameters, because they have no influence on the distribution of routing codes and because their own routing codes cannot be modified from other operator terminals.
  - In the mode with operator LOGON (NBCONOPI=Y), regardless of the settings of the system parameters, the main operator terminal is allowed to modify the routing codes of authorized user programs with generated authorization names, provided that it has input authorization. In the mode without operator LOGON (NBCONOPI=N) it always has input authorization and is further allowed to modify the routing codes of all physical operator terminals.

<b>Mode without operator LOGON: NBCONOPI = N</b>		
<b>ASRSW1</b>	<b>ASRSW2</b>	<b>Effect</b>
0	0	Physical operator subterminals and authorized user programs with generated authorization names are allowed to modify their own routing codes
0	1	Physical operator subterminals are allowed to modify their own routing codes. Authorized user programs with generated authorization names are allowed to modify their own routing codes.
1	0	Only the main console is allowed to modify routing code assignments, but it may do so for all consoles
1	1	Only the main operator terminal and authorized user programs with generated authorization names are allowed to modify routing codes, but they may do so for all consoles

Table 26: Effect of system parameters ASRSW1 and ASRSW2 (mode without operator LOGON)

<b>Mode with operator LOGON: NBCONOPI = Y</b>		
<b>ASRSW1</b>	<b>ASRSW2</b>	<b>Effect</b>
0	0	Authorized user programs with generated authorization names are allowed to modify their own routing codes
0	1	Authorized user programs with generated authorization names are allowed to modify routing codes
1	0	Only the main console is allowed to modify routing codes, and it may do so only for authorized user programs with generated authorization names
1	1	Authorized user programs with generated authorization names are allowed to modify each other's routing codes

Table 27: Effect of system parameters ASRSW1 and ASRSW2 (mode with operator LOGON)

---

## 2.23 ASSIGN-STREAM

Assign S variable stream

<b>Component:</b>	SDF-P-BASYS
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The ASSIGN-STREAM command assigns an S variable stream to a variable or a server (e.g. FHS). See also “S variable streams” in the “SDF-P” manual [34].

#### *Restrictions*

Assignment of an S variable stream to a variable using TO=\*VARIABLE(...) is not possible unless the chargeable SDF-P subsystem is loaded.

## Format

### ASSIGN-STREAM

**STREAM-NAME** = **SYSVAR** / **SYSMSG** / **SYSINF** / <structured-name 1..20>

,**TO** = **\*STD** / <structured-name 1..20> / **\*DUMMY** / **\*SAME-AS-CALLING-PROC** / **\*VARIABLE(...)** /  
**\*SERVER(...)**

**\*VARIABLE(...)**

|     **VARIABLE-NAME** = **\*NONE** / <composed-name 1..255>(…)

|             <composed-name>(…)

|             |     **WRITE-MODE** = **\*EXTEND** / **\*PREFIX**

|     **,RETURN-VARIABLE-NAME** = **\*NONE** / <composed-name 1..255>(…)

|             <composed-name 1..255>(…)

|             |     **WRITE-MODE** = **\*EXTEND** / **\*PREFIX**

|     **,CONTROL-VAR-NAME** = **\*NONE** / <composed-name 1..255>(…)

|             <composed-name 1..255>(…)

|             |     **WRITE-MODE** = **\*EXTEND** / **\*PREFIX**

|     **,RET-CONTROL-VAR-NAME** = **\*NONE** / <composed-name 1..255>(…)

|             <composed-name 1..255>(…)

|             |     **WRITE-MODE** = **\*EXTEND** / **\*PREFIX**

**\*SERVER(...)**

|     **SERVER-NAME** = <structured-name 1..30>

|     **,SERVER-INFORMATION** = **\*NONE** / <c-string 1..1800>

## Operands

**STREAM-NAME** = <structured-name 1..20> / **SYSVAR** / **SYSMSG** / **SYSINF**

Assigns an S variable stream. The operand values **SYSINF**, **SYSMSG**, and **SYSVAR** are reserved words. They must not be abbreviated.

- **SYSINF**: contains structured outputs from commands and programs
- **SYSMSG**: contains structured guaranteed messages
- **SYSVAR**: contains information from **SYSINF** and **SYSVAR**; however, it is still possible to process the different data items separately.

**TO =**

Specifies the server which is assigned to the current S variable stream.

---

**TO = \*STD**

Default assignment. The following table indicates the default values used internally by TO for the various combinations featuring the STREAM-NAME operand.

STREAM-NAME=	TO=*STD	Information contained
SYSINF	SYSVAR	structured outputs from commands and programs
SYSMSG	SYSVAR	Structured guaranteed messages
SYSVAR	*DUMMY	structured outputs from commands and programs and structured guaranteed messages
<structured-name 1..20>	*DUMMY	User variable stream

**TO = <structured-name 1..20>**

Name of the user server.

Any loops in chains of S variable stream assignments will be rejected; e.g.

```
ASSIGN-STREAM S3, *DUMMY
ASSIGN-STREAM S2, S3
ASSIGN-STREAM S3, S2          -----> SDP0511
```

**TO = \*DUMMY**

No assignment. Transmitted variables are lost. The client is informed of this by a warning.

**TO = \*SAME-AS-CALLING-PROC**

Assigns the calling procedure's server. If there is no assignment in the calling procedure, the assignment is rejected and the S variable stream remains unaltered.

**TO = \*VARIABLE(...)**

The server is SDF-P. The transmitted variables are written to the specified S variables, or read from it. Specification is only possible if the chargeable SDF-P subsystem is loaded. The operands of the \*VARIABLE(...) structure are completely described in the "SDF-P" manual [34].

**TO = \*SERVER(...)**

Links the S variable stream with the specified server.

**SERVER-NAME = <structured-name 1..30>**

Name of the server.

**SERVER-INFORMATION =**

Information which must be sent to the server, e.g. the name of the format library for FHS.

**SERVER-INFORMATION = \*NONE**

No information must be sent to the server.

**SERVER-INFORMATION = <c-string 1..1800>**

Text of the message, in the form of a string.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
2	0	SDP0531	Warning by the server; process being continued
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	CMD0216	User does not have the required privilege
	64	SDP0091	Semantic error
	64	SDP0532	Server error; command rejected
	64	SDP0534	Internal server error; command terminated. Server link terminated following unexpected event or due to shortage or absence of system resources
	130	SDP0099	No further address space available

## Example

See the SHOW-STREAM-ASSIGNMENT and TRANSMIT-BY-STREAM commands in the “SDF-P” manual [34].

## 2.24 ASSIGN-SYSDTA

Assign SYSDTA to input source

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Job processing File processing
<b>Domain:</b>	JOB PROCEDURE PROGRAM
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The ASSIGN-SYSDTA command assigns the system (input) file SYSDTA to an input source. The primary assignment and attributes of SYSDTA are described in [section "System files"](#).

#### *Restrictions*

Allocating a system file to a variable with TO=\*VARIABLE(...) is only possible if the chargeable subsystem SDF-P is loaded.

### Format

#### ASSIGN-SYSDTA

```
TO = <filename 1..54> / *VARIABLE(...) / *LIBRARY-ELEMENT(...) / *PRIMARY / *SYSCMD /  
      *DISKETTE(...)  
*VARIABLE(...)  
  | VARIABLE-NAME = <composed-name 1..254>  
*LIBRARY-ELEMENT(...)  
  | LIBRARY = <filename 1..54 without-gen-vers>  
  | ,ELEMENT = <composed-name 1..64 with-under>(…)  
  |           <composed-name 1..64 with-under>(…)  
  |           | VERSION = *HIGHEST-EXISTING / *STD / <composed-name 1..24>  
  | ,TYPE = S / <alphanum-name 1..8>  
,DATA-ESCAPE-CHAR = *COMPATIBLE / '&&' / '#' / '*' / '@' / '$' / *STD
```

---

## Operands

### TO =

Input source to which SYSDTA is to be assigned.

### TO = <filename 1..54>

Name of the file to which SYSDTA is to be assigned. The file must be cataloged with the following attributes:

- variable-length records
- SAM or ISAM access method
- start of ISAM key: byte 5
- length of ISAM key: 8 bytes

### TO = \*VARIABLE(...)

Name of a complex S variable of the "list" type (i.e. a series of elements of the same variable type which can only be accessed sequentially). Complex S variables can only be used if the chargeable subsystem SDF-P is loaded (see the "SDF-P" manual [34]). The command will be rejected if the specified list has not been declared or if the list elements are not of variable type STRING (or ANY).

#### VARIABLE-NAME = <composed-name 1..254>

Name of the S variable.

### TO = \*LIBRARY-ELEMENT(...)

The input source is a PLAM library element.

#### LIBRARY = <filename 1..54 without-gen-vers>

Name of a PLAM library.

#### ELEMENT = <composed-name 1..64 with-under>(...)

Name of an element in the specified library. Hyphens are also permitted. However, hyphens are not permitted as the last character.

#### VERSION = \*HIGHEST-EXISTING / \*STD / <composed-name 1..24>

Addition of the version to the element name. The default value is the latest version of the specified element.

#### TYPE = S / <alphanum-name 1..8>

Type of the element.

- S Element type S (source program); default value.
- D Element type D (text data)
- M Element type M (macro)

### TO = \*PRIMARY

Resets SYSDTA to the primary assignment (see [section "System files"](#)).

### TO = \*SYSCMD

Combines SYSDTA and SYSCMD, i.e. the system reads both commands and data via SYSCMD.

---

**DATA-ESCAPE-CHAR =**

This specifies whether variables are to be replaced in data records.

**i** This operand is allowed only in procedure mode. It is not available in interactive mode and guided dialog.

**DATA-ESCAPE-CHAR = \*COMPATIBLE**

The replacement of variables and expressions in data records is to be performed in compatible fashion with the previous behavior:

- When the assignment SYSDTA not equal to SYSCMD is made, no replacement takes place in data records
- When SYSDTA=SYSCMD, replacement takes place in data records as defined in the SET-PROCEDURE-OPTIONS, MODIFY-PROCEDURE-OPTIONS or BEGIN-PROCEDURE command.

**DATA-ESCAPE-CHAR = '&' / '#' / '\*' / '@' / '\$' / \*STD**

*This specification is possible only with the assignment SYSDTA not equal to SYSCMD. In the case of TO=\*SYSCMD or TO=\*PRIMARY, the specification is rejected.*

In data records, variables and expressions which begin with the specified character are to be replaced. Permissible characters are &, #, \*, @ and \$. Specifying & is equivalent to specifying \*STD (as on command level). If the character & is to be specified explicitly, it *must* be entered twice.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	SSM3200	Command executed with warning
2	0	SSM3034	The system file is already assigned to *PRIMARY
	1	SSM2036	Operand invalid
	32	SSM1013	System error during command execution
	64	SSM1025	Floppy disk device not available
	64	SSM1026	Floppy disk device not available or the floppy disk could not be mounted
	64	SSM2061	Error on accessing PLAM library element
	64	SSM2064	System file cannot be assigned via RFA
	64	SSM3030	SYSDTA is already assigned to floppy disk
	64	SSM3031	Semantic error
	64	SSM3055	Invalid record or file format
	64	SSM3056	OPEN error on input (DMS error is contained as in the insertion into the SYSOUT message)
	64	SSM3100	S variable does not exist
	64	SSM3101	S variable not of list type
	64	SSM3102	SDF-P subsystem not available
	64	SSM3104	DATA-ESCAPE-CHAR not equal to *COMPATIBLE not permitted when SYSDTA=SYSCMD
	64	SSM3105	Specification of DATA-ESCAPE-CHAR not valid in the current software configuration
	64	SSM3200	Error on accessing PLAM library or element
	65	SSM2074	SPOOL subsystem not loaded; a floppy disk device cannot be accessed

---

## Notes

- Only one file may be assigned with one ASSIGN-SYSDTA command. Users wishing to assign more files must enter a corresponding number of ASSIGN-SYSDTA commands.
- At the procedure level, the system file SYSDTA is no longer assigned when the end of the file has been reached. Any further reading results in the message "SYSDTA NOT ASSIGNED". When processing returns to a lower procedure level, SYSDTA is assigned to the device that was defined at that lower level.
- The replacement of variables, which is defined in the DATA-ESCAPE-CHAR operand for SYSDTA not equal to SYSCMD is restricted to S procedures.

The following applies for this setting:

- When data in the context of a non-S procedure or ENTER file is read, the read operation is rejected with message SSM3106.
- If an error occurs while variables are being replaced, the data record is rejected, and reading from the input source is terminated with EOF.
- If the primary allocation is switched to while reading from the input source (file, library member or S variable), no variables are replaced (e.g. EDT switches to primary allocation after EOF occurs).

## Examples

### Example 1

**/start-assembh** \_\_\_\_\_ (1)

```
% BLS0523 ELEMENT 'ASSEMBH', VERSION '013', TYPE 'C' FROM LIBRARY ':LOSH:$TSOS.  
SYSPRG.ASSEMBH.013' IN PROCESS  
% BLS0500 PROGRAM 'ASSEMBH', VERSION '01.3A02' OF '2012-04-04' LOADED  
% BLS0552 COPYRIGHT (C) FUJITSU TECHNOLOGY SOLUTIONS 2012. ALL RIGHTS RESERVED  
% ASS6010 V01.3A02 OF BS2000 ASSEMBH READY  
%  
//compile source=*sysdta,...  
. . .  
% ASS6012 END OF ASSTRAN
```

**/assign-sysdta to=src.testprog** \_\_\_\_\_ (2)

**/start-assembh**

```
% BLS0523 ELEMENT 'ASSEMBH', VERSION '013', TYPE 'C' FROM LIBRARY ':LOSH:$TSOS.  
SYSPRG.ASSEMBH.013' IN PROCESS  
% BLS0500 PROGRAM 'ASSEMBH', VERSION '01.3A02' OF '2012-04-04' LOADED  
% BLS0552 COPYRIGHT (C) FUJITSU TECHNOLOGY SOLUTIONS 2012. ALL RIGHTS RESERVED  
% ASS6010 V01.3A02 OF BS2000 ASSEMBH READY  
% ASS6011 ASSEMBLY TIME: 385 MSEC  
% ASS6018 0 FLAGS, 0 PRIVILEGED FLAGS, 0 MNOTES  
% ASS6019 HIGHEST ERROR-WEIGHT: WARNING  
% ASS6006 LISTING GENERATOR TIME: 121 MSEC  
% ASS6012 END OF ASSEMBH
```

---

**/assign-sysdta to=\*primary** \_\_\_\_\_ (3)

- (1) The system file SYSDTA has primary assignment. The assembler reads its input from the terminal.
- (2) SYSDTA is assigned to the file *SRC.TESTPROG*. The assembler reads its input from this file (COMPILE statement and source program if SOURCE=\*SYSDTA is declared in the COMPILE statement).
- (3) The primary assignment is returned to SYSDTA.

*Example 2*

**/assign-sysdta to=\*lib-elem(lib=biblio,elem=testprog)**  
**/start-assembh**

```
% BLS0523 ELEMENT 'ASSEMBH', VERSION '013', TYPE 'C' FROM LIBRARY ':1OSH:$TSOS.  
SYSPRG.ASSEMBH.013' IN PROCESS  
% BLS0500 PROGRAM 'ASSEMBH', VERSION '01.3A10' OF '2012-10-11' LOADED  
% BLS0552 COPYRIGHT (C) FUJITSU TECHNOLOGY SOLUTIONS 2012. ALL RIGHTS RESERVED  
% ASS6010 V01.3A10 OF BS2000 ASSEMBH READY  
% ASS6011 ASSEMBLY TIME: 429 MSEC  
% ASS6018 0 FLAGS, 0 PRIVILEGED FLAGS, 0 MNOTES  
% ASS6019 HIGHEST ERROR-WEIGHT: WARNING  
% ASS6006 LISTING GENERATOR TIME: 154 MSEC  
% ASS6012 END OF ASSEMBH
```

**/assign-sysdta to=\*primary**

The assembler reads its input from the element *TESTPROG* from the library file *BIBLIO*. After the compiler run has been completed, SYSDTA once more obtains the primary assignment.

*Example 3*

```
/BEG-PROC LOG=*ALL, PAR=*YES(PROC-PAR=(&INFILE1,&OUTFILE,&INFILE2,&SFID))  
/ASS-SYSDTA TO=*SYSCMD  
/START-SDF-I  
OPEN INPUT-FILE=&INFILE1, OUTPUT-FILE=&OUTFILE  
MERGE FILE=&INFILE2, REMOVE-ID=&SFID  
END  
/END-PROC
```

Because of the ASSIGN-SYSDTA command, when the non-S procedure executes SYSDTA, like SYSCMD, is contained in the file in which the procedure is stored. This then also enables the SDF-I utility to read the statements from this procedure file.

---

## 2.25 ASSIGN-SYSEVENT

Assign event stream to user task

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job processing Operator terminal control
<b>Domain:</b>	CONSOLE-MANAGEMENT JOB
<b>Privileges:</b>	STD-PROCESSING OPERATING

### Function

This command causes an event stream to be assigned to the user task from which it was issued. It has essentially three main functions:

1. Assigning an event stream to the user's own task. This registers the user task with the event stream service (ESS) and causes an event stream task to start event stream logging in an event stream file (ESF). The components of the event stream are all asynchronous events addressed to the user task and the synchronous events defined when the command is issued. A nonprivileged user is allowed to assign a user event stream (TO=\*USER-LOG). The user task is connected to a private user event stream, and events are logged in a private user event stream file (UESF). A user with the OPERATING privilege is able to assign a system event stream (TO=\*SYSTEM-LOG), which involves the logging of all asynchronous system messages distributed via routing codes. In such cases the user task is connected to the central system event stream, and events are logged in the central system event stream file (SESF).  
  
A user task can only ever be assigned one event stream (user or system event stream). If a user task with an event stream already assigned to it is assigned a new event stream, the assignment is changed to match the new specifications in the command. The assignment which applied before is canceled (implied TO=\*DUMMY).
2. Canceling the assignment of an event stream to the user's own task (ASSIGN-SYSEVENT TO=\*DUMMY). The user task is deregistered from the ESS, and the events from the event stream are no longer logged in the ESF.
3. Modifying the assigned event stream. This primarily lets you redefine the set of synchronous messages being logged within an existing assignment (i.e. for your own active event stream).

## Format

### ASSIGN-SYSEVENT

**TO = \*USER-LOG (...)** / \*DUMMY / \*CURRENT / \*SYSTEM-LOG(...)

**\*USER-LOG(...)**

|     **LOG-ID = \*OWN-TSN** / <alphanum-name 1..4>

|     **,OPEN-MODE = \*CREATE** / \*OUTPUT / \*EXTEND

**\*SYSTEM-LOG(...)**

|     **LOG-ID = \*OWN-TSN** / <alphanum-name 1..4>

|     **,OPEN-MODE = \*CREATE** / \*OUTPUT / \*EXTEND

**,ADD-SYNCH-EVENTS = \*UNCHANGED-OR-STD** / \*NONE / \*ALL / list-poss(3): \*SYSOUT-MSG / \*CMD /

**\*STMT**

**,CLOSE-MODE = \*UNCHANGED-OR-STD** / \*DELETE-EVENTS / \*KEEP-EVENTS

## Operands

**TO = \*USER-LOG(...)** / \*DUMMY / \*CURRENT / \*SYSTEM-LOG(...)

Specifies the logical medium to which the assignment is to relate, thereby defining the function of the command (start, stop or modify an event stream).

**TO = \*USER-LOG(...)**

Assigns a user event stream to the user task. The associated events are logged in a UESF.

**LOG-ID = \*OWN-TSN** / <alphanum-name 1..4>

Defines the name that is assigned to the event stream. The default name is the TSN of your own task.

**OPEN-MODE = \*CREATE** / \*OUTPUT / \*EXTEND

Defines the open mode for event stream assignment. You can either create a new event stream or continue with an existing one.

**OPEN-MODE = \*CREATE**

Creates and starts a new event stream. The UESF is created. If an event stream of the same name and type already exists, the command is rejected.

**OPEN-MODE = \*OUTPUT**

Reassigns and overwrites an existing, closed event stream. If the event stream does not yet exist, a new one is created. The UESF is overwritten, or a new one is created. The event stream record is updated accordingly.

**OPEN-MODE = \*EXTEND**

Reassigns and extends an existing, closed event stream. If the event stream does not exist, the command is rejected.

---

**TO = \*DUMMY**

Cancels the currently applicable assignments of the event stream. Logging of the associated events in the UESF or the central SESF is terminated. As you can only refer to your own active event stream, there is no need to indicate a LOG-ID.

**TO = \*CURRENT**

Modifies the properties of the currently applicable event stream assignment. As you can only refer to your own active event stream, there is no need to indicate a LOG-ID.

**TO = \*SYSTEM-LOG(...)**

*Reserved for users with the OPERATING privilege.*

Assigns a system event stream to the user task. The associated events are logged in the central SESF.

**LOG-ID = \*OWN-TSN / <alphanum-name 1..4>**

Defines the name that is assigned to the event stream. The default name is the TSN of your own task.

**OPEN-MODE = \*CREATE / \*OUTPUT / \*EXTEND**

Defines the open mode for event stream assignment. You can either create a new event stream or continue with an existing one.

**OPEN-MODE = \*CREATE**

Creates and starts a new event stream. If an event stream of the same name and type already exists, the command is rejected.

**OPEN-MODE = \*OUTPUT**

Reassigns and overwrites an existing, closed event stream. If the event stream does not yet exist, a new one is created. The event stream record is updated accordingly.

**OPEN-MODE = \*EXTEND**

Reassigns and extends an existing, closed event stream. If the event stream does not exist, the command is rejected.

**ADD-SYNCH-EVENTS = \*UNCHANGED-OR-STD / \*NONE / \*ALL / list-poss(3): \*SYSOUT-MSG / \*CMD / \*STMT**

Defines the logical set of event stream components that is to be logged in addition to the asynchronous messages addressed to the user task.

**ADD-SYNCH-EVENTS = \*UNCHANGED-OR-STD**

Additional logging is determined by the type of assignment:

If you are assigning an event stream using TO=\*USER-LOG or \*SYSTEM-LOG, then ADD-SYNCH-EVENTS=\*NONE applies. If you are modifying the assigned event stream using TO=\*CURRENT, the current setting is retained unmodified. The operand is ignored for an assignment using TO=\*DUMMY.

**ADD-SYNCH-EVENTS = \*NONE**

Only asynchronous events addressed to the user task are to be logged.

**ADD-SYNCH-EVENTS = \*ALL**

All message types are to be logged.

**ADD-SYNCH-EVENTS = \*SYSOUT-MSG**

Messages sent to SYSOUT by command servers and user programs are to be logged in addition to asynchronous messages. Logging also extends to:

- all system messages and unformatted WROUT output, but not to FHS masks or other formatted screen output (such as EDT masks)

- 
- all WRTRD output of the message system (MIP) which requires a response. A message requiring a response (query message) is always logged together with the response because the query and the response are logically related.

**ADD-SYNCH-EVENTS = \*CMD**

Commands input from the user task which are executed using SDF are to be logged in addition to the asynchronous messages.

**ADD-SYNCH-EVENTS = \*STMT**

Statements input from within a user program in the user task which are executed using SDF are to be logged in addition to the asynchronous messages.

**CLOSE-MODE = \*UNCHANGED-OR-STD / \*DELETE-EVENTS / \*KEEP-EVENTS**

Governs whether the event stream is simply to be closed or is also to be deleted when the assignment is canceled. If the assignment is switched from one event stream to another, this operand only ever applies to the second event stream. The event stream that is closed when the assignment is switched keeps the setting it had beforehand.

**CLOSE-MODE = \*UNCHANGED-OR-STD**

If you are assigning the event stream using LOG-ID, this operand value defaults to CLOSE-MODE=\*DELETE-EVENTS. If you are canceling the assignment using TO=\*DUMMY or modifying the assigned event stream using TO=\*CURRENT, the setting defaults to \*UNCHANGED, which means that the previous setting is retained.

**CLOSE-MODE = \*DELETE-EVENTS**

Specifies that the event stream record and the logged events are to be deleted when the assignment is canceled. If a user task has been assigned a user event stream (TO=\*USER-LOG), the associated UESF is deleted as well.

**CLOSE-MODE = \*KEEP-EVENTS**

Specifies that the event stream record and the logged events are not to be deleted when the assignment is canceled. The SHOW-SYSEVENT-LOG command can still be used to display the logged events. If a user task has been assigned a user event stream (TO=\*USER-LOG), the associated UESF is saved.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed successfully
1	0	NBR3103	No need to execute command, no event stream assigned
	1	CMD0202	Syntax error
	32	NBR3199	Internal error on command server
	32	NBR3111	Error generating user event stream task (UEST)
	32	NBR3112	System event stream task (SEST) not available
	64	CMD0216	User does not have the necessary privilege
	64	NBR3012	Initialization error in user event stream task (UEST)
	64	NBR3014	Termination error in user event stream task (UEST)
	64	NBR3102	Name of event stream not unique
	64	NBR3106	Event stream already assigned, OPEN-MODE=*CREATE operand rejected
	64	NBR3107	Event stream file (ESF) locked
	64	NBR3108	Event stream not available
	64	NBR3113	Event stream not assigned owing to /SHUTDOWN

---

## 2.26 ASSIGN-SYSLST

Assign SYSLST to output destination

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Job processing File processing
<b>Domain:</b>	JOB PROCEDURE PROGRAM
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The ASSIGN-SYSLST command assigns a SYSLST system file to an output destination. SYSLST system files are SYSLST, SYSLST01, SYSLST02, ...SYSLST99.

The primary assignment and attributes of SYSLST system files are described in [section "System files"](#).

#### *Restrictions*

Allocating a system file to a variable with TO=\*VARIABLE(...) is only possible if the chargeable subsystem SDF-P is loaded.

## Format

### ASSIGN-SYSLST

```
TO = <filename 1..54> / *VARIABLE(...) / *LIBRARY-ELEMENT(...) / *PRIMARY / *DUMMY /
      *SYSLST-NUMBER(...)
*VARIABLE(...)
  |   VARIABLE-NAME = <composed-name 1..254>
*LIBRARY-ELEMENT(...)
  |   LIBRARY = <filename 1..54 without-gen-vers>
  |   ,ELEMENT = <composed-name 1..64 with-under>(…)
  |           <composed-name 1..64 with-under>(…)
  |           |   VERSION = *UPPER-LIMIT / <composed-name 1..24>
  |           ,TYPE = P / *STD / <alphanum-name 1..8>
*SYSLST-NUMBER(…)
  |   SYSLST-NUMBER = <integer 1..99>
,OPEN-MODE = *OUTPUT / *EXTEND
,SYSLST-NUMBER = *STD / <integer 1..99>
,CODED-CHARACTER-SET = *TASK-TYPE-DEFAULT / *NONE / <name 1..8>
```

## Operands

### TO =

Output destination to which the SYSLST file is to be assigned.

### TO = <filename 1..54>

Name for the new file or name of an already existing file to which the SYSLST file is to be assigned. A new file is created with the following attributes:

- SAM access method
- Initial allocation of the size defined by the system parameter SSMAPRI (default: 24 PAM pages).
- Secondary allocation of the size defined by the system parameter SSMASEC (default: 24 PAM pages).

An existing file must have the following attributes:

- SAM access method
- it must not reside on a multifile tape.

*For SYSLST (not SYSLST01 through SYSLST99):*

If no further storage space is available during SYSLST output to a library element, the system behaves as described in the "[Notes on the behavior of the system in case of insufficient storage space](#)".

---

**TO = \*VARIABLE(...)**

Name of a complex S variable of the "list" type (i.e. a series of elements of the same variable type which can only be accessed sequentially). Complex S variables can only be used if the chargeable subsystem SDF-P is loaded (see the "SDF-P" manual [34]). The command will be rejected if the specified list has not been declared or if the list elements are not of variable type STRING (or ANY).

**VARIABLE-NAME = <composed-name 1..254>**

Name of the S variable.

**TO = \*LIBRARY-ELEMENT(...)**

Output to a PLAM library element.

**LIBRARY = <filename 1..54 without-gen-vers>**

Name of a PLAM library.

**ELEMENT = <composed-name 1..64 with-under>(...)**

Name of an element in the specified library.

**VERSION = \*UPPER-LIMIT / <composed-name 1..24>**

Addition of the version to the element name. The default value is the highest possible version of the specified element.

**TYPE = P / \*STD / <alphanum-name 1..8>**

Type of the element. The \*STD operand value corresponds to element type P .

P Element type P (print-edited data); default value

S Element type S (source program)

D Element type D (text data)

M Element type M (macro)

**TO = \*PRIMARY**

Resets the SYSLST file to its primary assignment (see [section "System files"](#)).

**TO = \*DUMMY**

Assigns the SYSLST file to a dummy file, which means that output to a volume is suppressed. For further information on using dummy files, see the FILE-NAME=\*DUMMY operand in the ADD-FILE-LINK command description.

**TO = \*SYSLST-NUMBER(...)**

Designates as output destination a SYSLST file from the series SYSLST01 through SYSLST99, to which a SYSLST file from the series SYSLST01 through SYSLST99 is to be assigned. This operand value is not permitted when SYSLST-NUMBER = STD (the default) applies, i.e. the system file SYSLST must not be assigned to a system file in the series SYSLST01 to SYSLST99.

**SYSLST-NUMBER = <integer 1..99>**

Number of the SYSLST file. It must not be the same as that specified in the (subsequent) operand SYSLST-NUMBER.

---

**OPEN-MODE = \*OUTPUT / \*EXTEND**

Specifies whether an already cataloged SAM file is to be replaced or extended.

If a complex S variable is assigned:

If OPEN-MODE=\*OUTPUT is specified, output resumes with the first list element. Previous list items can no longer be accessed. If OPEN-MODE=\*EXTEND is specified, the list of variables is extended (dynamic extension must have been permitted).

**SYSLST-NUMBER =**

Designates the SYSLST file to which the specified output destination is to be assigned.

**SYSLST-NUMBER = \*STD**

The system file SYSLST is assumed. This operand value must not be specified together with TO = \*SYSLST-NUMBER.

**SYSLST-NUMBER = <integer 1..99>**

The system file from the series SYSLST01 through SYSLST99 whose number is specified here is used. If the operand TO = \*SYSLST-NUMBER is specified, the number given here must not correspond to the number specified there.

**CODED-CHARACTER-SET = \*TASK-TYPE-DEFAULT / \*NONE / <name 1..8>**

Determines the code of the SYSLST file. This defines how the characters of a national character set are to be stored in binary form. The defined character set affects, for example, the screen display of the characters, the sort sequence (see the "XHCS" User Guide [51]).

**CODED-CHARACTER-SET = \*TASK-TYPE-DEFAULT**

The code defined for the SYSLST file depends on the task mode:

- No code table is used within a batch task (corresponds to CODED-CHARACTER-SET=\*NONE).
- The code table currently set for the task is used within a interactive task (see also the function description of the MODIFY-TERMINAL-OPTIONS command).

**CODED-CHARACTER-SET = \*NONE**

No code is defined for the SYSLST file.

**CODED-CHARACTER-SET = <name 1..8>**

The specified code is defined for the SYSLST file.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	SSM2039	Command executed but error occurred on closing the previously assigned SYSLST file (DMS error is contained as an insert in the SYSOUT message)
2	0	SSM3200	Command executed with a warning
2	0	SSM3034	The system file is already assigned to *PRIMARY
	1	SSM2036	Operand invalid
	1	SSM2038	The specified code table (CCS) is not permitted
	32	SSM1013	System error during command execution
	64	SSM0001	Loop during SYSLSTnn assignment
	64	SSM2012	OPEN error on output (DMS error is contained as an insert in the SYSOUT message)
	64	SSM2048	XHCS does not support the specified code table (CCS)
	64	SSM2061	Error on accessing PLAM library element
	64	SSM2064	System file cannot be assigned via RFA
	64	SSM3031	Semantic error
	64	SSM3055	Invalid record or file format
	64	SSM3100	S variable does not exist
	64	SSM3101	S variable not of list type
	64	SSM3102	SDF-P subsystem not available
	64	SSM3200	Error on accessing PLAM library or element

## Note

No loops may arise in the assignment of SYSLST files to one another. For example, the following combination is rejected with an error message:

```
/ASS-SYSLST...SYSLSTxx -> SYSLSTyy  
/ASS-SYSLST...SYSLSTyy -> SYSLSTxx
```

---

## Notes on the behavior of the system in case of insufficient storage space

If there is insufficient storage space during the output to the system file SYSLST (not SYSLST01 to SYSLST99) or SYSOUT, the system behaves as follows:

- In case of assignment to the temporary S.LST or S.OUT file (\*PRIMARY):  
If the system parameter is SSMPNOQ=YES (default setting), the logging is terminated (implicit assignment of the system file on \*DUMMY). The task issues the console message SSM2076 and continues to run normally.  
If SSMPNOQ=NO, the temporary file is treated like a permanent file (see below).
- In case of assignment to a permanent disk file or a library element in an interactive task:  
In interactive mode, the system asks the user (message SSM2035 or SSM2078) how to proceed further. The user has the following response options:
  - N Closes the assigned file or the library element and changes the system file assignment to the dummy file \*DUMMY (thereby losing further outputs!).
  - P Closes the assigned file or the library element and changes the system file assignment to the primary assignment \*PRIMARY.
  - T Requests a tape (volume type TAPE) to continue the output. From there on, the process is the same as in a batch task (see below).
  - M Has the same effect as T, but the requested volume type is taken from the SSMSDEVD system parameter (default setting: TAPE-C4).
- In case of assignment to a permanent disk file or a library element in a batch task:  
If the system parameter is SSMSDEVB=\*DUMMY, the system file assignment is changed to \*DUMMY and the previously used file or library element is closed. The task issues the console message SSM2076 and continues to run normally.  
If not, the system requests a tape with the volume type from the SSMSDEVB system parameter (default setting: TAPE). If it receives this tape, e.g. via an automatic assignment by MAREN, the disk file or library element is copied to it and subsequently deleted. The output is then continued in the tape file.  
The Name of the file on tape or MTC is the name of the disk file.  
The name of the library element on tape or MTC is `S.LST.PLAM-TO-TAPE.<tsn>.<date>.<time>.`

<tsn>	=	The task's TSN
<date>	=	Creation date in the format yyyy-mm-dd, with yyyy=year, mm=month and dd=day
<time>	=	Creation time in the format hhmmss, with hh=hours, mm=minutes and ss=seconds

If, however, MAREN reports that there are no free volumes of the requested type, the system file assignment is changed to \*PRIMARY (or to \*DUMMY, if it already was \*PRIMARY). The task issues the console message SSM2076 and continues to run normally.

Without MAREN the tape request will lead to the console query DMS0591. The task waits until the operator manually assigns a tape or rejects the assignment. In case of a rejection, the operator receives the question SSM3060, which has the same possible answers as the dialog question SSM2035 (see above).

---

## Examples

### Example 1

```
/ass-syslst to=*dummy _____ (1)  
/show-sys-file system-file=*syslst
```

```
%PROCEDURE LEVEL NUMBER 0  
%SYSLST : *DUMMY
```

```
/start-exe from-file=cob.prog
```

```
.  
. .  
. .
```

```
/ass-syslst to=mj.cob.dat,open-mode=*ext _____ (2)  
/show-sys-file system-file=*syslst
```

```
%PROCEDURE LEVEL NUMBER 0  
%SYSLST : :P:$USER.MJ.COB.DAT
```

```
/start-exe from-file=cob.prog
```

```
.  
. .  
. .
```

```
/ass-syslst to=*primary _____ (3)
```

- (1) A user program prints data on the printer. The user does not require any listings for trial operation, assigning SYSLST to a dummy file instead.
- (2) In productive use, the data is not to be output on the printer either, but is instead to be appended to the existing file *MJ.COB.DAT*.
- (3) SYSLST again receives its primary assignment.

*Example 2 (assigning SYSLST-NUMBER)*

```
/ass-syslst to=lst.syssdf.globals,syslst-number=1 _____ (1)
/ass-syslst to=lst.syssdf.implementation,syslst-number=2 _____ (2)
/ass-syslst to=lst.syssdf.cmd-list,syslst-number=3 _____ (3)
/show-sys-file _____ (4)
```

```
%PROCEDURE LEVEL NUMBER 0
%SYSCMD : (PRIMARY)
%SYSDTA : (PRIMARY)
%SYSIPT : NOT ASSIGNED
%SYSOUT : (PRIMARY)
%SYSLST : (PRIMARY)
%SYSLST01: :1OSN:$USERXY01.LST.SYSSDF.GLOBALS
%SYSLST02: :1OSN:$USERXY01.LST.SYSSDF.IMPLEMENTATION
%SYSLST03: :1OSN:$USERXY01.LST.SYSSDF.CMD-LIST
%SYSOPT : (PRIMARY)
%TASKLIB : (PRIMARY)
```

```
/start-sdf-a _____ (5)
```

```
% BLS0517 MODULE 'SDAMAIN' LOADED
% SDA0001 'SDF-A' VERSION '04.1G10' STARTED
%/open SYSSDF.NDCSFSYS,type=*system
%/show object=*global-info,output=*syslst(syslst-number=1)
%/show object=*cmd(name=*all),impl-info=*yes,output=*syslst(2)
%/show object=*cmd(name=*all),attach-info=*no,output=*syslst(3)
%/end
```

```
/ass-syslst to=*primary,syslst-number=1 _____ (6)
/ass-syslst to=*primary,syslst-number=2
/ass-syslst to=*primary,syslst-number=3
/show-sys-file
```

```
%PROCEDURE LEVEL NUMBER 0
%SYSCMD : (PRIMARY)
%SYSDTA : (PRIMARY)
%SYSIPT : NOT ASSIGNED
%SYSOUT : (PRIMARY)
%SYSLST : (PRIMARY)
%SYSOPT : (PRIMARY)
%TASKLIB : (PRIMARY)
```

- (1) System file SYSLST01 is assigned to *LST.SYSSDF.GLOBALS*.
- (2) System file SYSLST02 is assigned to *LST.SYSSDF.IMPLEMENTATION*.
- (3) System file SYSLST03 is assigned to *LST.SYSSDF.CMD-LIST*.
- (4) The SHOW-SYSTEM-FILE-ASSIGNMENT command shows the assignments of the system files.

- 
- (5) Call to the SDF-A utility routine (syntax file processing). Various items of information are to be output to files from a syntax file (global information, implementation statements, and a command list). The SDF-A SHOW statement only supports output to SYSOUT, SYSLST or SYSLST-NUMBER. To avoid having to keep changing the SYSLST assignment while the program is running, a number of SYSLST-NUMBER files were assigned to files before the program was called. Now a specific SYSLST-NUMBER file can be selected in the SHOW statements and the output sent to the file assigned to it.
  - (6) Once the program has executed, the assignment is canceled (see the output of the SHOW-SYSTEM-FILE-ASSIGNMENT command).

---

## 2.27 ASSIGN-SYSOUT

Assign SYSOUT to output destination

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Job processing File processing
<b>Domain:</b>	JOB PROCEDURE PROGRAM
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The ASSIGN-SYSOUT command assigns the system output file SYSOUT to an output destination. In interactive mode, SYSOUT is assigned primarily to the terminal. If it is reassigned to a different output destination, *a//*outputs are redirected. In addition, output may be displayed on the terminal (TERMINAL-DISPLAY operand set to \*YES). If this option is not taken (TERMINAL-DISPLAY=\*NO), the user's outputs are not restored to the terminal until SYSOUT is given the assignment \*PRIMARY.

The primary allocation and properties of SYSLST are described in [section "System files"](#).

### *Restrictions*

Allocating a system file to a variable with TO=\*VARIABLE(...) is only possible if the chargeable subsystem SDF-P is loaded.

## Format

### ASSIGN-SYSOUT

**TO** = <filename 1..54> / \***VARIABLE**(...) / \***LIBRARY-ELEMENT**(...) / \***PRIMARY** / \***DUMMY**

\***VARIABLE**(...)

|   **VARIABLE-NAME** = <composed-name 1..254>

\***LIBRARY-ELEMENT**(...)

|   **LIBRARY** = <filename 1..54 without-gen-vers>

|   **ELEMENT** = <composed-name 1..64 with-under>(…)

|           <composed-name 1..64 with-under>(…)

|           |   **VERSION** = \***UPPER-LIMIT** / <composed-name 1..24>

|   **TYPE** = **P** / \***STD** / <alphanum-name 1..8>

,**OPEN-MODE** = \***OUTPUT** / \***EXTEND**

,**TERMINAL-DISPLAY** = \***NO** / \***YES**

,**CODED-CHARACTER-SET** = \***TASK-TYPE-DEFAULT** / \***NONE** / <name 1..8>

## Operands

**TO =**

Output destination to which SYSOUT is to be assigned.

**TO = <filename 1..54>**

Name for the new file or name of an existing file to which SYSOUT is to be assigned. A new file is created with the following attributes:

- SAM access method
- Initial allocation of the size defined by the system parameter SSMAPRI (default: 24 PAM pages).
- Secondary allocation of the size defined by the system parameter SSMASEC (default: 24 PAM pages).

If an existing file is to be used, it must be a SAM file.

If no further storage space is available during SYSOUT output to a disk file, the system behaves as described in the ["Notes on the behavior of the system in case of insufficient storage space"](#).

**TO = \*VARIABLE**(…)

Name of a complex S variable of the “list” type (i.e. a series of elements of the same variable type which can only be accessed sequentially). Complex S variables can only be used if the chargeable subsystem SDF-P is loaded (see the “SDF-P” manual [34]). The command will be rejected if the specified list has not been declared or if the list elements are not of variable type STRING (or ANY).

**VARIABLE-NAME = <composed-name 1..254>**

Name of the S variable.

---

**TO = \*LIBRARY-ELEMENT(...)**

Output to a PLAM library element.

If no further storage space is available during SYSOUT output to a disk file, the system behaves as described in the ["Notes on the behavior of the system in case of insufficient storage space"](#).

**LIBRARY = <filename 1..54 without-gen-vers>**

Name of a PLAM library.

**ELEMENT = <composed-name 1..64 with-under>(...)**

Name of an element in the specified library.

**VERSION = \*UPPER-LIMIT / <composed-name 1..24>**

Addition of the version to the element name. The default value is the highest possible version of the specified element.

**TYPE = P / \*STD / <alphanum-name 1..8>**

Type of the element. The \*STD operand value corresponds to element type P.

- P Element type P (print-edited data); default value
- S Element type S (source program)
- D Element type D (text data)
- M Element type M (macro)

**TO = \*PRIMARY**

Resets SYSOUT to its primary assignment (see [section "System files"](#)).

**TO = \*DUMMY**

Assigns SYSOUT to a dummy file, which means that output to a volume is suppressed. For further information on using dummy files see the FILE-NAME=\*DUMMY operand in the ADD-FILE-LINK command description.

**OPEN-MODE = \*OUTPUT / \*EXTEND**

Specifies whether an already cataloged SAM file is to be replaced or extended. If a complex S variable is assigned: If OPEN-MODE=\*OUTPUT is specified, output resumes with the first list element. Previous list items can no longer be accessed. If OPEN-MODE=\*EXTEND is specified, the list of variables is extended (dynamic extension must have been permitted).

**TERMINAL-DISPLAY = \*NO / \*YES**

Specifies whether output to SYSOUT should also be displayed on the terminal. This operand is allowed only in interactive mode. If SYSOUT has its primary assignment, the operand is ignored.

**CODED-CHARACTER-SET = \*TASK-TYPE-DEFAULT / \*NONE / <name 1..8>**

Determines the code of the SYSOUT file. This defines how the characters of a national character set are to be stored in binary form. The defined character set affects, for example, the screen display of the characters, the sort sequence (see the "XHCS" User Guide [51]).

**CODED-CHARACTER-SET = \*TASK-TYPE-DEFAULT**

The code defined for the SYSOUT file depends on the task mode:

- No code table is used within a batch task (corresponds to CODED-CHARACTER-SET=\*NONE).

- The code table currently set for the task is used within an interactive task (see also the function description of the MODIFY-TERMINAL-OPTIONS command).

**CODED-CHARACTER-SET = \*NONE**

No code is defined for the SYSOUT file.

**CODED-CHARACTER-SET = <name 1..8>**

The specified code is defined for the SYSOUT file.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	SSM2039	Command executed but error occurred on closing the previously assigned SYSLST file (DMS error is contained as an insert in the SYSOUT message)
2	0	SSM3200	Command executed with a warning
2	0	SSM3034	The system file is already assigned to *PRIMARY
	1	SSM2036	Operand invalid
	1	SSM2038	The specified code table (CCS) is not permitted
	32	SSM1013	System error during command execution
	64	SSM2012	OPEN error on output (DMS error is contained as an insert in the SYSOUT message)
	64	SSM2048	XHCS does not support the specified code table (CCS)
	64	SSM2061	Error on accessing PLAM library element
	64	SSM2064	System file cannot be assigned via RFA
	64	SSM3031	Semantic error
	64	SSM3055	Invalid record or file format
	64	SSM3100	S variable does not exist
	64	SSM3101	S variable not of list type
	64	SSM3102	SDF-P subsystem not available
	64	SSM3200	Error on accessing PLAM library or element

---

## Notes on the behavior of the system in case of insufficient storage space

If there is insufficient storage space during the output to the system file SYSLST (not SYSLST01 to SYSLST99) or SYSOUT, the system behaves as follows:

- In case of assignment to the temporary S.LST or S.OUT file (\*PRIMARY):  
If the system parameter is SSMPNOQ=YES (default setting), the logging is terminated (implicit assignment of the system file on \*DUMMY). The task issues the console message SSM2076 and continues to run normally.  
If SSMPNOQ=NO, the temporary file is treated as a permanent file (see below).
- In case of assignment to a permanent disk file or a library element in an interactive task:  
In interactive mode the system asks the user (message SSM2035 or SSM2078) how to proceed further. The user has the following response options:
  - N Closes the assigned file or the library element and changes the system file assignment to the dummy file \*DUMMY (thereby losing further outputs!).
  - P Closes the assigned file or the library element and changes the system file assignment to the primary assignment \*PRIMARY.
  - T Requests a tape (volume type TAPE) to continue the output. From there on, the process is the same as in a batch task (see below).
  - M Has the same effect as T, but the requested volume type is taken from the SSMSDEVD system parameter (default setting: TAPE-C4).
- In case of assignment to a permanent disk file or a library element in a batch task:  
If the system parameter is SSMSDEVB=\*DUMMY, the system file assignment is changed to \*DUMMY and the previously used file or library element is closed. The task issues the console message SSM2076 and continues to run normally.  
If not, the system requests a tape with the volume type from the SSMSDEVB system parameter (default setting: TAPE). If it receives this tape, e.g. via an automatic assignment by MAREN, the disk file or library element is copied to it and subsequently deleted. The output is then continued in the tape file.  
The Name of the file on tape or MTC is the name of the disk file.  
The name of the library element on tape or MTC is S.OUT.LST.PLAM-TO- TAPE.<tsn>.<date>.<time>.

<tsn>	=	The task's TSN
<date>	=	Creation date in the format yyyy-mm-dd, with yyyy=year, mm=month and dd=day
<time>	=	Creation time in the format hhmmss, with hh=hours, mm=minutes and ss=seconds

If, however, MAREN reports that there are no free volumes of the requested type, the system file assignment is changed to \*PRIMARY (or to \*DUMMY, if it already was \*PRIMARY). The task issues the console message SSM2076 and continues to run normally.

Without MAREN the tape request will lead to the console query DMS0591. The task waits until the operator manually assigns a tape or rejects the assignment. In case of a rejection, the operator receives the question SSM3060, which has the same possible answers as the dialog question SSM2035 (see above).

---

## Example

The ENTER file E.ENTER contains the following records:

```
/SET-LOGON-PAR
/ASS-SYSOUT TO=L.PROT
/SHOW-SYS-FILE SYSTEM-FILE=*SYSOUT
/ASS-SYSOUT TO=*PRIMARY
/SHOW-SYS-STAT
/EXIT-JOB
```

Calling the ENTER file:

```
/enter-job from-file=e.enter,cpu-limit=19
```

```
% JMS0066 JOB '(NONE)' ACCEPTED ON 04-12-16 AT 14:55, TSN = 6VCN
```

During ENTER file execution the following records of the SYSOUT log are output

- on the printer:

```
/SET-LOGON-PAR
%. . . .
/ASS-SYSOUT TO=L.PROT
/SHOW-SYS-STAT
% SCP1095 DPRINTSV WARNING : SOME DPRINT PRINT-JOBS CANNOT BE DISPLAYED
% T1 T2 T3 T4PR T4FD T4TP T5AC T5KP T6 T7 T8
% 0 1 1 6 0 0 0 0 0 0 0
/EXIT-JOB
%. . . .
```

- to the file L.PROT:

```
/SHOW-SYS-FILE SYSTEM-FILE=SYSOUT
PROCEDURE LEVEL NUMBER 0
SYSOUT : :2OSG:$USER1.L.PROT
/ASS-SYSOUT TO=*PRIMARY
```

---

## 2.28 ASTOP

Suspend command file

**Component:** BS2000 OSD/BC

**Functional area:** Editing command files

**Domain:** not allocated

**Privileges:** OPERATING

**Routing code:** @

### Function

The ASTOP command suspends the processing of a command file. Processing of the command file is always resumed once the wait time set using the NBRUNWT system parameter has elapsed, even if an insufficient number of AGOGO commands has been specified.

For a description of how the command operates see “Command files for the operator” in the “Introduction to System Administration” [14].

The ASTOP command is allowed in RUN command files only. It is available in ISP format only; in other words, there are no SDF functions (such as syntax analysis or help).

### Format

<b>ASTOP</b>
<b>1</b> / <integer 1..255>

### Operands

**1** / <integer 1..255>

Number of AGOGO commands that must be received before command file processing is continued. Default value: 1 AGOGO command must be received.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors

---

## 2.29 ATTACH-DEVICE

Attach hardware units

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Device management
<b>Domain:</b>	DEVICE
<b>Privileges:</b>	OPERATING
<b>Routing code:</b>	G

### Function

This command enables the operator to make available one or more hardware units, i.e. to allow the operating system to use these units for I/O operations. The hardware units are attached via SVP.

#### *Effect of the ATTACH-DEVICE command*

1. If the specified hardware units were in the “detached explicitly” state, they are placed in the “attached” state and can be used again.
2. If the specified hardware units were in the “detached implicitly” state, an ATTACH is rejected. The “detached explicitly” state, if applicable, is canceled.
3. If the outward connections associated with the unit were in the “removed implicitly” state, they are placed in the “included” state. The connections can be used again.
4. All outward hardware units in the “detached implicitly” state which have at least one connection to the relevant unit in the “included” state are placed in the “attached” state. These units can be used again.
5. If there are hardware attach actions (SVP actions) for the units to be attached, these actions are initiated. The hardware units addressed explicitly in the command are not placed in the “attached” state unless the hardware reactions resulting from SVP processing receive a positive acknowledgment, otherwise ATTACH is rejected.
6. In the case of disks and tape devices for which it is possible to set up path groups, such path groups are set up for all the available paths.
7. When a PAV (**Parallel Access Volumes** device is attached (see the “Introductory Guide to Systems Support” [14 ])), the following applies:  
In the case of a base device, the associated alias devices are searched for and implicitly attached. Alias devices can only be explicitly attached using the ATTACH-DEVICE command when the associated base device is already attached.
8. If a FastDPAV basis device is attached, the associated FastDPAV alias devices are not attached implicitly (FastDPAV see the manual “Introduction to System Administration” [14]). The FastDPAV alias devices have to be explicitly ENABLED for input/output.
9. For a FastDPAV alias device in the state DISABLED, the ENABLED state is set by means of the ATTACH-DEVICE command:
  - In native operating mode
  - In VM operating mode, if the implicit device assignment to VM is not permitted (ASSIGN-BY-GUEST=\*YES) or the alias device is explicitly assigned to VM

## Format

### ATTACH-DEVICE

**UNIT** = \*CPU(...) / \*EXTRA-CPU(...) / \*CHANNEL(...) / \*CONTROLLER(...) /  
\*CHANNEL-RANGE(...) / \*DEVICE-RANGE(...) / \*PUBSET-DEVICES(...) /  
list-poss(255): <alphanum-name 2..2> / <x-text 4..4>

\*CPU(...)  
| **CPU-IDENTIFIER** = list-poss(16): <x-text 2..2>

\*EXTRA-CPU(...)  
| **CPU-IDENTIFIER** = \*ALL / \*ANY / <x-text 2..2>

\*CHANNEL(...)  
| **CHANNEL-PATH-ID** = list-poss(16): <x-text 2..2>  
| **SCOPE** = \*OWN-SYSTEM-ONLY / \*VM2000-GLOBAL

\*CONTROLLER(...)  
| **CONTROLLER-UNIT** = list-poss(16): <alphanum-name 2..2> / <x-text 4..4>  
| **SCOPE** = \*OWN-SYSTEM-ONLY / \*VM2000-GLOBAL

\*CHANNEL-RANGE(...)  
| **FROM** = <x-text 2..2>  
| **TO** = <x-text 2..2>  
| **SCOPE** = \*OWN-SYSTEM-ONLY / \*VM2000-GLOBAL

\*DEVICE-RANGE(...)  
| **FROM** = <alphanum-name 2..2> / <x-text 4..4>  
| **TO** = <alphanum-name 2..2> / <x-text 4..4>

\*PUBSET-DEVICES(...)  
| **PUBSET** = list-poss(255): <cat-id 1..4> / \*BY-PUBRES-DEVICE(...)  
| \*BY-PUBRES-DEVICE(...)  
| | **UNIT** = list-poss(255): <alphanum-name 2..2> / <x-text 4..4>

## Operands

### UNIT =

Specifies the hardware units to be attached to the system.

---

**UNIT = \*CPU(...)**

Specifies the CPU to be attached.

**CPU-IDENTIFIER = list-poss(16): <x-text 2..2>**

Specifies the CPU identifier.

**UNIT = \*EXTRA-CPU(...)**

Specifies the extra CPU that is to be attached.

**CPU-IDENTIFIER = \*ALL / \*ANY / <x-text 2..2>**

Specifies the identifier of the extra CPU. \*ANY attaches one available extra CPU. \*ALL attaches all available extra CPUs.

**UNIT = \*CHANNEL(...)**

Specifies the channel to be attached.

**CHANNEL-PATH-ID = list-poss(16): <x-text 2..2>**

Specifies the channel path ID of the channel. In the case of channels, the device name (MN) is the same as the channel path ID in hexadecimal representation.

**SCOPE =**

Specifies how the command is to be executed under VM2000.

**SCOPE = \*OWN-SYSTEM-ONLY**

The command is only executed in the local system.

**SCOPE = \*VM2000-GLOBAL**

If entered on the Monitor System (SU /390 and S server), the command is executed on all guest systems. If entered at another guest system or at the Monitor System (SU x86), the command is rejected with the message NKR0178.

**UNIT = \*CONTROLLER(...)**

Specifies the controller to be attached.

**CONTROLLER-UNIT = list-poss(16): <alphanum-name 2..2> / <x-text 4..4>**

Specifies the mnemonic device code (MN) of the controller to be attached.

**SCOPE =**

Specifies how the command is to be executed under VM2000.

**SCOPE = \*OWN-SYSTEM-ONLY**

The command is only executed in the local system.

**SCOPE = \*VM2000-GLOBAL**

If entered on the Monitor System (SU /390 and S server), the command is executed on all guest systems. If entered at another guest system or at the Monitor System (SU x86), the command is rejected with the message NKR0178.

**UNIT = \*CHANNEL-RANGE(...)**

Specifies a set of channels to be attached.

**FROM = <x-text 2..2>**

Specifies the channel path ID of the first channel in the set of channels to be attached.

---

**TO = <x-text 2..2>**

Specifies the channel path ID of the last channel in the set of channels to be attached. The following rules apply:  $chn_1 -id < chn_2 -id$ , and  $chn_2 -id - chn_1 -id < 64$ , i.e. a maximum of 64 channels can be attached at a time.

**SCOPE =**

Specifies how the command is to be executed under VM2000.

**SCOPE = \*OWN-SYSTEM-ONLY**

The command is only executed in the local system.

**SCOPE = \*VM2000-GLOBAL**

If entered on the Monitor System (SU /390 and S server), the command is executed on all guest systems. If entered at another guest system or at the Monitor System (SU x86), the command is rejected with the message NKR0178.

In the case of channels, the device name (MN) is the same as the channel path ID in hexadecimal representation.

**UNIT = \*DEVICE-RANGE(...)**

Defines the maximum of 256 devices, that can be attached. The mnemonic codes defined do not have to be contiguous. If no device is generated for one of the codes, processing continues with the next device code.

**FROM = <alphanum-name 2..2> / <x-text 4..4>**

Defines the mnemonic device code (MN) of the first device in the set of devices to be attached.

**TO = <alphanum-name 2..2> / <x-text 4..4>**

Defines the mnemonic device code (MN) of the last device in the set of devices to be attached.

**UNIT = \*PUBSET-DEVICES(...)**

Specifies that a pubset's disks are to be attached. Since the mnemonic device names (MNs) of the associated disks are administered in the SVL of the system disk, the latter must have been entered into the MRSCAT. The entry is made whenever the pubset is imported or exported and in the case of modifications to the composition of the pubset (see MODIFY-PUBSET-PROCESSING). Alternatively, you can enter the system disk manually with the ADD-MASTER-CATALOG-ENTRY and MODIFY-MASTER-CATALOG-ENTRY commands.

In all cases, as many disks as possible are attached. If pubset disks are mirrored then the following should be noted:

- If mirroring is performed with DRV, both disks are always attached.
- In the case of mirroring in external disk storage systems (see the "SHC-OSD" User Guide [37]) only the standard disks are attached (source or normal unit). If the mirror disks are to be attached then the mirror disk (target or additional mirror unit) of the system disk (pubres) must be specified in the PUBSET operand.

**PUBSET = list-poss(255): <cat-id 1..4> / \*BY-PUBRES-DEVICE(...)**

Identifies the pubset whose disks are to be attached. The pubset can be specified via its catalog ID or the device code of its system disk.

**PUBSET = <cat-id 1..4>**

Specifies the pubset's catalog ID. There must be a corresponding entry in the MRS catalog. If there is no entry then the disks can only be attached by specifying the system disk (see PUBSET=\*BY-PUBRES-DEVICE).

**PUBSET = \*BY-PUBRES-DEVICE(...)**

Specifies the pubset's system disk (pubres).

---

**UNIT = list-poss(255): <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device code (MN) of the pubres.

**UNIT = list-poss(255): <alphanum-name 2..2> / <x-text 4..4>**

Specifies the mnemonic device code (MN) if a device is to be attached.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	64	ETMRK..	Command execution faulty
2	64	ETMRK..	Command partially processed without error
4	64	NKR0...	Hardware unit was already attached
12	64	NKR0...	Internal check negative
16	64	NKR0...	Caller error
20	64	NKR0...	Software error

If there is an error in command termination, the maincode contains the message code of the message output during command processing. The command return codes with the ETMRK.. maincodes occur only if the hardware unit to be reconfigured is a CPU.

## Examples

1. Attach the channels with the channel path IDs 10 through 1F

```
/ATTACH UNIT=*CHANNEL-RANGE(FROM=10,TO=1F) or
```

```
/ATT *CH-R(10,1F)
```

2. Attach devices D1, D2 and C1

```
/ATTACH-DEVICE UNIT=(C1,D1,D2) or
```

```
/ATT (C1,D1,D2)
```

3. Attach CPU 1

```
/ATTACH-DEVICE UNIT=*CPU(CPU-IDENTIFIER=01) or
```

```
/ATT *CPU(01)
```

4. Attaching the pubset's disks with the catalog ID 2OSG

```
/ATTACH-DEVICE UNIT=*PUBSET-DEVICES(PUBSET=2OSG) or
```

```
/ATT *PUB-DEV(2OSG)
```

---

## 2.30 BEGIN-PARAMETER-DECLARATION

Initiate parameter declarations

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

### Function

The BEGIN-PARAMETER-DECLARATION command is an SDF-P control flow command. It is part of the header of an S procedure, and it identifies the beginning of the declaration section in this header. The procedure parameters are declared in the declaration section. There may be a SET-PROCEDURE-OPTIONS command before the declaration section. The END-PARAMETER-DECLARATION command terminates both the declaration section and the procedure header. Within the declaration section, only DECLARE-PARAMETER commands are permitted. If only one DECLARE-PARAMETER command is used, the BEGIN-PARAMETER-DECLARATION and END-PARAMETER-DECLARATION commands can be omitted. The declaration section is redundant if no procedure parameters are declared. The BEGIN-PARAMETER-DECLARATION command is also required when one or more OPERAND-VARIABLE-CONTAINER commands need to be inserted in the procedure header to initialize procedure parameters with permanent variables. Procedure parameters are stored as S variables and can therefore be queried and modified using SDF-P facilities.

### Format

<b>BEGIN-PARAMETER-DECLARATION</b>

---

## Return codes

The BEGIN-PARAMETER-DECLARATION command can be used within the procedure header of an S procedure. SDF-P detects errors in the procedure head during pre-analysis and terminates the procedure call. The command return codes can only occur if the command is used outside the procedure header.

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	1	CMD0202	Syntax error
	1	SDP0118	Command in false context
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	130	SDP0099	No further address space available

---

## 2.31 BEGIN-PROCEDURE

Begin procedure file and define procedure parameters

**Component :** SYSFILE

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

This command can only be used for non-S procedures.

The BEGIN-PROCEDURE command is required as the first record in a non-S procedure. It defines symbolic parameters that are used in the subsequent commands in the procedure file. Symbolic parameters are variables which are given actual values while the procedure is executing. These values may be defined as follows:

- when the procedure is called: in the CALL-PROCEDURE command,
- when the procedure is created: in the BEGIN-PROCEDURE command (so-called predefinition: these values are used only if no values are specified in the CALL-PROCEDURE command),
- while the procedure is executing (prompting): The user is requested to enter a value during the dialog if no values were defined for the corresponding symbolic operands either in the CALL-PROCEDURE command or in the BEGIN-PROCEDURE command.

The BEGIN-PROCEDURE command may be used only in procedure files. In interactive mode it is rejected, and is therefore not offered as a menu option.

### Format

**BEGIN-PROCEDURE**

**LOGGING** = \*NO / \*ALL / \*DATA / \*CMD

,**PARAMETERS** = \*NO / \*YES(...)

\*YES(...)

| **PROCEDURE-PARAMETERS** = <text 0..1800 with-low>

| ,**ESCAPE-CHARACTER** = \*NONE / <c-string 1..1>

,**INTERRUPTION-ALLOWED** = \*YES / \*NO

---

## Operands

### **LOGGING =**

Type of logging used for the procedure run. SDF statements are treated like commands for the purpose of logging.

### **LOGGING = \*NO**

No log of the procedure run is written to SYSOUT.

### **LOGGING = \*ALL**

Commands and input data for the procedure file are logged on SYSOUT when the procedure is executed.

### **LOGGING = \*DATA**

The input data for the procedure file is logged on SYSOUT when the procedure is executed.

### **LOGGING = \*CMD**

Commands and SDF statements of the procedure file are logged on SYSOUT when the procedure is executed.

### **PARAMETERS = \*NO / \*YES(...)**

Specifies whether the procedure contains symbolic parameters.

### **PARAMETERS = \*YES(...)**

#### **PROCEDURE-PARAMETERS = <text 0..1800 with-low>**

Names of the symbolic parameters to be used in the procedure file. They form the so called parameter list for the procedure.

Permissible characters for symbolic parameters:

first character:	&
second character:	letter
subsequent characters:	letters and digits
minimum length:	2 characters
maximum length:	255 characters

The individual symbolic parameters must be separated by commas; the entire expression must be enclosed in parentheses.

Symbolic parameters may be defined as positional parameters or as keyword parameters.

Positional parameters consist of only the name, e.g. &A.

Keyword parameters consist of the name followed by an equals sign, e.g. &A=. In addition, the name may be assigned a value, e.g. &A=VALUE. This value is used if the operand concerned is omitted when the procedure is called (CALL-PROCEDURE). The value must not exceed 254 characters in length.

Strings enclosed in apostrophes are also permitted as a value. The value must be enclosed in apostrophes if it contains blanks or special characters. Apostrophes within strings must be doubled. Lowercase letters within strings are retained.

If values are entered during procedure execution (prompting), lowercase letters will be converted into uppercase characters also within strings. The slash preceding a command cannot be replaced by parameters. Keyword parameters and positional parameters may appear in any order in the parameter list. If a symbolic parameter is followed in the procedure file by a period or an alphanumeric character, the parameter must be separated from it by a period.

---

**ESCAPE-CHARACTER = \*NONE / <c-string 1..1>**

Character (&, @, #, \$ or \*) identifying symbolic parameters in input data. If no character is specified (= presetting NONE) symbolic parameters in input data are not replaced. SDF statements are treated as commands, i.e. symbolic parameters must begin with & there and are always replaced. Symbolic parameters in input data must begin with the specified character. If the character is duplicated, it is replaced by a single character preventing parameter replacement.

**INTERRUPTION-ALLOWED =**

Defines whether the procedure can be interrupted with the K2 key for command input. Commands within the procedure which result in an interrupt are executed nonetheless.

**INTERRUPTION-ALLOWED = \*YES**

Interrupting the procedure with the K2 key is possible.

The user may enter commands.

The specification is ignored if the procedure is called from a noninterruptible procedure.

**INTERRUPTION-ALLOWED = \*NO**

Interruption of the procedure via the K2 key is not possible. Nested procedures for subsequent procedure levels are also noninterruptible (regardless of the setting in INTERRUPTION-ALLOWED). If a program in which the event class ESCPBRK has been defined is called in a procedure, this STXIT routine is always activated by means of the K2 key.

**Return codes**

The BEGIN-PROCEDURE command is not interpreted by SDF. It can only result in an error if used in an incorrect context. In such a case the following command return code is issued.

(SC2)	SC1	Maincode	Meaning
	64	SSM2057	Command not the first command of a non-S procedure

**Notes**

- The BEGIN-PROCEDURE command must always be the first record in a procedure file. This file must not contain any further BEGIN-PROCEDURE commands or LOGON or RESTART-PROGRAM commands.
- The description of the CALL-PROCEDURE command explains how a procedure file is called and how the symbolic parameters are replaced with current values.
- The description of the END-PROCEDURE command explains how a procedure file is terminated.

---

## Examples

### Example 1

The procedure file MJ.PROC begins with the following record:

```
/BEG-PROC LOG=*ALL,PAR=*YES( PROC-PAR=( &A, &B ),ESC-CHAR=C'#' )
```

By means of the procedure call:

```
/CALL-PROC FROM-FILE=MJ.PROC,PROC-PAR=(MODULE,LISTE)
```

the symbolic parameters are given values and the procedure is executed.

With the call:

```
/CALL-PROC FROM-FILE=MJ.PROC
```

the values are not defined until during the procedure run (prompting).

### Example 2

The procedure file MJ.PROC contains the following records:

```
/BEG-PROC LOG=*ALL,PAR=*YES( PROC-PAR=( &A, &B ),ESC-CHAR=C'#' )
/MODIFY-JOB-SWITCHES ON=( 1,4,5 )
/ASS-SYSDTA TO=*SYSCMD
/START-EXE FROM-FILE=$LMS
LIB MJ.BIBLIO.#A,BOTH,NEW
ADDJ #B
END
/SHOW-FILE-ATTR F-NAME=MJ.BIBLIO.&A,INF=*ALL-ATTR
/MODIFY-JOB-SWITCHES OFF=( 1,4,5 )
/END-PROC
```

By means of the procedure call:

```
/CALL-PROC FROM-FILE=MJ.PROC,PROC-PAR=(MODULE,LISTE)
```

the following commands and LMS statements are executed:

```
...
/ASS-SYSDTA TO=*SYSCMD
/START-EXE FROM-FILE=$LMS
LIB MJ.BIBLIO.MODULE,BOTH,NEW
ADDJ LISTE
END
/SHOW-FILE-ATTR F-NAME=MJ.BIBLIO.MODULE,INF=*ALL-ATTR
...
```

---

### Example 3

The procedure file MJ.PROC1 contains the following records:

```
/BEG-PROC LOG=*ALL,PAR=*YES( PROC-PAR=( &IN, &OUT=MJ.OUT ),ESC-CHAR=C'&' )
/ASS-SYSDTA TO=*SYSCMD
/MOD-JOB-SW ON=( 4,5 )
/START-EDT
@READ' &IN'
...
@WRITE' &OUT'
@HALT
/MOD-JOB-SW OFF=( 4,5 )
/END-PROC
```

When called with:

```
/CALL-PROC FROM-FILE=MJ.PROC1
```

the following output appears on the screen:

```
%/BEG-PROC LOG=*ALL,PAR=*YES( PROC-PAR=( &IN, &OUT=MJ.OUT ),ESC-CHAR=C'&' )
%/ASS-SYSDTA TO=*SYSCMD
%/MOD-JOB-SW ON=( 4,5 )
%/START-EDT
%@READ' &IN'
&IN=
mj.inputfile
%@READ' MJ.INPUTFILE'
...
%@WRITE' MJ.OUT'
%@HALT
%/MOD-JOB-SW OFF=( 4,5 )
%/END-PROC
```

Thus, the symbolic parameter &OUT is already preset by the procedure declaration; only &IN remains to be specified during the procedure run.

## 2.32 BROADCAST

Send message to all active user tasks

**Component:** BS2000 OSD/BC

**Functional area:** not allocated

**Domain:** not allocated

**Privileges:** OPERATING  
TSOS

**Routing code:** E

**i** The BROADCAST command is being replaced by the INFORM-ALL-JOBS command. BROADCAST continues to be supported to ensure backwards compatibility. For new applications INFORM-ALL-JOBS should be used. All that follows is a brief overview of the command's function, syntax and return codes.

### Function

The BROADCAST command sends a message from the operator to all interactive users currently connected to the system. The system adds the date and time of day to the operator's message.

### Format

<b>BROADCAST</b>	Alias: <b>BCST</b>
<b>MSG</b> = <text 1..72>	

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
2	0	NBR0725	Warning: The message could not be sent to all interactive tasks
2	32	NBR0727	Internal error: Error in \$PSTMS call (incorrect UNIT, FUNCTION or VERSION)
	64	CMD0216	User does not have the required privilege
	130	EXC0061	Class 4 memory request failed; command processing aborted

---

## 2.33 CALL-PROCEDURE

Run command sequence from procedure file or list variable

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The CALL-PROCEDURE command starts a stored command sequence (procedure). During processing, symbolic parameters contained in the sequence are replaced by the values specified in the command call (PROCEDURE-PARAMETERS operand). A procedure may contain the following components:

- commands (starting with a slash)
- SDF statements, i.e. statements for a program which are defined in a syntax file (starting with a double slash)
- input data, i.e. data, parameters and statements read by a program

During invocation, the procedure is assigned to the system file SYSCMD as the input source for commands. If the procedure includes SDF statements and/or input data, the SYSDTA system file must be assigned to the SYSCMD system file (see ASSIGN-SYSDTA, or SET-PROCEDURE-OPTIONS for S procedures).

Procedures can be stored as:

- a cataloged SAM or ISAM file (even a temporary one) with records of variable length
- a type J or SYSJ element in a PLAM library
- an S variable of the "list" type

There are two types of procedure, which differ in formal structure and operational sequence:

- non-S procedure
- S procedure

#### *Restrictions*

Users with SECURITY-ADMINISTRATION, SAT-FILE-EVALUATION or SAT-FILE-MANAGEMENT privilege can use the command in procedures only.

A procedure cannot be started from an S variable by specifying FROM=\*VARIABLE(...) unless the chargeable SDF-P subsystem is loaded.

---

### *Non-S procedure*

The first data record in the non-S procedure must be the command BEGIN-PROCEDURE. The symbolic parameters, logging, and interruptibility of the procedure can be specified. Next come the commands, SDF statements and input data to be processed. Processing ends with the command END-, CANCEL- or EXIT-PROCEDURE or the last data record. If an error occurs, spin-off is activated. Error handling is described under the SET-JOB-STEP command.

### *S procedure*

The first record in an S procedure must be a command. The commands BEGIN-PROCEDURE, or PROCEDURE (ISP command), and SET-LOGON-PARAMETERS, or LOGON (ISP command), are not allowed. Procedure attributes can be explicitly specified via SET-PROCEDURE-OPTIONS as the first command. If no explicit specification is made, the SDF-P presettings apply implicitly (see SET-PROCEDURE-OPTIONS). Once the procedure attributes have been defined, the DECLARE-PARAMETER command can be used to define symbolic parameters, which are replaced by the values of the like-named S variables during execution. S procedures can only execute if S variables are available, i.e. if at least the SDFPBASY subsystem (see [section "SDF-P-BASYS"](#) and the "SDF-P" manual [34]) is loaded.

Processing of commands, SDF statements and input data ends with the CANCEL- or EXIT-PROCEDURE command or with the final record. If an error occurs, SDF-P error recovery is activated. Error recovery is described under the command IF-BLOCK-ERROR.

Two different procedure formats are supported:

- text procedure. The S procedure is in its original text format. The full range of SDF-P functions is available only if the chargeable subsystem SDF-P is loaded when the procedure is called. In libraries, element type J should be used for text procedures.
- object procedure. An S procedure in text format has been translated to object format with the COMPILE-PROCEDURE command. The COMPILE-PROCEDURE command is part of the chargeable SDF-P subsystem. The object procedure can utilize the full functionality of SDF-P (apart from the COMPILE-PROCEDURE command) irrespective of whether the SDF-P subsystem is currently available or not. In libraries, element type SYSJ (the default for COMPILE-PROCEDURE) should be used for object procedures.

## **Automatic procedure start**

### *LOGON procedure*

After LOGON processing, SDF automatically starts the system LOGON procedure followed by the user LOGON procedure. A system LOGON procedure is started when system administration makes one available. A user LOGON procedure is started as a call procedure if it is cataloged in the relevant user identification under the name `SYS.SDF.LOGON.USERPROC` (if it is under `SYS.SDF.LOGON.USERINCL` it is called as an include procedure). LOGON procedures are ignored in the following cases and no warning is issued:

- The procedure file is simply cataloged but does not occupy any storage space.
- The task is an RFA task.
- The task does not possess any privileges apart from HARDWARE-MAINTENANCE, SECURITY-ADMINISTRATION, SAT-FILE-MANAGEMENT, and SAT-FILE-EVALUATION.

Input is not possible until the LOGON procedures have been executed.

### LOGOFF procedure

During LOGOFF processing, SDF automatically starts the system procedure and then the user LOGOFF procedure. A system LOGOFF procedure is started if one has been made available by systems support (entry in the SDF parameter file). A user LOGOFF procedure is started as a call procedure if it is cataloged under the name `SYS . SDF . LOGOFF . USERPROC` in the associated user logon (under `SYS . SDF . LOGOFF . USERINCL` the call takes the form of a call procedure). LOGOFF procedures are ignored in the following cases and no warning is issued:

- The procedure file is simply cataloged but does not occupy any storage space.
- The task was canceled with `CANCEL-JOB` or `FORCE-JOB-CANCEL`.
- The task is an RFA task.
- The task does not possess any privileges apart from `HARDWARE-MAINTENANCE`, `SECURITY-ADMINISTRATION`, `SAT-FILE-MANAGEMENT`, and `SAT-FILE-EVALUATION`.

### Implemented procedure

If commands implemented as procedures occur in an active syntax file (see the “SDF-A” manual [33]), the specified procedure is started when such a command is called.

## Nesting of procedures

Procedures may be nested to any depth: If the command sequence of a procedure file contains a `CALL-PROCEDURE` command, the sequence is interrupted and the next procedure is started, etc.

At the end of a procedure (`END-PROCEDURE`, `EXIT-PROCEDURE` or EOF condition), control branches back to the interrupt point of the procedure last exited. The figure below provides an illustration of procedure nesting with `CALL-PROCEDURE` for a *non-S procedure*.

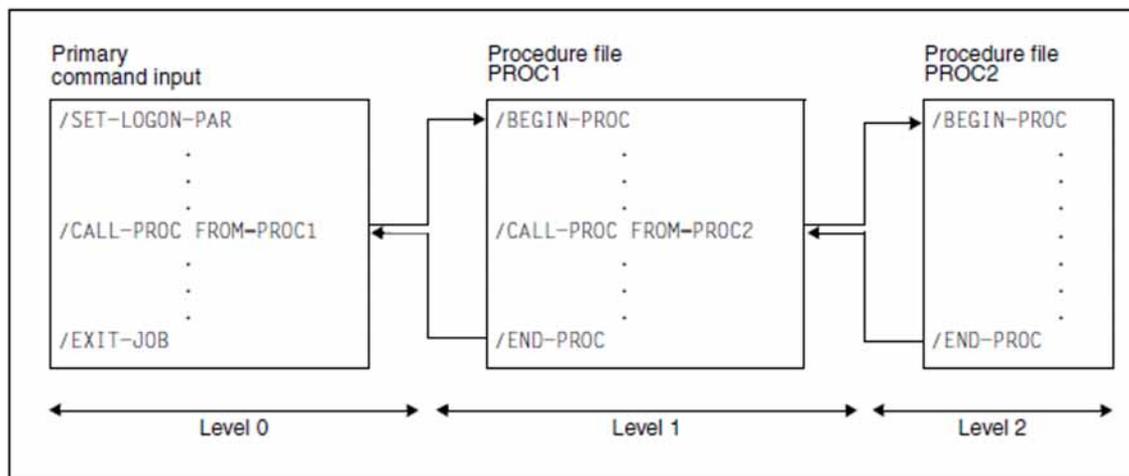

Figure 1: CALL-PROCEDURE procedure nesting

## Format

**CALL-PROCEDURE**

Alias: **CL/CLP**

**FROM-FILE** = <filename 1..54 without-gen> / \***LIBRARY-ELEMENT**(...) / \***VARIABLE**(...)

\***LIBRARY-ELEMENT**(...)

| **LIBRARY** = <filename 1..54 without-gen>

| ,**ELEMENT** = <composed-name 1..64>(…)

| <composed-name 1..64>(…)

| | **VERSION** = \***HIGHEST-EXISTING** / <composed-name 1..24>

| ,**TYPE** = \***STD** / \***BY-LATEST-MODIFICATION** / <alphanum-name 1..8>

\***VARIABLE**(...)

| **VARIABLE-NAME** = <composed-name 1..255>

,**PROCEDURE-PARAMETERS** = \***NO** / <text 0..1800 with-low>

,**LOGGING** = \***PARAMETERS**(...) / **YES** / \***NO** /

\***PARAMETERS**(...)

| **CMD** = \***BY-PROC-TEST-OPTION** / \***YES** / \***NO**

| ,**DATA** = \***BY-PROC-TEST-OPTION** / \***YES** / \***NO**

,**UNLOAD-ALLOWED** = \***YES** / \***NO**

,**EXECUTION** = \***YES** / \***NO**

## Operands

**FROM-FILE** = <filename 1..54 without-gen> / \***LIBRARY-ELEMENT**(...) / \***VARIABLE**(...)

Name of the procedure file.

**i** If the file/library name is specified without a catalog/user ID and if it is not cataloged in the user ID, the system tries to access a file or library of the same name in the system default ID. (For information on this “secondary read” function see the “Introductory Guide to DMS” [13].)

**FROM-FILE** = \***LIBRARY-ELEMENT**(...)

The procedure is stored in a PLAM library element.

**LIBRARY** = <filename 1..54 without-gen>

Name of the PLAM library containing the procedure as an element (type J or SYSJ: see TYPE operand).

**ELEMENT** = <composed-name 1..64>(…)

Name of the element.

---

**VERSION = \*HIGHEST-EXISTING / <composed-name 1..24>**

Version of the library element. The default value is HIGHEST-EXISTING, i.e. the procedure is taken from the element with the highest version.

**TYPE = \*STD / \*BY-LATEST-MODIFICATION / <alphanum-name 1..8>**

Designates the element type the procedure is stored under in the PLAM library.

**TYPE = \*STD**

The procedure can be stored as an element of type SYSJ or J. The specified element is first searched for among the type SYSJ elements. If it is not found there, the search proceeds to the type J elements.

A non-S procedure can only be a type J element. An S procedure may be either a text procedure (original text format) or an object procedure (compiled object format). To simplify maintenance of the two formats in a library, text procedures should be stored as type J elements, object procedures as type SYSJ elements. The COMPILE-PROCEDURE command (part of the chargeable SDF-P subsystem) by default generates an object procedure of type SJ from a text procedure of type J. If this convention is followed, specifying TYPE=\*STD (the default value) ensures that object procedures will be given precedence over text procedures.

**TYPE = \*BY-LATEST-MODIFICATION**

The procedure can be stored as an element of type SYSJ or J. If the specified element exists both as type SYSJ and as type J, the element most recently modified will be called. If the time stamp is identical, the type SYSJ element will be called. Specifying TYPE=\*BY-LATEST-MODIFICATION ensures that the most up-to-date element will be called, typically during the debugging phase when a procedure is being written or modified.

**TYPE = <alphanum-name 1..8>**

The procedure will be searched among elements of the specified type only.

**FROM-FILE = \*VARIABLE(...)**

*Only possible if the chargeable software product SDF-P is loaded.* The procedure is stored in an S variable of the "list" type.

**VARIABLE-NAME = <composed-name 1..255>**

Name of the S variable.

**PROCEDURE-PARAMETERS = \*NO / <text 0..1800 with-low>**

Parameter values to be used in place of the corresponding symbolic parameters in the procedure file. For "text", the following format applies:

( { *sympar*=*paramvalue* | *sympar*=*paramvalue* }[,...])

- *sympar* is the name of a symbolic keyword parameter declared either in the BEGIN-PROCEDURE command (without the initial "&") in the non-S procedure file, or in the DECLARE-PARAMETER command of the S procedure file.
- *paramval* is the current value either of a keyword or positional parameter declared in the BEGIN-PROCEDURE command (maximum length 254 characters), or of a procedure parameter defined in the DECLARE-PARAMETER command. Character strings enclosed in apostrophes are also allowed as actual parameter values. The value must be enclosed in apostrophes if it contains blanks or special characters. Apostrophes within strings must be doubled. Lowercase letters within strings are retained.

The null string is interpreted as missing parameter value and, in interactive mode, leads to a request for a value during procedure execution. Values input during procedure execution (prompting) are converted to uppercase letters also within strings. If the current value of a parameter is requested during procedure execution and the user presses the K2 key, the system issues message SSM2060 asking if the user wants to terminate the procedure. If the procedure is continued, the value is queried again.

The current “paramval” parameter values from the CALL-PROCEDURE command replace the symbolic parameters as follows:

In the case of S procedures, parameters can be transferred as keyword or positional parameters since no specification in this regard is made in the DECLARE-PARAMETER command. However, a positional parameter must not follow a keyword parameter. Prompting is only possible if it has been defined (INITIAL-VALUE=\*PROMPT).

In the case of non-S procedures, parameters can only be transferred as defined in the BEGIN-PROCEDURE command, i.e. positional parameters if defined as such and keyword parameters if defined as such.

- **Keyword parameters** receive their current values from the parameter list of the CALL-PROCEDURE command. If a value is not specified, the value defined in the procedure is used. If no value was defined there either, the value is requested, in interactive mode, when the procedure is executed. This is called “prompting”.

The following table provides an overview of related parameter specifications in the BEGIN-PROCEDURE and CALL-PROCEDURE commands:

		Specification in BEGIN- PROCEDURE	
		&X=ABC	&X=
Specification in CALL-PROCEDURE	X=	Prompting	Prompting
	X=DEF	DEF	DEF
	without	ABC	Prompting

- **Positional parameters** are assigned, in sequence, those current parameter values from the CALL-PROCEDURE command that are specified without the keyword “sympar=”. If the current value of a positional parameter is not specified in the CALL-PROCEDURE command (a comma stands for the value), it will be requested in interactive mode (prompting) when the procedure is executed (if the value is required at all).

**LOGGING = \*PARAMETERS(...) / \*YES / \*NO**

This controls logging of procedure execution.

The LOGGING operand is ignored when *non-S procedures* are called since in this case logging can only be declared in the procedure head (see the LOGGING operand in the BEGIN-PROCEDURE command). When an S procedure is logged, every procedure line that is processed is output with the line number and procedure level prefixed to it.

**LOGGING = \*PARAMETERS(...)**

Logging can be set separately for command/statement lines and for data lines.

**CMD = \*BY-PROC-TEST-OPTION / \*YES / \*NO**

This specifies whether commands are to be logged. The default value is BY-PROC-TEST-OPTION, i.e. no logging (equivalent to \*NO) or the value selected as the default by the user with the MODIFY-PROC-TEST-OPTIONS command (component of the chargeable SDF-P subsystem).

---

**DATA = \*BY-PROC-TEST-OPTION / \*YES / \*NO**

This specifies whether data lines are to be logged. The default value is BY-PROC-TEST-OPTION, i.e. no logging (equivalent to \*NO) or the value selected as the default by the user with the MODIFY-PROC-TEST-OPTIONS command (component of the chargeable SDF-P subsystem).

**UNLOAD-ALLOWED = \*YES / \*NO**

This specifies whether a program that was loaded when the procedure was called may be unloaded. Protection against unloading is guaranteed *only* for unloading by means of the commands START-(EXECUTABLE-)PROGRAM, LOAD-(EXECUTABLE-)PROGRAM, and CANCEL-PROGRAM.

The specification YES is ignored if the procedure is called from a procedure for which UNLOAD-ALLOWED=\*NO was declared.

**EXECUTION = \*YES / \*NO**

This specifies whether the procedure is merely to be analyzed for test purposes or whether it is also to be executed. Only EXECUTION=\*YES may be specified for *non-S procedures*. Testing is possible via the MODE operand of the MODIFY-SDF-OPTIONS command.

## Return codes

The following command return codes can only be returned if the called procedure does not supply any command return code itself (e.g. EXIT-PROCEDURE not executed). Command return codes whose maincode begins with "SSM" can only be returned when a non-S procedure is called. Command return codes whose maincode begins with "SDP" can only be returned when an S procedure is called.

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SSM2058	Protocol type error
2	0	SSM2065	EOF on procedure file, /END-PROC simulated
	1	SSM2036	Incomplete operand
	1	SSM2054	Symbolic operand error
	1	SSM2055	Symbolic operand error in /BEGIN-PROC
	1	SDP0138	Error during pre-analysis of the text procedure or object procedure faulty
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	SDP0093	Non-S procedure can only be type J element.
	64	SDP0144	Error during parameter transfer
	64	SSM2052	DMS error (OPEN error)
	64	SSM2053	Not a SAM/ISAM file or file does not begin with /BEGIN-PROC or /PROC
	64	SSM2056	Parameters of /CALL-PROC and /BEGIN-PROC incompatible
	64	SSM2061	Error on accessing library element
	64	SSM2064	Procedure file cannot be fetched from remote system
	130	SDP0099	No more address space available
xx	xx	xxxxxxx	Other return codes of the called procedure

---

## Notes

- Symbolic operands may be used anywhere in any command in the procedure file. However, they cannot replace the initial slash preceding a command.
- When the procedure records processed are logged to SYSOUT, symbolic operands are replaced with the current operand values.
- Procedure files may be protected with passwords against reading, overwriting and execution, e.g. using the MODIFY-FILE-ATTRIBUTES command. The execute password or a higher-ranking password must be given in an ADD-PASSWORD command before a CALL-PROCEDURE command is issued.
- When a library element is used, a temporary SAM file named S.IN.library.element.tsn.hhmmss.nnnn is created (only for non-S procedures), which contains the element. where:

library     Library name (up to 20 characters are printed)

tsn         Task sequence number

hhmmss     Time in hours-minutes-seconds

nnnn       Sequence number

This temporary file is automatically deleted when the following commands are encountered:

- EXIT-JOB or LOGOFF in the ENTER file
- END-PROCEDURE in the procedure
- If the CALL-PROCEDURE command is called via the CMD macro, the calling program is unloaded. Any ABEND-STXIT routine defined in the program is not activated. For details of the CMD macro, ABEND-STXIT routine, refer to the “Executive Macros” manual [22].
- If a non-S procedure file contains statement or data records in addition to command records, the following command record must be written in the procedure file prior to the statement or data records:

```
/ASSIGN-SYSDTA TO=*SYSCMD
```

This assignment need not be repeated in the event of nesting. In S procedures, this depends on the setting in the SET-PROCEDURE-OPTIONS command.

---

## 2.34 CANCEL-CCOPY-SESSION

Cancel CCOPY-Session

**Component:** CCOPY  
**Functional area:** Pubset and MRSCAT management  
**Domain:** STORAGE-MANAGEMENT  
**Privileges:** TSOS  
HSMS-ADMINISTRATION

### Function

The CANCEL-CCOPY-SESSION command cancels an active CCOPY session.

The user can have all CCOPY sessions displayed using the SHOW-CCOPY-SESSION command.

### Format

<b>CANCEL-CCOPY-SESSION</b>
<b>SESSION-ID</b> = <alphanum-name 8..8>

### Operands

**SESSION-ID = <alphanum-name 8..8>**

Identification (eight positions) of the CCOPY session that is to be canceled.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	32	DCH000A	Internal error
	32	DCH000B	Unexpected return code when a CCOPY session was canceled
	32	DCH000D	System error
	64	CMD0216	Privileges error
	64	DCH0007	Invalid session ID
	64	DCH0008	CCOPY session already terminated abnormally
	64	DCH0009	CCOPY session already terminated normally

---

## 2.35 CANCEL-JOB

Cancel user job

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job processing
<b>Domain:</b>	JOB
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE OPERATING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	P

### Function

The CANCEL-JOB command cancels jobs running under the user's own ID. The command can also be used to cancel batch jobs generated by the user's own ID and running under a different user ID (extended access).

Resources occupied by the job are released (as for EXIT-JOB or LOGOFF). A job cannot use this command to terminate itself (only possible with EXIT-JOB or LOGOFF). If the job to be canceled has already been terminated, the CANCEL-JOB command is rejected and a message to this effect is displayed at the terminal. The CANCEL-JOB command cancels a job only when the job is in TU status or when processing of the next command is imminent. A job cannot be canceled in the following circumstances:

- The job is waiting for an operator response. The command takes effect as soon as there has been a response (see the FORCE-JOB-CANCEL command to find out how to cancel jobs without waiting for a response).
- The job terminates abnormally due to a system error
- A HOLD-TASK command was issued for the job (by systems support personnel)
- The job is already in job termination; e.g.: actions following EXIT-JOB or LOGOFF, or actions in the user program after ABEND has been signaled (for more on the ABEND-STXIT routine, see the "Executive Macros" manual [22].)
- The job is in "PENDED INDEFINITELY" state
- The job is a system task.

If a job is to be canceled in interactive mode with CANCEL-JOB, the system requests confirmation if the job to be canceled was started with the attribute PROTECTION=\*CANCEL (see ENTER-JOB, ENTER-PROCEDURE or SET-LOGON-PARAMETERS command).

### Information on job termination

In the case of a job canceled with CANCEL-JOB, information about the originator of the CANCEL-JOB command is output to SYSOUT for that job. The output to SYSOUT contains an additional comment specified in the TEXT operand of the CANCEL-JOB command. If the job was terminated abnormally, i.e. the CANCEL-JOB command was issued with STEPS=\*ALL (default), the status indicator of a monitoring job variable is set to the value '\$A'. In addition, the information about the originator in abbreviated form and the comment from the TEXT operand are included in the system part (the first 128 bytes) of the monitoring job variable:

- The originator information starts at byte 37 and consists of the character string *CAN:'info'*, where *info* contains the first 27 bytes of the originator information supplied to SYSOUT.
- The comment starts at byte 70 and consists of the character string *TEXT:'text'*, where *text* contains the first 51 bytes of the comment specified in the operand.

For information on job monitoring, see the “Job Variables” manual [20].

### Privileged functions

If the CANCEL-JOB command is issued at the operator terminal or under a user ID with TSOS or OPERATING privilege, it can be used to cancel a job issued under any user ID.

## Format

<b>CANCEL-JOB</b>	Alias: <b>CNJ</b>
<b>JOB-IDENTIFICATION</b> = *TSN(...) / *MONJV(...)	
*TSN(...)	
<b>TSN</b> = <alphanum-name 1..4>	
, <b>HOST</b> = * <b>STD</b> / <c-string 1..8>	
*MONJV(...)	
<b>MONJV</b> = <filename 1..54 without-gen-vers>	
, <b>DUMP</b> = * <b>NO</b> / * <b>STD</b> / * <b>CANCEL-RUNNING-DUMP</b>	
, <b>SYSTEM-FILES</b> = * <b>STDOUT</b> / * <b>PRINT</b> / * <b>MAIL</b> / * <b>DELETE</b>	
, <b>STEPS</b> = * <b>ALL-STEPS</b> / * <b>CURRENT-STEP</b> / * <b>ALL-CALENDAR-REPETITIONS</b>	
, <b>TEXT</b> = * <b>NO</b> / <c-string 1..72>	

## Operands

**JOB-IDENTIFICATION** =

Type of job identification.

**JOB-IDENTIFICATION** = \*TSN(...)

The job is identified by its task serial number (TSN).

---

**TSN = <alphanum-name 1..4>**

TSN of the job to be canceled.

Leading zeros may be omitted

**HOST = \*STD / <c-string 1..8>**

Host system on which the job is running. The default is \*STD, which means that the job is running on the local host. The host name of a remote system can only be specified for systems which are on a computer network (see the "HIPLEX MSCF" manual [25]).

**JOB-IDENTIFICATION = \*MONJV(...)**

The job is identified by means of the monitoring job variable. The command is rejected if the JV is not accessible (no read permission or nonexistent JV) or is not monitoring a job.

For a job running on a remote host to be accessible via the monitoring JV, the MRSCAT of each host must contain the catalog ID of the subset of the other host.

**MONJV = <filename 1..54 without-gen-vers>**

Name of the JV monitoring the job to be canceled.

The job to which this job variable is assigned is then canceled. This operand is available only to users who have the software product JV.

**DUMP =**

Defines whether a user dump is to be output for the job to be canceled or whether a user or area dump that is currently being processed is to be canceled.

**DUMP = \*NO**

No memory dump.

**DUMP = \*STD**

The definition currently made in the job that is to be canceled (see DUMP operand in the MODIFY-TEST-OPTIONS command) is interpreted as follows:

Specification for the job that is to be canceled	Effects
DUMP=*NO	No memory dump.
DUMP=*STD / *YES / *SYSTEM	A user dump is requested, for DUMP=*SYSTEM eventually a system dump is requested.

**DUMP = \*CANCEL-RUNNING-DUMP**

If a user or area dump is currently being created for the job that is to be canceled then dump creation should be canceled immediately and the dump file deleted.

**SYSTEM-FILES =**

Specifies whether the system files are to be output to printer or sent by email. Output to printer is not possible if the value NO-SPOOL was set for the system parameter SSMLGOF1.

**SYSTEM-FILES = \*STDOUT**

Depending on the setting of the system parameter SSMOUT, the system files are output to the printer (see \*PRINT) or sent by email (see \*MAIL). In the case of cross-system command processing, the system parameter of the target system is evaluated.

---

**SYSTEM-FILES = \*PRINT**

The system files are output to printer.

**SYSTEM-FILES = \*MAIL**

The system files are sent by email. The receiver address(es) is/are taken over from the user entry of the user ID of the aborted job. How the receiver address is selected from an address list in accordance with the job name is described under the MAIL-FILE command. If transfer by email is not possible (e.g. no email address in the user ID), the system files are output to printer.

**SYSTEM-FILES = \*DELETE**

Output of the system files is suppressed.

**STEPS =**

Specifies how the job is to be canceled. Information about the originator of the CANCEL-JOB command is always output to SYSOUT for a job that is to be canceled. The information output is supplemented by the comment specified by the originator in the TEXT operand of the CANCEL-JOB command.

**STEPS = \*ALL-STEPS**

The specified job is canceled in its entirety. The status indicator of a monitoring job variable is set to '\$A'. The information about the originator of the CANCEL-JOB command is included in abbreviated form in the system part (the first 128 bytes) of the monitoring job variable. In addition, a text specified in the TEXT operand is included in the system part of the monitoring job variable.

The effect depends on the batch job type of the specified job:

- Repeat job: Only the cancellation of the Type 1 follow-up job of a repeat job will result in the termination of all future job repetitions.
- Calendar job: Cancellation of a calendar job affects only the current job which is still on the job queue or is executing. It does not affect subsequent repetitions of the calendar job. STEPS=\*ALL-CALENDAR-REPETITIONS can be used to terminate the entire calendar job.

**STEPS = \*CURRENT-STEP**

- The job is being processed:  
In the specified job, only the current processing step is canceled: the spin-off mechanism or SDF-P error handling is triggered. No information is included in a monitoring job variable. The job can be terminated normally if no other reason for abnormal termination occurs. If a user program is currently loaded, it is first terminated abnormally. If an error handling facility is provided within the ENTER file (for method, see SET-JOB-STEP command), then the job is continued at the next processing step. If the next processing step is termination of the job (EXIT-JOB or LOGOFF command), the job ends normally and a monitoring job variable is then set to '\$T' (normal end of job).

*Note*

On terminating a job with CANCEL-JOB and STEPS=\*CURRENT-STEP, no abnormal end of job results.

- The job is waiting to be processed:  
The job is canceled in its entirety as with STEPS=\*ALL-STEPS (see above).

**STEPS = \*ALL-CALENDAR-REPETITIONS**

The specified job is canceled as with STEPS=\*ALL-STEPS. If it is a calendar job, the entire calendar job (i.e. including any future repetitions) is removed from the job management system.

---

**TEXT = \*NQ / <c-string 1..72>**

Specifies whether and if so which text is to be output to SYSOUT as a comment in the specified job before abnormal termination. The text can be up to 72 characters long. If job monitoring is in use and the value \*ALL-STEPS (default) or \*ALL-CALENDAR-REPETITIONS was specified in the STEPS operand, the first 51 characters of the specified text are also included in the system part of the monitoring job variable.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
2	0	CMD0002	Command executed with a warning
	32	CMD0221	System error
	64	JMS0630	Semantic error
	64	JMS0640	MONJV error, illegal access or incorrect call time
	64	JMS0670	Error in a REMOTE job
	130	JMS0620	Memory saturation
	130	JMS0650	MSCF or target computer not available
	130	JMS0660	Retry command later

If the command is issued for a print job, command return codes are returned by SPOOL (see also CANCEL-PRINT-JOB).

**Notes**

- The CANCEL-JOB may be issued in batch or interactive mode or at the console.
- With spoolout tasks, more than one may have the same task sequence number (TSN), as a result of a PRINT-DOCUMENT command for several files, for example. In that case, the CANCEL-JOB command applies to all print jobs which have the TSN specified in the command. A message is issued for each job that is canceled. The SHOW-USER-STATUS command outputs a list of jobs that have not yet been canceled. The jobs in question may be undergoing processing or may still be waiting for processing.

*Notes on job monitoring (see also the “Job Variables” manual [ 20 ]):*

- If a job is monitored by a job variable (JV) is canceled, the JV job variable is set to “\$A” provided that STEPS=\*ALL-STEPS or \*ALL-CALENDAR-REPETITIONS has been set. With a waiting job this also applies to STEP=\*CURRENT-STEP. If a program executing within the job is being monitored by a job variable, the status indicator of the job variable monitoring the program is likewise set to “\$A”.
- If the job variable is not accessible or is not being used to monitor a job, the command is rejected.
- If a calendar job is being monitored, the job variable doing the monitoring is assigned to the calendar job for as long as it exists. Monitoring ends only when the entire calendar job ends.

## Example

*Job cancellation with STEPS=\*CURRENT-STEP and STEPS=\*ALL-STEPS*

```

- (1) The S procedure *PROC.SORT1* is started as a batch job via the ENTER-PROCEDURE command. The procedure comprises two work steps:
  - WORK-1: Waiting for normal termination of a job monitored by the job variable identified by parameter *MONJV-1*. The name of the input file for a SORT run is passed in the user part of the job variable. The parameter *OUTPUT-FILE-1* determines the output file of the SORT run.
  - WORK-2: Waiting for normal termination of a job monitored by the job variable identified by parameter *MONJV-2*. The name of the input file for a SORT run is passed in the user part of the job variable. The parameter *OUTPUT-FILE-2* determines the output file of the SORT run.
- Both work steps can be performed independently. The batch job is monitored using the job variable *JV.JOB-C*.
- (2) The started job *JOB-C* is waiting (WAIT-EVENT).
- (3) The first monitoring job variable *JV.JOB-A* is not assigned to any job.
- (4) So the section being processed is canceled with *STEP=\*CURRENT-STEP*.
- (5) *JOB-C* is waiting again (second WAIT-EVENT).
- (6) The monitoring job variable of *JOB-C* has not been affected by CANCEL-JOB.
- (7) The second monitoring job variable *JV.JOB-B* is not assigned to any job either.
- (8) The entire *JOB-C* is not to be terminated normally since further processing does not make sense.
- (9) The monitoring job variable indicates that the job has been abnormally terminated. It also contains the cause and the originator's comment in abbreviated form.

*SYSOUT log with execution of JOB-C*

<b>Privileges:</b>	STD-PROCESSING PRINT-SERVICE-ADMINISTRATION OPERATING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The CANCEL-PRINT-JOB command cancels print jobs on any server in any cluster. Depending on the user group, print jobs can be canceled in local clusters or in both local and remote clusters.

#### *Privileged functions*

RSO device administrators and spool and cluster administrators can cancel any job scheduled for printing on any device that they manage. For more information on these user groups see also the manuals “RSO” [32], “SPOOL” [43] and “Distributed Print Service” [10].

#### *9025/9026-RENO printers*

After a PRINT-DOCUMENT command, the print job can be in one of three possible statuses. The CANCEL-PRINT-JOB command affects the print job in different ways, depending on the status of the print job:

Status of the print job	Effects of the CANCEL-PRINT-JOB command
Queued	Print job is deleted and nothing is printed
File transfer from BS2000 to 9025/9026-RENO memory started but not yet completed	Spoolin is interrupted: that part of the print file which has already been transferred or has passed through spoolin is printed; the print job is canceled
File transfer from BS2000 to 9025/9026-RENO memory completed, spoolout started or already completed	Command has no effect; no error message; the print job is executed in full

## Format

### CANCEL-PRINT-JOB

**JOB-IDENTIFICATION** = **\*TSN** (...) / **\*SERVER-TSN**(...) / **\*MONJV**(...) / **\*FOREIGN**(...) / **\*SYSTEM-FILE**(...)

**\*TSN**(...)

| **TSN** = <alphanum-name 1..4>

| **,CLUSTER-NAME** = **\*LOCAL-CLUSTER** / <alphanum-name 1..8>

**\*SERVER-TSN**(...)

| **TSN** = <alphanum-name 1..4>

| **,SERVER-NAME** = <alphanum-name 1..8>

**\*MONJV**(...)

| **MONJV** = <filename 1..54 without-gen-vers>

**\*FOREIGN**(...)

| **IDENTIFICATION** = <c-string 1..255 with-low>

| **,CLUSTER-NAME** = <alphanum-name 1..8>

**\*SYSTEM-FILE**(...)

| **NAME** = list-poss(16): **\*SYSOUT** / **\*SYSLST**(...)

| **\*SYSLST**(...)

| | **SYSLST-NUMBER** = **\*STD** / <integer 1..99>

## Operands

**JOB-IDENTIFICATION** = **\*TSN**(...) / **\*SERVER-TSN**(...) / **\*MONJV**(...) / **\*FOREIGN**(...) / **\*SYSTEM-FILE**(...)

Type of job identification.

**JOB-IDENTIFICATION** = **\*TSN**(...)

The job is identified by its local task sequence number (TSN).

**TSN** = <alphanum-name 1..4>

TSN of the job to be canceled.

**CLUSTER-NAME** = **\*LOCAL-CLUSTER** / <alphanum-name 1..8>

Name of the cluster in which the print job is being processed. If a cluster name is specified, the specified TSN is the TSN on the gateway host in the specified remote cluster. Only a BS2000 cluster can be specified.

**JOB-IDENTIFICATION** = **\*SERVER-TSN**(...)

The print job is identified by its TSN on the server. Only print jobs in the local cluster can be addressed in this way.

---

**TSN = <alphanum-name 1..4>**

TSN of the job to be canceled on the server.

**SERVER-NAME = <alphanum-name 1..8>**

Name of the server on which the print job can be addressed by means of its TSN.

**JOB-IDENTIFICATION = \*MONJV(...)**

The print job is identified by its MONJV.

**MONJV = <filename 1..54 without-gen-vers>**

This operand can be used to address a print job by means of its MONJV, provided the specified MONJV is accessible on the host at which the command is issued. Only print jobs in the local cluster can be addressed in this way.

**JOB-IDENTIFICATION = \*FOREIGN(...)**

The print job is identified by a non-BS2000 job name.

**IDENTIFICATION = <c-string 1..255 with-lower-case>**

This operand can be used to address print jobs being processed in a cluster of UNIX-based systems.

**CLUSTER-NAME = <alphanum-name 1..8>**

Name of the cluster in which the print job is being processed. See the “Distributed Print Service” manual [10].

**JOB-IDENTIFICATION = \*SYSTEM-FILE(...)**

Identifies the system files \*SYSOUT and \*SYSLST. This operand resets an earlier PRINT-DOCUMENT ...,START-PROCESSING=\*AT-FILE-CLOSING/integer command. The system file is then printed with the default attributes, not those specified for in the PRINT-DOCUMENT command.

**NAME = list-poss(16): \*SYSOUT / \*SYSLST(...)**

Specifies the system files \*SYSOUT and/or \*SYSLST.

**NAME = \*SYSLST(...)**

Specifies the \*SYSLST system file.

**SYSLST-NUMBER = \*STD / <integer 1..99>**

The default SYSLST file or one or more numbers of the desired SYSLST files can be specified.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No errors Guaranteed messages: SCP0891, SCP1031, SCP1032
2	0	SCP1034	No response from operator
2	0	SPS0178	File lock cannot be canceled Guaranteed message: SPS0178
2	0	SPS0455	MONJV processing error Guaranteed message: SPS0455
2	0	SPS0464	JV subsystem not loaded
2	0	SPS0469	MONJV validity problem Guaranteed message: SPS0469
2	0	SCP0892	TSN not found or command processing not permitted
4	32	SCP0974	Memory error or system error. Command rejected
4	64	SCP0976	Invalid operand value
6	128	CMD2241	DPRINTCL subsystem not loaded
1	128	SPS0266	SPOOL subsystem not loaded/SPOOL task not available

## Notes

- Users must use this command to cancel print jobs they have sent to a different cluster (since local copies are not kept of print jobs sent to a different cluster). For example, the command /CANCEL-PRINT-JOB (TSN=12AB, CLUSTER-NAME=C1) cancels job 12AB in cluster C1.
- For their own print jobs in their own cluster, users can also use the existing command CANCEL-JOB, since there will be at least one local copy of such print jobs.
- The cluster administrator can cancel any print job in his or her own cluster. For example, to cancel a print job with a TSN of 1234 on remote server S1 that was issued on a remote client (i.e. when there is no local copy on the host at which the cluster administrator issues the CANCEL-PRINT-JOB command), the cluster administrator issues the command CANCEL-PRINT-JOB \*SERVER-TSN(1234,S1).
- A server need not be specified to cancel a print job in a remote cluster. In the remote cluster, copies of all the print jobs that come back from the local cluster are kept on a selected server that receives all print jobs from remote clusters.

---

## 2.37 CANCEL-PROCEDURE

Cancel procedure run

**Component:** SYSFILE  
**Functional area:** Procedures  
**Domain:** PROCEDURE  
**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The CANCEL-PROCEDURE command cancels a procedure run. SYSCMD is assigned to the primary command input. (See the EXIT-PROCEDURE command: SYSCMD is assigned to the procedure most recently left). All system files opened during procedure execution, including TASKLIB, are closed and again receive their primary assignments.

### Format

<b>CANCEL-PROCEDURE</b>	Alias: <b>CNP</b>

The CANCEL-PROCEDURE command has no operands and is executed immediately.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	32	SSM1013	Command not executed due to system error
	64	SSM2039	Error on closing output system file; the SYSOUT message contains the DMS error codes as an insert

### Notes

- Commands in procedure files: if an error in a non-S procedure triggers the spin-off mechanism, processing branches to the next of the following commands: CANCEL-PROCEDURE, LOGOFF, EXIT-JOB, SET-JOB-STEP, END-PROCEDURE or EXIT-PROCEDURE.
- A CANCEL-PROCEDURE command at procedure level 1 (i.e. no nesting) is identical to the EXIT-PROCEDURE command (see "[Figure: CANCEL- and EXIT-PROCEDURE commands at procedure level 1](#)").

## Examples

### Example 1

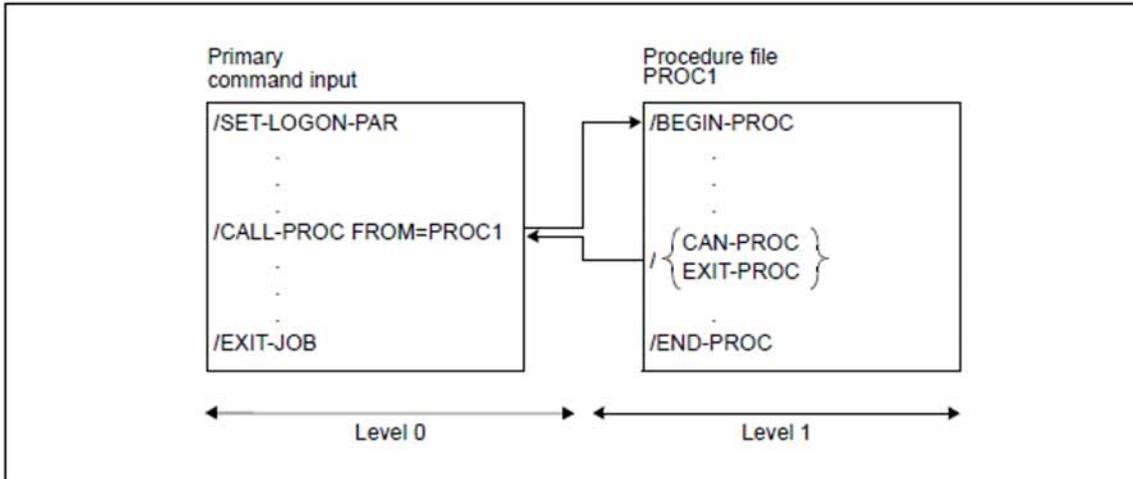

Figure 2: CANCEL- and EXIT-PROCEDURE commands at procedure level 1

The arrows indicate the sequence in which the commands are processed.

### Example 2

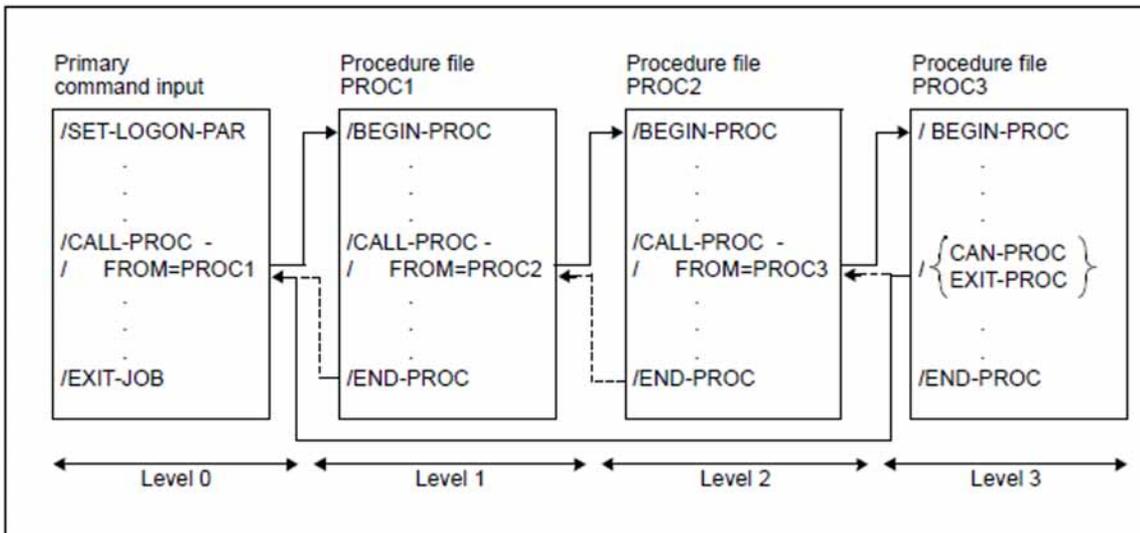

Figure 3: CANCEL- and EXIT-PROCEDURE commands at procedure level 3

The solid lines indicate the sequence in which the commands are processed in the case of CANCEL-PROCEDURE. By way of comparison, the broken lines indicate the process in the case of EXIT-PROCEDURE.

---

## 2.38 CANCEL-PROGRAM

Cancel program run

**Component:** BLSSERV

**Functional area:** Program control

**Domain:** PROGRAM

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The CANCEL-PROGRAM command cancels a program run and releases all the user memory reserved until that time by the dynamic binder loader DBL and the static loader ELDE.

If the program contains an STXIT routine for the ABEND event class, it is activated.

The status indicator of any program-monitoring job variable is set to '\$A'.

### Format

<b>CANCEL-PROGRAM</b>	Alias: <b>CNPG</b>

The CANCEL-PROGRAM command has no operands and is executed immediately.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	BLS0554	Warning: no program was loaded
	64	CMD0216	User has no authorization for the command
	64	BLS0553	The loaded program may not be unloaded

## 2.39 CANCEL-PUBSET-EXPORT

Cancel pubset export

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS  
OPERATING  
**Routing code:** R

### Function

This command cancels the wait state of an active EXPORT job that is to control the export of a pubset. The job terminates with an error message and the pubset remains available.

### Format

**CANCEL-PUBSET-EXPORT**

**PUBSET** = <cat-id 1..4>

### Operands

**PUBSET** = <cat-id 1..4>

Catalog ID of the pubset to be exported.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	DMS0355	Same export already active
1	0	DMS0364	Pubset not available
1	0	DMS036C	No task for EXPORT-PUBSET
	1	CMD0202	Syntax error
	32	DMS0363	Error while accessing MRSCAT
	64	DMS0360	No authorization for command
	130	DMS0351	Other import/export task active

---

## 2.40 CANCEL-PUBSET-IMPORT

Cancel import of pubset

**Component:** BS2000 OSD/BC  
**Functional area :** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS  
OPERATING  
**Routing code:** R

### Function

The CANCEL-PUBSET-IMPORT command causes an active import job to be canceled. In particular in a shared pubset network, this function can be used to cancel an import where the master is being changed so that the pubset becomes accessible again from at least one other system.

When this command is called, the import job loses its current disk accessing rights and it is prevented from building up new disk accessing rights.

However, the import job can only terminate if it encounters an error due to the loss of rights or if it finds the cancel request that is stored in the MRS catalog. If the import job does not terminate, it is not possible to import the pubset in the current session. The data consistency of the pubset is, however, ensured when it is imported on another system.

### Format

<b>CANCEL-PUBSET-IMPORT</b>
-----------------------------

<b>PUBSET</b> = <cat-id 1..4>
-------------------------------

### Operands

**PUBSET = <cat-id 1..4>**

Catalog ID of the pubset to be imported.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	32	DMS13D1	CANCEL-PUBSET-IMPORT was canceled because an error occurred when accessing the volume catalog.
	64	DMS13D1	Error during CANCEL-PUBSET-IMPORT; the insert describes the cause of the error, e.g.: <ul style="list-style-type: none"><li>• MRSCAT does not exist</li><li>• no pubset import</li><li>• a CANCEL-PUBSET-IMPORT is already being processed</li><li>• the pubset has already been imported</li><li>• the pubset import has already reached its final stage</li></ul>

---

## 2.41 CANCEL-RUN-PROCESS

Cancel processing of command file

**Component:** BS2000 OSD/BC

**Functional area:** Editing command files

**Domain:** not allocated

**Privileges:** OPERATING

**Routing code:** E

### Function

The CANCEL-RUN-PROCESS command cancels processing of a command file that has already been started. In order to execute it, the operator must specify a RUN-ID. This is assigned to each command file started by means of the RUN command. Command files that are started from another RUN sequence are assigned the same RUN-ID as the generating command file. When a command file is canceled by means of CANCEL-RUN-PROCESS all the command files generated by it are canceled automatically.

This command must not necessarily be entered at the same console as the RUN command. However, it does require the routing code E.

The command must not be issued from a user task with the operating privilege.

#### *Restrictions when using the "Operator LOGON" function*

If the "Operator LOGON" function is used (system parameter NBCONOPI=Y), the command is not accepted after "SYSTEM READY" unless the originating task is running under TSOS or under the user ID which entered the RUN command. The command is also allowed if the RUN command was issued by an authorized user program with generated authorization names or if the RUN command issuer has been disconnected. In all other cases, if this condition is not met, the command is rejected with message NBR0002.

### Format

<b>CANCEL-RUN-PROCESS</b>
<b>RUN-ID</b> = <alphanum-name 1..4>

### Operands

**RUN-ID = <alphanum-name 1..4>**

ID of the command file to be canceled. A unique RUN-ID is assigned to each command file started by means of the RUN command. If no RUN-ID or an unknown RUN-ID is specified, the command is rejected.

For information on using command files, see the section on "Command files for the operator" in the "Introduction to System Administration" [14].

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	64	NBR0001	Specified RUN-ID not found
	64	NBR0002	No authorization

---

## 2.42 CHANGE-ACCOUNTING-FILE

Change system accounting file

**Component:** BS2000 OSD/BC  
**Functional area:** Accounting system control  
**Domain:** ACCOUNTING  
**Privileges:** TSOS

### Function

The current accounting file, in which all accounting-specific data is stored, is closed and a new file is opened. After the accounting file has been changed, the old accounting file can still be accessed during the session for evaluation purposes, e.g. with the product RAV.

The default value \*UNCHANGED in the corresponding operand means that the current specification remains valid.

### Format

#### CHANGE-ACCOUNTING-FILE

**NAME** = \*NEXT / \*STD / <filename 1..54> / <partial-filename 2..53>

,**SPACE** = \*UNCHANGED / \*STD / \*RELATIVE(...)

\*RELATIVE(...)

| **PRIMARY-ALLOCATION** = <integer 1..65535>

| ,**SECONDARY-ALLOCATION** = <integer 0..32767>

,**BUFFER-LENGTH** = \*UNCHANGED / \*BY-PROGRAM / \*STD(...)

\*STD(...)

| **SIZE** = 1 / <integer 1..16>

,**VOLUME** = \*UNCHANGED / \*STD / <vsn 1..6>

### Operands

**NAME =**

Defines the name of the accounting file to be opened.

**NAME = \*NEXT**

The name of the continuation file is taken over for the new accounting file. The continuation file is determined:

- from the START-ACCOUNTING command if a list of alternative file names was defined in the ALTERNATE-FILES operand,
- by automatic generation of the file name by incrementing the current number by 1 (prerequisite: the old accounting file name was formed automatically).

---

**NAME = \*STD**

The new accounting file receives the standard file name  
\$TSOS.SYS.ACCOUNT.<date>.xxx.nn.

This file name is made up of the following elements:

<date>	:	yyyy-mm-dd or yy.mm.dd	date (year number as four digits)  date (year number as two digits)
xxx	:	session number	
nn	:	current number of the accounting file	

**NAME = <filename 1..54>**

Specifies a fully qualified name for the accounting file to be opened.

**NAME = <partial-filename 2..53>**

Specifies a partially qualified file name.

This specification results in automatic generation of the file name. The following points must be observed when specifying a partially qualified file name:

- the partial qualification must not exceed 26 characters in length (not including the user ID) because <date>.xxx.nn is added to the name;  
for catalog IDs that consist of more than one character, this value is reduced by the number of extra characters;  
if four-digit year numbers are being used (class 2 system parameter FMTYFNLG), only 24 characters may be used.
- the partial qualification may be terminated with the user ID; the file name automatically receives the suffix SYS.ACCOUNT.<date>.xxx.nn
- if no user ID is specified, the file is cataloged under TSOS.

**SPACE =**

Defines the storage space allocation for the file on the disk.

**SPACE = \*STD**

The storage space for the file is 48 PAM blocks each for primary and secondary allocation.

**SPACE = \*RELATIVE(...)**

Relative storage space allocation for the file.

**PRIMARY-ALLOCATION = <integer 1..65535>**

Number of PAM blocks for primary allocation.

**SECONDARY-ALLOCATION = <integer 0..32767>**

Number of PAM blocks for subsequent file extensions.

**BUFFER-LENGTH = \*UNCHANGED / \*BY-PROGRAM / \*STD(...)**

Defines the block size for the input/output buffer of the accounting file.

Specification of this operand is meaningful only for new files and is otherwise ignored.

**BUFFER-LENGTH = \*BY-PROGRAM**

Specifies a buffer of 2048 bytes (1 PAM block) for input/output of the file.

**BUFFER-LENGTH = \*STD(...)**

---

**SIZE = 1 / <integer 1..16>**

The specified number of PAM blocks is to be used as the buffer size. If the accounting file is to be set up on an NK4 pubset, the value specified should be an even number. However, any odd number will automatically be converted to the next highest multiple of 2 when the command is processed. In such cases, a message will inform the user of this action.

**VOLUME =**

Specifies that the new accounting file is to be created on a certain volume.

**VOLUME = \*STD**

The Data Management System of BS2000 decides on which volume the accounting file will be created.

**VOLUME = <vsn 1..6>**

The accounting file is to be created on the volume with the specified volume serial number. The VOLUME operand supports only volumes that do not require device-specific information.

If the accounting file is to be created on a **tape** or on a **private disk**, the system must be informed with a CREATE-FILE command before the accounting file is changed.

If in the case of a **public disk** this does not belong to the default pubset of the designated user ID, the catalog ID of the volume must be included in the file name. If the complete name is to be generated automatically, :catid:\$TSOS. must be specified.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NAM3001	Requested action has been performed, but was accompanied by a warning
	1	CMD0202	Syntax error
	32	CMD0221	Internal system error
	64	NAM0012	No authorization for command
	64	NAM3003	Semantic error
	128	CMD2280	Temporarily unable to execute the command

## 2.43 CHANGE-CONSLOG-FILE

Close current logging file and open new file

**Component:** BS2000 OSD/BC

**Functional area:** Error logging

**Domain:** ERROR-LOGGING  
SECURITY-ADMINISTRATION

**Privileges:** OPERATING  
SAT-FILE-MANAGEMENT  
TSOS

### Function

The CHANGE-CONSLOG-FILE command closes the current logging file and opens a new one (see also “Logging file” in the “Introduction to System Administration” [14]).

This enables the closed logging files to be evaluated during the current session. Read access to the logging file currently open is obtained with the SET-CONSLOG-READ-MARK command.

If a CHANGE-CONSLOG-FILE command is already being processed, all further CHANGE-CONSLOG-FILE commands are rejected. Depending on the NBKESNR system parameter, up to 99 files can be created per session or 999 per day. The NBKESNR system parameter also governs whether the CONSLOG file is created under the TSOS or SYSAUDIT user ID. The NBLOGENF system parameter (NBLOGENF=E(nforced)) can be used to prevent the last possible CONSLOG file from being changed.

When printing the closed logging file it is advisable to specify the LAST-CHARACTER=252 operand in the PRINT-DOCUMENT command.

### Format

<b>CHANGE-CONSLOG-FILE</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	NBR0905	CONSLOG not active
2	0	NBR0906	CONSLOG being deactivated
	64	NBR0904	Last possible sequence number reached, command no longer possible
	130	EXC065A	CHANGE-CONSLOG already being processed

---

## 2.44 CHANGE-DISK-MOUNT

Lock private disk

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** D

### Function

This command denies the user access to a private disk already in use.

### Format

#### CHANGE-DISK-MOUNT

```
UNIT = *VOLUME(...) / *EXCHANGE-PAIR(...) /  
      list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>  
*VOLUME(...  
  |   VOLUME = list-poss(10): <vsn 1..6>  
*EXCHANGE-PAIR(...  
  |   EXCHANGE-PAIR = list-poss(10): *PARAMETER(...  
  |   *PARAMETER(...  
  |       |   DISMOUNT-VOLUME = <vsn 1..6>  
  |       |   ,REMOUNT-VOLUME = <vsn 1..6>  
,ACTION = *EXCHANGE / *MOVE / *CANCEL
```

### Operands

#### **UNIT =**

Specifies one or more disks which are to be no longer available.

#### **UNIT = \*VOLUME(...)**

Specifies the volume serial numbers (VSN, up to 6 characters) of one or more disks which are to be no longer available. A maximum of 10 disks may be specified.

#### **VOLUME = list-poss(10): <vsn 1..6>**

Specifies the volume serial number (VSN).

## UNIT = \*EXCHANGE-PAIR(...)

**i** This operand value is not relevant, as in this and subsequent versions on only hard disk devices are supported.

## UNIT = list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>

Lists up to 10 disks that are to be no longer available.

## ACTION = \*EXCHANGE / \*MOVE / \*CANCEL

Specifies the way in which the mount state is to be changed.

**i** The operand values \*EXCHANGE and \*MOVE are not relevant, as in this and subsequent versions only hard disk devices are supported.

## ACTION = \*CANCEL

The allocated private disk specified under UNIT in the \*VOLUME operand is no longer to be available to the user. Every I/O request is rejected. Opened files are not closed; these files must be made available again using the REMOVE-FILE-ALLOCATION-LOCKS command before the next OPEN.

The disk parameters ASSIGN-TIME=\*USER and USER-ALLOCATION=\*NO are implicitly set. In this way all allocation requests are rejected until the disk is released by the occupying users. The disk can only be made available again (SET-DISK-VOL=...,USER=\*ALL) after it has been released by all users. Until that time it is also defined as allocated in the SHOW commands (SH-DEV, SH-DISK).

**i** The CANCEL function is an “emergency command” and should thus be used only in urgent cases, such as with a permanent INOP for the disk.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	NKV0001	Syntax error
	64	NKV0004	Command partially processed
	64	NKV0005	Command not processed for an object
	64	NKV0006	Command not processed
	130	NKVD002	Disk monitor not available

---

## 2.45 CHANGE-FILE-LINK

Change file link name

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT

### Function

The CHANGE-FILE-LINK command changes the file link name in an existing entry in the Task File Table (TFT), i.e. it assigns a new file link name to the file. All the other values in this TFT entry will remain unchanged.

The CHANGE-FILE-LINK command cannot be applied to the TFT entry of a file that is currently open. The ADD-FILE-LINK command can be used to create a new TFT entry; the SHOW-FILE-LINK command returns information on existing TFT entries.

### Format

<b>CHANGE-FILE-LINK</b>	Alias: <b>CGFL</b>
<b>LINK-NAME</b> = * <b>FIRST-BLANK</b> / <filename 1..8 without-gen>	
, <b>NEW-NAME</b> = <filename 1..8 without-gen>	

### Operands

**LINK-NAME = \*FIRST-BLANK / <filename 1..8 without-gen>**

Specifies the existing link name of the file.

**LINK-NAME = \*FIRST-BLANK**

If \*FIRST-BLANK is specified, the first TFT entry with a link name consisting of blanks is selected for change. Such an entry is created if neither the link name nor the file name is defined in the FCB macro call of a program and if no appropriate ADD-FILE-LINK command is issued before the program call. The file name in this entry is the symbolic name of the FCB macro call.

**LINK-NAME = <filename 1..8 without-gen>**

Specifies the existing link name of the file.

**NEW-NAME = <filename 1..8 without-gen>**

The new link name to be given to the file.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntactical or semantic error in command
	64	DMS05D5	Specified LINK name missing or invalid
	64	DMS05DD	New LINK name already exists
	64	DMS06FF	BCAM connection severed
	130	DMS0582	File is currently locked or being used and cannot be processed

## Example

### *Changing a file link name*

- (1) Output of the organization attributes of the SAM file *MAX.FILE.2*.
- (2) Creates a TFT entry for the file *MAX.FILE.2* under the link name PCIN (default link name of the utility routine PERCON for the input file).
- (3) Creates a TFT entry for the file *MAX.FILE.9* under the link name *PCOUT* (default link name of the utility routine PERCON for the output file). The file *MAX.FILE.2* is to be converted with the PERCON utility to the ISAM file *MAX.FILE.9* by constructing the ISAM key from the data bytes 6 to 9.
- (4) Invocation of the PERCON utility routine.
- (5) The file that is entered into the TFT with the default link name *PCIN* is to be used as the input file.
- (6) The file that is entered into the TFT with the default link name *PCOUT* is to be used as the output file.
- (7) The conversion begins.
- (8) The PERCON utility routine is terminated.
- (9) The output of the TFT entries indicates that the entries with link names *PCIN* and *PCOUT* still exist.
- (10) Output of the TFT entry with the link name *PCOUT* showing the file organization attributes.
- (11) Output of the file organization attributes from the catalog entry of the file *MAX.FILE.9*.
- (12) In order to enable processing of the file *MAX.FILE.9* with the utility routine EDT, the link name *PCOUT* is changed to *EDTISAM* with the CHANGE-FILE-LINK command. This makes it possible to process the existing TFT entry for the file *MAX.FILE.9* with the utility routine EDT via the default link name *EDTISAM* (without the TFT entry, EDT only processes ISAM files with KEY-POS=5 and KEY-LENGTH=8). It is not necessary to create a new TFT entry with ADD-FILE-LINK.
- (13) The output of the TFT entries indicates that the entries with the link names *PCIN* and *EDTISAM* exist.
- (14) Invocation of the utility routine EDT.
- (15) After processing in the EDT is complete, the TFT entry with the link name *EDTISAM* is deleted.

---

## 2.46 CHANGE-HEL-FILE

Change hardware error logging file

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Error logging
<b>Domain:</b>	ERROR-LOGGING
<b>Privileges:</b>	HARDWARE-MAINTENANCE

### Function

The CHANGE-HEL-FILE closes the current HEL (Hardware Error Logging) file and opens a new logging file. Hardware error logging is initiated either automatically on system startup or explicitly with the START-HEL-LOGGING command. The CHANGE-HEL-FILE command is rejected if logging is not active (message HEL0010).

HEL logging files are created under the TSOS user ID with a default name formed on the pattern \$TSOS.SYS.HEL.*yyyy-mm-dd.hhmmss*. The name components *yyyy-mm-dd* and *hhmmss* respectively identify the date and time when the logging file was initially opened. The file access rights are by default set to USER-ACCESS=\*SPECIAL and ACCESS=\*READ, which means that, in addition to TSOS, all user IDs including the maintenance IDs (HARDWARE-MAINTENANCE privilege) have read access to HEL logging files.

A HEL logging file is given the size specified in the SPACE operand. There is no provision for dynamic extension (SECONDARY-ALLOCATION=0). If the file grows to the size of the primary allocation, it is automatically closed and a new logging file is created and opened.

### Format

<b>CHANGE-HEL-FILE</b>
------------------------

<b>SPACE</b> = <u>*UNCHANGED</u> / *STD / <integer 24..65536 2Kbyte>
--

### Operands

**SPACE = \*UNCHANGED / \*STD / <integer 24..65536>**

Defines the size (primary allocation, plus rounding as required; see the PRIMARY-ALLOCATION operand of the CREATE-FILE command) of the logging file that is to be created.

**SPACE = \*UNCHANGED**

The logging file is to be the same size as the old one.

**SPACE = \*STD**

The logging file is given the default size of 400 PAM pages.

**SPACE = <integer 24..65536 2Kbyte >**

The logging file is given the specified number of PAM pages.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	32	HEL0100	Internal error
	32	HEL0105	Bourse problems
	32	HEL0106	DMS error
	32	HEL0107	DMS error
	64	HEL0010	Hardware error logging nor active
	64	HEL0110	Privilege error

## Example

**/change-hel-file**

```
% HEL0001 HW-ERROR-LOGGING FILE ':1SBZ:$TSOS.SYS.HEL.2017-01-29.141847'  
OPENED WITH 'SPACE= 402'
```

The CHANGE-HEL-FILE command with no operands opens a new logging file of the default size (in this case rounded up to 402 PAM pages; see the SPACE operand).

---

## 2.47 CHANGE-RESLOG-FILE

Change RESLOG file

**Component:** RESLOG

**Functional area:** Accounting system control

**Domain:** ACCOUNTING

**Privileges:** TSOS  
SW-MONITOR-ADMINISTRATION

### Function

The RESLOG (RESource LOGging) subsystem always logs the use of extra CPUs in the RESLOG file \$TSOS.SYS.RESLOG.<server-id>. You can use the CHANGE-RESLOG-FILE command to change the RESLOG file. Changing the logging file involves the following steps:

1. Close the current logging file \$TSOS.SYS.RESLOG.<server-id>
2. Rename the file to \$TSOS.SYS.RESLOG.<server-id>.<date> (the close time date is appended to the file name)
3. Create and open the new logging file \$TSOS.SYS.RESLOG.<server-id>

Closed RESLOG files can be evaluated using the START-RESLOG-EVALUATION command.

RESLOG logging is only performed at systems with extra CPUs (e.g. systems of type S140 and S170). For more details on RESLOG logging and the use of extra CPUs see the “Introduction to System Administration” [14].

### Format

<b>CHANGE-RESLOG-FILE</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error

**i** Command return codes that are returned in the event of an error (subcode 1 not equal to 0) cannot be guaranteed. Automatic error handling is nevertheless possible using the spin-off mechanism (corresponds to the default setting of the SET-PROCEDURE-OPTIONS command with ERROR-MECHANISM=\*SPIN-OFF-COMPATIBLE).

---

## 2.48 CHANGE-SERSLOG-FILE

Change SERSLOG file

**Component:** BS2000 OSD/BC

**Functional area:** Error logging

**Domain:** ERROR-LOGGING

**Privileges:** TSOS  
SW-MONITORING

**Routing code:** A

### Function

The CHANGE-SERSLOG-FILE command is executed only if software error logging is active.

The command closes the current SERSLOG file for logging relevant software errors (\$TSOS.SYS.SERSLOG.yyyy-mm-dd.xxx.nn) and opens a new one (with nn+1). The switchable logging procedure SERSLOG, which up to the time of command input has entered a record in the old file for each relevant software error, from now on will enter the records in the new file. The records automatically include the time, caller and further identifiers.

The information collected in the closed file can still be evaluated during the system session.

If the new SERSLOG file cannot be opened due to a DMS error, a message to that effect is issued at the operator terminal. In this case the old SERSLOG file remains the current file. If another CHANGE-SERSLOG-FILE command is issued, an attempt is made to open the **next-but-one** SERSLOG file. If the attempt succeeds, the number nn in the file name (see above) is incremented by 2 in order to mark the error in the sequence of files.

### Format

<b>CHANGE-SERSLOG-FILE</b>

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NER0000	Internal error
	32	CMD0221	System error
	32	NER0000	Internal error
	64	NER1070	Task break during processing
	64	NER1000	No authorization for command
	64	NER1040	DMS error
	128	NER0010	A SERSLOG command is already being processed
	129	NER1020	SERSLOG function is not active

## Example

**/show-serslog**

```
% NER1060 SERSLOG ACTIVE. FILE : ':SBZ7:$TSOS.SYS.SERSLOG.2017-01-27.006.01'
```

**/change-serslog-file**

**/show-serslog**

```
% NER1060 SERSLOG ACTIVE. FILE : ':SBZ7:$TSOS.SYS.SERSLOG.2017-01-27.006.02'
```

---

## 2.49 CHANGE-STORAGE-CLASS-CATALOG

Change storage class catalog

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Functions

The CHANGE-STORAGE-CLASS-CATALOG command allows systems support personnel to change the storage class catalog.

The command can also be used to dynamically load the storage class catalog if it was corrupt when the SM pubset was imported and so could not be loaded at that time (message DMS1483).

The file named :<sm-pubset-catid>.\$TSOS.SYSCAT.STORCLS contains the current storage class catalog. If the catalog is to be changed using CHANGE-STORAGE-CLASS-CATALOG, the new catalog must be stored as SYSCAT.STORCLS.BAK (with the same user and catalog IDs). When the command is executed, the original catalog is saved as SYSCAT.STORCLS.<date>.<time>, where <date> is the date (in yyyy-mm-dd format) and <time> is the time (in hhmmss format) when the catalog was changed. The new catalog is renamed to SYSCAT.STORCLS and thus becomes the current storage class catalog.

The procedure for dynamically loading and changing the storage class catalog is as follows:

1. Create a file named SYSCAT.STORCLS.BAK in the control volume set. It is best to create the file in VOLRES, so that the control volume set can also be reduced in size later.
2. Using HSMS, transfer the contents of a backup copy of the storage class catalog to SYSCAT.STORCLS.BAK.
3. Run the CHANGE-STORAGE-CLASS-CATALOG command. The storage class catalog will then be dynamically loaded from SYSCAT.STORCLS.BAK.

### Format

<b>CHANGE-STORAGE-CLASS-CATALOG</b>
<b>PUBSET</b> = <cat-id 1..4>

### Operands

**PUBSET** = <cat-id 1..4>

Identifies the pubset for which the storage class catalog is to be changed or dynamically loaded.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	1	CMD0202	Syntax error in command
	32	CMD0221	Internal system error
	64	CMD0216	No authorization for command
	64	DMS1485	Pubset not known
	64	DMS1486	Pubset is not a system-managed pubset
	64	DMS1487	Pubset not available
	64	DMS1490	Storage class management not available for this pubset
	64	DMS1483	Storage class catalog invalid
	64	DMS1481	Error accessing storage class catalog
	64	DMS1499	Catalog SYSCAT.STORCLS.BAK not in control volume set
	64	DMS1495	Catalog SYSCAT.STORCLS.BAK invalid
	64	DMS1496	Catalog SYSCAT.STORCLS.BAK does not exist
	129	DMS148D	Not enough class 4/5 memory
	129	DMS148E	Error on HIPLEX MSCF connection to master
	129	DMS148F	GCF subsystem not ready

---

## 2.50 CHANGE-TAPE-MOUNT

Change mount state of tape

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** T

### Function

This command changes the mount state of a tape (initiates the remounting of a tape).

### Format

#### CHANGE-TAPE-MOUNT

```
UNIT = *VOLUME(...) / *EXCHANGE-PAIR(...) /  
      list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>  
*VOLUME(...  
  |   VOLUME = list-poss(10): <vsn 1..6>  
*EXCHANGE-PAIR(...  
  |   EXCHANGE-PAIR = list-poss(10): *PARAMETER(...  
  |   *PARAMETER(...  
  |       |   DISMOUNT-VOLUME = <vsn 1..6>  
  |       |   ,REMOUNT-VOLUME = <vsn 1..6>  
,ACTION = *EXCHANGE / *MOVE / *CANCEL / *POSITION
```

### Operands

#### **UNIT =**

Specifies one or more tapes to be remounted.

#### **UNIT = \*VOLUME(...)**

Specifies the volume serial numbers (VSN, up to 6 characters) of one or more tapes whose mount state is to be changed. A maximum of 10 tapes may be specified.

#### **VOLUME = list-poss(10): <vsn 1..6>**

Specifies the VSN.

---

**UNIT = \*EXCHANGE-PAIR(...)**

A used tape for which no device is available is to be exchanged for a used tape which is allocated a device. A maximum of 10 pairs may be specified.

**EXCHANGE-PAIR = list-poss(10): \*PARAMETER(...)**

Specifies up to 10 pairs of used tapes. In each pair, one tape is to be exchanged for the other.

**DISMOUNT-VOLUME = <vsn 1..6>**

This used tape, which is allocated a device (PHASE IN-USE, ACTION neither NO DEVICE nor CANCELLED), is to be dismounted. Processing of this tape is interrupted but not terminated.

**REMOUNT-VOLUME = <vsn 1..6>**

This used tape, for which no device is available (PHASE='IN-USE' and ACTION not equal 'NO DEVICE' or ACTION not equal 'CANCELLED'), is to be mounted instead of the tape to which a device is allocated. Interruption processing of this tape is terminated. All input/output requests for this tape are processed again.

**UNIT = list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>**

Lists up to 10 tapes to be remounted.

**ACTION =**

Specifies the way in which the mount state is to be changed.

**ACTION = \*EXCHANGE**

In each of the tape pairs specified under UNIT in the \*EXCHANGE-PAIR operand, one tape is to be exchanged for the other.

**ACTION = \*MOVE**

The tape specified under UNIT in the \*VOLUME operand or the tape on the device specified by means of its mnemonic name is to be remounted on another device. The system proposes a free device. For remounting the following requirements apply:

- there must exist one free device which supports the recording density used;
- the tape is in the PHASE='IN-USE' status and ACTION not equal 'NO DEVICE' or ACTION not equal 'CANCELLED',
- the user must not have specified NO MOVE at reservation time

**ACTION = \*CANCEL**

The allocated tape specified under UNIT in the \*VOLUME operand is no longer to be available to the user. All further input/output requests are automatically rejected until the tape has been released by the user.

**ACTION = \*POSITION**

The allocated tape specified under UNIT in the \*VOLUME operand is to be repositioned. In this way the operator can correct any inadvertent intervention on the device.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	NKV0001	Syntax error
	64	NKV0004	Command partially processed
	64	NKV0005	Command not processed for an object
	64	NKV0006	Command not processed
	130	NKVT002	Tape monitor not available

## Notes

- Remounting (MOVE function) for a tape should always be announced with a command because if repositioning takes place without a command there is no guarantee that the tape on the backup device will remain repositionable.
- The state PHASE='IN-USE' and ACTION='NO DEVICE' can only occur for a tape if the device on which the tape is mounted is immediately detached and no backup device is available (detachment by the operator with / DETACH-DEVICE UNIT=mn, FORCE=YES or automatic detachment by the system).
- In the case of tapes without an STD label whose device is inoperable and for which no backup device is available, processing is stopped immediately. The display ACTION='NO DEVICE' is not possible for these tapes.

---

## 2.51 CHANGE-TASK-CPU-LIMIT

Change maximum CPU time for task

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** OPERATING  
TSOS

**Routing code:** P

### Function

The CHANGE-TASK-CPU-LIMIT command allows systems support to increase a task's maximum CPU time (task time limit, see also [section "Time limits in BS2000"](#)). This is a way of preventing important batch jobs being terminated prematurely because they have exceeded their CPU time limit.

Systems support can use the SHOW-JOB-STATUS command to check up on the elapsed time and the CPU time limit of a batch job which must not be terminated prematurely and can then run CHANGE-TASK-CPU-LIMIT to raise its CPU limit in good time.

When a batch job reaches its CPU time limit, message EXC0070 is displayed on the operator terminal. Systems support now has a maximum of 20 minutes in which to raise the job's CPU time limit using the CHANGE-TASK-CPU-LIMIT command. If the limit is not raised within this period, the batch job terminates.

If the CPU time limit is passed while a program is running, any STXIT routine defined for the program will not be processed unless the CPU limit is raised within 20 minutes.

### Format

#### CHANGE-TASK-CPU-LIMIT

**JOB-IDENTIFICATION** = \*TSN(...) / \*MONJV(...)

\*TSN(...)

| **TSN** = <alphanum-name 1..4>

\*MONJV(...)

| **MONJV** = <filename 1..54 without-gen-vers>

,**ADD** = \*SECONDS(...) / \*PERCENT(...)

\*SECONDS(...)

| **SECONDS** = <integer 1..32767 *seconds*>

\*PERCENT(...)

| **PERCENT** = <integer 1..100>

---

## Operands

### **JOB-IDENTIFICATION =**

Type of job identification.

Jobs may be identified by task sequence number (TSN) or by monitoring JV (MONJV).

### **JOB-IDENTIFICATION = \*TSN(...)**

The job is identified by its task sequence number (TSN).

**TSN = <alphanum-name 1..4>**

TSN of the job whose CPU time limit is to be raised.

### **JOB-IDENTIFICATION = \*MONJV(...)**

The job is identified by its monitoring JV.

**MONJV = <filename 1..54 without-gen-vers>**

Name of the JV monitoring the job whose CPU time limit is to be raised. The job must run on the local system.

### **ADD = \*SECONDS(...) / \*PERCENT(...)**

Specifies the amount by which the CPU time limit is to be raised. The increase can be given in seconds or as a percentage.

### **ADD = \*SECONDS(...)**

The increase is given in seconds.

**SECONDS = <integer 1..32767 seconds >**

Number of seconds by which the CPU time limit is to be raised.

### **ADD = \*PERCENT(...)**

The increase is given as a percentage of the current CPU time limit.

**PERCENT = <integer 1..100>**

Percentage by which the CPU time limit is to be raised.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
1	0	CMD0001	Maximum CPU limit reached
	32	CMD0221	Internal error
	64	CMD0216	No authorization
	64	NTIC001	Parameter error; TSN or. MONJV unknown

---

## 2.52 CHANGE-TASK-PRIORITY

Change run priority of active job

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** STD-PROCESSING  
OPERATING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** P

### Function

The CHANGE-JOB-PRIORITY command changes the run priority of a job running under the user's own ID. The command can also be used to process jobs generated by the user's own ID and running under a different user ID (extended access).

The maximum permissible priority is the numeric minimum of the maximum values (i.e. the more favorable of the values) in the user catalog and the job class definition. If no maximum value is defined for the job class, then the standard run priority is used.

Information on the entry in the user catalog can be requested using the SHOW-USER-ATTRIBUTES command (output field MAX-RUN-PRIORITY), using the job class definition with the SHOW-JOB-CLASS (output field RUN-PRIORITY) command.

The priority of jobs that have not yet been started can be changed using the MODIFY-JOB command.

#### *Privileged function*

If the CHANGE-TASK-PRIORITY command is issued at the operator terminal or under the TSOS user ID, it can be used to change the run priority of a job issued under any user ID. In this case the maximum permissible priority as defined for that user ID in the user catalog is irrelevant.

---

## Format

### CHANGE-TASK-PRIORITY

**JOB-IDENTIFICATION** = \*TSN(...) / \*MONJV(...)

\*TSN(...)

| **TSN** = <alphanum-name 1..4>

| **,HOST** = \*STD / <c-string 1..8>

\*MONJV(...)

| **MONJV** = <filename 1..54 without-gen-vers>

**,RUN-PRIORITY** = <integer 30..255>

## Operands

### **JOB-IDENTIFICATION =**

Type of job identification.

Jobs may be identified by task sequence number (TSN) or by monitoring JV (MONJV).

### **JOB-IDENTIFICATION = \*TSN(...)**

The job is identified by its task sequence number (TSN) and where appropriate by the host on which it is running.

**TSN = <alphanum-name 1..4>**

TSN of the job whose priority is to be changed.

**HOST = \*STD / <c-string 1..8>**

Host system on which the job is running.

The default is \*STD, which means that the job is running on the local host.

The host name of a remote system can only be specified for systems which are on a computer network (see the "HIPLEX MSCF" manual [25]).

### **JOB-IDENTIFICATION = \*MONJV(...)**

The job is identified by its monitoring JV.

**MONJV = <filename 1..54 without-gen-vers>**

Name of the JV monitoring the job whose priority is to be changed.

### **RUN-PRIORITY = <integer 30..255>**

Specifies the run priority to be assigned to the job. A low value indicates a high priority. The maximum permissible priority is the numeric minimum of the maximum values (i.e. the more favorable of the values) in the user catalog and the job class definition. If no maximum value is defined for the job class, the standard run priority is used. The values can be queried using the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	32	CMD0221	System error
	32	JMS0024	System error
	64	JMS0630	Semantic error (see SYSOUT message)
	64	JMS0640	MONJV error, illegal access or invalid time of call
	64	JMS0670	Error in a remote job
	130	JMS0620	Memory saturation
	130	JMS0650	MSCF or destination processor not available

---

## 2.53 CHANGE-VOLUME-SET-LIST-CATALOG

Change volume set list catalog

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Function

The CHANGE-VOLUME-SET-LIST-CATALOG command allows systems support to change the volume set list catalog.

The command can also be used to dynamically load the volume set list catalog if it was corrupt when the SM pubset was imported and so could not be loaded at that time (message DMS1484).

The file named :<sm-pubset-catid>.\$TSOS.SYSCAT.VSETLST contains the current volume set list catalog. If the catalog is to be changed using CHANGE-VOLUME-SET-LIST-CATALOG, the new catalog must be stored as SYSCAT.VSETLST.BAK (with the same user and catalog IDs). When the command is executed, the original catalog is saved as SYSCAT.VSETLST.<date>.<time>, where <date> is the date (in yyyy-mm-dd format) and <time> is the time (in hhmmss format) when the catalog was changed. The new catalog is renamed to SYSCAT.VSETLST and thus becomes the current volume set list catalog.

The procedure for dynamically loading and changing the volume set list catalog is as follows:

1. Create a file named SYSCAT.VSETLST.BAK in the control volume set. It is best to create the file in VOLRES, so that the control volume set can also be reduced in size later.
2. Using HSMS, transfer the contents of a backup copy of the volume set list catalog to SYSCAT.VSETLST.BAK.
3. Run the CHANGE-VOLUME-SET-LIST-CATALOG command. The volume set list catalog will then be dynamically loaded from SYSCAT.VSETLST.BAK.

### Format

<b>CHANGE-VOLUME-SET-LIST-CATALOG</b>
<b>PUBSET</b> = <cat-id 1..4>

### Operands

**PUBSET** = <cat-id 1..4>

Designates the pubset for which the volume set list catalog is to be changed or dynamically loaded.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	1	CMD0202	Syntax error in command
	32	CMD0221	Internal system error
	64	CMD0216	No authorization for command
	64	DMS1485	Pubset not known
	64	DMS1486	Pubset is not a system-managed pubset
	64	DMS1487	Pubset not available
	64	DMS1490	Storage class management not available for this pubset
	64	DMS1484	Volume set list catalog invalid
	64	DMS1482	Error accessing volume set list catalog
	64	DMS1499	Catalog SYSCAT.VSETLST.BAK not in control volume set
	64	DMS1495	Catalog SYSCAT.VSETLST.BAK invalid
	64	DMS1496	Catalog SYSCAT.VSETLST.BAK does not exist
	129	DMS148D	Not enough class 4/5 memory
	129	DMS148E	Error on HIPLEX MSCF connection to master
	129	DMS148F	GCF subsystem not ready

---

## 2.54 CHECK-DISK-MOUNT

Check mount state of a disk

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** D

### Function

This command checks the mount state of disk devices. The disk monitor (DM) is called to update the online state of the specified devices if the mounting or dismounting of a disk is not recognized by the system because of a missing activation interrupt.

### Format

<b>CHECK-DISK-MOUNT</b>
<b>UNIT</b> = *ALL / list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4> <b>,ACTION</b> = *UPDATE / *REPORT

### Operands

#### UNIT =

Defines the devices whose mount state is to be checked and updated.

#### UNIT = \*ALL

All disk drives having the following attributes are checked:

- ATTACHED or DETACH-PENDING
- ACTION-STATE = NO\_ACTION
- PHASE not equal MOUNT and PHASE not equal IN-USE.

#### UNIT = list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>

Specifies the mnemonic device names (2 or 4 alphanumeric characters) of the devices whose mount state is to be checked and updated. A maximum of 10 devices may be specified.

#### ACTION =

Defines the logging of the online state.

#### ACTION = \*UPDATE

An updated online state is to be logged by the following messages (default):

```
NKVD010   DISK vsn IS MOUNTED ON mn
NKVD011   DISK vsn IS DISMOUNTED FROM mn
```

No message is issued for devices whose online state has not changed.

---

**ACTION = \*REPORT**

Like UPDATE; in addition the device error state is logged via message EXC0857 if no volume is recognized as online.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	NKV0001	Syntax error
	64	NKV0004	Command partially processed
	64	NKV0005	Command not processed for an object
	64	NKV0006	Command not processed
	130	NKVD002	Disk monitor not available

**Note**

The SHC-OSD subsystem requires the assignment of mnemonics to volume numbers for the supported disks. BS2000 determines the volume numbers during system power-up and during attachment of devices (/ATTACH-DEVICE) and enters them into the BS2000 device table.

If the configuration is changed in the storage system, the assignment of mnemonics to volume numbers can change as well. In these cases, the mnemonic <mn> can be used to update the volume number for the disk:

```
/CHECK-DISK-MOUNT UNIT=<mn> , ACTION=*UPDATE
```

If BS2000 recognizes a change, the volume numbers are updated for all other disks in the storage system automatically.

---

## 2.55 CHECK-FILE-CONSISTENCY

Check NK-ISAM file for consistency

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING

The command CHECK-FILE-CONSISTENCY checks an ISAM file that is of type BLOCK-CONTROL-INFO = \*WITHIN-DATA-BLOCK and has not been correctly closed to ensure that it is consistent. This command is only meaningful for NK-ISAM files which are processed with WRITE-IMMEDIATE=\*YES.

Only files identified as open (see the STATUS=\*PAR(REPAIR-NEEDED=\*YES) option in the SHOW-FILE-ATTRIBUTES command) are selected. The file lock is removed.

Concurrent copy locks remain in place if the concurrent copy session has not yet ended. If a file is identified as open, the LLP (last logical page) is set to the last PAM page used.

If the file is on a mirrored disk (see the "DRV" manual [11]), the consistency (contents) of file blocks is restored if required.

If the file contains secondary keys, the secondary index is checked to ensure that it was created or deleted completely (since processing may have aborted at the time of creating or deleting the secondary index).

Multiblocks (an ISAM data block consisting of several PAM pages) are checked for consistency, i.e. to determine whether processing was aborted when writing a multiblock. For information on "multiblocks" see the "Introductory Guide to DMS" [13].

An existing file lock can also be removed by using the command REMOVE-FILEALLOCATION-LOCKS. But no inconsistencies are detected in the process. Inconsistencies in a file can be eliminated with the REPAIR-DISK-FILES command.

### Format

<b>CHECK-FILE-CONSISTENCY</b>
<b>FILE-NAME</b> = <filename 1..54> / <partial-filename 2..53>
<b>,SELECT</b> = * <u>ANY-DISK</u> / *PRIVATE-DISK / *PUBLIC-DISK / *NET-STORAGE

### Operands

**FILE-NAME** = <filename 1..54> / <partial-filename 2..53>

Names of the files to be checked. Write access authorization is required for files which are not under the user's own user ID.

**SELECT** = \*ANY-DISK / \*PRIVATE-DISK / \*PUBLIC-DISK

Restricts the files which are to be checked to the specified volume type. This operand is of use only if a partially qualified name, or the name of a file generation group, is specified for FILE-NAME.

**SELECT = \*ANY-DISK**

Any files can be checked, irrespective of their volume types.

**SELECT = \*PRIVATE-DISK**

Checks files which are stored on private disks.

**SELECT = \*PUBLIC-DISK**

Checks files which are stored on public disks.

**SELECT = \*NET-STORAGE**

Checks files which are stored on a Net-Storage volume.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
	0	CMD0001	No action required
	0	DMS06E6	File specified in command is empty
	0	DMS06E9	No valid record found during reconstruction of ISAM file
	0	DMS06ED	Error on writing unrecoverable blocks to scratch file
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0533	Requested file not cataloged in pubset
	64	DMS0535	Specified file not shareable
	64	DMS055C	Requested file not cataloged in pubset
	64	DMS0583	An error occurred when reconstructing the file
	64	DMS0585	Error detected during catalog processing or multihost processing
	64	DMS0586	Currently not possible to access or reserve volume
	64	DMS0587	Use of specified command restricted by system administrator
	64	DMS0588	It was not possible to allocate disk space

64	DMS05F8	It was not possible to allocate disk space Guaranteed message: DMS05F8
64	DMS05FC	Specified user ID not in HOME pubset
64	DMS0609	No access to system file
64	DMS0609	No file corresponds to specified selection criterion
64	DMS06CC	No file corresponding to specified operands
64	DMS06E4	Reconstruction for this file type not possible with specified command
64	DMS06FF	BCAM connection severed
64	DMS06FF	File created with WROUT=NO. Consistency check is not practical
130	DMS0524	System address space full
130	DMS053C	Insufficient space in pubset catalog file
130	DMS0582	File is currently locked or in use and cannot be processed
130	DMS0585	Error detected during catalog processing or multihost processing
130	DMS0586	Currently not possible to access or reserve volume
130	DMS0588	It was not possible to allocate disk space
130	DMS0594	Not enough virtual memory available
130	DMS05C8	Maximum permitted number of files reached

---

## 2.56 CHECK-IMPORT-DISK-FILE

Check file import procedure

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE  
FILE-GENERATION-GROUP

**Privileges:** TSOS  
STD-PROCESSING

### Function

Simulates the effect of executing the IMPORT-FILE command (operand SUPPORT=DISK), but does not actually import the file, i.e the user receives a SYSOUT/SYSLST log which shows how the IMPORT-FILE command would have been processed.

The log provides a list of the files on the volume identified in the VOLUME operand, and the informative data /messages which would have been returned by actually executing the IMPORT-FILE command.

For files on the private disk or the Net-Storage volume, DMS will not check at this point whether there are file locks or protection attributes which might prevent importation. When the importation is actually performed, the user must ensure that the files are not locked, and that write access is permitted.

#### *Privileged functions*

As with the IMPORT-FILE command, systems support (TSOS privilege) can use the NEW-USER option to control which user ID the files are cataloged under.

By default, systems support (TSOS privilege) is a co-owner of all the files (and can therefore create files under all user logons). When SECOS is used, this co-ownership can be restricted for permanent files.

Systems support can generate files under any user ID (TSOS privilege). In conjunction with the SECOS software product a user can allow other user IDs to act as co-owners. Co-owners of a user ID are then also allowed to import files under that ID.

---

## Format

### CHECK-IMPORT-DISK-FILE

**VOLUME** = <alphanum-name 1..6>

,**DEVICE-TYPE** = <device>

,**FILE-NAME** = **\*ALL** / <partial-filename 2..50 without-cat> / <filename 1..51 without-cat>

,**TYPE-OF-FILE** = [ **\*ANY** ](...)

[ **\*ANY** ](...)

|       **GENERATIONS** = **\*YES** / **\*NO**

,**OUTPUT** = **\*SYSLST** / **\*SYSOUT** / **\*ALL**

,**NEW-USER** = **\*NONE** / <name 1..8>

,**PUBSET** = **\*STD** / <cat-id 1..4>

## Operands

**VOLUME** = <alphanum-name 1..6>

Specifies the VSN (volume serial number) of the volume which records the files whose importation is to be checked.

**DEVICE-TYPE** = <device>

Identifies the type of device on which the private disk is to be mounted.

Only device types known in the system are accepted. In interactive mode, DEVICE-TYPE=? calls up a list of the available device types.

The volume type NETSTOR must be specified for Net-Storage volumes.

Every specification of a disk device type known in the system is handled like the STDDISK specification.

**FILE-NAME** = **\*ALL** / <partial-filename 2..50 without-cat> / <filename 1..51 without-cat>

Identifies the files, file generation groups or file generations for which the importation (cataloging) is to be checked. By default, DMS will check the cataloging of all files etc. which are stored on the volume specified in the VOLUME operand under the user ID for the job which is currently running.

**TYPE-OF-FILE** = **\*ANY**(...)

*For file generation groups:* specifies how file generation groups are to be treated.

**GENERATIONS** = **\*YES** / **\*NO**

Specifies whether the only check that is required is on the cataloging of the group entry, or whether the cataloging of the file generations which are stored on the same private disk is also to be checked.

**GENERATIONS** = **\*YES**

If the group entry is held on the private disk, DMS will catalog this entry and all those of its generations which begin on this disk. If there is no group entry on the disk or in the user catalog, no file generations will be cataloged.

**GENERATIONS** = **\*NO**

DMS transfers just the group entry for the FGG to the catalog.

---

**OUTPUT = \*SYSLST / \*SYSOUT / \*ALL**

Specifies how the processing of commands is to be logged (see the [table "CHECK-IMPORT-DISK-FILE: Special return codes and messages"](#)).

**OUTPUT = \*SYSLST**

The execution of commands will be logged on SYSLST; this log contains the special return codes and message texts (see [table "CHECK-IMPORT-DISK-FILE: Special return codes and messages"](#)).

**OUTPUT = \*SYSOUT**

The execution of commands will be logged on SYSOUT; only the special return codes and file names are output in this log (see [table "CHECK-IMPORT-DISK-FILE: Special return codes and messages"](#)).

**OUTPUT = \*ALL**

The processing of commands will be logged on SYSLST and SYSOUT (see OUTPUT= \*SYSLST and OUTPUT=\*SYSOUT).

**NEW-USER = \*NONE / <name 1..8>**

User ID under which the file is to be cataloged (see also the IMPORT-FILE command).

**PUBSET = \*STD / <cat-id 1..4>**

Specifies the pubset on which the files are to be cataloged. If a Net-Storage volume is specified in the VOLUME operand, the pubset to which the Net-Storage volume is allocated must be specified here.

**PUBSET = \*STD**

If no specification is provided for the PUBSET, the catalog entries will be set up under the default catalog ID for the user ID (see the SHOW-USER-ATTRIBUTES command).

**PUBSET = <cat-id 1..4>**

Specifies the pubset on which the files are to be cataloged.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset Guaranteed message: DMS051B
	64	DMS051C	User not authorized to access pubset Guaranteed message: DMS051C
	64	DMS0533	Requested file not cataloged in pubset Guaranteed message: DMS0533
	64	DMS0535	Specified file not shareable
	64	DMS053E	File already cataloged on private volume
	64	DMS055C	Catalog entry not found on specified private disk
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS05FE	Requested file(s) not found
	64	DMS0585	Error detected during catalog processing or multihost processing
	64	DMS0586	Currently not possible to access or reserve volume
	130	DMS0524	System address space full
	130	DMS0582	File is currently locked or in use and cannot be processed
	130	DMS0585	Error detected during catalog processing or multihost processing
	130	DMS0586	Currently not possible to access or reserve volume
	130	DMS0594	Not enough virtual memory available

## Special return codes and messages

Code on SYSOUT	Message on SYSLST	Meaning
0	FILE DID NOT EXIST	There was no file with the same name and a new catalog entry would be created.
2	FILE EXISTS	A file of the same name already exists.
4	ERROR ON CATALOG ACCESS	System error during catalog access.
5	FILE ALREADY ON PRIVATE	The file is already cataloged and is stored on the private disk specified by VOLUME.
6	ERROR ON VTOC ACCESS	System error when accessing the F1 label of the private disk or the catalog of the Net-Storage volume.
7	GENERATION OUT OF RANGE	Invalid attempts to import a file generation: the absolute generation number of the generation to be imported conflicts with the limits defined in the group entry.
8	C.E. HAS BEEN REPLACED	A catalog entry already exists for the specified disk
A	INVALID FILENAME	<p>The path name of the file to be imported (including catid and userid) is longer than 54 characters.</p> <p>Path name = :catid: .userid:filename</p> <p>It should be noted that the file name is made up from the details specified in two <i>different</i> operands in the command:</p> <p>the file name is specified in the FILE-NAME operand, the catalog ID in the PUBLIC-VOLUME-SET operand</p> <p>For a 1-character catalog ID, the file name must not be longer than 51 characters. For a 4-character catalog ID, the file name must not be longer than 48 characters.</p>
B	ERROR ON NET-STORAGE ACCESS	
C	LARGE FILE NOT ALLOWED	
D	RENAME OF NODE-FILES NOT ALLOWED	

Table 28: CHECK-IMPORT-DISK-FILE: Special return codes and messages

## Example

*Check import for a private disk*

```
/check-imp-disk-file vol=work01,dev-type=d3435,  
                    file-name=*all,output=*sysout _____ (1)
```

```
% 0 :2OSG:$USER1.MAX.FILE.1  
% 0 :2OSG:$USER1.MAX.FILE.2  
% 0 :2OSG:$USER1.MAX.FILE.3  
% 0 :2OSG:$USER1.MAX.FILE.4  
% 2 :2OSG:$USER1.MAX.LIB
```

```
/show-file-attr max.lib _____ (2)
```

```
%          3 :2OSG:$USER1.MAX.LIB  
%:2OSG: PUBLIC:      1 FILE RES=          3 FRE=          3 REL=          3 PAGES
```

```
/mod-file-attr max.lib,new-name=max.lib.old _____ (3)
```

```
/check-imp-disk-file vol=work01,dev-type=d3435,  
                    file-name=*all,output=*sysout _____ (4)
```

```
% 0 :2OSG:$USER1.MAX.FILE.1  
% 0 :2OSG:$USER1.MAX.FILE.2  
% 0 :2OSG:$USER1.MAX.FILE.3  
% 0 :2OSG:$USER1.MAX.FILE.4  
% 0 :2OSG:$USER1.MAX.LIB
```

- (1) The command checks whether all files of the user *USER1* on the private disk *WORK01* can be imported. The information returned by CHECK-IMPORT-DISK-FILE is to be output to SYSOUT.
- (2) The code returned for the file *MAX.LIB* is 2, i.e. there is already an existing catalog entry for the file. The command SHOW-FILE-ATTRIBUTES returns information on the existing catalog entry for the file *MAX.LIB*. The file is stored on public disk.
- (3) The command MODIFY-FILE-ATTRIBUTES is used to rename the file *MAX.LIB* to *MAX.LIB.OLD*.
- (4) A repeated CHECK-IMPORT-DISK-FILE command (see Point 1) indicates that all files of the private disk *WORK01* (including *MAX.LIB*) can be imported.

---

## 2.57 CHECK-PUBSET-MIRRORS

Check homogeneity of pubset mirroring

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

The CHECK-PUBSET-MIRRORS command checks whether mirroring of a pubset is homogeneous. The homogeneity check is performed in relation to SRDF and TimeFinder/Mirror mirroring. In the case of a pubset which is not mirrored a check is also made to see whether only individual disks are mirrored. Mirroring of the pubset is homogeneous if all volumes of the pubset have identical mirroring properties.

The homogeneity check is performed for the currently supported full replication forms (see the respective manual "SHC-OSD" [37]).

### Format

<b>CHECK-PUBSET-MIRRORS</b>
-----------------------------

<b>PUBSET</b> = <cat-id 1..4>
-------------------------------

### Operands

**PUBSET = <cat-id 1..4>**

Catalog ID of the pubset for which homogeneity of pubset mirroring is to be checked.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed (mirroring is homogeneous)
5	32	DMS136E	Unexpected return code when SHC-OSD was called
	32	DMS136F	Unexpected return code when a system function was called
	64	CMD0216	No authorization
	64	DMS136D	Pubset mirroring is not homogeneous
1	64	DMS136E	Specified pubset does not exist
2	64	DMS136E	Specified pubset cannot be accessed
3	64	DMS136E	SHC-OSD subsystem not available
4	64	DMS136E	Specification of a volume set not allowed
	64	DMS13DB	Homogeneity check aborted because VSN not unique

---

## 2.58 CHECK-SNAPSET-CONFIGURATION

Check and update Snapset configuration

**Component:** BS2000 OSD/BC

**Functional area:** Pubset and MRSCAT management

**Domain:** SNAPSET  
MULTI-CATALOG-AND-PUBSET-MGMT

**Privileges:** TSOS  
HSMS-ADMINISTRATION

### Function

This command checks the Snapset configuration of an imported pubset. If Snapsets are detected which could not be connected when the pubset was imported, an attempt is made to connect these Snapsets retroactively.

### Format

<b>CHECK-SNAPSET-CONFIGURATION</b>
<b>PUBSET</b> = <u>*DEFAULT-PUBSET</u> / <cat-id 1..4>
<b>,SNAPSET</b> = <u>*ALL</u> / <name 1..1 with-low> / <integer -52..-1>

### Operands

**PUBSET = \*DEFAULT-PUBSET / <cat-id 1..4>**

Determines the pubset whose Snapset configuration is to be checked.  
The default value is the catalog ID of the calling user's default pubset.

**SNAPSET =**

Defines the snapset whose configuration is to be checked.

**SNAPSET = \*ALL**

The configuration of all snapsets is to be checked.

**SNAPSET = <name 1..1 with-low> / <integer -52..-1>**

The configuration of the specified snapset is checked, whereby the snapset is specified by its snapset ID or its relative age (-1 corresponds to the most recent snapset). Maximal 52 snapsets of a pubset are distinguished by their snapset IDs which may contain 26 lowercase letters a..z and uppercase letters A..Z.

---

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
	32	CMD0216	No authorization to issue command
	64	DMS1351	Internal error
	64	DMS1386	Error in the memory request
	64	DMS1389	Error in MSCF communication
	64	DMS138C	Pubset not accessible
	64	DMS13D5	No Snapset available
1	64	DMS13D7	Internal error in Snapset management: Return code of GCF
6	64	DMS13D7	Internal error in Snapset management: Return code of SHC-OSD
7	64	DMS13D7	Internal error in Snapset management: Return code of CCOPY
	64	DMS13DF	SHC-OSD subsystem not available
	64	DMS13E5	No Snapset catalog available
	64	DMS13FA	Shared pubset and Snapsets are not supported on master computer
	64	DMS148F	GCF not loaded

---

## 2.59 CHECK-TAPE-MOUNT

Check mount state of tape and MTC devices

**Component:** BS2000 OSD/BC

**Functional area:** Device management

**Domain:** DEVICE

**Privileges:** OPERATING

**Routing code:** T

### Function

This command checks the mount state of tape devices and magnetic tape cartridge devices. The tape monitor (TM) is called to update the online state for the specified devices. A typical application is where the mounting or dismounting of a tape or magnetic tape cartridge is not recognized by the system because of the absence of an activation interrupt.

### Format

<b>CHECK-TAPE-MOUNT</b>
<b>UNIT</b> = *ALL / list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4> <b>,ACTION</b> = *UPDATE / *REPORT

### Operands

**UNIT =**

Defines the devices whose mount state is to be checked.

**UNIT = \*ALL**

All tape devices having the following attributes are checked:

- ATTACHED or DETACH-PENDING
- ACTION-STATE = NO ACTION
- PHASE not equal MOUNT and PHASE not equal IN-USE.

**UNIT = list-poss(10): <alphanum-name 2..2> / <alphanum-name 4..4>**

The devices whose mount state is to be checked and updated are defined by means of their mnemonic name. A maximum of 10 devices may be specified.

**ACTION =**

Defines the logging of the online state.

**ACTION = \*UPDATE**

An updated online state is to be logged by the following messages (default value):

```
NKVT010 TAPE vsn MOUNTED ON DEVICE mn
```

```
NKVT011 TAPE vsn DISMOUNTED FROM DEVICE mn
```

---

No message is issued for devices whose online state has not changed.

**ACTION = \*REPORT**

Logging as for UPDATE; in addition the device error state is logged via message EXC0858 if no volume is recognized as online.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error
	1	NKV0001	Syntax error
	64	NKV0004	Command partially processed
	64	NKV0005	Command not processed for an object
	64	NKV0006	Command not processed
	130	NKVT002	Tape monitor not available

---

## 2.60 CLOSE-VARIABLE-CONTAINER

Close variable container

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

### Function

The CLOSE-VARIABLE-CONTAINER command closes the specified variable containers.

#### *Note*

If a variable container is closed before its scope ceases to exist, the variables remain declared but can no longer be accessed. All access attempts are rejected with error message SDP1030.

### Format

<b>CLOSE-VARIABLE-CONTAINER</b>
---------------------------------

<b>CONTAINER-NAME</b> = <composed-name 1..64 with-wild(80)> / list-poss(2000): <composed-name 1..64>
--

### Operands

**CONTAINER-NAME =**

Name of the variable container.

**CONTAINER-NAME = <composed-name 1..64 with-wild(80)>**

Variable container whose name corresponds to the pattern string specified.

**CONTAINER-NAME = list-poss(2000): <composed-name 1..64>**

List of variable container names.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	CMD0216	User does not have required privilege
	64	SDP0091	Semantic error
	130	SDP0099	No more address space available

## Example

See the SHOW-VARIABLE-CONTAINER-ATTR command in the “SDF-P” manual [34].

---

## 2.61 CLOSE-VIRTUAL-DEVICE-DIALOG

Close dialog with virtual printer

**Component:** SPOOL  
**Functional area:** Controlling spoolout job  
**Domain:** SPOOL-PRINT-SERVICES  
**Privileges:** STD-PROCESSING  
PRINT-SERVICE-ADMINISTRATION

### Function

This command closes the dialog between the virtual device and the application procedure in which the call takes place. It is executed in batch mode only.

The command is part of a set of four commands which enable an application to be created in the form of an S procedure (for an example, see the OPEN-VIRTUAL-DEVICE-DIALOG command). These commands manage the dialog between a virtual device and the application which was started in batch mode as an S procedure:

- OPEN-VIRTUAL-DEVICE-DIALOG
- GET-JOB-FROM-VIRTUAL-DEVICE
- RETURN-JOB-TO-VIRTUAL-DEVICE
- CLOSE-VIRTUAL-DEVICE-DIALOG

### Format

<b>CLOSE-VIRTUAL-DEVICE-DIALOG</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error; command successfully processed
	32	SCP0974	Unexpected command
5	32	SCP0974	Memory request error

### Notes

1. If the dialog cannot be established, the command is rejected and a return code is set.
2. If no initialization took place (OPEN-VIRTUAL-DEVICE-DIALOG command), the command is rejected and a return code is set.
3. This command can only be used in batch mode.
4. Spin-off processing is activated each time an error is detected.

---

## 2.62 COMPARE-DISK-FILES

Compare disk files

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
TSOS  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
HARDWARE-MAINTENANCE

### Function

The COMPARE-DISK-FILES command compares two disk files block by block (PAM) or record by record (SAM, ISAM) and informs the user of the result of the comparison.

The files can reside on public volumes, Net-Storage volumes or private disks. Permanent files, temporary files or work files can be compared.

Entire file generation groups cannot be compared, although individual file generations can.

SAM node files, like SAM files on public volumes, are compared record by record. When the data are read, the Net-Client converts them from the net coded character set to the coded character set. This means that the comparison is based on the coded character set. As a result, two SAM node files may be regarded as equal despite differences in the net coded character sets.

The files to be compared must be identical with respect to the following properties:

- Access method (FILE-STRUCTURE)
- Block format (BLOCK-CONTROL-INFO)  
The default BLOCK-CONTROL-INFO=\*IGNORE-ATTRIBUTE also permits different block formats.
- Coded character set (CODED-CHARACTER-SET)
- For SAM files:
  - REC-SIZE when REC-FORM=F
- For ISAM files:
  - REC-SIZE when REC-FORM=F
  - Properties of the ISAM key (KEY-LEN, KEY-POS, LOG-FL-LEN, VAL-FL-LEN)
  - Properties of the secondary key (KEY-LEN, KEY-POS, DUPKEY) for NK-ISAM
- For PAM files:
  - Blocking factor (BUFFER-LENGTH)
  - Number of occupied PAM pages (HIGHEST-USED-PAGE)

The command will be rejected for files with one of the following properties:

- The file is empty.
- The file is open.

- The file is locked (e.g. SECURE lock)
- The REPAIR-NEEDED or NO-DMS-ACCESS label is set.

PLAM libraries are PAM files and are compared block by block. The utility routine "LMS" [21] permits a comparison at member level.

The TPCOMP2 utility routine is available to compare tape files, see the "Utility Routines" manual [9].

## Format

### COMPARE-DISK-FILES

**FILE-NAME1** = <filename 1..54>

,**FILE-NAME2** = <filename 1..54>

,**BLOCK-CONTROL-INFO** = \*IGNORE-ATTRIBUTE / \*INCLUDE-ATTRIBUTE

,**PAMKEY-USER-INFO** = \*INCLUDE / \*IGNORE

## Operands

**FILE-NAME1** = <filename 1..54>

Name of the first file which is to be compared.

**FILE-NAME2** = <filename 1..54>

Name of the second file which is to be compared.

**BLOCK-CONTROL-INFO** = \*IGNORE-ATTRIBUTE / \*INCLUDE-ATTRIBUTE

The files' block format is included in the comparison (\*INCLUDE-ATTRIBUTE) or ignored (\*IGNORE-ATTRIBUTE).

**PAMKEY-USER-INFO** = \*INCLUDE / \*IGNORE

*Only relevant for PAM files with BLOCK-CONTROL-INFO=\*PAMKEY:*

The user information in the PAM key is included in the comparison (\*INCLUDE) or ignored (\*IGNORE).

## Output information about the file comparison

If the files are identical, message DMS0630 is issued.

If the files are not identical, message DMS0631 is issued. Depending on the file type, further information is output:

- For SAM files:  
Message DMS0632 displays the number of the record in which the first difference occurs. The block and record numbers within the data block are also displayed for this position.
- For ISAM files:  
Message DMS0633 displays the number of the record in which the first difference occurs.
- For PAM files:  
Message DMS0634 displays the number of the 2K data block and the byte number within this data block in which the first difference occurs.  
If PAMKEY-USER-INFO=\*INCLUDE is used and the first difference in the user information is found in the PAM key, message DMS0635 displays the number of the associated 2K data block.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	DMS0630	Command executed without error. The files are identical.
	0	DMS0631	Command executed without errors. The files are not identical.
	1	CMD0202	Syntax or semantic error in file name
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Command privilege missing
	64	DMS0501	File catalog not available
	64	DMS0512	File catalog not found
	64	DMS051B	User ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0535	Specified file not shareable
	64	DMS0585	An error was detected during catalog processing or during multiprocessor processing
	64	DMS05FC	User ID not in home pubset
	64	DMS0636	File attributes do not permit a comparison
	64	DMS0684	File does not exist
	130	DMS0524	System address space full
	130	DMS0582	File is currently locked or in use and cannot be processed
	130	DMS0594	Not enough virtual memory available

---

## 2.63 CONCATENATE-DISK-FILES

Join SAM files together

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING  
TSOS

### Function

The CONCATENATE-DISK-FILES command joins two or more SAM files together, concatenating them to form a single file. This is, however, conditional on the files all having matching FILE-STRUCTURE, BUFFER-LENGTH, RECORD-FORMAT, BLOCK-CONTROL-INFORMATION and CODED-CHARACTER-SET structure attributes. Files with a fixed record length (RECORD-FORMAT=FIXED) must have matching record lengths (RECORD-SIZE). The target file is freely selectable, but by default the first of the files being concatenated is used as the target file. The command is rejected if the user does not have write permission for the target file.

#### *Methodology*

The files are copied record by record in the order specified in the FROM-FILES operand, with each appended file beginning in a separate data block. If an error (e.g. no read permission) occurs while copying is in progress, processing of the command aborts with an error code. If the target file (TO-FILE operand) has already been created, it will not be deleted.

A message provides information about the file which could not be processed.

Processing of encrypted files is possible only if the relevant crypto passwords are entered into the task's crypto password table (see the ADD-CRYPTO-PASSWORD command).

### Format

<b>CONCATENATE-DISK-FILES</b>
<b>FROM-FILES</b> = list-poss(255): <filename 1..54>
<b>,TO-FILE</b> = <b>*FIRST-INPUT-FILE</b> / <filename 1..54>

### Operands

**FROM-FILES = list-poss(255): <filename 1..54>**

Defines the list of files which are to be copied, in the given order, to the file specified in the TO-FILE operand.

**TO-FILE = \*FIRST-INPUT-FILE / <filename 1..54>**

Specifies the file to which the files specified in the FROM-FILE operand are to be copied. The command is rejected if the user does not have write permission for the target file.

**TO-FILE = \*FIRST-INPUT-FILE**

The files specified in the FROM-FILES operand are to be copied to the first file listed in the FROM-FILES operand. In other words, the files following the first file are to be appended to the first file in the order specified in the FROM-FILES operand.

## TO-FILE = <filename 1..54>

Specifies the name of the file to which the files specified in the FROM-FILES operand are to be copied. If a file with this name already exists, it will be overwritten.

If the file is one of the set specified in the FROM-FILES operand, it must be the first file listed there.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command successfully executed
	64	CMD0202	Syntactical/semantic error in file name
	64	DMS0681	DMS error during processing. For more detailed information the inserts can be queried using the chargeable product SDF-P

## Example

```
/ass-syslst to=text.1,sys-num=1 _____ (1)
/ass-syslst to=text.2,sys-num=2
/ass-syslst to=text.3,sys-num=3

/wr-text 'We begin with TEXT.1 ... ,output=*syslst(1) _____ (2)
/wr-text .... then comes TEXT.2 ... ,output=*syslst(2)
/wr-text .... and last there is TEXT.3! ,output=*syslst(3)
/ass-syslst *primary,sys-num=1 _____ (3)
/ass-syslst *primary,sys-num=2
/ass-syslst *primary,sys-num=3

/concat-disk-file from=(text.1,text.2,text.2,text.2,text.3),to=text.all _____ (4)
/sh-file text.all _____ (5)
```

```
We begin with TEXT.1 ...
.... then comes TEXT.2 ...
.... then comes TEXT.2 ...
.... then comes TEXT.2 ...
.... and last there is TEXT.3!
```

```
% SHO0301 WARNING: END OF FILE REACHED
```

```
S*SOF+ 1( 1)
```

```
e
```

---

```
% SH00500 :1OSN:$USERXY01.TEXT.ALL  CLOSED
```

- (1) The SYSLST system file (SYSLST01, SYSLST02 and SYSLST03) is assigned to files TEXT.1, TEXT.2 and TEXT.3.
- (2) Using the WRITE-TEXT command, text is written to SYSLST01, SYSLST02 and SYSLST03 and hence to the assigned files TEXT.1, TEXT.2 and TEXT.3.
- (3) The system file assignment is canceled. As a result TEXT.1, TEXT.2 and TEXT.3 are closed and made accessible.
- (4) The CONCATENATE-DISK-FILES command is used to copy the contents of TEXT.1 once, TEXT.2 three times and TEXT.3 once to a file named TEXT.ALL.
- (5) The SHOW-FILE command displays the contents of TEXT.ALL. Output ends with statement "e" (END).

## 2.64 CONNECT-CMD-SERVER

Create/modify entry in operator command table

**Component:** BS2000 OSD/BC  
**Functional area:** Operator function control  
**Domain:** not allocated  
**Privileges:** OPERATING  
**Routing code:** K

### Function

The CONNECT-CMD-SERVER creates or modifies an entry in the command table. This entry links the command specified by means of CMD-NAME with a \$CONSOLE application, which then functions as the command server.

**i** The CONNECT-CMD-SERVER is only permitted for \$CONSOLE applications.

### Format

#### CONNECT-CMD-SERVER

**CMD = \*PARAMETERS (...)**

**\*PARAMETERS(...)**

- | **CMD-NAME** = <structured-name 1..30>
- | **,SAME-NAME** = **\*NONE** / list-poss(8): <structured-name 1..30>
- | **,AUTHORIZATION-CODE** = **\*STD** / <c-string 1..1>
- | **,PASSWORD-POSSIBLE** = **\*NO** / **\*YES**

**,SELECT = \*EXTERNAL-SERVER (...)**

**\*EXTERNAL-SERVER(...)**

- | **APPLICATION-NAME** = **\*OWN**
- | **,COMPLETION-CONTROL** = **\*NO** / **\*YES(...)**
- | **\*YES(...)**
- | | **QUESTION-POSSIBLE** = **\*YES** / **\*NO**

### Operands

**CMD = \*PARAMETERS(...)**

Defines a structure for the command for which an entry is to be created or modified.

---

**CMD-NAME = <text 1..30>**

Defines the full command name for which an entry in the command table is to be created or modified. The command name may be up to 30 characters long and must comply with the naming convention for command names.

**SAME-NAME =**

Defines aliases.

This operand is only relevant if a command is being defined. This operand is ignored when changing the attributes of commands that have already been entered.

**SAME-NAME = \*NONE**

The command may only be entered using the command name specified using CMD-NAME.

**SAME-NAME = list-poss(8): <text 1..30>**

Defines the set of aliases that may be used in place of the command name defined using CMD-NAME. An alias may be up to 30 characters long and must comply with the naming convention for command names.

**AUTHORIZATION-CODE =**

Defines the authorization code which a command issuer must have in order to use the command identified by CMD-NAME.

An authorization code can only be generated when a new entry in the command table is being created. This operand is ignored when an existing entry is being modified.

**AUTHORIZATION-CODE = \*STD**

This operand causes the specified command to be protected by the authorization code (default = E) defined in the class 2 system parameter NBACODE.

**AUTHORIZATION-CODE = <c-string 1..1>**

Explicit specification of an authorization code (A..Z, 0-9 or \*,#, @,\$).

**PASSWORD-POSSIBLE =**

Specifies whether SDF is to be called and passwords deleted before the command is logged in the CONSLOG file.

**PASSWORD-POSSIBLE = \*NO**

The command is not checked to see whether it contains a password before being entered to the CONSLOG file.

**PASSWORD-POSSIBLE = \*YES**

Causes SDF to be called in order to delete any passwords from the command before it is logged in the CONSLOG file.

This operand value is only to be used in connection with SDF commands whose operands are all explicitly defined in the SDF syntax file (syntax of each operand can be analyzed).

Passwords in special commands that are not contained in the SDF syntax file or whose operands are not explicitly defined will be included in the system CONSLOG file.

**SELECT = \*EXTERNAL-SERVER(...)**

The entry should refer to a special operator command. Special operator commands are commands which are executed in \$CONSOLE applications (authorized user programs).

**APPLICATION-NAME =**

Defines the name of the \$CONSOLE application.

---

**APPLICATION-NAME = \*OWN**

The entry is to be made for a special operator command for which the command issuer should also function as the command processor.

**COMPLETION-CONTROL =**

Specifies whether commands to be executed in \$CONSOLE applications can continue to be administered by the OPR subsystem once they have been passed to the application. This is always the case if the \$CONSOLE application executing the command informs the OPR subsystem that command processing has terminated.

**COMPLETION-CONTROL = \*NO**

The OPR subsystem considers the command involved to be terminated as soon as it has been passed to the executing application. Once the command has been passed on successfully, the OPR subsystem issues message NBR0768 to indicate command termination.

**COMPLETION-CONTROL = \*YES(...)**

The OPR subsystem does not consider the command involved to be terminated until it has received a command termination acknowledgment from the executing application. The OPR subsystem indicates command termination, as for normal operator commands, by issuing message NBR0740.

**QUESTION-POSSIBLE =**

Informs the system whether the application may ask questions regarding the command during command execution.

**QUESTION-POSSIBLE = \*YES**

The application may ask questions regarding the command during command execution. In this case, the job ID must be unique within the set of commands being processed by this application. Otherwise, the command is rejected.

**QUESTIONS-POSSIBLE = \*NO**

The application does not ask any questions regarding the command during command execution.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	NBR1125	Parameters only evaluated at initial logon
2	0	NBR1118	Command executed, but at least one SAME name rejected
	1	CMD0202	Syntax error
	64	NBR1113	Maximum number of links already reached
1	64	NBR1115	Semantic operand error
	64	NBR1119	Command permitted only for \$CONSOLE application
	64	NBR1124	Operand error connected with selected interface version

## 2.65 CONSOLE

Assign standby operator terminals

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** not allocated  
**Privileges:** OPERATING  
**Routing code:** \*

**i** If the “Operator LOGON” function is used (system parameter NBCONOPI=Y), the command is not available.  
In the mode without operator LOGON (NBCONOPI=N), the command is available.

### Function

The CONSOLE command changes the assignment of standby operator terminals or switches over to standby operator terminals. It also serves to cancel assignments and switchover operations.

#### *Restrictions*

The CONSOLE command can be issued from the main operator terminal only. (Any modification of the routing code '\*' for the command has no effect.)

The command is available in ISP format only; in other words, there are no SDF functions (such as syntax analysis or help).

### Format

Operation	Operanden
CONSOLE	{DEFINE, { REPLACEMENT=(mn1,mn2[,mn1,mn2,...] / ORIGINAL[={ mn / (mn,mn,...) / ALL }]} } /  SWITCH, { OFF=(mn / (mn,mn,...) / ON=(mn / (mn,mn,...)) } /  HELP[,CS={ (mn / (mn,mn,...) / ALL }]} }

---

## Operands

DEFINE Changes the assignment of standby operator terminals.

### REPLACEMENT

=(mn<sub>1</sub>,mn<sub>2</sub>[,mn<sub>1</sub>,mn<sub>2</sub>,...])

Operator terminal “mn<sub>1</sub>” is assigned standby operator terminal “mn<sub>2</sub>”. If more than 2 operator terminals are specified, the assignments are effected in pairs and in sequence. “mn” is the mnemonic device name of an operator terminal.

#### *Note*

TELESERVICE buffers cannot be assigned as standby operator terminals.

### ORIGINAL

=mn

=(mn,mn)

The operator terminals “mn” are assigned the standby operator terminals defined in the OPR parameter service.

=ALL

All operator terminals are assigned the standby operator terminals defined in the OPR parameter service.

If no operator terminal is specified, the main operator terminal is assigned the standby operator terminal defined in the OPR parameter service.

### SWITCH

Switches operator terminals over to their standby operator terminals or resets this switchover.

### OFF

=mn

=(mn,mn,...)

The operator terminals “mn” are switched over to their standby operator terminals. If only one operator terminal is available to the system, the command is rejected.

The main operator terminal is not permitted to switch itself off.

### ON

=mn

=(mn,mn,...)

The operator terminals “mn” regain their functions. The standby operator terminals are stripped of the functions of the reactivated operator terminals.

If the former main operator terminal is reactivated, it regains only its previous routing codes; the “main operator terminal” function is retained by the standby operator terminal.

### HELP

Provides information on the allocation of standby operator terminals defined in the OPR parameter service or by the CONSOLE command.

---

## CS

=mn

=(mn,  
mn,...)      Outputs the standby operator terminal allocation for the operator terminals "mn".

=ALL      Outputs the standby operator terminal allocation for all operator terminals.

If no operator terminal is specified, the standby operator terminal allocation of the main operator terminal is output.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Incorrect operand
	1	EXC0646	Incompatible operands
	1	EXC0648	Console names not specified in pairs by DEFINE operand
	64	EXC0647	Console has invalid console name
	64	EXC0649	TELESERVICE consoles may not be assigned as standby consoles
	64	EXC0654	Command may only be issued from main console
	64	NBR0710	Deactivation of main console not permitted

---

## 2.66 CONVERT-FILE-TO-PDF

Convert a text file to a PDF file

<b>Component:</b>	CONV2PDF
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE, SPOOL-PRINT-SERVICES, UTILITIES
<b>Privileges:</b>	STD-PROCESSING

### Function

The CONVERT-FILE-TO-PDF command converts text files (SAM or ISAM files and text-based library elements) to PDF files. These can then be easily read or printed out page by page using a PDF viewer (e.g. Adobe Reader) on a PC.

The user can also specify more than one text file in a command call. In addition, a list of files can also be read from a list file or CSV file. In this case, the files will be converted one after the other. The resulting messages contain the corresponding line number. All file names of a list are edited, even if an error occurs.

Output then takes place either to individual PDF files or to one combined PDF file. When a combined PDF file is used, bookmarks are automatically set for the start pages of the text files which have been converted. Further parameters enable the user to control the content and layout of the PDF file:

- processing records fully or only in part
- line spacing (existing print control characters are optionally interpreted)
- page size
- Character density
- margins
- font
- truncating or wrapping of long data lines
- background picture on the PDF pages

Alternatively, the user can also control the layout via spool parameters, as with the PRINT-DOCUMENT command.

It must be borne in mind that depending on the layout only a particular number of characters can be displayed in a line. Data lines which extend beyond the right-hand margin are truncated or optionally wrapped when a PDF file is created.

The data in the PDF file is compressed. File transfer must be performed in binary mode.

## Format

```

---

## Operands

**FROM-FILE = list-poss(16): <filename 1..54 with-wild(80)> / \*FROM-FILE(...) / \*FROM-CSV-FILE(...) / \*LIBRARY-ELEMENT(...)**

Name of the text file to be converted which exists either as a file or a library element. Multiple files or library elements can be specified using wildcards or in a list. Only SAM or ISAM files are accepted (except for SAM files with REC-FORM=U). \*FROM-FILE can also specify a list file containing the names of the text files to be converted. \*FROM-CSV-FILE can be used to specify a CSV file containing the names of the text files to be converted and the target files.

**FROM-FILE = \*FROM-FILE(...)**

The names of the files to be converted should be read from a list file. Each line of the list file contains exactly one (source) file name. It is not case-sensitive and spaces are ignored. Each file name is validated and, if there is no error, a PDF file is generated from this file. The PDF file has the same name as the source file with the extension .PDF.

If an error occurs, a message is output with the line number of the currently processed file name.

**LIST-FILE-NAME = <filename 1..54 without-gen-vers>**

Specifies the name of the list file.

**FROM-FILE = \*FROM-CSV-FILE(...)**

The names of the files to be converted should be read from a CSV file. Each line of the CSV file contains exactly 2 file names - source and destination files, separated by a comma or semicolon. It is not case-sensitive and spaces are ignored. Each source file name is validated and, if there is no error, a PDF file is created with the name of the respective destination file.

If an error occurs, a message is output with the line number of the currently processed file name.

**FROM-FILE = \*LIBRARY-ELEMENT(...)**

The specified element from a PLAM library is to be converted. An element is fully defined by its name, its type and its version.

The records of an element are assigned to particular record types. There are 255 record types. A distinction is drawn between user record types (1 through 159) and special record types (160 through 255). Only the user record types of an element can be converted to PDF.

**LIBRARY = <filename 1..54 without-vers>**

Name of the PLAM library from which an element is to be converted.

**ELEMENT = <composed-name 1..64 with-under with-wild(80)>(…)**

Name of the element to be converted. Multiple elements can be output using wildcards.

**VERSION = \*HIGHEST-EXISTING / \*UPPER-LIMIT / <composed-name 1..24 with-under with-wild(40)>**

The version of the element which is to be output. Default is \*HIGHEST-EXISTING, i.e. the last element in alphabetical order. If the version is specified in wildcard format, and if there are library elements with the same names to which the wildcard specification applies, then all of these library elements are output.

**BASE = \*STD / <composed-name 1..24 with-under with-wild(40)>**

Prefix for version selection. In conjunction with VERSION=\*HIGHEST-EXISTING this enables the highest version to be addressed with a particular prefix. BASE=\*STD has the same effect as BASE=\*

For detailed information on specifying the base, see the "LMS" manual [21].

---

**TYPE = <alphanum-name 1..8 with-wild (12)>**

The type of the library element to be output.

If specified in wildcard format, the name consists of a maximum of 12 alphanumeric characters.

**Note**

The records of LMS elements of type C, L or R belong to the special record types (160 through 255). That is the reason why no records of such elements can be converted.

**TO-FILE =**

Specifies the name of the PDF file to be created.

**TO-FILE = \*BY-SOURCE**

The name of a created PDF file consists of the name of the corresponding text file (file or element name) and the suffix "PDF". If an illegal file name results, the command is rejected.

**TO-FILE = \*CONCATENATE(...)**

All the text files (files or elements) specified are to be combined in one PDF file. In this case each text file starts on a new page.

**TO-FILE = <filename 1..54 without-gen>**

Name of the PDF file.

**BOOKMARK =**

Controls the setting of bookmarks in the PDF file.

**BOOKMARK = \*BY-SOURCE**

The start page of each of the text files is assigned a bookmark with the name of the text file (file or element name).

**BOOKMARK = \*NONE**

Suppresses the setting of bookmarks.

**BOOKMARK = list-poss(16): <filename 1..54 with-wild-constr(80)>**

The start page of each of the text files is assigned a bookmark with a name which is specified explicitly. When a list is specified, the names are set as bookmarks in the specified order. When a constructor string is specified, the bookmarks are mapped in accordance with the wildcard sequence specified in the FROM-FILE or ELEMENT-NAME operand.

**TO-FILE = list-poss(16): <filename 1..54 without-gen-vers with-wild-constr(80)>(…)**

Specifies the name(s) of the PDF file(s) explicitly. If wildcards are specified in FROM-FILE or ELEMENT-NAME, a constructor string can be specified for the PDF files.

The default for library elements is that the specified name is also assigned a suffix containing the type and version of the element (format: <to-file>.<version>.<type>). The creation of this suffix can also be controlled using the following operands:

**WITH-VERSION = \*STD / \*YES / \*NO**

*Evaluated only for library elements:*

Specifies whether the suffix should contain the element version. \*STD specifies \*YES as the default.

**WITH-TYPE = \*STD / \*YES / \*NO**

*Evaluated only for library elements:*

Specifies whether the suffix should contain the element type. \*STD specifies \*YES as the default.

---

**WRITE-MODE = \*CREATE / \*REPLACE-ONLY / \*ANY**

Determines the write mode for the PDF files which are to be created. The default value is \*CREATE, i.e. a new file is created. The command is rejected for a file which already exists.

**WRITE-MODE = \*REPLACE-ONLY**

The output file must already exist and is overwritten during conversion. If the file does not already exist, the command is rejected.

**WRITE-MODE = \*ANY**

A new output file is created. If the file already exists, it is overwritten.

**FILE-FORMAT = \*STD / \*SAM / \*PAM**

Determines the file format of the PDF file.

**i** An existing PDF file can be converted retroactively to the other file format using the SAM/PAM converter (which is called using the START-SAM-PAM-CONVERTER command, see the “BS2ZIP” manual [53]).

**FILE-FORMAT = \*STD**

Uses the file format which is defined in the SYSPAR.CONV2PDF parameter file. The parameter file is searched for at the following storage locations (search takes place in the specified order):

1. Caller's user ID
2. TSOS user ID

If no parameter file is found, FILE-FORMAT=\*SAM applies.

**i** You will find the template of a parameter file with the name SYSPAR.CONV2PDF.<version> under the installation ID of CONV2PDF.

**FILE-FORMAT = \*SAM**

The PDF file is created in SAM file format using REC-FORM=U.

**FILE-FORMAT = \*PAM**

The PDF file is created in PAM file format and BLOCK-CONTROL=NO. In this file format the PDF file can also be created as a node file.

**PRESENTATION = \*DIRECT-PARAMETERS(...) / \*SPOOL-PARAMETERS(...)**

Defines the layout of the PDF file. Direct specification of the layout properties is preset. Alternatively the layout can be determined by specifying pool parameters (as with print output).

**PRESENTATION = \*DIRECT-PARAMETERS(...)**

Specifies the layout of the PDF file directly.

**RECORD-PART = \*ALL / \*PARAMETERS(...)**

Defines whether the records of the text file are to be processed in full or if only a particular part of each record is to be processed.

When the default value \*ALL is specified, the records are processed in full.

**RECORD-PART = \*PARAMETERS(...)**

Specifies which part of the records is to be processed. Only the specified part is taken into account during conversion to PDF. This entry can be used, for example, to omit the ISAM key or control characters in the PDF file.

**FIRST-CHARACTER = 1 / <integer 2..32767>**

Allows a byte number (record column) to be specified indicating the point as of which the records of a file are to be output. The bytes of a record are numbered consecutively from left to right starting with 1; ISAM keys and control characters are components of a record.

**LAST-CHARACTER = \*STD / <integer 1..32767>**

Specifies the byte indicating the point at which processing of each record is to stop.

**LINE-SPACING = 1 / 2 / 3 / \*BY-EBCDIC-CONTROL(...) / \*BY-IBM-CONTROL(...) / \*BY-ASA-CONTROL(...)**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING= 1 / 2 / 3**

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL(...) / \*BY-IBM-CONTROL(...) / \*BY-ASA-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as EBCDIC, IBM or ASA feed control characters (refer to PRINT-DOCUMENT command).

**CONTROL-CHAR-POS = \*STD / <integer 1..2040>**

Number of the data byte which is interpreted as the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**PAGE-SIZE = \*A4 / \*A4-LANDSCAPE / \*A3 / \*A3-LANDSCAPE / \*A5 / \*A5-LANDSCAPE / \*PARAMETERS(...)**

Determines the page size of the PDF file:

Operand value	DIN format	Width x Height (mm)
*A4	DIN-A4	210 x 297
*A4-LANDSCAPE	DIN-A4 landscape	297 x 210
*A3	DIN-A3	297 x 420
*A3-LANDSCAPE	DIN-A3 landscape	420 x 297
*A5	DIN-A5	148 x 210
*A5-LANDSCAPE	DIN-A5 landscape	210 x 148
*PARAMETERS(...)	User-specific	max. 2040 x 2040

**PAGE-SIZE = \*PARAMETERS(...)**

Specifies the width and length of a PDF page explicitly.

**WIDTH = <integer 2..2040>**

Specifies the page width in mm.

**HEIGHT = <integer 2..2040>**

Specifies the page length in mm.

**MARGINS = \*PARAMETERS(...)**

Defines the distances to the margins.

---

**LEFT = 20 / <integer 0..2040>**

Specifies the distance to the left-hand margin in mm.

**RIGHT = 20 / <integer 0..2040>**

Specifies the distance to the right-hand margin in mm. Data lines which extend beyond the right-hand margin are truncated or wrapped according to the specification in the LINE-TRUNCATION operand.

**TOP = 20 / <integer 0..2040>**

Specifies the distance to the top margin in mm.

**BOTTOM = 20 / <integer 0..2040>**

Specifies the distance to the bottom margin in mm.

**DENSITY = \*PARAMETERS(...)**

Defines the line density.

**LINES-PER-INCH = 6 / <integer 3..24>**

Number of lines which are to be output per inch.

**FONT = \*PARAMETERS(...)**

Determines the font which is to be used.

**NAME = \*COURIER / \*HELVETICA / \*TIMES**

Specifies the name of the font.

**CHARACTER-STYLE = \*NORMAL / \*BOLD / \*ITALIC / \*BOLD-ITALIC**

Specifies the character style (normal, bold, italics, or bold and italics).

**SIZE = 8 / <integer 1..72>**

Specifies the font size in points (pt).

**LINE-TRUNCATION = \*YES / \*NO**

Specifies whether data lines which extend beyond the right-hand margin are truncated (see also definition of the right-hand margin in the MARGINS operand).

The default is \*YES, i.e. longer data lines are truncated. When data lines are truncated, a message to this effect is issued after conversion.

**LINE-TRUNCATION = \*NO**

Longer data lines are wrapped. The line break takes place at the word which extends beyond the margin. Thereby a word is a string which is limited by blanks, punctuation marks or the margin.

**OVERLAY = \*NONE / \*PARAMETERS(...)**

Specifies whether a background picture is to be used.

**OVERLAY = \*PARAMETERS(...)**

The PDF pages are to contain a background picture.

**FROM-FILE = <filename 1..54 without-gen-vers>**

File which contains the background picture.

**i** Only pictures in JPG format are supported. Transfer of the pictures from the PC to BS2000 must take place in binary format.

**FRAME = \*PAGE / \*TEXT / \*CUSTOM(...)**

Determines the frame in which the background picture is positioned.

---

**FRAME = \*PAGE**

The background picture is positioned within the physical page (determined by the specifications in the PAGE-SIZE operand).

**FRAME = \*TEXT**

The background picture is positioned within the text frame (determined by the specifications in the MARGINS operand).

**FRAME = \*CUSTOM(...)**

Defines a frame by means of the distances to the margins. This frame is independent of the text frame. However, the preset values are the same as the defaults in the PAGE-SIZE and MARGINS operands.

**LEFT = Q / <integer 0..2040>**

Specifies the distance to the left-hand margin in mm.

**RIGHT = Q / <integer 0..2040>**

Specifies the distance to the right-hand margin in mm.

**TOP = Q / <integer 0..2040>**

Specifies the distance to the top margin in mm.

**BOTTOM = Q / <integer 0..2040>**

Specifies the distance to the bottom margin in mm.

**HORIZONTAL-ALIGNMENT = \*LEFT / \*RIGHT / \*CENTER**

Determines the horizontal alignment of the picture within the frame.

**HORIZONTAL-ALIGNMENT = \*LEFT**

The picture is aligned with the left-hand margin of the frame.

**HORIZONTAL-ALIGNMENT = \*RIGHT**

The picture is aligned with the right-hand margin of the frame.

**HORIZONTAL-ALIGNMENT = \*CENTER**

The picture is centered horizontally in the frame.

**VERTICAL-ALIGNMENT = \*TOP / \*BOTTOM / \*CENTER**

Determines the vertical alignment of the picture within the frame.

**VERTICAL-ALIGNMENT = \*TOP**

The picture is aligned with the top.

**VERTICAL-ALIGNMENT = \*BOTTOM**

The picture is aligned with the bottom.

**VERTICAL-ALIGNMENT = \*CENTER**

The picture is centered vertically in the frame.

**SCALE = \*UNCHANGED**

Determines the size of the picture.

The default is \*UNCHANGED, i.e. the picture size is not changed.

**SCALE = \*FIT-HEIGHT**

The picture is fitted to the height of the frame.

---

**SCALE = \*FIT-WIDTH**

The picture is fitted to the width of the frame.

**SCALE = \*FIT-FRAME**

The picture is fitted to the height and width of the frame. If the relationships of scale of the frame and picture differ, the picture may be distorted.

**PRESENTATION = \*SPOOL-PARAMETERS(...)**

Specifies spool parameters which control the layout of the PDF file (analogously to print output with the PRINT-DOCUMENT command).

**RECORD-PART = \*ALL / \*PARAMETERS(...)**

Defines whether the records of the text file are to be processed in full or if only a particular part of each record is to be processed.

When the default value \*ALL is specified, the records are processed in full.

**RECORD-PART = \*PARAMETERS(...)**

Specifies which part of the records is to be processed. Only the specified part is taken into account during conversion to PDF. This entry can be used, for example, to omit the ISAM key or control characters in the PDF file.

**FIRST-CHARACTER = 1 / <integer 2..32767>**

Allows a byte number (record column) to be specified indicating the point as of which the records of a file are to be output. The bytes of a record are numbered consecutively from left to right starting with 1; ISAM keys and control characters are components of a record.

**LAST-CHARACTER = \*STD / <integer 1..32767>**

Specifies the byte indicating the point at which processing of each record is to stop.

**LINE-PER-PAGE = \*STD / <integer 1..32767>**

Specifies how many lines (including blank lines) are to be output on a page.

**LINE-PER-PAGE = \*STD**

If the operand is omitted, the number of lines per page is calculated using the following formula:

Number of lines = P \* L - N - 6

The name sections have the following meanings:

P = paper size in inches

L = line density

N = number of line before the first channel 1

If the value specified for the LINE-PER-PAGE operand is greater than the specified number of lines in the loop, the value in the loop is used.

**LINE-SPACING = 1 / 2 / 3 / \*BY-EBCDIC-CONTROL(...) / \*BY-IBM-CONTROL(...) / \*BY-ASA-CONTROL(...)**

Specifies the number of line feeds and the way in which control characters are interpreted.

**LINE-SPACING= 1 / 2 / 3**

The records are to be printed out with 1-, 2- or 3-line spacing.

**LINE-SPACING = \*BY-EBCDIC-CONTROL(...) / \*BY-IBM-CONTROL(...) / \*BY-ASA-CONTROL(...)**

The contents of the first byte of each record are to be interpreted as EBCDIC, IBM or ASA feed control characters (refer to PRINT-DOCUMENT command).

---

**CONTROL-CHAR-POS = \*STD / <integer 1..2040>**

Number of the data byte which is interpreted as the feed control character. In the case of records of variable length, the fields containing the length information are not counted as data.

**FORM-NAME = \*STD / <alphanum-name 1..6>**

Determines the page format of the PDF file by specifying the form. The spool parameter file must contain a standard form for the printer type HP-90.

The default setting \*STD causes the standard form STD to be used for the printer type specified in the PRINTER-TYPE operand.

**FORM-NAME = <alphanum-name 1..6>**

Name of the form. Depending on the ROTATION operand, either the normal loop or the loop for page rotation from the form definition is used.

A loop is named implicitly in the form specification. The assigned loop must be contained in the printer control file \$SYSSPOOL.PRFILE.

The loop named implicitly via the FORM-NAME operand is ignored if the LOOP-NAME operand is specified at the same time.

When FORM-NAME=\*STD and LOOP-NAME=\*STD, the standard form entered for the specified printer is used.

Forms are created with the SPSERVE utility routine. The SHOW-SPOOL-FORMS command displays information on forms.

**LOOP-NAME = \*STD / <alphanum-name 1..3>**

Name of the loop to be loaded into the feed information buffer (VFB/FCB).

The loop name must not include the characters '\$', '&' or '@'.

The default setting \*STD causes the form's default loop to be used for the specified printer type.

Loops are stored in the PRFILE printer control file. They are created and managed using the PRM utility routine.

**LOOP-NAME = <alphanum-name 1..3>**

Name of the loop which is to control line feed. The length of the specified loop must match the length of the default loop of the form used.

A loop for LP- HP printers is selected from the PRFILE in accordance with the specification in the PRINTER-TYPE operand.

**CHARACTER-SET = \*STD / <alphanum-name 1..3>**

Name of the font which is to be used for conversion.

Courier is the font which is always used. Only the font properties WEIGHT and CHARACTER-STYLE are evaluated for PDF conversion.

The table below shows the character style resulting from this (see the CHARACTER-STYLE operand in the direct parameters):

Font property WEIGTH=	Font property CHARACTER-STYLE=	
	*ITALICS	Other value
*BOLD	*BOLD-ITALICS	*BOLD
Other value	*ITALICS	*NORMAL

---

The default setting \*STD causes the standard font to be used for the specified printer type. It can be displayed by means of SHOW-SPOOL-FORMS.

Fonts are created with the SPSERVE utility routine. The SHOW-SPOOL-CHARACTER-SETS displays information on the fonts.

**PRINTER-TYPE = \*HP90-PRINTER / \*HP-PRINTER / \*LP-PRINTER**

Determines which form is to be used for PDF conversion via the printer type.

**PRINTER-TYPE = \*HP90-PRINTER**

The form for HP90 printers is used.

**PRINTER-TYPE = \*HP-PRINTER**

The form for HP printers is used.

**PRINTER-TYPE = \*LP-PRINTER**

The form for LP printers is used.

**LEFT-MARGIN = 20 / <integer 0..2040>**

The output text is to be indented from the left margin by the specified number of millimeters. An indent of 20 millimeters is preset.

**ROTATION = \*NO / \*YES**

Specifies whether page rotation is to be executed.

**ROTATION = \*NO**

Page rotation is not performed. Any control characters for page rotation in the file are not interpreted. The loop for conversion is determined as follows:

- When a loop is specified explicitly in the LOOP-NAME operand, the specified loop is used.
- If no loop was specified (corresponds to LOOP=\*STD), the form definition is evaluated:
  - If a form was specified in the FORM operand, the loop defined for VERTICAL-CONTROL is used.
  - If no form was specified (corresponds to FORM=\*STD), the standard form for the corresponding printer type (see the PRINTER-TYPE operand) is evaluated and the loop defined for VERTICAL-CONTROL is used.

**ROTATION = \*YES**

Page rotation is executed. Any control characters for page rotation contained in the file are evaluated. The loop for conversion is determined as follows:

- When a loop is specified explicitly in the LOOP-NAME operand, the specified loop is used.
- If no loop was specified (corresponds to LOOP=\*STD), the form definition is evaluated:
  - If a form was specified in the FORM operand, the loop defined for ROTATION-CONTROL is used.
  - If no form was specified (corresponds to FORM=\*STD), the standard form for the corresponding printer type (see the PRINTER-TYPE operand) is evaluated and the loop defined for VERTICAL-CONTROL is used.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	1	CMD0202	Syntax or semantic error in command

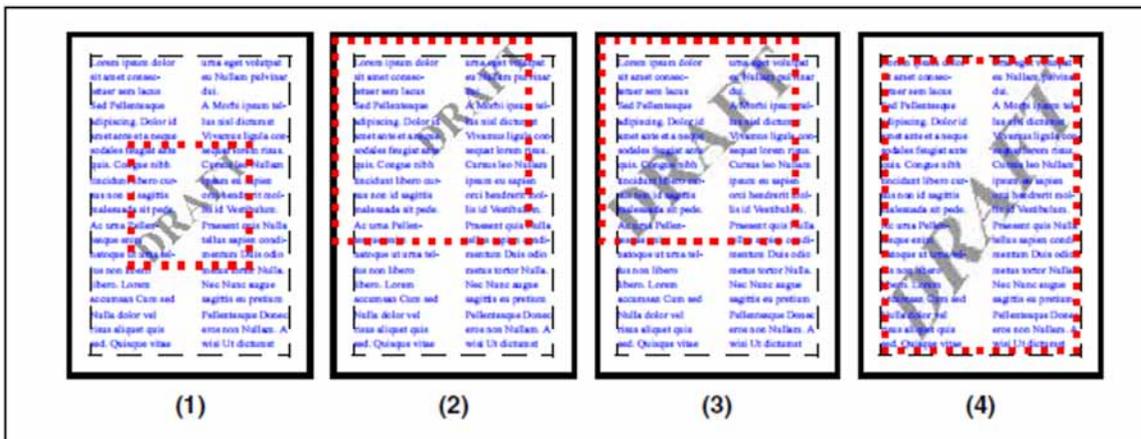

## Note

The CCS of the specified file is used for conversion. If no file-specific CCS is defined, the CCS defined for the user ID is used. If there is no user-specific CCS, the defined system-global CCS is used.

Only those characters from the CCS are displayed which are also contained in the Windows Code Page WCP1252P (see the "XHCS" manual [51]).

## Examples of how the OVERLAY operand is used

The figure below shows four examples of PDF pages on which the background picture draft.jpg is used:

- (1) Positions the background picture draft.jpg in its original size (70 x 70 mm) in the center of the page. Specification in the OVERLAY operand:

```
overlay=*par(from-file=draft.jpg, frame=*page,
horizontal-alignment=*center, vertical-alignment=*center)
```

- (2) Positions the background picture draft.jpg in its original size at the top right in a user-specific frame. The frame is square (130 x 130 mm) and begins at the top left of the DIN A4 page. Specification in the OVERLAY operand:

```
overlay=*par(from-file=draft.jpg,
frame=*custom(left=0,right=80,top=0,bottom=167),
horizontal-alignment=*right, vertical-alignment=*top)
```

- 
- (3) Positions the background picture draft.jpg in the same user-specific frame as in example 2. Here the picture is fitted to the frame size. As the scale of the frame matches that of the picture, no distortion occurs. Specification in the OVERLAY operand:

```
overlay=*par(from-file=draft.jpg,  
             frame=*custom(left=0,right=80,top=0,bottom=167), SCALE=*FIT-FRAME)
```

- (4) Positions the background picture draft.jpg in the text frame and fits the picture to the frame size. In the case of a DIN A4 page with 20 mm spacing, the text frame is 170 mm wide and 257 mm high. As this scale does not match that of the picture, distortion occurs here. Specification in the OVERLAY operand:

```
overlay=*par(from-file=draft.jpg, frame=*text, SCALE=*FIT-FRAME)
```

---

## 2.67 COPY-FILE

Copy files

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	TSOS SECURITY-ADMINISTRATION SAT-FILE-MANAGEMENT SAT-FILE-EVALUATION STD-PROCESSING HARDWARE-MAINTENANCE
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The COPY-FILE command copies files, file generations or file generation groups one block at a time, without changing them. The command can therefore not be used to modify file attributes. For example, a SAM file cannot be converted to an ISAM file, nor can fixed-length records be changed to variable-length ones.

It is, however, possible to change the BLOCK-CONTROL-INFO file attribute (see the BLOCK-CONTROL-INFO operand).

Tape files with BLOCK-CONTROL-INFO=\*PAMKEY must, therefore, have the default block format so that they can be processed using COPY-FILE.

If the target file (copy) is not yet cataloged, it is automatically created on a public volume when the COPY-FILE command is executed (as with a CREATE-FILE command with default values for the specified target file).

If the target file is to be stored on a different volume (Net-Storage volume, private disk or tape), it must be created using the CREATE-FILE command (DEVICE-TYPE, VOLUME operands) before the COPY-FILE command is issued.

If the target file is a SAM node file, the net coded character set can be assigned in the CREATE-FILE command. This is the character set used to store the data of the node file on Net-Storage. When the SAM file is then copied from public space to Net-Storage, the net coded character set of the target file is retained.

If a SAM node file is copied into a SAM node file, the net coded character set of the source file is adopted for the target file as well. If a SAM node file is copied to public space, the net coded character set is not adopted for the SAM file on public space.

The COPY-FILE command uses the internal file link names DMCOPY11 (FROM-FILE) and DMCOPY22 (TO-FILE). Both of these two link names are released again after processing, even if the user explicitly specified them.

Thus, if wildcards are used in the file name, any existing TFT entry is applicable only during copying of the first file to be processed.

If the target file is a disk file which has not yet been cataloged, the primary and secondary allocations are taken from the original disk file (see also the CREATE-FILE command, PRIMARY-ALLOCATION operand). If the original file is on tape, the target disk file will be given a default allocation.

---

The COPY-FILE command will be rejected if the target file is a read-only file (ACCESS=READ or no write authorization when access is controlled using BASIC-ACL or GUARDS), if a password has been specified to protect it against unauthorized write access, if a retention period (*EXPIR-DATE* > today's date) has been specified for it, or if the secondary allocation for the output file has a null value and the primary allocation is insufficient.

The user may specify whether the protection attributes of the original file are to be transferred to the target file (PROTECTION operand).

#### *Privileged functions*

A user working with the TSOS privilege can select the IGNORE-PROTECTION operand to explicitly circumvent any file protection on the source and target files which would prevent copying of the file.

#### *Verifying command execution*

The user can verify command execution. Use of the verification mechanisms is particularly helpful when a set of files is specified (using a partially qualified file name or wildcards).

The REPLACE-OLD-FILES operand governs whether a verification check is carried out before an existing target file is overwritten.

The DIALOG-CONTROL operand governs whether a verification dialog is to be conducted with the user. The OUTPUT operand lets the user specify whether each file name that is processed is to be logged in a guaranteed message to SYSOUT. The processed file names can be viewed in the message stream (see the ASSIGN-STREAM command, STREAM-NAME=SYSMSG operand, or the EXECUTE-CMD command, MSG-STRUCTURE-OUTPUT operand, in the "SDF-P" manual [34]).

#### *File generation groups*

A file generation group can be copied into another file generation group only if one of the following conditions is fulfilled:

1. The group entries for the two file generation groups match each other (i.e. the values for *MAXIMUM*, *FIRST-GEN*, *LAST-GEN* and *BASE-NUM* in the catalog entry are the same). In the file generation group into which DMS is to write the copy, the generations from *FIRST-GEN* to *LAST-GEN* must already be cataloged.
2. The value for *MAXIMUM* is the same for both file generation groups, and the file generation group into which DMS is to write the copy contains no generations (i.e. the fields *FIRST-GEN*, *LAST-GEN* and *BASE-NUM* in the catalog entry have the value zero).

A file generation group which is to be copied may not contain any generations on tape.

A file generation group can only be copied into a single file or a file generation if it consists of SAM file generations which have the same attributes (e.g. same record and block lengths, same record format, same BLK-CONTR value). Furthermore, the target file generation must not be part of the file generation group which is to be copied.

#### *Files held on private disks*

If a file on a private disk has an entry in the system catalog, but no entry in the F1 label, the catalog entry is deleted when the file is copied. If this file is the input file, the command is rejected. If it is the target file, a new file is created in public space. Any COPY-FILE command for an ISAM file held on private disk with separate index and data areas will be rejected.

---

### *Tape files*

- K tape files. Tape files for which *BLK-CONTR=PAMKEY* must have the standard block format (catalog entry *BUF-LEN=STD(n)* if the COPY-FILE command is to be used on them).
- NK tape files. Tape files for which *BLK-CONTR=DATA/NO* and for which the BUF-LEN value is a multiple of 2048 bytes can be copied.
- External files on tape. When NK files are copied to tape, the BLK-CONTR information is removed if the catalog entry is deleted. If a tape file is to be copied which is not cataloged, it must first be cataloged by an IMPORT-FILE command. If the file is an NK file (*BLK-CONTR=DATA/NO*), the user must supply the correct BLOCK-CONTROL-INFO operand in the ADD-FILE-LINK command, i.e. he must specify BLOCK-CONTROL-INFO=\*NO /\*WITHIN-DATA-BLOCK to correspond to the actual file format, and must specify LINK-NAME = DMCOPY11 and the ACCESS-METHOD operand.

If a K file (*BLK-CONTR=PAMKEY*) is inadvertently copied as an NK file (*BLK-CONTR= DATA*), the resulting disk file will be unreadable; this is because the first 16 bytes on each PAM page, which for *BLK-CONTR=PAMKEY* would hold data, will have been overwritten with management information.

Internally, the COPY-FILE command uses the access method UPAM, which does not support the processing of continuation tapes. It is thus possible to copy several files to one tape. It is not possible, however, to copy files which extend across multiple tapes.

### *PLAM libraries*

PLAM libraries can only be copied if the library does not contain any specially protected data (see the “LMS” manual [21]).

A PLAM library protected by BASIC-ACL or GUARDS in a remote system cannot be copied.

### *Remote file access (see the “RFA” manual [31])*

Copying from one remote system to another, with the input and output on different systems, is supported by a higher-level execution routine. The local system acts, in this case, only as an intermediate station for data transfer.

A SET-RFA-CONNECTION command must be issued for both of the remote systems before copying is started.

When a remote file is copied to a local one with the operand PROTECTION=\*SAME, the passwords will not be transferred.

If different versions of BS2000, the following basic rules apply:

- The COPY-FILE should be issued on the system with the highest version.
- The file should be converted appropriately, either before or afterwards, using the PAMCONV utility.
- The specified operands must be supported by the operating system version of the remote system.
- If a file is to be copied from one remote system to another and I/O on two different systems is involved, the operation is supported by the higher-ranking execution routine. The local system serves as an intermediate system for data transfer.
- The SET-RFA-CONNECTION command must be issued for both remote systems before copying starts.

## File encryption

Normally it is not necessary to enter the crypto password in the task's crypto password table in order to copy encrypted files as the file content is transferred without being decrypted.

Decryption during copying is required for the following copying operations:

- Encrypted files are copied to tape or private disk.
- Shared update processing was defined in the TFT entry of the internal file link name DMCOPY11 or DMCOPY22 (see the ADD-FILE-LINK command).

## Format

<b>COPY-FILE</b>	Alias: <b>CPF</b>
<b>FROM-FILE</b> = <filename 1..54 with-wild(80)>	
, <b>TO-FILE</b> = <filename 1..54 with-wild-constr(80)>	
, <b>PROTECTION</b> = <u>*STD</u> / *SAME	
, <b>CHANGE-DATE</b> = <u>*STD</u> / *SAME	
, <b>REPLACE-OLD-FILES</b> = <u>*YES</u> / *NO / *BY-DIALOG	
, <b>BLOCK-CONTROL-INFO</b> = <u>*KEEP-ATTRIBUTE</u> / *IGNORE-ATTRIBUTE / *CHECK-REMOVAL	
, <b>IGNORE-PROTECTION</b> = <u>*NO</u> / list-poss(2): *SOURCE-FILE / *TARGET-FILE	
, <b>DIALOG-CONTROL</b> = <u>STD</u> / *NO / *ERROR / *FILE-CHANGE / *MORE-THAN-ONE-FILE / *USER-ID-CHANGE / *CATALOG-CHANGE	
, <b>OUTPUT</b> = <u>*NO</u> / *SYSOUT	

## Operands

### **FROM-FILE = <filename 1..54 with-wild(80)>**

Name of the file, file generation or file generation group which is to be copied (the original file). If the file name includes wildcards, or if the specification is partially qualified, the command is executed for the associated set of files. Processing can be controlled and verified with the aid of the DIALOG-CONTROL and OUTPUT operands. Only systems support is allowed to use wildcards within the user ID. If the original file (FROM-FILE) is not cataloged under the user ID for the job, the relevant user ID must be specified in the command, and the user ID under which the command is called must be authorized to access this file/file generation/FGG (USER-ACCESS= ALL-USERS, or read access rights using BASIC-ACL or GUARDS, or co-owner).

If the original file is a file generation group, the target file (TO-FILE) must also be an FGG (with the sole exception of an FGG (FROM-FILE) which consists of SAM file generations which all have the same attributes for record format, record and block length, and the block control information). In this case only, it is possible to copy into a single file or file generation. The target file generation may not be a constituent of the file generation group which is being copied.

---

**TO-FILE = <filename 1..54 with-wild-constr(80)>**

Name of the file, file generation or file generation group into which the copy is to be made (the target file). If a set of files has been specified in the FROM-FILE operand, a constructor string can be used to specify how the names of the target files are to be formed. The constructor string should be designed to ensure that the names of the target files are unique. If, for example, a fully qualified file name is specified as the target file for a set of files, the first source file will be copied to this file. For the following source files, the target file will already exist. Depending on the setting of the REPLACE-OLD-FILES operand, either every subsequent source file will likewise be copied to the target file, or copying will be rejected. When processing of the command is complete, the target file will hold the contents either of the first source file or of the last source file.

If the target file has not yet been cataloged, then only the user's own ID (the one under which the SET-LOGON-PARAMETERS command was issued) or a user ID for which the user is co-owner may be specified. If a target file which has not yet been cataloged is to be stored on an SM pubset, the system attempts to locate it on a suitable volume set on the basis of the source file's attributes (performance, availability). If the target file is already cataloged under another user's ID, this user ID must be specified, and the user ID under which the command is called must be authorized to access this file (i.e. USER-ACCESS=ALL-USERS or the appropriate access rights using BASIC-ACL or GUARDS must have been assigned).

If the target file is a file generation group, then the original file must also be a file generation group.

If the file is to be copied to a private volume, then the target file must have been appropriately cataloged beforehand (CREATE-FILE).

The COPY-FILE command will be rejected in the following cases:

- if the target file may only be read; i.e. if ACCESS=READ is defined or if write access is prohibited using BASIC-ACL or GUARDS;
- if there is still a retention period applicable to the file (*EXPIR-DATE* > current date);
- if the target file is password-protected against unauthorized write access;
- if the primary allocation for a target file on disk is insufficient and the secondary allocation is defined as 0.

**PROTECTION = \*STD / \*SAME**

Specifies whether the same attributes for file protection and file security are to be set up for the target file as for the original one.

The coding table entered in the catalog (*COD-CH-SET*) is always entered in the catalog entry of the target file.

The performance attributes of the source file are **not** transferred (see output fields *IO(PERF)*, *IO(USAGE)*, *DISK-WRITE*, SHOW-FILE-ATTRIBUTES command).

**PROTECTION = \*STD**

Specifies that the attributes of the original file for file protection and file security should *not* be applied to the target file. If the target file is to be newly created, it will be given the default attributes arising from the CREATE-FILE command. If the target file already exists, it will retain its previous protection attributes.

**PROTECTION = \*SAME**

The target file is assigned the same file security and protection attributes as the source file (i.e. for *BACKUP-CLASS*, *SAVED-PAG*, *NUM-OF-BACKUP-VERS*, *EXPIR-DATE*, *EXPIR-TIME*, *DESTROY*, *FREE-FOR-DEL*, *MANAGE-CLASS*, *USER-ACC*, *ACCESS*, and the same passwords). The AUDIT value and the lock to prevent the release of memory space (*SP-REL-LOCK=YES*) are not transferred. For a BASIC-ACL and defined GUARDS, a distinction must be made between the following cases:

- Target file on public disk or Net-Storage volume:  
The file protection attributes set with BASIC-ACL or GUARDS are transferred.

- Target file on private disk:  
If access is controlled by a GUARDS, system default attributes are set (USER-ACCESS=OWNER-ONLY, ACCESS=WRITE). If the file is only protected by a BASIC-ACL, the BASIC-ACL is transferred.
- Target file on tape:  
Protection attributes are always set to system default values (USER-ACCESS=ALL-USERS, ACCESS=WRITE).

The operand value PROTECTION=\*SAME will be ignored in the following cases:

- The target file is a temporary file.
- The target file is a file generation (for which the attributes for protection and security are defined in the group entry).
- A nonprivileged user specifies a target file with a foreign user ID.

As management classes are subset-specific they can only be taken over if the source and target files reside on the same subset. When copying to another subset an existing target file retains its management class; a new target file is assigned MANAGEMENT-CLASS=\*NONE (as with PROTECTION=\*STD).

If a temporary file is copied into a permanent one and PROTECTION=\*SAME is specified, the permanent file will be given the attribute BACKUP=E, i.e. the new file will be ignored when ARCHIVE backups are carried out. The value for BACKUP must be amended by a MODIFY-FILE-ATTRIBUTES command if the file is to be backed up automatically during ARCHIVE runs.

If a permanent file is copied into a temporary one and PROTECTION=\*SAME is specified, the permanent file will be given the attribute NUM-OF-BACKUP-VERS=0, i.e. the new file will be ignored during next version backups.

If a temporary file is copied into a permanent one, it will be given the attribute NUM-OF-BACKUP-VERS=0, i.e. the new file will be ignored when version backups are carried out. If the file is to be included into version backup, the value > 0 must be specified by a MODIFY-FILE-ATTRIBUTES command.

The following applies for nonprivileged users when copying from a foreign user ID: If the original file is protected with BASIC-ACL or GUARDS (see the "SECOS" manual [35]), the target file's protection attributes USER-ACCESS, ACCESS, BASIC-ACL, and GUARDS are set to system default values (see the CREATE-FILE command).

#### **CHANGE-DATE = \*STD / \*SAME**

Specifies whether the target file is to be given the same change date (CHANGE-DATE) as the source file.

#### **CHANGE-DATE = \*STD**

The change date of the target file will be updated.

#### **CHANGE-DATE = \*SAME**

The change date of the source file will be transferred to the target file. The specification will apply in the following cases:

- The target file resides under a foreign user ID.
- The target file is a file generation.

---

**REPLACE-OLD-FILES = \*YES / \*NO / \*BY-DIALOG**

The user can specify here whether, if there is already a file cataloged under the name of the target file, it should be overwritten or whether the system should ask at execution time whether to overwrite any such file (REPLACE-OLD-FILES=\*BY-DIALOG).

In *batch mode*, REPLACE-OLD-FILES=\*NO always applies.

If the target file is a *tape file*, the operand REPLACE-OLD-FILES will be ignored. Any existing *tape file* with the same name will be overwritten with no message.

If the target file is *empty*, it will be overwritten without any message.

**REPLACE-OLD-FILES = \*YES**

Specifies that any existing disk file should be overwritten without any message.

**REPLACE-OLD-FILES = \*NO**

Any existing file will not be overwritten. The command is rejected. In procedures error handling is triggered (spin-off mechanism in non-S procedures or SDF-P error handling in S procedures).

**REPLACE-OLD-FILES = \*BY-DIALOG**

The operand value \*BY-DIALOG will only have any effect in interactive mode. It allows the user to decide in an interactive dialog with the system, whether to overwrite an existing target file or not. The query "OVERWRITE (Y /N?)" will be displayed. If the reply is "Y", the target file will be overwritten without any further message.

If the reply is "N", the target file is not overwritten and a message to this effect is issued.

**BLOCK-CONTROL-INFO = \*KEEP-ATTRIBUTE / \*IGNORE-ATTRIBUTE / \*CHECK-REMOVAL**

Specifies whether there may be any difference in the file attribute BLOCK-CONTROL-INFO (*BLK-CONTR*) for the original and target files (or in the TFT entry DMCOPY22).

During copying, data is transferred in blocks, i.e. without regard to the internal block structure of the file. For this reason, a file in K format (*BLK-CONTR=PAMKEY*) should not be copied into a file in NK format (*BLK-CONTR=DATA* or *NO*), or vice versa. Such transfers should be carried out using a utility routine which takes into account the internal block structure of the file (e.g. PERCON, PAMCONV).

\*KEEP-ATTRIBUTE is the default setting, i.e. both files (or the TFT entry for DMCOPY22) must have the same BLOCK-CONTROL-INFO attribute.

However, for files whose internal block structure does not depend on the BLOCK-CONTROL-INFO attribute, copying can be permitted (e.g. PLAM libraries). By specifying the operand values IGNORE-ATTRIBUTE or CHECK-REMOVAL, differing BLOCK-CONTROL-INFO attributes can be accepted.

It is recommended that BLOCK-CONTROL-INFO=\*CHECK-REMOVAL is specified if the operand BLOCK-CONTROL-INFO has earlier been defined by an /ADD-FILE-LINK LINK-NAME=DMCOPY22 command.

**BLOCK-CONTROL-INFO = \*KEEP-ATTRIBUTE**

This attribute in the TFT entry for the target file, or in its catalog entry as appropriate, must match that for the original file. If this is not the case, the command is rejected.

**BLOCK-CONTROL-INFO = \*IGNORE-ATTRIBUTE**

Allows any differences in the BLOCK-CONTROL-INFO attribute to be ignored in particular cases.

When a source file (*BLK-CONTR=PAMKEY*) is being copied to a file for which the BLOCK-CONTROL information is specified as *BLK-CONTR=NO* or *BLK-CONTR=DATA*, the PAM key will **not** be checked for possible user data.

This user data in the PAM key will no longer be available in the target file. If *BLK-CONTR=DATA* is specified for the target file, the first twelve bytes of each logical block which is copied will be overwritten with the BLOCK-CONTROL information.

Copying is possible in the following cases:

<b>BLOCK-CONTROL-INFO in the output field BLK-CONTR (SHOW-FILE-ATTRIBUTES)</b>	
<b>Original file</b>	<b>Target file</b>
PAMKEY	DATA (disk file only)
PAMKEY	NO
DATA (disk file only)	PAMKEY
NO	PAMKEY

**BLOCK-CONTROL-INFO = \*CHECK-REMOVAL**

Any differences in the BLOCK-CONTROL-INFO attribute will only be ignored if no user data would be lost from the PAM key during copying. When an original file for which the BLOCK-CONTROL-INFO attribute is *BLK-CONTR=PAMKEY* is being copied into a target file in NK format (*BLK-CONTR=DATA* or *NO*), the PAM keys will be checked for user data. If the user part of the PAM key does contain data, then the COPY-FILE command will be rejected. This ensures that no user data will be lost.

Copying is possible in the following cases (if no user data is lost):

<b>BLOCK-CONTROL-INFO in the output field BLK-CONTR (SHOW-FILE-ATTRIBUTES)</b>	
<b>Original file</b>	<b>Target file</b>
PAMKEY	DATA (disk file only)
PAMKEY	NO

**IGNORE-PROTECTION = \*NO / \*SOURCE-FILE / \*TARGET-FILE**

Specifies whether systems support wishes to circumvent the file protection, and if so for which file.

**IGNORE-PROTECTION = \*NO**

The default option is that the existing file protection on the source and destination files will be observed.

**IGNORE-PROTECTION = \*SOURCE-FILE**

The protection attributes of the source file, which the file's owner declared when creating the file, are to be ignored for privileged users (system administration). The protection may be by READ or EXEC-PASSWORD attributes, and by enhanced protection measures using BASIC-ACL or GUARDS.

**IGNORE-PROTECTION = \*TARGET-FILE**

For privileged users (systems support), the protection attributes of the destination file are to be ignored when the source file is copied. The protection may be by ACCESS- or EXPIRATION-DATE, READ-/WRITE- or EXEC-PASSWORD attributes, and by enhanced protection measures using BASIC-ACL or GUARDS.

---

**DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*FILE-CHANGE / \*MORE-THAN-ONE-FILE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during command execution. The verification dialog allows you to monitor the progress of the command and to take action if necessary. A control dialog is only possible in interactive mode but, in this mode, may also be used in procedures. In batch mode, all operand values have the same effect as \*NO.

If one of the events (apart from \*ERROR) specified in the DIALOG-CONTROL operand occurs, a verification dialog is initiated. Message DMS0810 is issued, asking you whether you want the command to be executed for the shown file or file set. The SDF abbreviation rules apply to the entered response. To display the possible responses, enter a question mark.

*Syntax of replies to message DMS0810 (verification dialog):*

*possible replies:* \*YES(...) / \*NO(...) / \*TERMINATE

\*YES(...)

| **DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /**  
| **\*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**  
| **,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT**

\*NO(...)

| **DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /**  
| **\*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**  
| **,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT**

---

### *Meaning of the operands*

The meaning of the DIALOG-CONTROL and OUTPUT suboperands is the same as that of the corresponding main command operands. The operand value \*UNCHANGED leaves the previous setting unchanged.

#### **Reply \*YES(...)**

The set of files listed in the message is processed. If you specify a new value in the DIALOG-CONTROL operand which calls for a reduction in the size of the set of files listed in the message (e.g. changing \*CATALOG-CHANGE to \*FILE-CHANGE), the file set is first slimmed down to reflect the new value, and then a second verification dialog is conducted for the reduced set of files.

The meaning of the DIALOG-CONTROL and OUTPUT suboperands is the same as that of the corresponding main command operands.

#### **Reply \*NO(...)**

The set of files listed in the message is not processed. If you change the DIALOG-CONTROL operand, the verification check is not repeated until the next time the associated event occurs. If there are other files to process before the event occurs, they will be processed without verification.

#### **Reply \*TERMINATE**

The set of files listed in the message is not processed and processing of the command terminates. Within a procedure, error handling (spin-off or SDF-P error handling) is initiated.

If an error occurs while one of the selected files is being processed and DIALOG-CONTROL has a setting other than \*NO, an error verification dialog is initiated. Guaranteed message DMS0812 shows you the names of the source and target files in question and the DMS error code. You are then asked by message DMS0813 whether and if so how command execution is to continue. The SDF abbreviation rules apply to the entered response. To display the possible responses, enter a question mark.

*Syntax of replies to message DMS0813 (error verification dialog)*

*possible replies:* \*YES(...) / \*RETRY(...) / \*NO / \*SKIP-CATALOG(...) / \*SKIP-USER-ID(...)

**\*YES(...)**

| **DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /**  
| **\*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**  
| **,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT**

**\*RETRY(...)**

| **DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /**  
| **\*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**  
| **,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT**

**\*SKIP-CATALOG(...)**

| **DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /**  
| **\*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**  
| **,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT**

**\*SKIP-USER-ID(...)**

| **DIALOG-CONTROL = \*UNCHANGED / \*NO / \*ERROR / \*MORE-THAN-ONE-FILE /**  
| **\*FILE-CHANGE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**  
| **,OUTPUT = \*UNCHANGED / \*NO / \*SYSOUT**

*Meaning of the operands*

The meaning of the DIALOG-CONTROL and OUTPUT suboperands is the same as that of the corresponding main command operands. The operand value \*UNCHANGED leaves the previous setting unchanged.

**Reply \*YES(...)**

Processing is to continue with the next file name.

**Reply \*RETRY(...)**

Processing is to be retried for the same file name.

**Reply \*SKIP-CATALOG(...)**

Processing is to continue with the file names from the next selected catalog. This selection only makes sense if wildcards were used in the catalog ID.

**Reply \*SKIP-USER-ID(...)**

Processing is to continue with the file names from the next selected user ID. If file names of a user ID on different pubsets have been selected, processing is to continue with the file names from the next selected catalog ID. This selection only makes sense if wildcards were used in the user or catalog ID.

---

**DIALOG-CONTROL = \*STD**

The default \*STD setting is equivalent to \*MORE-THAN-ONE-FILE in an interactive dialog (when SYSCMD is connected to the terminal) and to \*NO in procedures and in batch mode.

**DIALOG-CONTROL = \*NO**

All the selected files are processed without an opportunity for the user to intervene.

**DIALOG-CONTROL = \*MORE-THAN-ONE-FILE**

A verification dialog is initiated if more than one file has been selected.

The verification query is issued for each of the selected files. If the catalog and/or user ID contains wildcards, the query is issued for each catalog and/or user ID.

DIALOG-CONTROL=\*ERROR also applies implicitly.

**DIALOG-CONTROL = \*ERROR**

An error verification dialog is initiated if an error occurs while one of the selected file names is being processed.

**DIALOG-CONTROL = \*FILE-CHANGE**

A verification dialog is initiated for each selected file name. DIALOG-CONTROL=\*ERROR also applies implicitly.

**DIALOG-CONTROL = \*CATALOG-CHANGE**

The verification query is issued for all the selected file names in a catalog. DIALOG-CONTROL=\*ERROR also applies implicitly.

**DIALOG-CONTROL = \*USER-ID-CHANGE**

The verification query is issued for all the selected file names of a user ID within a catalog. DIALOG-CONTROL=\*ERROR also applies implicitly.

**OUTPUT = \*NO / \*SYSOUT**

Specifies whether the names of processed files are to be logged on SYSOUT.

**OUTPUT = \*NO**

Only any errors that occur are logged on SYSOUT.

**OUTPUT = \*SYSOUT**

The names of processed files and any errors that occur are logged on SYSOUT (guaranteed messages DMS0816 and DMS0812).

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	DMS0546	Catalog entry for specified file has reached maximum size
2	0	DMS054A	Insufficient disk space or access to disk not possible
2	0	DMS05F5	Some blocks of the source file could not be copied.
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing.
	32	DMS05C7	Unexpected internal error in DMS
	64	DMS0585	Error detected when processing catalog or multiprocessor system. Guaranteed message: DMS053C
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Privilege error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051A	File already exists Guaranteed message: DMS051A
	64	DMS051B	Requested user ID not in pubset Guaranteed message: DMS051B
	64	DMS051C	User not authorized to access pubset Guaranteed message: DMS051C
	64	DMS0533	Requested file not cataloged in pubset Guaranteed message: DMS0533
	64	DMS0535	Specified file not shareable
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator

	64	DMS0588	The disk storage assignment could not be executed
	64	DMS05F8	DMS error reported Guaranteed message: DMS05F8
	64	DMS05F9	File attributes in source and target file not compatible
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0609	No access to system file
	64	DMS0610	Action with selection specification (wildcards): command execution failed for at least one of the selected files
	64	DMS0698	File generation groups do not have the same attributes
	64	DMS06B5	File already open or catalog entry not updated after system error
	64	DMS06B6	File attributes not compatible with file generation group
	64	DMS06C4	File generation group not yet cataloged
	64	DMS06D0	Specified file generation does not exist
	64	DMS06FF	BCAM connection severed
	128	DMS0506	Function not executed due to change in master
	130	DMS0524	System address space exhausted
	130	DMS053C	No space in pubset catalog file
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system. Guaranteed message: DMS053C
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0588	The disk storage assignment could not be executed
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

```

- (1) Output of the protection attributes for the file *PAUL.FILE.2*. The file has a BASIC-ACL entry. Access control is implemented via an BASIC-ACL (highest activated access protection).
- (2) Copies the file *PAUL.FILE.2* to the file *CARL.P-2*, thus creating its catalog entry with default attributes (see the CREATE-FILE command).
- (3) Output of the protection attributes for the file *CARL.P-2*. The file is only protected via the standard access control list (ACCESS and USER-ACCESS).
- (4) The file *PAUL.FILE.2* is copied to the file *CARL.P-2* again. In this case, PROTECTION=\*SAME defines the transfer of protection attributes from the source file.
- (5) Output of the protection attributes for the file *CARL.P-2*. The file has the same protection attributes as the source file *PAUL.FILE.2* (see step 1).

- (6) Output of the protection attributes the file *PROC.MINI.2*. The file is protected by an execute password ( ' *MAXI* ).
- (7) Output of the protection attributes the file *BSP.PROC.1*. The file is protected by a write password ( ' *JOHN* ).
- (8) Attempts to copy the file *PROC.MINI.2* to the file *EXP.PROC.1*. The password for read access to *PROC.MINI.2* is not yet contained in the password table of the task. So the COPY-FILE command is rejected.
- (9) Entry of the password ' *MAXI* ' into the password table of the task (see step 6).
- (10) Attempts to copy the file *PROC.MINI.2* to the file *EXP.PROC.1*. The password for write access to *EXP.PROC.1* is not yet contained in the password table of the task. So the COPY-FILE command is rejected.
- (11) Entry of the password ' *JOHN* ' into the password table of the task (see step 7).
- (12) Attempts to copy the file *PROC.MINI.2* to the file *EXP.PROC.1*.
- (13) Output of the protection attributes the file *BSP.PROC.1*. Since PROTECTION= \*SAME is specified, the file has the same protection attributes as the source file *PROC.MINI.2*, i.e. it is now protected by the execute password ' *MAXI* '.

- (1) Output of the catalog entry for the file *PROC.MINI.2* with the attributes for file protection and file security. The file is accessible to all users (USER-ACCESS=ALL-USER) who also know the defined execute password *'MAXI'*.
- (2) Entry of the password *'MAXI'* into the password table of the task.
- (3) Copies the file *PROC.MINI.2* to the temporary file *TEMP.FILE.1* with PROTECTION=\*SAME.
- (4) Output of the catalog entry for the temporary file *TEMP.FILE.1* with the file protection and backup attributes for the file. Default attributes have been set for the temporary file, as it is not possible to transfer a password, BACKUP-CLASS=A, or USER-ACCESS=ALL-USERS, e.g. (see also the CREATE-FILE command).
- (5) Copies the temporary file *TEMP.FILE.1* to the file *MAX.FILE.2* with PROTECTION= \*SAME.
- (6) The catalog entry indicates that the file protection and backup attributes of the temporary file have been copied.
- (7) Output of the catalog entry for the file *MAX.FILE.3* with the file protection and backup attributes. The file is protected by means of a BASIC-ACL.

---

(8) Copies the temporary file *TEMP.FILE.1* to the file *MAX.FILE.3*.

- 
- (9) Output of the catalog entry for the file *MAX.FILE.3* with the file protection and backup attributes. These attributes have not been changed.

*Example 5: Copying an existing file interactively*

```
/copy-file from=max.file.1,to=max.file.10,replace-old=*by-dialog _____ (1)
```

```
% DMS0518 FILE ':2OS2:$USER1.MAX.FILE.10' ALREADY EXISTS. OVERWRITE? REPLY (Y=YES; N=NO)?
```

```
n _____ (2)
```

```
% DMS0519 COPY COMMAND WITHDRAWN BY CALLER
```

```
/copy-file from=max.file.1,to=max.file.11,replace-old=*by-dialog _____ (3)
```

- (1) Specifies that the file *MAX.FILE.1* is to be copied to the file *MAX.FILE.10* and that a prompt is to be issued before overwriting any existing target file.
- (2) The file *MAX.FILE.10* already exists. *N* is entered in response to the prompt. So the COPY-FILE command is not executed.
- (3) Specifies that the file *MAX.FILE.1* is to be copied to the file *MAX.FILE.11* and that a prompt is to be issued before overwriting any existing target file. Since the target file does not exist in this case, the COPY-FILE command is executed without a prompt.

Example 6: Copying a file on private disk

```
/cre-file max.priv-file.1,sup=priv(vol=work01,dev-type=d3435) _____ (1)

%:2OSG: PRDISC:      1 FILE RES=          3 FRE=          3 REL=          0 PAGES
```

- (1) Creates a catalog entry for the file *MAX.PRIV-FILE.1*, which is to be stored on the private disk *WORK01*.
- (2) Output of the newly created catalog entry showing information on the file organization and the volume allocation. Since the file has not yet been opened, information on the file structure is not yet available (e.g. *FILE-STRUC=NONE*).
- (3) Copies the file *MAX.FILE.1* to the file *MAX.PRIV-FILE.1*.
- (4) Output of the catalog entry for the file *MAX.PRIV-FILE.1* showing information on the file organization and volume allocation. The file attributes (e.g. *FILE-STRUC=ISAM*) were entered during on executing the *COPY-FILE* command.

Example 7: Copying a file to a tape file (tape cartridge)

%:20S2: TAPE :          1 FILE
```

- 
- (1) Output of the catalog entry for the file *MAX.TAPE-FILE.1* showing information on the file organization and volume allocation. Only the catalog entry exists at this stage. The file has not yet been opened (e.g. FILE-STRUC=NONE). The data contained in the file is to be stored on the magnetic tape cartridge *D2315K* of volume type *TAPE-C4*. Since no volume has been reserved as yet, the volume ID is shown in parentheses.
  - (2) Creates a TFT entry with the link name *DMCOPY22* for the file *MAX.TAPE-FILE.1*. The default link name of the COPY-FILE command is used for the target file.
  - (3) Output of the catalog entries for the files *MAX.FILE.4* and *MAX.FILE.5* showing the file protection information. Both files have a BASIC-ACL entry as the highest activated access control. The USER-ACCESS attribute is set to all users in each case.
  - (4) Output of the TFT entry with the link name *DMCOPY.22* indicating the file processing attributes.
  - (5) Copies the file *MAX.FILE.5* to the tape file *MAX.TAPE-FILE.1* with PROTECTION= \*SAME.
  - (6) Output of the catalog entry for the file *MAX.TAPE-FILE.1* showing information on the file protection, file organization and volume allocation. The file attributes have been updated (e.g. FILE-STRUC=SAM). The file is located on volume *D2315K*. The BASIC-ACL could not be copied. The file is only protected by standard access control, with the USER-ACCESS attribute set to OWNER-ONLY.
  - (7) Creates a catalog entry for the tape file *MAX.TAPE-FILE.2*, which is also to be stored on the tape cartridge *D2315K*.
  - (8) Creates a TFT entry with the link name *DMCOPY22* for the file *MAX.TAPE-FILE.2*. The default link name of the COPY-FILE command is used for the target file. Since this is the second file to be stored on the tape cartridge, FILE-SEQUENCE=\*NEW (or alternatively, FILE-SEQUENCE=2) must also be specified. Without this specification, the default value FILE-SEQUENCE=1 would be assumed when executing the copy operation, and the first file would be overwritten.
  - (9) Output of the TFT entry with the link name *DMCOPY22* showing the relevant file processing information (see also the *F-SEQ* output field).
  - (10) Copies the file *MAX.FILE.5* to the tape file *MAX.TAPE-FILE.2* with PROTECTION= \*SAME.
  - (11) Output of the catalog entry for the file *MAX.TAPE-FILE.2* showing the protection attributes, organization, and volume allocation for the file. The file attributes have been updated (e.g. FILE-STRUC=SAM). The file is located as the second file on volume *D2315K*. The BASIC-ACL could not be copied. The file is only protected by standard access control, with the USER-ACCESS attribute set to \*ALL-USERS.

Example 8: Changing the BLOCK-CONTROL-INFO when copying

```
/show-file-attr ah.lib,org=*yes _____ (1)
```

```
%0000000273 :2OSG:$USER1.ASS.PLAMLIB

% TYPE       = PLAM-LIB
% AVAIL      = *STD
% WORK-FILE  = *NO          F-PREFORM = *NONE      S0-MIGR    = *ALLOWED
%:2OSG: PUBLIC:      1 FILE RES=      273 FRE=      47 REL=      45 PAGES
```

```
/add-file-link link=dmcopy22,file-name=max.file.12,
                block-contr=*no _____ (2)
```

```
/copy-file from=ah.lib,to=max.file.12,block-contr=*check-removal _____ (3)
```

```
/show-file-attr max.file.12,org=*yes _____ (4)
```

```
%0000000273 :2OSG:$USER1.MAX.FILE.12
% ----- ORGANIZATION -----
% FILE-STRUC = PAM          BUF-LEN   = STD(1)      BLK-CONTR  = NO
% IO(USAGE)  = READ-WRITE  IO(PERF)  = STD      DISK-WRITE = IMMEDIATE
% TYPE       = PLAM-LIB
% AVAIL      = *STD
% WORK-FILE  = *NO          F-PREFORM = *NONE      S0-MIGR    = *ALLOWED
%:2OSG: PUBLIC:      1 FILE RES=      273 FRE=      47 REL=      45 PAGES
```

- (1) Output of the catalog entry for the file *ASS.PLAMLIB* showing the file organization. The file is a PLAM library that was created with BLOCK-CONTROL-INFO=\*PAMKEY. The file is to be copied to an NK file with BLOCK-CONTROL-INFO=\*NO. Since the internal block structure of the file does not depend on the PAMKEY, a different BLOCK-CONTROL-INFO is permitted when copying.
- (2) Creates a TFT entry with the link name *DMCOPY22* for the target file *MAX.FILE.12* with BLOCK-CONTROL-INFO=\*NO. The default link name of the COPY-FILE command is used for the target file.
- (3) Copies the file *ASS.PLAMLIB* to the file *MAX.FILE.12* with BLOCK-CONTROL-INFO= \*CHECK-REMOVAL (copy only if no user information from the PAMKEY is lost).
- (4) Output of the catalog entry for the target file *MAX.FILE.12* showing the organization of the file. The file was created with BLOCK-CONTROL-INFO=\*NO.

Example 9: Copying two or more files with a COPY-FILE command

```

```

- (1) All files whose first subname is *PROC* and whose second subname is *PTEST* are to be copied. The newly formed names are to have *PTEST* (second search string in index notation) and *-BACKUP* as the first subname. The second subname is to be made up of *PROC* (first search string) and *EDURE*. The third name part of the search string is to remain unchanged. Copying is to be confirmed for each file (DIALOG-CONTROL) and the new name is to be output to SYSOUT (OUTPUT).

- 
- (2) All files which begin with the subname *PROT*, contain a freely selectable character string and end with the string *FEHL* and another character are to be copied. The new names are to begin with the subname made up of the string *FEHLERPROTOKOLL* (= error log) and the last character of the search string. This is to be followed by the string identified by \* in the search string.
  - (3) An error occurred when editing the file *PROT.SDFFRAME.FEHL1*. The newly formed name of the target file would end with a period and is therefore not possible. Processing is continued by entering *YES*.

## 2.68 COPY-JV

Copy job variable

**Component:** JV  
**Functional area:** Job variables  
**Domain:** JOB-VARIABLES  
**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

This function is available to the user only if the chargeable software product JV has been loaded as a subsystem.

### Function

The COPY-JV command copies the content of a job variable (source JV) to another job variable (target JV). Optionally it is possible to copy not only the content but also the protection attributes of the source JV with the exception of any existing MONJV or CJC protection.

Both permanent and temporary job variables can be copied.

Read access must be permitted for the source JV and write access for the target JV. If a target JV does not exist it is created. When a permanent JV is created the maximum permitted number specified in the user entry may not be exceeded (see also the CREATE-JV command).

#### *Privileged functions*

Systems support (TSOS privilege) is by default co-owner of all job variables (and can therefore also create or copy job variables under any user ID). This co-ownership can be restricted for permanent job variables if SECOS is used.

### Format

<b>COPY-JV</b>	Alias: <b>CPJV</b>
<b>FROM-JV</b> = <filename 1..54 without-gen-vers> / * <b>LINK</b> (...) * <b>LINK</b> (...)   <b>LINK-NAME</b> = <alphanum-name 1..7> <b>,TO-JV</b> = <filename 1..54 without-gen-vers> / * <b>LINK</b> (...) * <b>LINK</b> (...)   <b>LINK-NAME</b> = <alphanum-name 1..7> <b>,PROTECTION</b> = * <b>STD</b> / * <b>SAME</b> <b>,REPLACE-OLD-JV</b> = * <b>YES</b> / * <b>NO</b>	

---

## Operands

### **FROM-JV = <filename 1..54 without-gen-vers>**

Name of the job variable which is to be copied (source JV).

Write access must be permitted (for a JV under a foreign user ID either USER-ACCESS=ALL-USERS or read permission via BASIC-ACL or GUARDS or co-ownership must exist).

### **FROM-JV = \*LINK(...)**

The source JV is named via a link name.

#### **LINK-NAME = <alphanum-name 1..7>**

Link name of the JV.

### **TO-JV = <filename 1..54 without-gen-vers>**

Name of the job variable which is to be copied to (target JV).

If the target JV is not yet cataloged, it is created. In this case only the user's own user ID may be specified or a user ID for which the user is co-owner.

If the target JV is cataloged, write access must be permitted (in the case of a JV under a foreign user ID, either the standard access control must exist with USER-ACCESS= \*ALL-USERS or write permission via BASIC-ACL or GUARDS or co-ownership). However, the target JV is overwritten only if REPLACE=\*YES is specified (default).

### **TO-JV = \*LINK(...)**

The target JV is named via a link name.

#### **LINK-NAME = <alphanum-name 1..7>**

Link name of the JV.

### **PROTECTION = \*STD / \*SAME**

Specifies whether the protection attributes of the source JV are also to apply for the target JV.

If MONJV or CJC protection exists for the source JV, this is **not** taken over.

### **PROTECTION = \*STD**

The protection attributes are *not* applied to the target JV. If the target JV is to be newly created, it will be assigned the system defaults as protection attributes (see also the defaults of the CREATE-JV command). The existing protection attributes are retained if the target JV already exists.

### **PROTECTION = \*SAME**

The target JV is assigned the same protection attributes as the source JV (i.e. for *ACCESS*, *USER-ACCESS*, *OWNER*, *GROUP*, *OTHERS*, *EXPIR-DATE*, *EXPIR-TIME*, *MAN-CLASS*, defined GUARDS, and the same passwords; see also the output fields of the SHOW-JV-ATTRIBUTES command). If MONJV or CJC protection exists it is not taken over.

The PROTECTION=\*SAME specification is ignored in the following cases (i.e. \*STD applies):

- The target JV is a temporary JV.
- CJC protection exists for the target JV.
- The target JV resides under a foreign user ID and the caller is not a co-owner.

As management classes are pubset-specific they can only be taken over if the source and target JVs reside on the same pubset. When copying to another pubset an existing target JV retains its management class; a new target JV is assigned MANAGEMENT-CLASS=\*NONE (as with PROTECTION=\*STD).

In the case of a source JV which resides under a foreign ID and is protected with BASIC-ACL or GUARDS, the protection attributes USER-ACCESS, BASIC-ACL and GUARDS are set to the system defaults (see the CREATE-JV command).

---

**REPLACE-OLD-JV = \*YES / \*NO**

Specifies whether an existing target JV is to be overwritten.

**REPLACE-OLD-JV = \*YES**

An existing target JV is overwritten without any message being issued.

**REPLACE-OLD-JV = \*NO**

An existing target JV is not overwritten. The command is rejected. In procedures error handling is triggered (spin-off mechanism in non-S procedures or SDF-P error handling in S procedures).

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	CMD0001	Command executed with a warning
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JVS04E0	Command not executable in the call environment; if possible, remove cause of error (see SYSOUT message JVS04xx)
	130	JVS04E1	Command cannot be executed at this time; for cause see SYSOUT message JVS04xx
	130	CMD2282	Subsystem JV not available for indefinite time

1 Downloading1

## 2.69 COPY-POSIX-FILE

Copy file from or to POSIX

<b>Component:</b>	POSIX-BC
<b>Functional area:</b>	File processing POSIX administration and application
<b>Domain:</b>	FILE
<b>Privileges:</b>	all privileges

### Function

The COPY-POSIX-FILE command offers the functionality of the POSIX command *bs2cp* in BS2000:

- Copying files from the POSIX file system to BS2000 files or elements of a PLAM library
- Copying BS2000 files or elements of a PLAM library to the POSIX file system (library elements are only copied to simple files)

Access to BS2000 files via RFA (Remote File Access) is not supported. For encrypted files, the crypto password must be entered into the crypto password table (see the ADD-CRYPTO-PASSWORD command).

#### *Notes on command execution*

The specifications in the COPY-POSIX-FILE command generate a *bs2cp* command with the corresponding parameters (if a list of file names is specified, a corresponding number of *bs2cp* commands) which is called in a POSIX shell (see the START-POSIX-SHELL command). The caller must, therefore, have a HOME directory in POSIX. The settings from the profile in the HOME directory (e.g changing the current directory and values of the environment variables *IO\_CONVERSION* and *BS2CPTABS*) affect the copy process.

Before the *bs2cp* command is called, two other POSIX commands may be issued if required:

- The handling of text and binary files when copying (RECORD-CONVERSION operand) is controlled via an *ftyp* command.
- The file attributes of the target files are optionally controlled via a *bs2file* command (FILE-ATTRIBUTES operand).

The POSIX command *bs2cp* is described in the “POSIX Basics for Users and System Administrators” manual [28], the *bs2file* and *ft yp* commands in the “POSIX Commands” manual [29].

The mode of operation of the COPY-POSIX-FILE command is described in detail in the “POSIX Basics for Users and System Administrators” manual [28].

## Format

**COPY-POSIX-FILE**

Alias: **CPXF/BS2CP**

**COPY-DIRECTION** = **\*FROM-POSIX** / **\*TO-POSIX**

**,POSIX-FILE** = **\*BY-SOURCE(...)** / list-poss(2000): <posix-pathname 1..1023>

**\*BY-SOURCE(...)**

| **POSIX-DIRECTORY** = ./ <posix-pathname 1..1023 without-wild>

| **,PREFIX** = **\*NONE** / <c-string 0..80 with-low>

| **,SUFFIX** = **\*NONE** / <c-string 0..80 with-low>

**,BS2000-FILE** = **\*BY-SOURCE(...)** / **\*LIBRARY-ELEMENT(...)** / list-poss(2000): <filename 1..54 with-wild(80)>

**\*BY-SOURCE(...)**

| **PREFIX** = **\*NONE** / <c-string 0..53>

| **,SUFFIX** = **\*NONE** / <c-string 0..40>

**\*LIBRARY-ELEMENT(...)**

| **LIBRARY** = <filename 1..54>

| **,ELEMENT** = **\*BY-SOURCE(...)** / list-poss(2000): <composed-name 1..64 with-under-wild>(...)

| **\*BY-SOURCE(...)**

| | **VERSION** = **\*HIGHEST-EXISTING** / **\*UPPER-LIMIT** / <composed-name 1..24 with-under>

| | **,PREFIX** = **\*NONE** / <c-string 0..63>

| | **,SUFFIX** = **\*NONE** / <c-string 0..63>

| <composed-name 1..64 with-under-wild>(...)

| | **VERSION** = **\*HIGHEST-EXISTING** / **\*UPPER-LIMIT** / <composed-name 1..24 with-under>

| **,TYPE** = **\*S** / **\*D** / **\*J** / **\*M** / **\*P** / **\*X** / **\*L**

**,CHARACTER-CONVERSION** = **\*NO** / **\*YES(...)**

**\*YES(...)**

| **TABLE** = **\*STD** / <posix-pathname 1..1023 without-wild>

**,OUTPUT** = **\*NONE** / **\*SYSOUT**

**,RECORD-CONVERSION** = **\*TEXT (...)** / **\*BINARY**

**\*TEXT** (...)

| **SUBSTITUTE-TABULATOR** = **\*YES** / **\*NO**

,**FILE-ATTRIBUTES** = **\*STD** / **\*PARAMETER**(...)

**\*PARAMETER**(...)

| **FILE-NAME** = **\*ALL** / <filename 1..54>

| **,ATTRIBUTES** = **\*STD** / <c-string 0..1000>

## Operands

**COPY-DIRECTION =**

Copy direction.

**COPY-DIRECTION = \*FROM-POSIX**

POSIX files are copied to BS2000.

**COPY-DIRECTION = \*TO-POSIX**

BS2000 files or PLAM elements are copied to POSIX.

**POSIX-FILE = \*BY-SOURCE / list-poss(2000): <posix-pathname 1..1023>**

Specifies the POSIX files to be used during copying.

**POSIX-FILE = \*BY-SOURCE**

*This specification is only possible when copying \*TO-POSIX:*

The names of the POSIX files should be derived from the BS2000 names. If multiple BS2000 files are to be copied to POSIX, this operand value must be specified.

**POSIX-DIRECTORY =**

Specifies the directory to which the BS2000 files or the PLAM elements are to be copied.

**POSIX-DIRECTORY = . .**

The files are copied to the directory currently set.

As default, this is the home directory of the calling BS2000 user. Another current directory can be set by using the change directory command in the *.profile* file (with the POSIX command *cd*).

**POSIX-DIRECTORY = <posix-pathname 1..1023 without-wild>**

The files are copied to the explicitly specified directory.

**PREFIX = \*NONE / <c-string 0..80 with-low>**

Prefix for the POSIX file name. \*NONE is the default, i.e. no prefix is used.

**SUFFIX = \*NONE / <c-string 0..80 with-low>**

Suffix for the POSIX file name. \*NONE is the default, i.e. no suffix is use.

**POSIX-FILE = list-poss(2000): <posix-pathname 1..1023>**

The names of POSIX files are entered explicitly. The following must be taken into account:

- When copying *\*FROM-POSIX*:  
Enter one or more absolute or relative path names of the POSIX files. The POSIX wildcard syntax (shell special characters for file name replacement) is supported.

- When copying *\*TO-POSIX*:  
If only one BS2000 file is copied and the name of the target file is to be explicitly specified, the absolute or relative path name of a POSIX file must be specified. Wildcard syntax is not permitted.
- As default, relative path names refer to the home directory of the calling BS2000 user. Another directory can be set by using the change directory (*cd*) command in the *.profile* file.

**BS2000-FILE = \*BY-SOURCE(...) / \*LIBRARY-ELEMENT(...) / list-poss(2000): <filename 1..54 with-wild(80)>**

Specifies the BS2000 files or the PLAM elements to be used during copying.

**BS2000-FILE = \*BY-SOURCE(...)**

*This specification is only possible when copying \*FROM-POSIX:*

The names of the BS2000 files are derived from the names of the POSIX files. This is a mandatory entry when more than one POSIX file is to be copied to BS2000.

**PREFIX = \*NONE / <c-string 0..53 with-low>**

Prefix for the BS2000 file name. \*NONE is the default, i.e. no prefix is used.

**SUFFIX = \*NONE / <c-string 0..40 with-low>**

Suffix for the BS2000 file name. \*NONE is the default, i.e. no suffix is use.

**BS2000-FILE = \*LIBRARY-ELEMENT(...)**

PLAM elements are used during copying.

**LIBRARY = <filename 1..54>**

Name of the PLAM library.

**ELEMENT =**

Specifies the PLAM elements to be used during copying.

**ELEMENT = \*BY-SOURCE(...)**

*This specification is only possible when copying \*FROM-POSIX:*

The element name is to be derived from the POSIX name. This is a mandatory entry if more than one POSIX file is to be copied to a PLAM library in BS2000.

**VERSION =**

Specifies which version of an element is to be used.

**VERSION = \*HIGHEST-EXISTING**

The target element with the highest version is used. The following must be taken into account:

- If an element does not yet exist, it is assigned version *001*.
- If existing elements are copied, then the element is overwritten with the highest version.

**VERSION = \*UPPER-LIMIT**

The target element should be assigned the highest possible version (X'FF'; this corresponds to the tilde character in the *bs2cp* command).

**VERSION = <composed-name 1..24 with-under>**

The version is explicitly entered.

**PREFIX = \*NONE / <c-string 0..63 with-low>**

Prefix for the element file name. \*NONE is the default, i.e. no prefix is used.

**SUFFIX = \*NONE / <c-string 0..63 with-low>**

Suffix for the element file name. \*NONE is the default, i.e. no suffix is used.

---

**ELEMENT = list-poss(2000): <composed-name 1..64 with-under-wild>(…)**

The names of the elements are entered explicitly. The following must be taken into account:

- When copying *\*TO-POSIX*:  
Enter one or more element names. The LMS wildcard syntax (“\*”, “<”, “:”, “>”) is supported.  
In contrast to the POSIX command *bs2cp* a list of element names can also be specified here. In this case, the POSIX command *bs2cp* is called for each element name (with/without wildcard). The entries for the other operands then apply for all *bs2cp* calls.
- When copying *\*FROM-POSIX*:  
Explicit specification of an element name (wildcards are not allowed here) if only one POSIX file is copied and the name of the target element is to be defined explicitly.

**VERSION =**

Specifies the element version used.

**VERSION = \*HIGHEST-EXISTING**

The element with the highest version is used.

**VERSION = \*UPPER-LIMIT**

The copied element should be assigned the highest possible version (X'FF').

**VERSION = <composed-name 1..24 with-under>**

The version is entered explicitly.

**TYPE = \*S / \*D / \*J / \*M / \*P / \*X / \*L**

Specifies the type of PLAM elements handled. As default, the type S (Source) is used.

**BS2000-FILE = list-poss(2000): <filename 1..54 with-wild(80)>**

The names of the BS2000 files are entered explicitly. The following must be taken into account:

- When copying *\*TO-POSIX*:  
Enter one or more file names. The BS2000 wildcard syntax is supported with restrictions (only the wildcard “\*”).  
In contrast to the POSIX command *bs2cp* a list of BS2000 file names can also be specified here. In this case, the POSIX command *bs2cp* is called for each file name (with/without wildcard). The entries for the other operands then apply for all *bs2cp* calls.
- When copying *\*FROM-POSIX*:  
Explicit specification of a file name (wildcards are not allowed here) if only one POSIX file is copied and the name of the target file is to be defined.

**WRITE-MODE =**

*This specification is only relevant when copying \*FROM-POSIX.*

Specifies whether target files or elements that already exist in BS2000 are overwritten (this is similar to the *-f* option in the POSIX command *bs2cp*).

**WRITE-MODE = \*BY-DIALOG**

In this case the dialog will display a prompt asking if an existing file should be overwritten.

```
bs2cp: overwrite A ? y (yes), n (no), a (all) or q (quit)
```

**WRITE-MODE = \*REPLACE**

The dialog prompt is suppressed and existing files or elements are always overwritten.

**WRITE-MODE = \*CREATE**

Target files or elements which do not yet exist are created. Existing target files or elements are not overwritten.

---

**CHARACTER-CONVERSION =**

Specifies if character conversion can be carried out during the copying process (this is similar to the *-k* and *-t* options in the POSIX *bs2cp* command).

**CHARACTER-CONVERSION = \*NO**

Character conversion is not carried out.

**CHARACTER-CONVERSION = \*YES(...)**

Character conversion is carried out.

**TABLE =**

Specifies the conversion table.

**TABLE = \*STD**

Internal POSIX default tables are used (this is similar to the *-k* option in the POSIX command *bs2cp*).

**TABLE = <posix-pathname 1..1023 without-wild>**

The conversion table is entered explicitly (this is similar to the *-t* option in the POSIX command *bs2cp*).

*Note*

The shell variable *BS2CPTABS* (see *bs2cp*) is not supplied with values via this specification. If required the variable in the *.profile* can be set.

**OUTPUT =**

Specifies whether extended logging of the *bs2cp* command is to be output (this is similar to the *-l* option in the POSIX command *bs2cp*).

**OUTPUT = \*NONE**

The extended logging is not output.

**OUTPUT = \*SYSOUT**

The extended logging is output to SYSOUT.

**RECORD-CONVERSION =**

Entry specifying how the contents of BS2000 files are to be handled during copying.

This parameter generates the POSIX command *ftyp* with the corresponding parameters. If an operand value is not explicitly specified (corresponds to the preset value RECORD-CONVERSION=\*TEXT(SUBSTITUTE-TABULATOR=\*YES)), *ftyp text* is set as the default.

**RECORD-CONVERSION = \*TEXT(...)**

SAM files or PLAM library elements are handled as text files. "newline" in the POSIX file becomes a change of record in the BS2000 file (or vice versa, depending on the copying direction).

**SUBSTITUTE-TABULATOR =**

Specifies how tabulator characters are to be handled.

**SUBSTITUTE-TABULATOR = \*YES**

Tabulator characters are to be filled (*ftyp text*).

**SUBSTITUTE-TABULATOR = \*NO**

Tabulator characters are retained (*ftyp textbin*).

**RECORD-CONVERSION = \*BINARY**

SAM files or PLAM library elements are handled as binary files.

---

**FILE-ATTRIBUTES =**

*This specification is only relevant when copying \*FROM-POSIX.*

When POSIX files are copied to BS2000 (not for PLAM elements) the file attributes of the target files in BS2000 can be entered in the same way as for the POSIX command *bs2file*. Depending on the parameter entry, a *bs2file* command is issued in the shell before the actual *bs2cp* command.

**FILE-ATTRIBUTES = \*STD**

No *bs2file* command is issued:

Files which do not yet exist are assigned the standard file attributes (SAM access method, variable record format, and standard blocking). Existing files retain their attributes. If only the catalog entry exists for a file (no OPEN has taken place), the ISAM access method is used.

**FILE-ATTRIBUTES = \*PARAMETER(...)**

A *bs2file* command is issued when copying. The file attributes are specified in the same way as for the POSIX command *bs2file*.

**FILE-NAME =**

Specifies the file for which the attributes are to be set.

**FILE-NAME = \*ALL**

The attributes entered are valid for the first file to be copied with any name (corresponds to the "\*" entry in the POSIX command *bs2file*).

**FILE-NAME = <filename 1..54>**

The attributes entered are valid for the first file which is to be copied which has this name.

**ATTRIBUTES =**

Specifies the file attributes.

**ATTRIBUTES = \*STD**

The standard file attributes are used.

**ATTRIBUTES = <c-string 1..1000>**

Explicit specification of the file attributes.

The file attributes supported are described for the POSIX command *bs2cp* (see the "POSIX Basics for Users and System Administrators" manual [28]). The entry format for the file attributes (operands and possible values) is described under the FILE macro (see the "DMS Macros" manual [12]).

Example: ATTRIBUTES= 'FCBTYPE=SAM,RECFORM=F,BLKSIZE=80'

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	64	POS6010	Invalid combination of the specifications BS2000-FILE=*BY-SOURCE and COPY-DIRECTION=*TO-POSIX
	64	POS6011	Invalid combination of the specifications BS2000-FILE=*LIBRARY-ELEMENT(..., ELEMENT=*BY-SOURCE,...) and COPY-DIRECTION=*TO-POSIX
	64	POS6012	Invalid combination of the specifications POSIX-FILE=*BY-SOURCE and COPY-DIRECTION=*FROM-POSIX
	64	POS6013	More than one BS2000 file specified as target.
	64	POS6014	More than one PLAM library element specified as target.
	64	POS6015	More than one POSIX file specified as target.
	64	POS6016	More than one BS2000 file or PLAM library element specified as source and one POSIX file specified as target; however, this is not a directory.
	64	POS6017	More than one POSIX file specified as source, but BS2000-FILE=*BY-SOURCE not specified.
	64	POS6018	The required version of SDF or SDF-P-BASYS is not installed.
	64	POS6019	Error when starting the POSIX shell.
	64	POS6020	Error when executing the POSIX command bs2cp.
	64	POS6021	Invalid specification of FILE-ATTRIBUTES.
	64	POS6022	Error when executing the POSIX command bs2file.
	64	POS6023	Invalid specification of wildcards.
	64	POS6024	Invalid specification in the ATTRIBUTES operand.

---

## 2.70 COPY-SYSTEM-FILE

Copy contents of logical system file

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	File processing
<b>Domain:</b>	JOB PROCEDURE PROGRAM
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The COPY-SYSTEM-FILE command copies the contents of the logical system file SYSLST, for which the primary assignment is in force, to a file. The user can thus have the contents stored in a cataloged file without having previously performed a corresponding assignment of SYSLST. The present contents of SYSLST are immediately accessible to the user in the specified file, i.e. there is no need to wait until a listing is available which is only produced at the end of the job or previously by means of PRINT-DOCUMENT. After the copy operation, output to the logical system file is continued.

The part of the logical system file SYSLST that was copied with the COPY-SYSTEM-FILE command **cannot** be deleted. With the DELETE-SYSTEM-FILE command, only the part of the logical system file SYSLST that has been created since the last COPY-SYSTEM-FILE command can be deleted.

### Format

<b>COPY-SYSTEM-FILE</b>	Alias: <b>CPSF</b>
<b>FILE-NAME = *SYSLST</b>	
, <b>TO-FILE</b> = <filename 1..54 without-gen-vers>	

### Operands

#### **FILE-NAME = \*SYSLST**

Name of the logical system file whose contents are to be copied. The default value is the logical system file SYSLST.

#### **TO-FILE = <filename 1..54 without-gen-vers>**

Name of the file to which the contents of the system files are to be copied. The specified file is opened with OPEN=OUTPUT, i.e. the contents of any existing file are lost. If insufficient storage space is available for the user ID, the command is rejected.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	32	SSM3284	DMS error during command execution
	64	SSM3282	System file has no primary assignment
	64	SSM3283	System file is empty

---

## 2.71 CREATE-ALTERNATE-INDEX

Create secondary index for NK-ISAM file

**Component:** BS2000 OSD/BC  
**Functional area:** File processingg  
**Domain:** FILE  
**Privileges:** STD-PROCESSING

### Function

There is a key field for each record in an NK-ISAM file, which contains the record's primary key. The user can specify the position and length of this primary key in the ADD-FILE-LINK command (KEY-POSITION and KEY-LENGTH operands) when the file is created. These details are copied into the catalog entry (see the command SHOW-FILE-ATTRIBUTES). All primary keys are managed internally by means of a directory, called the primary index. NK-ISAM finds any required record in the file by looking up its primary key in the primary index.

The command CREATE-ALTERNATE-INDEX allows an additional, secondary, index to be set up for the file. It defines an additional key field for the records in the file. For records which already exist (which will be read in sequentially), NK-ISAM creates an internal directory, which is called the secondary index. This is made up of the secondary keys for each record, their corresponding primary keys, and the entries sorted into order of the secondary key values (see the SORT-WORK-FILE operand).

Secondary keys are supported in macro calls for the ISAM access method (see the "DMS Macros" manual [12]).

When a particular secondary key value is used for a read or positioning operation within the file, NK-ISAM looks through the entries to find this key. The entry which it finds will contain the corresponding primary key value. Using the primary key determined in this way, the required record is looked up in the primary index.

Any particular secondary key value may be contained in more than one record (depending on the DUPLICATE-KEY operand). When secondary keys are being used, the primary key values must always be unique. The correspondence between the secondary and primary keys then allows the record(s) to be unambiguously identified. The user may define up to 30 different secondary keys for a file. Each of the secondary keys which is defined, and the associated secondary index which is created for it, has a name which must be unique (see the KEY-NAME operand). Provided that the following requirements are met, the key fields may be in any required position:

- For variable-length records, allowance must be made for the 4-byte record length field at the start of the record.
- Any key field which is defined must lie within the record. In the case of variable-length records, the length of the shortest records will represent a limit.
- Key fields may not lie within any overflow blocks, which may arise when a K-ISAM file is converted to an NK-ISAM file if the maximum length of record was used.

Secondary keys cannot be managed separately from the primary key. When a file is extended, the secondary indices are automatically extended. For large files it is better (for performance reasons) to set up the required secondary index or indices after the file has been created.

The SHOW-INDEX-ATTRIBUTES command provides information on secondary keys which have been defined, or secondary indices which have been created, for a file.

Its execution involves read access to the file (OPEN=INPUT).

The user can delete secondary indices again using the DELETE-ALTERNATE-INDEX command.

Terminating index creation:

- If NK-ISAM detects an error during the creation of an index (e.g. a data record which is too short), any partly created index will be deleted.
- If the index creation is terminated due to a system crash, the file is locked and can be recreated using the REPAIR-DISK-FILES command. When this is done, the secondary index is deleted.
- An incompletely created index is retained, and is identified as INCOMPLETE if it is output using SHOW-INDEX-ATTRIBUTES. Attempts to open the file will be rejected with DMS0D84. The incomplete secondary index can only be deleted, and then recreated from the beginning.

## Format

### CREATE-ALTERNATE-INDEX

```
FILE-NAME = <filename 1..54>
,ALTERNATE-INDEX = list-poss(30): [*PARAMETERS](...)
  [*PARAMETERS](...)
    | KEY-NAME = <name 1..8>
    | ,KEY-POSITION = <integer 1..32496>
    | ,KEY-LENGTH = <integer 1..127>
    | ,DUPLICATE-KEY = *YES / *NO
,SORT-WORK-FILE = *STD / *LINK(...)
  *LINK(...)
    | LINK-NAME = <name 1..8>
```

## Operands

### **FILE-NAME** = <filename 1..54>

Name of the NK-ISAM file.

The file must fulfill the following requirements:

- It must be already cataloged.
- It must be an NK-ISAM file, i.e. the PAM keys are at the beginning of each PAM page (BLK-CONTR=DATA).
- The primary index must already exist, i.e. the file must have already been opened once in OUTPUT mode.
- The file must not contain any primary keys with the same value (duplicate keys).
- The primary keys must not contain any logical or value flags (see the LOGICAL-FLAG-LENGTH and VALUE-FLAG-LENGTH operands in the ADD-FILE-LINK command).

### **ALTERNATE-INDEX** = list-poss(30): \***PARAMETERS**(...)

For the secondary index which is to be created, this operand specifies the index name, the position and length of the key in the record, and the permissibility of duplicate secondary key values in different records.

Up to 30 secondary indices can be defined in a list.

---

**KEY-NAME = <name 1..8>**

Defines the name of the secondary index.

The selected name must be unique. The SHOW-INDEX-ATTRIBUTES command can be used to establish which names have already been used.

**KEY-POSITION = <integer 1..32496>**

Defines the position of the first byte of the key field within each data record. Records of *variable* length begin with a 4-byte field, the record length field. The permitted positions depend on the length of the key field.

**KEY-LENGTH = <integer 1..127>**

Defines the length of the key field in bytes.

The key field may be up to 127 bytes long. The position of the key field within the record will depend on its position *and* its length. A key field may not lie within an "overflow" block. Overflow blocks are created if a file is converted from K-ISAM format to NK-ISAM format and the maximum record length is used in the K-ISAM format file.

**DUPLICATE-KEY = \*YES / \*NO**

Specifies whether the secondary keys in different records may have the same value. The default setting is YES, i.e. duplicate keys are permitted.

In this case, the secondary index may contain several entries for any particular secondary key value. These entries are sorted according to their date of creation (in time stamp order).

**SORT-WORK-FILE = \*STD / \*LINK(...)**

Specifies which disk is to be used for the sort run when the secondary index is being created, if main memory provides insufficient space.

When the sort run ends, the assigned file will be *deleted*.

The default setting is \*STD, i.e. if it is required, the sort run will use a file named DISWORK.<tsn>.

**SORT-WORK-FILE = \*LINK(...)**

By specifying its file link name, the user can select another file as the work file.

**LINK-NAME = <name 1..8>**

File link name under which the file to be used is entered into the TFT.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	32	DMS0A37	Internal system error
	32	DMS0A3A	Inconsistent control block
	32	DMS0A42	Internal error on opening the file
	32	DMS0A43	Internal error on closing the file
	32	DMS0A44	Error on reading the file
	32	DMS0A45	Error on writing to the file
	32	DMS0A47	DMS error in sort part of NK-ISAM
	32	DMS0A48	Internal error in sort part of NK-ISAM
	32	DMS0A4F	RDTFT error
	64	DMS0A3D	Incomplete secondary key found
	64	DMS0A3F	Secondary index already defined
	64	DMS0A30	Remote BS2000 system has a version < V10.0A
	64	DMS0A31	Specified catalog ID does not exist
	64	DMS0A33	File contains duplicate primary keys
	64	DMS0A34	Secondary index already exists
	64	DMS0A36	File contains ISAM flags
	64	DMS0A39	Invalid KEYPOS parameter
	64	DMS0A40	List includes duplicated names
	64	DMS0A46	Not an NK-ISAM file
	64	DMS0A4D	File contains duplicate secondary key
	64	DMS0A4E	SHARUPD = YES was specified
	128	DMS0A49	Command interrupted
	130	DMS0A32	Specified catalog ID not available
	130	DMS0A38	Insufficient virtual memory
	130	DMS0A3C	Maximum number of secondary keys

	130	DMS0A3E	ISAM pool is overloaded
--	-----	---------	-------------------------

## Examples

### Creation of multiple secondary indices

```
/show-file-attr max.file.4,inf=(org=*yes) _____ (1)
```

```
%0000000126 :2OSG:$USER1.MAX.FILE.4
% ----- ORGANIZATION -----
% FILE-STRUC = ISAM          BUF-LEN   = STD(1)      BLK-CONTR  = PAMKEY
% IO(USAGE)  = READ-WRITE   IO(PERF)  = STD        DISK-WRITE = IMMEDIATE
% REC-FORM   = (V,N)        REC-SIZE  = 0
% KEY-LEN    = 8            KEY-POS   = 5
% AVAIL      = *STD
% WORK-FILE  = *NO          F-PREFORM = *K          S0-MIGR   = *ALLOWED
%:2OSG: PUBLIC:      1 FILE RES=      126 FRE=      5 REL=      3 PAGES
```

```
/cre-alter-index file-name=max.file.4,
                alter-index=( (key-name=strasse,key-pos=30,key-len=20), — (2)
```

```
                (key-name=ort,key-pos=50,key-len=25) ) — (3)
```

```
/show-index-at max.file.4 _____ (4)
```

```
%FILE-NAME: :2OSG:$USER1.MAX.FILE.4
% KEY-NAME  KEY-POSITION  KEY-LENGTH  DUPKEY
%-----
% STRASSE   30            20          YES
% ORT       50            25          YES
```

- (1) Returns information on the organization of the NK-ISAM file *MAX.FILE.4*. The primary key begins at the 5th byte (after a record length field of 4 bytes) and is 8 bytes long. The file contains a customer list, where the 8-digit customer number serves as the primary key.

Two secondary indices are defined in a list in the CREATE-ALTERNATE-INDEX command (see points 2 and 3):

- (2) In order to enable access in a program via the street name which is contained in each record, a secondary index with the name *STREET* is to be created for this data field. The data field begins at the 30th byte and is 20 bytes long. Since a street name may be contained in several records, *DUPLICATE-KEY=\*YES* is permitted (default value).
- (3) In order to enable access in a program via the city name which is contained in each record, a secondary index with the name *CITY* is to be created for this data field. The data field begins at the 50th byte and is 25 bytes long. Since a city name may be included in several records, *DUPLICATE-KEY=\*YES* is permitted (default value).
- (4) The *SHOW-INDEX-ATTRIBUTES* command returns information on all secondary indices that were created for the file *MAX.FILE.4*.

## 2.72 CREATE-DUMP

Generate user dump

**Component:** BS2000 OSD/BC  
**Functional area:** Program control  
**Domain:** PROGRAM  
**Privileges:** all privileges bar  
HARDWARE-MAINTENANCE  
OPERATING

### Function

The CREATE-DUMP command allows users to initiate creation of a user dump. A dump is only generated if Y is entered in response to the following query:

```
IDA0N45 DUMP DESIRED? REPLY (Y=USER-/AREADUMP TO DISK;  
Y,<VOLUMETYPE>=USER-/AREADUMP TO TAPE; Y,SYSTEM=SYSTEMDUMP; N=NO)
```

Users can convert the user dump to a system dump by setting their read authorization so that the value m is greater than or equal to 3 in the command `MODIFY-TEST-OPTIONS PRIVILEGE=PARAMETERS(READ=m, WRITE=1)`. This option is only open to users who have the appropriate authorization in the user entry. The `SHOW-USER-ATTRIBUTES` command displays information about the user entry.

Whether the CREATE-DUMP command results in creation of a dump depends on the setting of the test option DUMP (see the `MODIFY-TEST-OPTIONS` command):

DUMP=*NO:	Dump creation is suppressed
DUMP=*STD:	Dump creation is suppressed in batch and procedure mode. In dialog mode, a dump is only created if you respond with "Y" to message IDA0N45.
DUMP=*YES:	Dump creation is initiated without prompting.
DUMP=*SYSTEM:	The user dump is converted into a system dump without prompting.

### Format

<b>CREATE-DUMP</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	32	CMD0221	System error

---

## 2.73 CREATE-FILE

Define name and attributes for new file

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING TSOS SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The CREATE-FILE command creates a catalog entry for a file. The following attributes are defined for the file and stored in the catalog under the specified file name:

- name (FILE-NAME operand)
- type of volume and performance attributes (SUPPORT operand)
- protection attributes (PROTECTION operand)
- method and frequency with which the file is automatically backed up by ARCHIVE or HSMS (SAVE operand)
- user information (USER-INFORMATION and ADM-INFORMATION operands)
- lock against migration when public storage space is automatically managed by the software product HSMS (MIGRATE operand)
- character set (CODED-CHARACTER-SET operand)
- character set for SAM node files (NET-CODED-CHARACTER-SET operand)

Further attributes, see "[Overview of functions](#)".

#### *Privileged functions*

The following functions are available only if physical allocation of public space is allowed:

- explicit specification (values other than the default, \*STD) of a volume or volume set in the VOLUME or VOLUME-SET operand in the structure SUPPORT=\*PUBLIC-DISK (STORAGE-CLASS=\*NONE(...)) when creating files on the pubset's disks
- absolute space reservation using SPACE=\*ABSOLUTE(...) in the structure SUPPORT=\*PUBLIC-DISK(...) (note that no permission is required when SUPPORT=\*PRIVATE-DISK)
- intensified migration locking using MIGRATE=\*FORBIDDEN

Exception: These functions are also available for work files when no authorization for physical allocation exists.

---

Physical allocation is allowed in the following cases:

- for tasks with TSOS privilege
- for files of a user ID which has PHYSICAL-ALLOCATION=\*ALLOWED in its pubset-specific user entry (see the SHOW-USER-ATTRIBUTES command)
- for files in SF pubsets which have an MRSCAT entry that allows physical allocation for all users (see the SHOW-MASTER-CATALOG-ENTRY command, INFORMATION=\*USER) operand.

Systems support (TSOS privilege) personnel can supplement the user information in the file catalog with one to eight bytes of information about the file (ADM-INFORMATION operand).

Systems support personnel (TSOS privilege) can have accesses to the file monitored (AUDIT operand). To configure the AUDIT function, nonprivileged users need appropriate authorization in the user entry of the pubset in which the file is to be created (see the *AUDIT* output field of the SHOW-USER-ATTRIBUTES command).

By default, systems support (TSOS privilege) is a co-owner of all the files (and can, therefore, create files under all user logons). When SECOS is used, this co-ownership can be restricted.

Systems support can generate files under any user ID (TSOS privilege). In conjunction with the SECOS software product a user can allow other user IDs to act as co-owners. Co-owners are thus allowed to create permanent files under that ID.

#### *Temporary files*

Since temporary files are job-related, it is not possible to define file protection for them, i.e. the specified protection attributes (PROTECTION operand) cannot differ from the defaults (except for DESTROY-BY-DELETE, AUDIT, and SPACE-RELEASE-LOCK).

A nonprivileged user can only generate temporary files on the default pubset of his user ID.

#### *Files in SM pubsets*

The storage location for a file on an SM pubset can be selected on the basis of a storage class. This simplifies the automatic management of storage space (for details see the “Introduction to System Administration” [14] or the “System-Managed Storage” manual [45]).

Systems support personnel allocates to a storage class certain file attributes which are implicitly set for all files assigned to that storage class. If a storage class is specified, there is no need to explicitly specify values for the WORK-FILE, VOLUME-SET, VOLUME, DEVICE-TYPE, IO-ATTRIBUTES, DISK-WRITE, FILE-PREFORMAT and AVAILABILITY operands. The SHOW-STORAGE-CLASS command allows users to find out which storage classes of the SM pubset are available to them and which file attributes are set.

#### *Physical allocation in SM pubsets*

A user who is allowed to perform physical allocation of public storage space (see “Privileged functions”) can directly specify a volume or volume set (VOLUME or VOLUME-SET operand) in the STORAGE-CLASS=\*NONE(...) structure in order to select a specific volume set of an SM pubset as the storage location for a file.

In addition, a lock on migration to another volume set of the SM pubset is placed on the file (S0-MIGRATION=\*FORBIDDEN; see also the identically named operand in the command description). If the user has specified a volume set of the WORK usage mode, the WORK-FILE attribute is specified implicitly.

---

When S0-MIGRATION=\*FORBIDDEN is set (in this case implicitly), the file's PERFORMANCE and AVAILABILITY attributes are matched to the identically named attributes of the volume set. These attributes correspond to the levels of PERFORMANCE (STD, HIGH, VERY-HIGH) and AVAILABILITY (STD, HIGH) which are hierarchically arranged in the user catalog. To ensure that there are adequate levels of performance and availability, files with the S0-MIGRATION=\*FORBIDDEN attribute are always assigned at least the PERFORMANCE and AVAILABILITY levels defined for the volume set (you can list the attributes of the volume set with the SHOW-PUBSET-DEFINITION-FILE command (and also with SHOW-PUBSET-CONFIGURATION)). Any explicit specification of the PERFORMANCE and AVAILABILITY operands which selects a lower level in the hierarchy is ignored. The minimum value is recorded in the file's catalog entry, and the level in the user catalog is set accordingly. Note that a file's PERFORMANCE attribute may be higher than the maximum permissible value as set in the user entry (*DMS-TUNING-RESOURCES* output field). Then, regardless of the level that has been set, the file will at best be processed using the value which is in the user entry at the time of OPEN processing. The level settings and the value of the DMS-TUNING-RESOURCES attribute can be viewed in the output of the SHOW-USER-ATTRIBUTES command, INFORMATION =\*PUBSET-ATTRIBUTES operand.

### *Example*

In conjunction with physical allocation, the user specifies PERFORMANCE=\*HIGH or \*STD (or this applies implicitly since it is the default), but the attribute of the chosen volume set is PERFORMANCE=\*VERY-HIGH. The file will then automatically be assigned the attribute PERFORMANCE=\*VERY-HIGH. If the user entry includes DMS-TUNING-RESOURCES=\*CONCURRENT-USE, the file will actually only be processed with a setting of PERFORMANCE=\*HIGH.

### *Work files*

The user can create a file as a work file in an SM pubset (operand setting WORK-FILE= \*YES). The file is created as a permanent file in a volume set defined for that purpose. Systems support personnel can delete work files again at times which it defines.

By default, work files are not backed up.

### *Files on tapes and tape cartridges*

When the catalog entries for tape files are being accessed or created, the special features associated with this storage medium must be taken into account.

For files with standard labels, details of the shareability (USER-ACCESS), access type (ACCESS) and passwords are transferred from the catalog entry to the file labels when the file is created (OPEN).

When a file is created, its file attributes are transferred to the file labels without being checked. Write protection (ACCESS=\*READ) can thus be defined for a file which has still to be created. The file can then be opened as an output file, and created; the write protection will take effect after this.

If a file was cataloged using CREATE-FILE, by default it will be shareable unless USER-ACCESS=\*OWNER-ONLY is specified in a CREATE-FILE command (or later by a MODIFY-FILE-ATTRIBUTES command before the file is opened for the first time).

### *Files on remote systems*

If a file is created via an RFA connection on a remote system which has its FARMTSAV system parameter set to 1, the catalog entry is marked as modified (its internal version number is given a value of 1) and will if necessary be backed up in the next incremental backup.

## Overview of functions

Function / Meaning	Level 1 operands	Level 2/3 operands

## Operands

### **FILE-NAME = <filename 1..54 without-gen>**

The name to be given to the new file.

You may specify only your own user logon or a user logon to which co-ownership has been assigned.

The maximum number of files specified for the user in the user catalog must not be exceeded. The permitted number of permanent and temporary files may also be limited. The applicable values can be determined from the output of the SHOW-USER-ATTRIBUTES command. A nonprivileged user can only generate temporary files on the default pubset of his user ID.

### **SUPPORT = \*PUBLIC-DISK(...) / \*PRIVATE-DISK(...) / \*TAPE(...) / \*NONE**

Type of volume.

### **SUPPORT = \*PUBLIC-DISK(...)**

The file is to be created on public disk or Net-Storage. The pubset on which the file is to be created is uniquely identified by the (explicitly specified or default) catalog ID in the file name.

### **STORAGE-TYPE = \*STD / \*PUBLIC-SPACE / \*NET-STORAGE(...)**

Determines the storage type for the file's storage location.

### **STORAGE-TYPE = \*STD**

The file is created on the default storage type for storing files on this pubset.

### **STORAGE-TYPE = \*PUBLIC-SPACE**

The file is created on the disks of the pubset.

In addition to the entry in the file catalog, the file is also created physically with the smallest possible amount of storage space (see the "SPACE operand").

### **STORAGE-TYPE = \*NET-STORAGE(...)**

The file is created on a Net-Storage volume.

The authorization NET-STORAGE-USAGE=\*ALLOWED (default) must be entered to the user entry. Catalog entries are generated both on the local pubset and in the relevant file system of the Net-Server. However, the file is not created physically.

If no volume is specified, the file is created on the default Net-Storage volume. If no default Net-Storage volume is assigned to the pubset but only one or more explicitly specified Net-Storage volumes, the system determines the Net-Storage volume on which the file is created.

**i** Files with a PAM key, file generation groups, work files and temporary files cannot be created on Net-Storage.

### **FILE-TYPE = \*STD / \*BS2000 / \*NODE-FILE**

Determines the file type of the file to be created.

### **FILE-TYPE = \*STD**

The file is created as a BS2000 file on a Net-Storage volume. When the volume of a private disk is specified under STORAGE-CLASS=\*NONE(...), the file is created on the private disk.

### **FILE-TYPE = \*BS2000**

The file is created as a BS2000 file on a Net-Storage volume. When under STORAGE-CLASS=\*NONE (...) specifications regarding the volume or device type are provided which do not permit this, the command is aborted with an error.

---

**FILE-TYPE = \*NODE-FILE**

The file is created as a node file on a Net-Storage volume. When under STORAGE-CLASS=\*NONE(...) specifications regarding the volume or device type are provided which do not permit this, the command is aborted with an error.

**STORAGE-CLASS = \*STD / <composed-name 1..8> / \*NONE(...)**

Governs the properties of the file's storage location.

Systems support staff can define storage classes to facilitate automatic management of storage space in SM pubsets. A storage class is allocated certain file attributes which are implicitly set for all files assigned to that storage class. If a storage class is specified, there is no need to explicitly specify values for the WORK-FILE, VOLUME-SET, VOLUME, DEVICE-TYPE, IO-ATTRIBUTES, DISK-WRITE, FILE-PREFORMAT and AVAILABILITY operands.

The SHOW-STORAGE-CLASS command allows users to find out which storage classes of an SM pubset are available to them and which file attributes are set. Assigning a storage class simplifies the automatic management of storage space in an SM pubset (for details see the "Introduction to System Administration" [14] or the "System-Managed Storage" manual [45]).

**STORAGE-CLASS = \*STD**

A file in an SM pubset is assigned the default storage class from the user entry for that pubset. If the file is to be created in an SF pubset or if there is no default storage class defined, the file is given the same attributes as with STORAGE-CLASS=\*NONE with default values.

**STORAGE-CLASS = <composed-name 1..8>**

A file in an SM pubset is assigned the specified storage class. The storage class must exist and be accessible to the user at the time when the assignment is made. This specification is ignored for a file in an SF pubset; the file is then given the same attributes as with STORAGE-CLASS=\*NONE with default values.

**STORAGE-CLASS = \*NONE(...)**

This value has the same effect as \*STD if all the following conditions are met:

- The file is created on a volume set intended for permanent storage.
- A default storage class is assigned to the user ID at the SM pubset in question.
- Physical allocation is not permitted.

Only in this case are the operands WORK-FILE, PERFORMANCE, USAGE, DISK-WRITE, and AVAILABILITY ignored.

In all other cases, the properties of the file's storage location are determined on the basis of the following operands and no storage class is assigned to the file.

**WORK-FILE = \*STD / \*NO / \*YES**

*The operand is evaluated only for files in SM pubsets.* Specifies whether the file is a work file which systems support is allowed to delete at a time which it defines.

**WORK-FILE = \*STD**

The file is to be a work file only if it is stored in a volume set for work files as a result of the value of the VOLUME or VOLUME-SET operand.

**WORK-FILE = \*NO**

The file is not to be a work file.

**WORK-FILE = \*YES**

The file is to be a work file.

---

**IO-ATTRIBUTES = \*STD / \*PARAMETERS(...)**

Specifies the performance requirements demanded by the user for input/output operations. Whether such requirements are satisfied and the extent to which they are fulfilled depends on the cache medium that is defined for the associated pubset (see the output of the SHOW-MASTER-CATALOG-ENTRY command). If the file is created in an SM pubset, the performance requirements are taken into account when the volume set is selected.

Read and write access is performed through a fast cache. The number of disk accesses and the access times are reduced.

Performance attributes for file processing can also be defined in the TFT (see also the ADD-FILE-LINK command).

**IO-ATTRIBUTES = \*STD**

The file has no special performance attributes and is therefore not processed via a cache.

**IO-ATTRIBUTES = \*PARAMETERS(...)**

Performance attributes are determined by the values of the PERFORMANCE and USAGE operands.

**PERFORMANCE = \*STD / \*HIGH / \*VERY-HIGH / \*USER-MAXIMUM**

Specifies the file's performance attribute. It indicates the priority required for the I/O operations selected in the USAGE operand. The highest performance attribute allowed is defined in the user entry (see also the *DMS-TUNING-RESOURCES* output field in the output of the SHOW-USER-ATTRIBUTES command).

**PERFORMANCE = \*STD**

The file has no special performance attribute and is therefore not processed via a cache.

The USAGE operand does not affect the processing of the file in this case.

**PERFORMANCE = \*HIGH**

The file is to be processed through a cache (high performance priority). This specification is only possible for users who have the DMS tuning privilege CONCURRENT-USE or EXCLUSIVE-USE for the pubset (see the output field *DMS-TUNING-RESOURCES* in the output of the SHOW-USER-ATTRIBUTES command).

**PERFORMANCE = \*VERY-HIGH**

The file is to be processed through a cache. The referenced data in the file is to be kept permanently in the cache (highest performance priority). The cache data is only evicted from the cache when the file is closed. Specification only possible for users who have the DMS tuning privilege EXCLUSIVE-USE for the pubset (see the output for the SHOW-USER-ATTRIBUTES command, output field *DMS-TUNING-RESOURCES*).

*Note*

All cache segments used for this file are locked until the file is closed. If there are many files open with this attribute at the same time, the cache memory available for normally cached files may, as a result, be so greatly restricted that data accesses to such files can no longer be implemented with an adequate level of performance.

**PERFORMANCE = \*USER-MAXIMUM**

The file is assigned the highest performance attribute contained in the user catalog for the user.

---

**USAGE = \*READ-WRITE / \*WRITE / \*READ**

Specifies the I/O operations for which enhanced performance (caching) is required. The default setting is \*READ-WRITE, i.e. the requirements apply to read and write operations.

If the file does not have a particular performance attribute (PERFORMANCE= \*STD) and if the cache area for the pubset is not defined in such a way that all existing files are served (see the operand CACHED-FILES=\*ALL for the MODIFY-PUBSET-CACHING-ATTRIBUTES command), then the USAGE operand has no effect on processing.

**USAGE = \*READ-WRITE**

The performance requirements apply both to read and to write operations.

**USAGE = \*WRITE**

The performance requirements apply to write operations only.

**USAGE = \*READ**

The performance requirements apply to read operations only.

*Note*

With USAGE=\*READ-WRITE or \*WRITE, write caching is performed only if the conditions for the DISK-WRITE file attributes are met (see CREATE-FILE or MODIFY-FILE-ATTRIBUTES). For write caching with DISK-WRITE= \*IMMEDIATE, the cache medium being used must be failsafe (see the *CACHE-MEDIUM* output field of the SHOW-MASTER-CATALOG-ENTRY command with INFORMATION=\*USER).

**DISK-WRITE = \*STD / \*IMMEDIATE / \*BY-CLOSE**

Specifies the time at which the data must be on a nonvolatile medium (disk or failsafe cache medium) after a write operation. If a volatile cache medium is used as the write cache, data in the file will not be in a consistent state until CLOSE processing has been completed because the write data is written out to disk during CLOSE processing. System errors during the processing phase may lead to inconsistencies. Write caching for files containing data which cannot easily be restored should be performed using only fail-safe cache media, i.e. data consistency after each write operation should be requested with DISK-WRITE=\*IMMEDIATE.

**DISK-WRITE = \*STD**

The default setting STD is equivalent to the value \*IMMEDIATE for permanent files and the value \*BY-CLOSE for temporary files.

**DISK-WRITE = \*IMMEDIATE**

Data contained in the file must be on a nonvolatile medium immediately after a write operation.

Write caching is performed for files marked in this way only if a nonvolatile cache area is active for the pubset (see the *CACHE-MEDIUM=NONVOLATILE* output field of the SHOW-MASTER-CATALOG-ENTRY command with INFORMATION=\*USER). If a volatile cache area is active for the pubset ( *CACHE-MEDIUM=VOLATILE* output field), only read accesses are buffered for the file; write accesses are performed directly on the disks.

---

**DISK-WRITE = \*BY-CLOSE**

Data contained in the file needs to be on a nonvolatile medium only after CLOSE processing. Write caching for files marked in this way is performed regardless of whether the cache medium is fail-safe, i.e. even on volatile cache media.

Unsaved cached data is written out during CLOSE processing. The data in the file will not be on a nonvolatile medium (disk storage) until that point.

This attribute is suitable only for files containing data that can easily be restored (list files generated during compilation, for example), as a system error may cause inconsistencies in the files.

**AVAILABILITY = \*STD / \*HIGH**

Specifies availability requirements for the file. Files for which high availability is required must always be created by the system on suitable volumes (such as a disk with DRV mirroring). If no appropriate volume is available, the command is rejected.

**AVAILABILITY = \*STD**

The file is not subject to special availability requirements.

**AVAILABILITY = \*HIGH**

The file is to have high availability. If the volume is not capable of meeting the requirement, or if no suitable volume set is available within the SM pubset, the command is rejected.

The command is also rejected if applied to a work file or a temporary file.

**FILE-PREFORMAT = \*BY-PUBSET-DEFAULT / \*K / \*NK2 / \*NK4**

*The operand is evaluated only for files in SM pubsets.* Governs the preferred file format, which is taken into account in the choice of volume set. As long as the file has not yet been opened (no CREATION-DATE in the catalog entry), the chosen storage location is provisional and may still change in the course of OPEN processing.

**FILE-PREFORMAT = \*BY-PUBSET-DEFAULT**

The preferred file format which applies is the format that systems support has defined as the pubset-specific default for the SM pubset using the MODIFY-PUBSET-SPACE-DEFAULTS command. The value set can be determined with the SHOW-PUBSET-SPACE-DEFAULTS command (and also with SHOW-PUBSET-CONFIGURATION).

**FILE-PREFORMAT = \*K**

The file is to be created as a K file (BLOCK-CONTROL-INFO=\*PAMKEY).

**FILE-PREFORMAT = \*NK2**

The file is to be created as an NK file in 2K format (BLOCK-CONTROL-INFO= \*WITHIN-DATA-2K-BLOCK or \*WITHIN-DATA-BLOCK for a SAM file).

**FILE-PREFORMAT = \*NK4**

The file is to be created as an NK file in 4K format (BLOCK-CONTROL-INFO= \*WITHIN-DATA-4K-BLOCK or \*WITHIN-DATA-BLOCK for a SAM file).

**VOLUME-SET = \*STD / \*CONTROL-VOLUME-SET / <cat-id 1..4>**

*The specification is relevant only for a file on an SM pubset.*

Determines the volume set on which the file is to be created.

Systems support can specify a volume set explicitly using \*CONTROL-VOLUME-SET or <cat-id 1..4>.

Nonprivileged users cannot specify a volume set explicitly unless they have authorization to perform physical allocation of public storage space (see "[Privileged functions](#)").

---

**VOLUME-SET = \*STD**

The file is stored in a suitable volume set of the SM pubset.

**VOLUME-SET = \*CONTROL-VOLUME-SET**

*Subject to restrictions (see general operand description).*

The file is stored in a control volume set of the SM pubset. S0-MIGRATION= \*FORBIDDEN is set implicitly.

If the volume set does not match the requested file attributes, the command is rejected.

**VOLUME-SET = <cat-id 1..4>**

*Subject to restrictions (see general operand description).*

The file is stored in the specified volume set of the SM pubset. S0-MIGRATION= \*FORBIDDEN is set implicitly. If the volume set does not match the requested file attributes, the command is rejected.

**VOLUME = \*STD / list-poss(255): <vsn 1..6>**

VSN of a public disk or of a Net-Storage volume on which the file is to be created.

**VOLUME = \*STD**

The system selects appropriate VSNs.

**VOLUME = list-poss(255): <vsn 1..6>**

Systems support can specify volume serial numbers explicitly.

Nonprivileged users can specify a VSN for a Net-Storage volume explicitly. Nonprivileged users cannot specify a VSN explicitly for a public disk explicitly unless they have authorization to perform physical allocation of public storage space (see "[Privileged functions](#)").

VSNs can only be specified for public disks of the pubset whose pubset ID matches the catalog ID of the file name.

If the specified disk is part of a volume set in an SM pubset, S0-MIGRATION and MIGRATE=\*FORBIDDEN are set implicitly.

When a file is to be created on Net-Storage, the Net-Storage volume specified must be allocated to the catalog ID of the file name.

When the file is to be stored on a specific Net-Storage volume without a default name, the VSN must be specified. Otherwise, the file is stored on the default Net-Storage volume or, if this does not exist, the system selects a Net-Storage volume.

**DEVICE-TYPE = \*BY-VOLUME / <device>**

Type of device to which the required public disk or Net-Storage volume is assigned. Only device types known within the system are accepted. In interactive mode, the possible device types are displayed with DEVICE-TYPE=?.

The volume type NETSTOR must be specified for Net-Storage volumes.

If at least one volume ID is specified with VOLUME, each specification of a disk device type which is known to the system is handled like the STDDISK specification.

**DEVICE-TYPE = \*BY-VOLUME**

The disk device type belonging to the public disk is determined by the system.

**DEVICE-TYPE = <device>**

Systems support can specify device types explicitly.

When files are created on public volumes, nonprivileged users cannot specify a device type explicitly unless they have authorization to perform physical allocation (see "[Privileged functions](#)").

**SPACE = \*STD / \*RELATIVE(...) / \*ABSOLUTE(...)**

Influences the storage space allocation for the file. The SPACE operand is always evaluated.

### SPACE = \*STD

For its primary and secondary allocations, the file is assigned the values defined by systems support.

### SPACE = \*RELATIVE(...)

With this operand, the user reserves storage space for the file (relative allocation). In doing so, he must take into account the following: the space ceiling defined in the user entry may be exceeded only if the user is authorized to do so (PUBLIC-SPACE-EXCESS=\*YES, see the output of the SHOW-USER-ATTRIBUTES command).

In order to minimize system administration time, the following points should be noted when specifying primary and secondary allocations:

- the primary allocation should correspond to the expected size of the file to be created;
- for large files, the primary and secondary allocations should be selected as a multiple of the administration units packet or segment.

In relation to the allocation of storage space, the effect of the BUFFER-LENGTH operand in the ADD-FILE-LINK command must also be taken into account: when the primary and secondary allocations are being determined, the file's block length should be taken into account; for BUFFER-LENGTH=\*STD(SIZE=n), where  $n \geq 2$ , the following applies:

File type	SPACE operand	
	Primary allocation	Secondary allocation
SAM	$\geq 2n$	$\geq n$
ISAM (K-ISAM and NK-ISAM)	$> n$	
PAM (chained I/O)	$> 0$	

Table 30: Minimum values for primary and secondary space allocations

### PRIMARY-ALLOCATION = <integer 1..2147483647>

Number of PAM pages to be allocated initially.

The specified number of PAM pages will be reserved immediately. The number should correspond to the expected size of the file.

When storage space is actually allocated, the specified number of PAM pages is rounded up to a multiple of **k** if required. At this **k** is the number of PAM pages in the smallest allocation unit in each case.

Pubset/volume set format	Smallest allocation unit in Kbytes	Rounding factor k
K pubset/volume set	6	3
NK2(6K) pubset/volume set	6	3
NK2(8K) pubset/volume set	8	4
NK2(64K) pubset/volume set	64	32
NK4(8K) pubset/volume set	8	4

NK4(64K) pubset/volume set	64	32
----------------------------	----	----

Table 31: Smallest allocation unit based on pubset/volume set format

The pubset/volume set format and the smallest allocation unit can also be determined by the user from the output of the SHOW-MASTER-CATALOG-ENTRY command.

**SECONDARY-ALLOCATION = \*STD / <integer 0..32767>**

The number of PAM pages by which the storage space should be extended, if this should become necessary. The default is STD, the default value for the system. In contrast to the primary allocation, the secondary allocation does not take effect as soon as the CREATE-FILE command is executed, but only if the reserved space proves insufficient when the file is being created or extended. The system will then automatically increase the storage space allocation for the file by the number of PAM pages specified in SECONDARY-ALLOCATION (field *S-ALLOC* in the output of the SHOW-FILE-ATTRIBUTES command). The value for secondary allocation is doubled after each successful extension. It is no longer doubled when the maximum value set in the system has been reached. When storage space is actually allocated, the specified number of PAM pages is rounded up to a multiple of *k* if required. The rounding factor *k* is dependent on the pubset/volume set format, i.e. on the formatting of the associated disks (see the PRIMARY-ALLOCATION operand).

A specification of SECONDARY-ALLOCATION=0 prevents dynamic expansion of the file.

**SPACE = \*ABSOLUTE(...)**

*This operand value is allowed only in combination with VOLUME operands.*

Systems support staff can allocate storage space explicitly. In the case of files on Net-Storage, an absolute assignment of storage space is not permitted.

Nonprivileged users are allowed to allocate it only if they have authorization to perform physical allocation of public storage space (see "[Privileged functions](#)"). With this operand, the user reserves storage space for the file by an absolute allocation, i.e. he specifies the number of the PAM page on which the storage space allocation is to start. In doing so, he must take the following into account: An absolute allocation will only be made if it is possible to reserve the whole of the specified number of blocks (SIZE) on *one* single disk. If more than one disk was specified in the VOLUME operand, then only the first of the named disks will be used. If there isn't enough free storage space on the disk, the CREATE-FILE command will be rejected; there will be no partial allocation. Since an absolute allocation always refers to a single volume, a separate CREATE-FILE or MODIFY-FILE-ATTRIBUTES command must be issued for each volume. The secondary allocation for the file (see the SECONDARY-ALLOCATION operand) will have the value zero, i.e. if the number of pages specified in SIZE proves insufficient at a later point, there will be no automatic extension of the storage space.

**FIRST-PAGE = <integer 1..2147483647>**

Block number of the PAM page at which storage space reservation on the public disk is to start. Since storage space is only reserved in units of *k* PAM pages, where *k* is the number of PAM pages per smallest allocation unit, the value of FIRST-PAGE =  $k * n + 1$  ( $n \geq 0$ ).

**SIZE = <integer 3..2147483647>**

Number of PAM pages to be reserved on the public disk. SIZE must be a multiple of *k*. The amount of storage space available on a disk depends on its type and its initialization; systems support should, therefore, be asked what maximum value SIZE may have.

**MANAGEMENT-CLASS = \*NONE / <composed-name 1..8>**

*Only for files in SM pubsets* Specifies whether the HSMS backup, archiving and long-term archiving functions are controlled by a management class defined using HSMS. See the "HSMS" manual [18] for further details. Management class allocations are rejected for files in SF pubsets.

---

**MANAGEMENT-CLASS = \*NONE**

The file attributes set with the SAVE and MIGRATE operands are evaluated for file backup and migration.

**MANAGEMENT-CLASS = <composed-name 1..8>**

Name of the management class defined using HSMS. The specified management class must exist, and the user ID of the file owner must have access authorization.

**USER-INFORMATION = \*NONE / <c-string 1..8 with-low>**

Specifies whether user information is to be added to the catalog entry. This information is not evaluated by the system. Its content and meaning are defined solely by the user. The default is \*NONE, i.e. no information is added.

**ADM-INFORMATION = \*NONE / <c-string 1..8 with-low>**

*This operand is available only to privileged users (TSOS privilege).* Specifies whether a text is to be added to the catalog entry as information for systems support. This information is not evaluated by the system. Its content and meaning are defined solely by systems support. The default is \*NONE, i.e. no information is added.

**SUPPORT = \*PRIVATE-DISK(...)**

The file is to be set up on a private disk.

**VOLUME = \*ANY(...) / list-poss(255): <alphanum-name 1..6>**

The VSN (volume serial number) of the disk on which the file is to be set up.

**VOLUME = \*ANY(...)**

Indicates that any private disk should be mounted on the specified device type (no particular VSN is required).

The VSNs of the volumes which were requested are copied into the volume list in the catalog entry. If the user requests more than one volume to be mounted, the NUMBER-OF-DEVICES operand should be used to specify how many volumes are to be mounted at the same time.

**NUMBER-OF-DEVICES = 1 / <integer 1..9>**

Number of disks required.

**VOLUME = list-poss(255): <alphanum-name 1..6>**

A maximum of 255 different VSNs may be specified, i.e. for each CREATE-FILE command a maximum of 255 volumes may be requested. Each VSN may be specified only once. Starting with the volume on which the file starts, all the VSNs are copied into the volume list of the catalog entry.

For private disks, DMS attempts to reserve the whole of the storage space, requested by the SPACE operand, on the first of the private disks (see also the SPACE operand).

**DEVICE-TYPE = \*BY-VOLUME-CATALOG / <device>**

The type of device to which the required disks are allocated. Only device types known within the system are accepted. In interactive mode, the possible device types are displayed with DEVICE-TYPE=?. If at least one volume ID is specified with VOLUME, each specification of a disk device type which is known to the system is handled like the STDDISK specification.

The permissible specifications for DEVICE-TYPE can also be found in the device table in [section "Device type table"](#) (device type column). The devices available on the system can be listed with the SHOW-DEVICE-CONFIGURATION command.

**DEVICE-TYPE = \*BY-VOLUME-CATALOG**

The device type is determined via the MAREN device substitution function if the MAREN subsystem is available.

---

**SPACE = \*STD / \*RELATIVE(...) / \*ABSOLUTE(...)**

Influences the storage space allocation for the file. The SPACE operand is always evaluated. Storage space allocation is described in the “Introductory Guide to DMS” [13].

**SPACE = \*STD**

For its primary and secondary allocations, the file is assigned the values defined by the system parameters DMPRALL and DMSCALL.

**SPACE = \*RELATIVE(...)**

With this operand, the user reserves storage space for the file (relative allocation).

In order to minimize system administration time, the following points should be noted when specifying primary and secondary allocations:

- the primary allocation should correspond to the expected size of the file to be created;
- for large files, the primary and secondary allocations should be selected as a multiple of the administration units packet or segment.

In relation to the allocation of storage space, the effect of the BUFFER-LENGTH operand in the ADD-FILE-LINK command must also be taken into account: when the primary and secondary allocations are being determined, the file’s block length should be taken into account; for BUFFER-LENGTH=\*STD(SIZE=n), where  $n \geq 2$ , the following applies:

File type	SPACE operand	
	Primary allocation	Secondary allocation
SAM	$\geq 2n$	$\geq n$
ISAM (K-ISAM and NK-ISAM)	$> n$	
PAM (chained I/O)	$> 0$	

Table 32: Minimum values for primary and secondary space allocations

**PRIMARY-ALLOCATION = <integer 1..2147483647>**

Number of PAM pages to be allocated initially. The specified number of PAM pages will be reserved immediately. The number should correspond to the expected size of the file. The PRIMARY-ALLOCATION specification is rounded up to a multiple of 3, and the corresponding number of PAM pages are allocated on the private disk specified by the VOLUME operand. The system attempts to reserve the primary allocation on the first of the disks specified.

When large files are to be created, and when there are only a few segments free on each disk, specifying an appropriate primary allocation will initiate a disk swap. This then avoids excessive fragmentation of the file.

---

**SECONDARY-ALLOCATION = \*STD / <integer 0..32767>**

The number of PAM pages by which the storage space should be extended, if this should become necessary. The default is STD, the default value for the system. In contrast to the primary allocation, the secondary allocation does not take effect as soon as the CREATE-FILE command is executed, but only if the reserved space proves insufficient when the file is being created or extended. The system will then automatically increase the storage space allocation for the file by the number of PAM pages specified in SECONDARY-ALLOCATION (field *S-ALLOC* in the output of the SHOW-FILE-ATTRIBUTES command). The value for secondary allocation is doubled after each successful extension. It is no longer doubled when the maximum value set in the system has been reached. If required, the defined number of PAM pages is rounded up to a multiple of 3 when allocating space.

A specification of SECONDARY-ALLOCATION=0 prevents dynamic expansion of the file.

**SPACE = \*ABSOLUTE(...)**

Absolute allocation (only meaningful when a VSN is specified in the VOLUME operand).

With this operand, the user reserves storage space for the file by an absolute allocation, i.e. he specifies the number of the PAM page on which the storage space allocation is to start. In doing so, he must take the following into account: An absolute allocation will only be made if it is possible to reserve the whole of the specified number of blocks (SIZE) on *one* single disk. If more than one disk was specified in the VOLUME operand, then only the first of the named disks will be used. If there isn't enough free storage space on the disk, the CREATE-FILE command will be rejected; there will be no partial allocation. Since an absolute allocation always refers to a single volume, a separate CREATE-FILE or MODIFY-FILE-ATTRIBUTES command must be issued for each volume. The secondary allocation for the file (see the SECONDARY-ALLOCATION operand) will have the value zero, i.e. if the number of pages specified in SIZE proves insufficient at a later point, there will be no automatic extension of the storage space.

**FIRST-PAGE = <integer 1..2147483647>**

The block number of the PAM page on which the storage space reservation on the private disk is to start. Since storage space is only reserved in units of three PAM pages, FIRST-PAGE is limited by: FIRST-PAGE =  $3n + 1$  ( $n \geq 0$ ). The PAM page on which storage space reservations can start on any disk will depend on how the disk is initialized.

**SIZE = <integer 1..2147483647>**

Specifies how many PAM pages are to be reserved on the disk; SIZE must be a multiple of three. The amount of storage space available on a disk depends on its type and its initialization; systems support should, therefore, be asked what maximum value SIZE may have.

**DATA-SUPPORT = \*SAME / \*PARAMETERS(...)**

*Only for ISAM files:* where the data section is stored. This operand is used if the data and index blocks for an ISAM file are to be stored on separate disks.

**DATA-SUPPORT = \*SAME**

The data and index blocks of the ISAM file are not to be stored on separate disks.

**DATA-SUPPORT = \*PARAMETERS(...)**

The data and index blocks of the ISAM file are to be stored on separate disks. The values specified in the operands VOLUME, DEVICE-TYPE, and SPACE are only applicable to the index section of the file.

**i** Only K-ISAM files can be separated into index and blocks. The values specified for the operands DATA-VOLUME, DATA-DEVICE-TYPE, and DATA-SPACE are ignored for NK-ISAM files.

---

**DATA-DEVICE-TYPE = <device>**

*For K-ISAM files with separate index and data sections:* The device type to which the required disks are assigned. Only device types known within the system are accepted. In interactive mode, the possible device types are displayed with DEVICE-TYPE=?. If at least one volume ID is specified with DATA-VOLUME, each specification of a disk device type which is known to the system is handled like the STDDISK specification.

The disk type for the data section is named with DATA-DEVICE-TYPE (for the index section with DEVICE-TYPE). The permissible specifications for DEVICE-TYPE can also be found in the device table in [section "Device type table"](#) (device type column). DATA-DEVICE-TYPE must be specified if no storage has yet been reserved for the file. Although NK-ISAM does not support separation of index and data sections, it is possible to specify DATA-DEVICE-TYPE (for compatibility with K-ISAM).

**DATA-VOLUME = list-poss(255): <alphanum-name 1..6>**

*In conjunction with DATA-DEVICE-TYPE for ISAM files with separate index and data sections.*

The VSN of the private disk on which the data section of the ISAM file is to be set up. A maximum of 255 VSNs may be specified, but each VSN may be specified only once.

Although NK-ISAM does not support separation of index and data sections, it is possible to specify DATA-VOLUME (for compatibility with K-ISAM). DATA-VOLUME specifies the VSN of the volume on which the data section of the ISAM file is to be stored; the VOLUME operand must be specified for the index section. The further details are analogous to those for DATA-DEVICE-TYPE.

**DATA-SPACE = \*RELATIVE(...) / \*ABSOLUTE(...)**

*In conjunction with DATA-DEVICE-TYPE/DATA-VOLUME for the data section of ISAM files with separation of index and data sections* Defines the storage space allocations for the data section of an ISAM file. In contrast to the SPACE operand, the user must explicitly specify the storage space allocation, since the system does not provide a default allocation (minimal specification: the primary allocation under SPACE=\*RELATIVE).

The rules for specifying primary, secondary, and absolute allocations correspond to those for the SPACE operand, but relate to the volumes listed in DATA-VOLUME instead (see also the operands DATA-DEVICE, DATA-VOLUME). Although NK-ISAM does not support separation of index and data sections, it is possible to specify DATA-SPACE (for compatibility with K-ISAM).

**DATA-SPACE = \*RELATIVE(...)**

With this operand, the user can reserve storage space for the data section of an ISAM file in the form of a relative allocation.

**PRIMARY-ALLOCATION = <integer 1..2147483647>**

Number of PAM pages to be allocated initially. The specified number of PAM pages will be reserved immediately. The number should correspond to the expected size of the file. The system will attempt to make the initial allocation on the first disk specified.

**SECONDARY-ALLOCATION = \*STD / <integer 0..32767>**

The number of PAM pages for later file extensions.

The default value is STD, the system default value.

The number of PAM pages specified here is not immediately reserved. Only when the number of pages initially reserved is no longer sufficient will the system automatically increase the storage space allocated to the data section of the ISAM file by the number of PAM pages specified in the SECONDARY-ALLOCATION. This allocation is made dynamically, i.e. each time that additional storage space is required. If it is not already a multiple of 3, the extra space requested will be rounded to one. The value of the secondary allocation is copied into the catalog entry.

---

**DATA-SPACE = \*ABSOLUTE(...)**

With this operand, the user reserves storage space for the data section of the file by an absolute allocation, i.e. he specifies the number of the physical block on the disk at which the storage space allocation is to start. In doing so, the following must be taken into account: An absolute allocation will only be made if it is possible to reserve the whole of the specified number of PAM pages (SIZE) on **one** single disk. If more than one disk was specified in the DATA-VOLUME operand, then only the first of the named disks will be used.

**FIRST-PAGE = <integer 1..2147483647>**

PAM page number at which the absolute assignment begins. (The number specified must be a multiple of 3, plus 1; e.g. 1 / 4 / 7 / 10 etc.).

**SIZE = <integer 1..2147483647>**

The number of PAM pages to be reserved (this must be a multiple of 3).

**SUPPORT = \*TAPE(...)**

The file is to be created on tape. The required tape need not be mounted immediately by the operator.

**VOLUME = \*NO / \*ANY(...) / list-poss(255): <alphanum-name 1..6>**

Volume serial numbers of the tapes on which the file is to be created. A maximum of 255 volume serial numbers may be specified.

**VOLUME = \*NO**

No VSNs are to be entered into the catalog yet.

**VOLUME = \*ANY(...)**

The operator may mount any suitable tapes on the specified device type (no particular VSNs are required).

The VSNs of the volumes which were requested are copied into the volume list in the catalog entry. If the user requests more than one volume to be mounted, the NUMBER-OF-DEVICES operand should be used to specify how many volumes are to be mounted at the same time.

**NUMBER-OF-DEVICES = 1 / <integer 1..9>**

The number of tapes which is required.

**VOLUME = list-poss(255): <alphanum-name 1..6>**

A maximum of 255 different VSNs may be specified, i.e. for each CREATE-FILE command a maximum of 255 volumes may be requested. Each VSN may be specified only once.

**DEVICE-TYPE = \*BY-VOLUME-CATALOG / <device>**

Device type to which the required tapes are assigned. The value to be specified is the device type or volume type of the tapes, from which the Device Management System determines the device type which is to be made available for tape processing. Only device types known within the system are accepted. In interactive mode, the possible device types are displayed with DEVICE-TYPE=?.

If TAPE is specified as the device type, magnetic tape devices that support a recording density of 1600 or 6250 bpi (bytes per inch) are assigned. Other permissible specifications can be found in [section "Device types for DMS tape processing"](#).

DEVICE-TYPE=WORK requests a work tape. Work tapes are identified by having no tape owner entry in the VOL1 label (contents of "Owner identifier" field: X'40'). Work tapes should be requested if they are required only for the duration of the processing, and are not to be archived. If DEVICE-TYPE=WORK is specified, the operands VOLUME and PREMOUNT-LIST will be ignored.

DEVICE-TYPE=WORK should not be specified for file sets, because the work tape which is allocated is always that which is immediately available.

Tape cartridges cannot be requested as work tapes.

**DEVICE-TYPE = \*BY-VOLUME-CATALOG**

The device type is determined via the MAREN device substitution function if the MAREN subsystem is available.

**PREMOUNT-LIST = \*NONE / list-poss(255): <integer 0..255>**

The tape sequence number of the tape to be mounted. Issues a MOUNT message on the console requesting the mounting of tapes or suppresses the request.

**PREMOUNT-LIST = \*NONE**

The first volume specified in the VOLUME operand will be requested.

**PREMOUNT-LIST = list-poss(255): <integer 0..255>**

Issues a MOUNT message on the console requesting the mounting of tapes or suppresses the request. The tape sequence numbers specified here relate to the VSNs listed in the VOLUME operand. The volumes specified in this way are to be mounted by the operator (MOUNT request on the console). Multiple tape sequence numbers must be listed in ascending order (n,n+1,...).

Specifying PREMOUNT-LIST=0 has the effect that no tapes will be requested. Otherwise, it is only on opening the file that the first volume is requested.

**SUPPORT = \*NONE**

A catalog entry will be created, but no storage space will be reserved yet for the file.

**PROTECTION = \*STD / \*PARAMETERS(...)**

The protection attributes for the file.

**PROTECTION = \*STD**

The values supplied by default protection are employed for the protection attributes. The AUDIT and FREE-FOR-DELETION protection attributes are always set to \*NONE.

If default protection is not active, the system default values for the operands of the \*PARAMETERS structure are set.

Protection attribute	PROTECTION-ATTR=			
	*FROM-FILE	*STD <sup>1)</sup>	*BY-DEF-PROT-OR-STD	
			Default protection not active <sup>1)</sup>	Default protection active
ACCESS	value from reference file	WRITE	WRITE	values from default protection
USER-ACCESS		OWNER-ONLY	OWNER-ONLY	
BASIC-ACL		NONE	NONE	
DESTROY-BY-DELETE		NO	NO	

GUARDS		NONE	NONE	
SPACE-RELEASE-LOCK		NO	NO	
READ-PASSWORD	NONE	NONE	NONE	
WRITE-PASSWORD	NONE	NONE	NONE	
EXEC-PASSWORD	NONE	NONE	NONE	
FREE-FOR-DELETION	NONE	NONE	NONE	NONE
AUDIT	NONE	NONE	NONE	NONE

<sup>1)</sup> The system default values are entered.

Table 33: Effects of PROTECTION-ATTR on protection attributes in the case of CREATE-FILE

### PROTECTION = \*PARAMETERS(...)

This operand allows the following protection attributes to be specified for the file. If the default value \*NONE or \*NO is specified for an attribute, the corresponding protection function is not activated. In conjunction with the ACCESS, USER-ACCESS, BASIC-ACL, GUARDS and FREE-FOR-DELETION protection attributes and with password protection, only default protection attributes (see [table 33](#)) may be specified for temporary files. Since only the creating job can access temporary JVs, no protection is required against foreign access.

When the file is accessed, the highest activated protection level applies. The following table shows the method used for access control, the protection attributes, and the job variable protection hierarchy (protection levels):

Access control	Protection attribute	Prot. level
Standard access control	ACCESS and USER-ACCESS	0
Basic access control list	BASIC-ACL	1
Access control via guards	GUARDS using the software product SECOS	2

Table 34: Hierarchy of access control methods

Passwords are evaluated independently, without regard to the implemented protection level.

If the file's date of release for deletion has been reached (see the FREE-FOR-DELETION operand), the file owner can delete the file regardless of its access protection.

### PROTECTION-ATTR = \*BY-DEF-PROT-OR-STD / \*STD / \*FROM-FILE(...)

Specifies from where the protection attributes with the value \*BY-PROTECTION-ATTR or \*BY-PROT-ATTR-OR-NONE are to be obtained. For the assignments, see [table "Effects of PROTECTION-ATTR on protection attributes"](#).

### PROTECTION-ATTR = \*BY-DEF-PROT-OR-STD

The values supplied by default protection are entered for the operands with \*BY-PROTECTION-ATTR or \*BY-PROT-ATTR-OR-NONE. If default protection is not active, system default values or \*NONE will be assigned to the relevant operands.

### PROTECTION-ATTR = \*STD

System default values are set for operands with \*BY-PROTECTION-ATTR. \*NONE is set for operands with \*BY-PROT-ATTR-OR-NONE.

---

**PROTECTION-ATTR = \*FROM-FILE(...)**

Operands for which \*BY-PROTECTION-ATTR is specified, receive the value that they have in the catalog entry of the file named next. \*NONE is set for operands with \*BY-PROT-ATTR-OR-NONE.

If the protection attributes are to be copied for a temporary file, either the operands ACCESS=\*WRITE, USER-ACCESS=\*OWNER-ONLY, BASIC-ACL=\*NONE, and GUARDS=\*NONE must be specified explicitly or the specified file must have been cataloged with these attributes. ACCESS and USER-ACCESS can have any value in the case of temporary tape files.

**FILE-NAME = <filename 1..54 without-gen>**

Reference file from which the protection attributes with \*BY-PROTECTION-ATTR are to be copied. The file has to be on the same pubset as the new file currently being created. If the file does not exist or if it is not accessible (e.g. with SHOW-FILE-ATTRIBUTES), then the command is rejected.

**ACCESS = \*BY-PROTECTION-ATTR / \*WRITE / \*READ**

The ACCESS operand enables a file to be protected against overwriting; it specifies whether write access to the file is permitted (implicitly allowing read access) or only read access. This protection attribute is part of the standard access control mechanism and is only evaluated if no higher protection level has been activated (see [table "Hierarchy of access control methods"](#)).

*Tape files:* When the file is first opened, DMS copies the ACCESS type identifier into the HDR3 label. During subsequent accesses to the file, the file owner can bypass the checks on access type by using the command ADD-FILE-LINK... PROTECTION-LEVEL=\*LOW.

**ACCESS = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used.

**ACCESS = \*WRITE**

All types of access to the file are permitted.

*Tape files:* HDR3 label: access type identifier = 0

**ACCESS = \*READ**

The file may only be accessed to read it.

*Temporary files:* Write access cannot be prevented, ACCESS=\*READ will be rejected.

*Tape files:* HDR3 label: access type identifier = 1

**USER-ACCESS = \*BY-PROTECTION-ATTR / \*OWNER-ONLY / \*ALL-USERS / \*SPECIAL**

Specifies whether the file may be accessed by user IDs other than that of its owner or co-owners. The access type permitted in this case is governed by the ACCESS protection attribute (see the ACCESS operand).

This protection attribute is part of the standard access control mechanism. It is evaluated for users without HARDWARE-MAINTENANCE privileges only if no higher access protection is defined for the file (see [table "Hierarchy of access control methods"](#)).

*Tape files:* When the file is first opened, DMS copies the SHARE indicator into the HDR1 label ("access indicator").

**USER-ACCESS = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used.

### USER-ACCESS = \*OWNER-ONLY

The file is not shareable, which means that only the file owner and any co-owners have access to it.

*Tape files:* HDR1 label: access indicator = 1

### USER-ACCESS = \*ALL-USERS

The file is shareable, which means that any user ID can access it.

*Temporary files:* USER-ACCESS=\*ALL-USERS is not permitted

*Tape files:* HDR1 label: access indicator = (X'40') 'BLANK'

### USER-ACCESS = \*SPECIAL

User IDs with HARDWARE-MAINTENANCE privileges (online maintenance) may access the file. USER-ACCESS=\*ALL-USERS applies implicitly, which means that the file can be accessed by all user IDs, including the maintenance IDs. If accesses under a maintenance ID are to be permitted, SPECIAL must be set even if BASIC-ACL or GUARDS is used for access control.

### BASIC-ACL = \*BY-PROTECTION-ATTR / \*NONE / \*STD /

**\*PARAMETERS(...)** / \*GROUP-X / \*GROUP-RX / \*GROUP-WRX / \*ALL-X / \*ALL-RX /

**\*ALL-WRX**

Specifies whether a BASIC-ACL entry should be created for the file, and hence whether this entry is to be used for access control. A BASIC-ACL entry will only be evaluated if no higher protection level has been activated for the file (see also [table "Hierarchy of access control methods"](#)).

The following operand values correspond to common BASIC-ACL settings:

Operand value	BASIC-ACL protection								
	OWNER			GROUP			OTHERS		
	R	W	X	R	W	X	R	W	X
*STD	Y	Y	Y	N	N	N	N	N	N
*GROUP-X	Y	Y	Y	N	N	Y	N	N	N
*GROUP-RX	Y	Y	Y	Y	N	Y	N	N	N
*GROUP-WRX	Y	Y	Y	Y	Y	Y	N	N	N
*ALL-X	Y	Y	Y	N	N	Y	N	N	Y
*ALL-RX	Y	Y	Y	Y	N	Y	Y	N	Y
*ALL-WRX	Y	Y	Y	Y	Y	Y	Y	Y	Y

Y: access granted  
N: access denied

Table 35: Meaning of the operand values for common BASIC-ACL settings

### BASIC-ACL = \*BY-PROTECTION-ATTR

The value defined for the file specified in the PROTECTION-ATTR operand is used.

---

**BASIC-ACL = \*NONE**

No BASIC ACL entry will be created for the file. Access will be controlled as defined in the USER-ACCESS and ACCESS entries.

**BASIC-ACL = \*PARAMETERS(...)**

A BASIC-ACL entry is created for the file, and the BASIC-ACL (basic access control list) is used to control access, provided no higher protection level has been activated (see [table 34](#)). Read, write and execute authorizations must be explicitly set for each user ID which is to have access rights, otherwise no access right will be granted. Those with access rights are:

- OWNER, i.e. the user ID of the file owner and the user IDs of the co-owners and of systems support (see “Privileged functions”).
- GROUP, i.e. all user IDs which are in the same group as the file owner (excluding the owner, the co-owners and systems support). Definition of user groups is possible only when the software product SECOS is used. However, to allow for possible later installation of SECOS, GROUP should be given the same access rights as for OTHERS.
- OTHERS, i.e. all user IDs which belong to a different group from the file owner (excluding the owner, the co-owners and systems support).

**OWNER = \*NO-ACCESS / \*PARAMETERS(...)**

Specifies what access rights are to be given to the owner and the co-owners. The default setting is \*NO-ACCESS, i.e. there is no read, write or execute permission.

**OWNER = \*PARAMETERS(...)**

The access rights will be as specified:

**READ = \*NO / \*YES**

Specifies whether read authorization is set.  
The default setting is \*NO, i.e. there is no read permission.

**WRITE = \*NO / \*YES**

Specifies whether write authorization is specified.  
The default setting is \*NO, i.e. there is no write permission. Write permission does not imply read permission.

**EXEC = \*NO / \*YES**

Indicates whether read access is permitted or not.  
The default setting is \*NO, i.e. there is no execute permission.

**GROUP = \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights are to be set for all user IDs from the group of the owner.  
The default setting is \*NO-ACCESS, i.e. there is no read, write or execute permission.

**GROUP = \*PARAMETERS(...)**

Access rights are to be set as specified:

**READ = \*NO / \*YES**

Specifies whether read authorization is set.  
The default setting is \*NO, i.e. there is no read permission.

---

**WRITE = \*NO / \*YES**

Specifies whether write authorization is specified.  
The default setting is \*NO, i.e. there is no write permission.  
Write permission does not imply read permission.

**EXEC = \*NO / \*YES**

Indicates whether read access is permitted or not.  
The default setting is \*NO, i.e. there is no execute permission.

**OTHERS = \*NO-ACCESS / \*PARAMETERS(...)**

Specifies what access rights are to be given to all other user IDs. Unless the software product SECOS is in use, the access authorizations defined for GROUP and OTHERS should be the same. The default setting is \*NO-ACCESS, i.e. there is no read, write or execute permission.

**OTHERS = \*PARAMETERS(...)**

Access rights are to be set as specified:

**READ = \*NO / \*YES**

Specifies whether read authorization is set. The default setting is \*NO, i.e. there is no read permission.

**WRITE = \* NO / \*YES**

Specifies whether write authorization is specified.  
The default setting is \*NO, i.e. there is no write permission. Write permission does not imply read permission.

**EXEC = \*NO / \*YES**

Indicates whether read access is permitted or not.  
The default setting is \*NO, i.e. there is no execute permission.

**GUARDS = \*BY-PROTECTION-ATTR / \*NONE / \*PARAMETERS(...)**

Specifies whether access to the file is controlled by GUARDS.

**GUARDS = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used.

**GUARDS = \*NONE**

Access to the JV is not to be controlled via GUARDS.

**GUARDS = \*PARAMETERS(...)**

Access to the JV is to be controlled via GUARDS.

---

Access to the file is controlled via a guard, i.e. a specific object identifying all the conditions subject to which access will be granted: such as date, time and user ID. The GUARDS function unit of the chargeable software product SECOS (see the "SECOS" manual [35]) must be installed in order to create and maintain a guard. Each guard is uniquely identified by its name. The guard name resembles a file name: it can contain a user ID and consists of a name part which is up to 8 characters in length. If no user ID is specified explicitly, the user's own ID is added implicitly. Each access mode can be controlled by a separate guard. If no guard is assigned for an access mode (\*NONE), access control will refuse any corresponding access (e.g. WRITE=\*NONE prevents all write access). Specifying GUARDS=\*PARAMETERS defines access control using GUARDS with the default value \*NONE for all access modes, which means that the file cannot be read, updated or executed. The GUARDS subsystem is not required in order to define access control via GUARDS. The appropriate checks by GUARDS are not performed until the time file access takes place: If a guard has been defined but is not available, all access of the type controlled by that guard is prohibited. No access at all is possible if the GUARDS subsystem is not available at the time of access.

**READ = \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard controlling read access (up to 8 characters if no user ID is specified).

The default value is \*NONE, i.e. no read access is granted.

**WRITE = \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard controlling write access (up to 8 characters if no user ID is specified).

The default value is \*NONE, i.e. no write access is granted.

**EXEC = \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard for execute protection (up to 8 characters when no user ID is specified).

The default setting is \*NONE, i.e. the file cannot be executed.

**WRITE-PASSWORD = \*BY-PROT-ATTR-OR-NONE / \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

Write or read password for the JV to be modified.

The password defined here must be specified in the ADD-PASSWORD command to enable write access to the file.

The WRITE-PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

*Temporary files:* cannot be password-protected

*Tape files:* the password protection is noted in the HDR3 label

**WRITE-PASSWORD = \*BY-PROT-ATTR-OR-NONE**

Allocation of a write password is independent of the value of the PROTECTION-ATTR operand.

If PROTECTION-ATTR=\*BY-DEF-PROT-OR-STD is set, the values supplied by default protection or - if default protection is not activated - \*NONE is entered.

With PROTECTION-ATTR=\*STD / \*FROM-FILE(), \*NONE is entered, i.e. no write protection password is used.

**WRITE-PASSWORD = \*NONE**

No write protection password is specified.

---

**WRITE-PASSWORD = <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>**

Defines a password required for write accesses.

**READ-PASSWORD = \*BY-PROT-ATTR-OR-NONE / \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

Password for protection against unauthorized reading.

The password defined here must be specified in the ADD-PASSWORD command to enable read access to the file.

The READ-PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

*Temporary files:* cannot be password-protected

*Tape files:* the password protection is noted in the HDR3 label

**READ-PASSWORD = \*BY-PROT-ATTR-OR-NONE**

Allocation of a read password is independent of the value of the PROTECTION-ATTR operand.

If PROTECTION-ATTR=\*BY-DEF-PROT-OR-STD is set, the values supplied by default protection or - if default protection is not activated - \*NONE is entered.

With PROTECTION-ATTR=\*STD / \*FROM-FILE( ), \*NONE is entered, i.e. no read protection password is used.

**READ-PASSWORD = \*NONE**

No read protection password is specified.

**READ-PASSWORD = <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>**

Defines a password required for read accesses.

A source program which is protected by a read password cannot be compiled.

**EXEC-PASSWORD = \*BY-PROT-ATTR-OR-NONE / \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

The password used to protect against unauthorized execution of the file.

This type of password is specified for procedures, ENTER files and programs. The password defined here must be specified in the ADD-PASSWORD command before the procedure or program can be run.

The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

*Temporary files:* cannot be password-protected

*Tape files:* the password protection is noted in the HDR3 label

---

**EXEC-PASSWORD = \*BY-PROT-ATTR-OR-NONE**

Assignment of an execution protection password depends on the value of the PROTECTION-ATTR operand. If PROTECTION-ATTR=\*BY-DEF-PROT-OR-STD is set, the values supplied by default protection or - if default protection is not activated - \*NONE is entered.

With PROTECTION-ATTR=\*STD / \*FROM-FILE( ), \*NONE is entered, i.e. no execution protection password is used.

**EXEC-PASSWORD = \*NONE**

No execute protection password is specified.

**EXEC-PASSWORD = <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>**

Defines a password which is required to call a program/procedure file. If EXEC-PASSWORD=X'00000000' is specified, it will be ignored.

**DESTROY-BY-DELETE = \*BY-PROTECTION-ATTR / \*NO / \*YES**

To increase the level of protection of data, the user can specify in the catalog entry that any data no longer required is overwritten by X'00' (binary zero). For disk files, DESTROY-BY-DELETE affects deletion, file migration, and storage space release operations (see the MODIFY-FILE-ATTRIBUTES, and DELETE-FILE commands); for tape files, any data remaining on the tape when EOF or EOV processing is carried out will be overwritten (see also the ADD-FILE-LINK command, DESTROY-OLD-CONTENTS operand).

**DESTROY-BY-DELETE = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used.

**DESTROY-BY-DELETE = \*NO**

If this operand is set to \*NO, the action specified in the DELETE-FILE command (OPTION operand) will be carried out.

*Disk files:* the storage space released will be left unchanged if the operand OPTION= DESTROY-ALL is not specified in the DELETE-FILE command.

*Tape files:* Any data which follows on the tape will not be overwritten if DESTROY-OLD-CONTENTS=\*YES is not specified in the ADD-FILE-LINK command for the current processing run.

**DESTROY-BY-DELETE = \*YES**

The setting \*YES for this operand will be effective even if a different specification has been made in the OPTION operand of the DELETE-FILE command.

*Disk files:* when the storage space is released or deleted, it will be automatically overwritten with binary zeros (X'00').

*Tape files:* the contents of the tape following the end-of-file will be overwritten with binary zeros (X'00'). It is not necessary to explicitly set the ADD-FILE-LINK command to delete residual data for the current processing run (i.e. the operand DESTROY-OLD-CONTENTS=\*YES).

**i** Please also observe the notes in the section “Data protection by data destruction” in the “Introductory Guide to DMS” [13].

---

**AUDIT = \*STD / \*NONE / \*SUCCESS / \*FAILURE / \*ALL**

This operand specifies whether accesses to the file are to be monitored. This monitoring may also be made dependent on the result of the access (see the operand values \*SUCCESS and \*FAILURE). Systems support staff (TSOS privilege) can use this function unrestrictedly. Nonprivileged users require the appropriate authorization in the user entry of the pubset in which the file is to be created (see the *FILE-AUDIT* output field of the SHOW-USER-ATTRIBUTES command). Without this authorization, the command will be rejected if auditing is requested.

It is possible to monitor the following DMS actions:

- the creation, amendment (protection attributes), reading and deletion of a catalog entry
- the opening and closing of files
- the renaming, importing and exporting of files

Monitoring is performed by System Exit Routines or, if the software product is being used, by the SAT function unit. In order to use System Exit Routines for monitoring, they must be activated (this is the responsibility of the system support staff, user ID TSOS). In order to use SAT for monitoring, SAT logging must have been started, and events for the FILE to be monitored must not be excluded from the logging procedure (this is the responsibility of the security officer, under the user ID SYSPRIV). The user cannot alter any explicit settings of SAT made by the security officer. The SAT log files can be analyzed by the SAT file administrator, under the user ID SYSAUDIT.

**AUDIT = \*STD**

The value is currently equivalent to \*NONE.

**AUDIT = \*NONE**

No monitoring.

**AUDIT = \*SUCCESS**

All successful DMS operations on the file will be monitored.

**AUDIT = \*FAILURE**

All unsuccessful DMS operations on the file will be monitored.

**AUDIT = \*ALL**

All DMS operations on the file will be monitored.

**SPACE-RELEASE-LOCK = \*BY-PROTECTION-ATTR / \*NO / \*YES**

Specifies whether the releasing storage space is allowed.

**SPACE-RELEASE-LOCK = \*BY-PROTECTION-ATTR**

The value defined for the file specified in the PROTECTION-ATTR operand is used.

**SPACE-RELEASE-LOCK = \*NO**

Space is not released.

**SPACE-RELEASE-LOCK = \*YES**

Space is released.

**FREE-FOR-DELETION = \*NONE / <date> / <integer 0..99999>**

Specifies the date from which the owner is allowed to delete the file regardless of the ACCESS, BASIC-ACL, GUARDS, EXPIRATION-DATE protection attributes and regardless of the password (release date for deletion).

---

**FREE-FOR-DELETION = \*NONE**

No free-for-deletion date is defined. The protection attributes are taken into account with regard to file deletion.

**FREE-FOR-DELETION = <date>**

Once the specified date is reached, the file can be deleted regardless of its protection attributes listed above. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two-digit year specifications < 60, 19 to two-digit year specifications >= 60.

**FREE-FOR-DELETION = <integer 0..99999>**

After the specified number of days, the file can be deleted regardless of its protection attributes named above. The deletion release date must be specified in the form +n.

**SAVE = \*STD / \*NO / \*PARAMETERS(...)**

Specifies how the file is to be treated when backups are performed with the ARCHIVE or HSMS utility if no management class has been assigned.

**SAVE = \*STD**

The default values set under PARAMETERS will be applied if no management class has been assigned.

**SAVE = \*NO**

This specification is equivalent to BACKUP-CLASS=\*E, NUM-OF-BACKUP-VERS=0 and SAVED-PAGES=\*COMPLETE-FILE under \*PARAMETERS (q.v.).

**SAVE = \*PARAMETERS(...)**

Specifies the frequency and type of backup. These details are taken into account when regular backups are carried out (using the ARCHIVE or HSMS utility).

**BACKUP-CLASS = \*STD / \*A / \*B / \*C / \*D / \*E**

*Only for disk files.* Backup frequency, where \*A represents the most frequent backups. BACKUP relates to the automatic backup of files using either ARCHIVE or HSMS and specifies which files are to be backed up during each backup run.

**BACKUP-CLASS = \*STD**

The value defined by the system parameter BACKUP.

**BACKUP-CLASS = \*A**

The most frequent backup. Files with this setting will be backed up by every backup run.

**BACKUP-CLASS = \*B**

Files with this setting will be backed up every time a backup run is performed for files with BACKUP-CLASS=\*B or \*C or \*D.

**BACKUP-CLASS = \*C**

Files with this setting will be backed up every time a backup run is performed for files with BACKUP-CLASS=\*C or \*D.

**BACKUP-CLASS = \*D**

The least frequent backup. Files with this setting will only be backed up when a backup run is performed for files with BACKUP-CLASS=\*D.

**BACKUP-CLASS = \*E**

Not backed up by ARCHIVE or HSMS. This value is the only possible value for temporary files (and is the default value). It is also appropriate for permanent files if, for example, work files are involved.

---

**SAVED-PAGES = \*COMPLETE-FILE / \*MODIFIED-PAGES**

*Only for disk files:* like BACKUP-CLASS, refers to the backup with ARCHIVE or HSMS and defines whether the entire file is to be backed up completely during automatic backup runs, or whether only those blocks that have changed since the last backup are to be saved.

**SAVED-PAGES = \*COMPLETE-FILE**

The complete file is backed up.

**SAVED-PAGES = \*MODIFIED-PAGES**

Incremental saving: only the modified blocks are saved. This is an appropriate specification for large files.

**NUM-OF-BACKUP-VERS = \*STD / <integer 0..32>**

Specifies the maximum number of file versions kept in the version backup archive.

**NUM-OF-BACKUP-VERS = \*STD**

A permanent file on a public volume or on Net-Storage, as well as a file without specified memory allocation is given the default value by means of the NUMBACK system parameter.

Files on a private disk, on tape or temporary files are given the value 0.

**NUM-OF-BACKUP-VERS = <integer 0..32>**

Defines the maximum number of file versions kept in the version backup archive. The value 0 means the file will be ignored when version backups are performed.

For temporary files or files on private disks, the values unequal to 0 are rejected.

A file on tape does not participate in the version backup, so the specified value is ignored and the value 0 is set.

**MIGRATE = \*STD / \*ALLOWED / \*INHIBITED / \*FORBIDDEN**

*This specification is relevant only for files on public disks.* The operand is evaluated by the software product HSMS (Hierarchical Storage Management System). It allows a user to specify whether files that have not been accessed for a long time (by the user) may be migrated to a storage medium with slower access. The files will be migrated from the online processing level S0 to the background level S1, which is available online, or to background level S2 (e.g. tape storage) which is available offline (for further details see the "HSMS" manual [18]).

---

**MIGRATE = \*STD**

Depends on the type of file or its storage location, the following default values apply:

\*ALLOWED for permanent files

\*INHIBITED for temporary files

\*FORBIDDEN for files created directly on the disk of an SM pubset (VOLUME operand)

**MIGRATE = \*ALLOWED**

If HSMS is being used, the file may be migrated from the processing level (S0) to the background level (S1), or to the archive level (S2).

**MIGRATE = \*INHIBITED**

The file may only be migrated for a brief period, e.g. for reorganization purposes (migration lock).

**MIGRATE = \*FORBIDDEN**

*This specification is allowed only in conjunction with authorization to perform physical allocation of public storage space (see "Privileged functions" under "Function" above).* The file must not be migrated, typically because it is intended to stay in its current physical storage location (intensified migration lock).

**CODED-CHARACTER-SET = \*USER-DEFAULT / \*NONE / <name 1..8>**

*This operand is ignored with regard to files on private disks.* Determines the code of the file. This defines how the characters of a national character set are to be stored in binary form. The specified character set has an effect on the representation of characters on the screen, the collating sequence, etc. (see the "XHCS" manual [51]).

**CODED-CHARACTER-SET = \*USER-DEFAULT**

The code is taken over from the file owner's user ID if a code other than EDF03IRV is entered there, otherwise \*NONE applies.

**CODED-CHARACTER-SET = \*NONE**

No coded character set is specified for the file.

**CODED-CHARACTER-SET = <name 1..8>**

Specifies the coded character set for the file.

**NET-CODED-CHAR-SET = \*USER-DEFAULT / \*ISO / \*NO-CONVERSION / <name 1..8>**

*Only relevant for Net-Storage files of the type node file. This specification is ignored for other files.* Defines which Net-Storage coded character set (NETCCS) is to be used for a node file on Net-Storage. The NETCCS is the character set used to store the data from SAM node files on Net-Storage. During copying, the data are converted from the CODED-CHARACTER-SET into the NET-CODED-CHARACTER-SET and vice versa. All SAM node files and PAM node files created with BS2000 V11.0 or later have a defined NETCCS. PAM node files created with an older version than V11.0 are treated as if they were created with \*NO-CONVERSION. Only data from SAM node files are converted. In the case of PAM node files, the NET-CODED-CHAR-SET is not evaluated while data are copied.

### NET-CODED-CHAR-SET = \*USER-DEFAULT

The setting is defined by the definition in the user entry. The resulting NETCCS of the file is determined based on the following table:

User entry (SYSSRPM) or specification in the CREATE-FILE / MODIFY-FILE-ATTRIBUTES command		Resulting NETCCS in the catalog entry of the node file
CCS	NETCCS	NETCCS
EDF03IRV/*NONE	*ISO	ISO88591; during code conversion, EDF041 is assumed for CCS
EDF03DRV	*ISO	ISO88591; during code conversion, EDF04DRV is assumed for CCS
EDF04DRV	*ISO	ISO88591
EDF04x	*ISO	ISO8859x with x=1,2,..F
ISO8859x	*ISO or *NO-CONV	ISOx
UTFx	*ISO or *NO-CONV	UTFx
<name_a 1..8>	<name_b 1..8>	<name_b 1..8>
<name_a 1..8>	*NO-CONV	<name_a 1..8>

### NET-CODED-CHAR-SET = \*ISO

For SAM node files, EBCDIC character sets are converted into character sets common in the open world. In the process, the NETCCS is mapped onto an ISO variant that corresponds to the CCS. Examples:

```
EDF03IRV => ISO88591
EDF04DRV => ISO88591
EDF04x   => ISO8859x
```

**i** The following applies here: If an ISO or UTF character set was specified for the CODED-CHARACTER-SET, no conversion takes place. In this case, \*ISO acts like \*NO-CONVERSION.

### NET-CODED-CHAR-SET = \*NO-CONVERSION

The character set of the file is not converted while the file is transferred to the Net-Storage. The value of the CODED-CHARACTER-SET is adopted for the NET-CODED-CHAR-SET. If the CODED-CHARACTER-SET is equivalent to \*NONE or EDF03IRV, the resulting NETCCS becomes EDF03IRV.

A node file is created on the Net-Storage in the EBCDIC character set specified in the CCS.

### NET-CODED-CHAR-SET = <name 1..8>

Name of the NETCCS with which a node is created on the Net-Storage.

**i** There is no check whether the name corresponds to a valid character set!

**SUPPRESS-ERRORS = \*NONE / \*FILE-EXISTING**

Determines whether the existence of the specified file is handled as an error.

**SUPPRESS-ERRORS = \*NONE**

If the specified file already exists, the command is rejected, and error handling is initiated (spin-off mechanism resp. The error triggers the spin-off mechanism resp. the SDF-P error handling.

**SUPPRESS-ERRORS = \*FILE-EXISTING**

If the specified file already exists, the command has no effect on the file and its catalog entry. No error is reported.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	DMS051E	Inconsistency in private disk pool or operand error detected
2	0	DMS0546	Catalog entry for specified file has reached maximum size
2	0	DMS054A	Insufficient disk space or access to disk not possible
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0216	Privilege error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset Guaranteed messages: DMS051B, DMS0681
	64	DMS051C	User not authorized to access pubset Guaranteed messages: DMS051C, DMS0681
	64	DMS053E	File already cataloged on private volume
	64	DMS0540	Volume does not support requested file attributes
	64	DMS0557	Invalid volume specification
	64	DMS0579	Invalid operand for temporary file or work file
	64	DMS057A	Invalid combination of file attributes and storage class
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057E	File has been migrated, and HSMS is not available

	64	DMS057F	Renaming of migrated file not permitted
	64	DMS0585	Error detected when processing catalog or multiprocessor system.
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS0588	The disk storage assignment could not be executed
	64	DMS059F	Specified value for number of backup versions invalid
	64	DMS05B5	Guard not available
	64	DMS05BD	Invalid combination of file and volume set attributes
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS060D	Invalid file name for reference file (PROTECTION-ATTR)
	64	DMS0613	Unknown management class
	64	DMS0618	Unknown storage class
	64	DMS061A	Storage class catalog could not be read
	64	DMS0640	Access to Net-Storage is rejected by the ONETSTOR subsystem because of communication problems with the net client
	64	DMS0641	File already exists on Net-Storage
	64	DMS0642	Large files not permitted on the specified pubset
	64	DMS0643	Net client reports access error
	64	DMS0644	Net client reports internal error
	64	DMS0645	File does not exist on Net-Storage
	64	DMS0647	Specified file type does not match the catalog entry
	64	DMS0648	Specification of file type, device and volume are not compatible
	64	DMS0649	Net server reports POSIX-ACL error
	64	DMS064A	Net client reports that access to files is forbidden on the Net-Storage volume
	64	DMS064B	Access to node files not supported by the net client
	64	DMS0652	Absolute storage space request not permitted on Net-Storage
	64	DMS0683	File already exists Guaranteed message: DMS0683
	64	DMS06FF	BCAM connection severed
	128	DMS0506	Function not executed due to change in master

	130	DMS0524	System address space exhausted
	130	DMS053C	No space in pubset catalog file
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system. Guaranteed message: DMS053C
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0588	The disk storage assignment could not be executed
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

## Examples

*Example 1: Creating a catalog entry*

```
/create-file file-name=max.file.1  
/show-file-attr file-name=max.file.1,inf=*all-attributes
```

```
%0000000003 :2OSG:$USER1.MAX.FILE.1
% ----- HISTORY -----
% CRE-DATE = NONE ACC-DATE = NONE CHANG-DATE = NONE
% CRE-TIME = NONE ACC-TIME = NONE CHANG-TIME = NONE
% ACC-COUNT = 0 S-ALLO-NUM = 0
% ----- SECURITY -----
% READ-PASS = NONE WRITE-PASS = NONE EXEC-PASS = NONE
% USER-ACC = OWNER-ONLY ACCESS = WRITE
% AUDIT = NONE FREE-DEL-D = *NONE EXPIR-DATE = NONE
% DESTROY = NO FREE-DEL-T = *NONE EXPIR-TIME = NONE
% SP-REL-LOCK= NO ENCRYPTION = *NONE
% ----- BACKUP -----
% BACK-CLASS = A SAVED-PAG = COMPL-FILE VERSION = 0
% MIGRATE = ALLOWED
% #BACK-VERS = 0
% ----- ORGANIZATION -----
% FILE-STRUC = NONE BUF-LEN = NONE BLK-CONTR = NONE
% IO(USAGE) = READ-WRITE IO(PERF) = STD DISK-WRITE = IMMEDIATE
% REC-FORM = NONE REC-SIZE = 0
% AVAIL = *STD
% WORK-FILE = *NO F-PREFORM = *K S0-MIGR = *ALLOWED
% ----- ALLOCATION -----
% SUPPORT = PUB S-ALLOC = 9 HIGH-US-PA = 0
% EXTENTS VOLUME DEVICE-TYPE EXTENTS VOLUME DEVICE-TYPE
% 1 GVS2.3 D3435
% NUM-OF-EXT = 1
%:2OSG: PUBLIC: 1 FILE RES= 3 FRE= 3 REL= 3 PAGES
```

The output of the SHOW-FILE-ATTRIBUTES command shows the catalog entry that was generated for the file *MAX.FILE.1* using CREATE-FILE. Since no specification was made for the SUPPORT operand, storage space on public disk was reserved for the file.

Example 2: Creating a catalog entry for a tape file

```
/create-file file-name=max.tape-file.1
            support=*tape(vol=m2326k,dev-type=tape-c4)
/show-file-attr file-name=max.tape-file.1,inf=*all-attributes
```

```
%          :20SG:$USER1.MAX.TAPE-FILE.1
% ----- HISTORY -----
% CRE-DATE   = NONE          ACC-DATE   = NONE          CHANG-DATE = NONE
% CRE-TIME   = NONE          ACC-TIME   = NONE          CHANG-TIME = NONE
% ACC-COUNT  = 0             S-ALLO-NUM = 0
% ----- SECURITY -----
% READ-PASS  = NONE          WRITE-PASS = NONE          EXEC-PASS  = NONE
% USER-ACC   = ALL-USERS    ACCESS     = WRITE
% AUDIT      = NONE          FREE-DEL-D = *NONE          EXPIR-DATE = NONE
% DESTROY    = NO           FREE-DEL-T = *NONE          EXPIR-TIME = NONE
% ----- BACKUP -----
% BACK-CLASS = A            SAVED-PAG  = COMPL-FILE  VERSION    = 0
% #BACK-VERS = 0
% ----- ORGANIZATION -----
% FILE-STRUC = NONE          BUF-LEN    = NONE          BLK-CONTR  = NONE
% REC-FORM    = NONE          REC-SIZE   = 0
% CODE        = NONE          LABEL      = NONE          FILE-SEQ   = NONE
% BLK-OFFSET  = 0
% ----- ALLOCATION -----
% SUPPORT     = PVT                    BLK-COUNT  = 0
% EXTENTS     VOLUME    DEVICE-TYPE
% NONE        NONE      NONE
%:20SG: TAPE :          1 FILE
```

The output of the SHOW-FILE-ATTRIBUTES command shows the catalog entry that was generated with CREATE-FILE for the tape file *MAX.TAPE-FILE.1*, which is to be stored on the tape cartridge *M2326K* (volume type *TAPE-C4*). No reserved storage space is shown for the tape file, since only the catalog entry is saved in the file catalog of the pubset *20SG*.

Example 3: Creating a catalog entry for a file on private disk

```
/create-file file-name=max.disk-file.1,support=*priv(vol=work01,  
            dev-type=d3435)  
/show-file-attr file-name=max.disk-file.1,inf=*all-attr
```

```
% ----- HISTORY -----  
% CRE-DATE   = NONE          ACC-DATE   = NONE          CHANG-DATE = NONE  
% CRE-TIME   = NONE          ACC-TIME   = NONE          CHANG-TIME = NONE  
% ACC-COUNT  = 0             S-ALLO-NUM = 0  
% ----- SECURITY -----  
% READ-PASS  = NONE          WRITE-PASS = NONE          EXEC-PASS  = NONE  
% USER-ACC   = OWNER-ONLY   ACCESS     = WRITE  
% AUDIT      = NONE          FREE-DEL-D = *NONE          EXPIR-DATE = NONE  
% DESTROY    = NO           FREE-DEL-T = *NONE          EXPIR-TIME = NONE  
% SP-REL-LOCK= NO           ENCRYPTION = *NONE  
% ----- BACKUP -----  
% BACK-CLASS = A            SAVED-PAG = COMPL-FILE  VERSION    = 0  
% MIGRATE    = ALLOWED  
% #BACK-VERS = 0  
% ----- ORGANIZATION -----  
% FILE-STRUC = NONE          BUF-LEN   = NONE          BLK-CONTR  = NONE  
% IO(USAGE)  = READ-WRITE   IO(PERF)  = STD            DISK-WRITE = IMMEDIATE  
% REC-FORM   = NONE          REC-SIZE  = 0  
% AVAIL      = *STD  
% ----- ALLOCATION -----  
% SUPPORT    = PVT          S-ALLOC   = 9            HIGH-US-PA = 0  
% EXTENTS    VOLUME        DEVICE-TYPE  EXTENTS    VOLUME    DEVICE-TYPE  
%      1      WORK01        D3435  
% NUM-OF-EXT = 1  
%: 2OSG: PRDISC:      1 FILE RES=      3 FRE=      3 REL=      0 PAGES
```

The output of the `SHOW-FILE-ATTRIBUTES` command shows the catalog entry that was generated with `CREATE-FILE` for the file `MAX.FILE.1`, for which storage space was reserved on the private disk `WORK01`.

Example 4: Creating catalog entries for files on private disk

```
/create-file file-name=max.net-file.1,support=*public(vol=wk0025,  
                dev-type=netstor)  
/show-file-attr file-name=max.net-file.,inf=*all-attr _____ (1)
```

```
%0000000004n:CK68:$USER1.MAX.NET-FILE.1  
% ----- HISTORY -----  
% CRE-DATE   = NONE          ACC-DATE   = NONE          CHANG-DATE = NONE  
% CRE-TIME   = NONE          ACC-TIME   = NONE          CHANG-TIME = NONE  
% ACC-COUNT  = 0             S-ALLO-NUM = 0  
% ----- SECURITY -----  
% READ-PASS  = NONE          WRITE-PASS = NONE          EXEC-PASS  = NONE  
% USER-ACC   = OWNER-ONLY   ACCESS      = WRITE          ACL         = NO  
% AUDIT      = NONE          FREE-DEL-D = *NONE          EXPIR-DATE = NONE  
% DESTROY    = NO            FREE-DEL-T = *NONE          EXPIR-TIME = NONE  
% SP-REL-LOCK= NO            ENCRYPTION = *NONE  
% ----- BACKUP -----

% NUM-OF-EXT = 1  
%:CK68: NET   :           2 FILES RES=           8 FRE=           8 REL=           8 PAGES
```

- (1) The output of the SHOW-FILE-ATTRIBUTES command shows the catalog entry that was generated with CREATE-FILE for the *MAX.NET-FILE.1* file which was created beforehand on the Net-Storage volume *WK0025*. The Net-Storage volume is allocated to the default pubset *CK68*. As the volume does not have the default name, the VSN and the volume type *NETSTOR* must be specified explicitly in the CREATE-FILE command.
- (2) Another *MAX.NET-FILE.2* file is created on the default Net-Storage volume of the pubset *CK68* (the VSN is *CK68@0*) using CREATE-FILE. In this case it is sufficient to specify the storage type (see the STORAGE-TYPE=*\*NET-STORAGE* operand).
- (3) The output of the SHOW-FILE-ATTRIBUTES command shows the allocation attributes for the two files.

*Example 5: Creating a catalog entry / file protection with BASIC-ACL and GUARDS*

```
/cre-file file-name=max.file.2,prot=(basic-acl=*std)  
/show-file-attr max.file.2,inf=(security=*yes) _____ (1)
```

```
%0000000003 :2OSG:$USER1.MAX.FILE.2

```

- (1) The output of the SHOW-FILE-ATTRIBUTES command shows the protection attributes of the file *MAX.FILE.2*. The CREATE-FILE command was used earlier to create the catalog entry and to define access control using a BASIC-ACL. All access rights (read, write, execute) were set for the file owner *USER1*. Other user IDs have no access rights.
- (2) The output of the SHOW-FILE-ATTRIBUTES command shows the protection attributes of the file *MAX.FILE.3*. The CREATE-FILE command was used earlier to create the catalog entry and to define access control using GUARDS. Read and write access from the file owner *USER1* and all other users are not permitted unless the conditions which are specified in the guard *PROT-A01* of the user *USER1* are satisfied. The file cannot be executed, since no guard was specified in the EXEC operand.
- (3) The output of the SHOW-FILE-ATTRIBUTES command shows the protection attributes of the file *MAX.FILE.4*. When the catalog entry was generated, the protection attributes were copied from *MAX.FILE.3*.

---

## 2.74 CREATE-FILE-GENERATION

Create new file generation for file generation group

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE-GENERATION-GROUP
<b>Privileges:</b>	STD-PROCESSING TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The CREATE-FILE-GENERATION command creates a new file generation for a file generation group (which already exists). File attributes such as the generation name, the specification of the volume, the storage allocation, and performance attributes can be defined (see “Overview of functions”). The file protection and data backup attributes are defined once only for the entire file generation group using the CREATE-FILE-GROUP command. User and systems support information (see the USER-INFORMATION and ADM-INFORMATION operands) is not copied from the group entry but can be defined separately for each file generation.

A file generation group write-protected by BASIC-ACL or GUARDS cannot be extended.

For basic information on file generations and file generation groups, see the “Introductory Guide to DMS” [13].

#### *Privileged functions*

The following functions are available to nonprivileged users only if physical allocation of public space is allowed (see “Privileged functions” in the function description of the [CREATE-FILE](#) command):

- explicit specification (values other than the default, \*STD) of a volume or volume set in the VOLUME and VOLUME-SET operands in the structure SUPPORT=\*PUBLIC-DISK (STORAGE-CLASS=\*NONE(...))
- absolute space reservation using SPACE=\*ABSOLUTE(...) in the structure SUPPORT=\*PUBLIC-DISK(...) (note that no authorization is required for SUPPORT=\*PRIVATE-DISK)

Systems support personnel can supplement the user information in the file catalog with one to eight bytes of information about the file generation (ADM-INFORMATION operand).

By default, systems support (TSOS privilege) is a co-owner of all the files (and can, therefore, create file generations under all user logons). When SECOS is used, this co-ownership can be restricted.

In conjunction with the SECOS software product a user can allow other user IDs to act as co-owners of the file generation groups of his user ID. Co-owners of a user ID are then also allowed to create file generations under that ID.

#### *File generations in SM pubsets*

See the function description of the [CREATE-FILE](#) command, sections “Files in SM pubsets” and “Physical allocation in SM pubsets”.

---

### *Work files*

When a file generation is created in an SM pubset, the CREATE-FILE-GROUP command is used to define whether the file generation group is to have the work file attribute (WORK-FILE-GROUP=\*YES). For more information on work files see the “Introductory Guide to DMS” [13]. If the file generation is assigned a storage class (explicitly or implicitly, see STORAGE-CLASS operand), the value specified for the WORK-FILE attribute must match the group entry of the file generation group.

### *File generations on tape (magnetic tape/tape cartridge)*

In conjunction with a group entry on a public volume, file generations can also be stored on tape (operand SUPPORT=\*TAPE). When creating or accessing the catalog entry of file generations on tape, some special points relating to the use of tapes should be taken into account.

For file generations with standard labels, details of shareability (USER-ACCESS), access type (ACCESS) and passwords are transferred from the catalog entry to the tape labels when the file is created (OPEN). The BASIC-ACL, and GUARDS protection attributes are not transferred.

No access checking is performed when a file generation is created on tape. That means that write protection even for a tape file generation that has yet to be created can be set to ACCESS=\*READ. The file generation can be opened and created as an output file; write protection does not come into effect until after it has been created.

The protection attributes of the file generation group can be modified with the MODIFY-FILE-GROUP-ATTRIBUTES command. For any file generations already created on tape, the change is made only in the file catalog, not in the tape labels.

Access (OPEN) to an existing tape file generation is checked against the protection attributes stored in the file catalog. The entries in the labels are disregarded.

When a tape file generation is imported, access checking is based on the protection attributes stored in the file labels. If the tape file generation was password-protected when it was created, the same password must be specified again when it is imported, even if the file generation group is now protected by a different password or none at all.

## Overview of functions

Function / Meaning	Level 1 operands	Level 2/3 operands
Specify name of file generation	GENERATION-NAME =	
Specify the volume	SUPPORT	
Volume: pubset	SUPPORT = *PUBLIC-DISK(...)

```

---

## Operands

### **GENERATION-NAME = <filename 1..54 without-vers>**

The name of the new file generation.

The catalog and user IDs must match those for the file generation group. Only the user's own user ID or a user ID for which the user is co-owner may be specified. Systems support personnel (TSOS privilege) may specify any user ID. The number specified for the new file generation can be either absolute or relative (to the BASE-NUMBER value of the group entry); for details see the "Introductory Guide to DMS" [13]. Regardless of how it is specified, the number of the new file generation must in absolute terms be the group entry's LAST-GEN value incremented by 1, if the value of LAST-GEN is 9999, the value for the new generation must be 1 (see also the BASE-NUMBER and LAST-GEN output fields of the SHOW-FILE-ATTRIBUTES command).

### **SUPPORT = \*PUBLIC-DISK(...)**

Indicates that the file generation is to be set up on a public disk. The pubset (related set of public disks) on which the file generation is to be created is uniquely identified by the (explicitly specified or default) catalog ID in the file name.

### **STORAGE-CLASS = \*STD / <composed-name 1..8> / \*NONE(...)**

Governs the properties of the file generation's storage location. Systems support defines storage classes to facilitate automatic management of storage space in SM pubsets. A storage class is allocated certain file attributes which are implicitly set for all files assigned to that storage class. If a storage class is specified, there is no need to explicitly specify values for the VOLUME-SET, VOLUME, DEVICE-TYPE, IO-ATTRIBUTES, DISK-WRITE, FILE-PREFORMAT and AVAILABILITY operands. The WORK-FILE attribute of the storage class must match that of the group entry.

The SHOW-STORAGE-CLASS command allows users to find out which storage classes of an SM pubset are available to them and which file attributes are set.

### **STORAGE-CLASS = \*STD**

A file generation in an SM pubset is assigned the default storage class from the file generation group's group entry. The default storage class is governed by the STOR-CLASS-DEFAULT operand of the CREATE-FILE-GROUP or MODIFY-FILE-GROUP-ATTRIBUTES command. If the file generation is to be created in an SF pubset or if there is no default storage class defined, the file generation is given the same attributes as with STORAGE-CLASS=\*NONE with default values.

### **STORAGE-CLASS = <composed-name 1..8>**

A file generation in an SM pubset is assigned the specified storage class. The storage class must exist and be accessible to the user at the time when the assignment is made. This specification is ignored for a file generation in an SF pubset; the file is then given the same attributes as with STORAGE-CLASS=\*NONE with default values.

### **STORAGE-CLASS = \*NONE(...)**

STORAGE-CLASS=\*NONE has the same effect as \*STD if all the following conditions are met:

- The file generation is created on a volume set intended for permanent storage.
- A default storage class is assigned to the user ID at the SM pubset in question.
- Physical allocation is not permitted.

Only in this case are the operands PERFORMANCE, USAGE, DISK-WRITE, and AVAILABILITY are ignored.

In all other cases, the properties of the file generation storage location are determined by the operands of the structure \*NONE(...) and no storage class is assigned to the file generation.

The WORK-FILE attribute is copied from the group entry (see the CREATE-FILE-GROUP command, WORK-FILE-GROUP operand).

For a description of the remaining operands, see the [CREATE-FILE](#) command.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	DMS051E	Inconsistency in private disk pool or operand error detected
2	0	DMS0546	Catalog entry for specified file has reached maximum size
2	0	DMS054A	Insufficient disk space or access to disk not possible
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset Guaranteed messages: DMS051B, DMS0681
	64	DMS051C	User not authorized to access pubset Guaranteed messages: DMS051C, DMS0681
	64	DMS0533	Requested file not cataloged in pubset Guaranteed message: DMS0533
	64	DMS053E	File already cataloged on private volume
	64	DMS0555	Specified file name already cataloged
	64	DMS0557	Invalid volume specification
	64	DMS057A	Invalid combination of file attributes and storage class
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS057F	Renaming of migrated file not permitted

	64	DMS0585	Error detected during catalog processing or multihost processing
	64	DMS0586	Currently not possible to access or reserve volume
	64	DMS0587	Use of specified command restricted by system administrator
	64	DMS0588	It was not possible to allocate disk space
	64	DMS05BD	Invalid combination of file and volume set attributes
	64	DMS05CC	File name already cataloged
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0618	Unknown storage class
	64	DMS061A	Storage class catalog could not be read
	64	DMS0683	File already exists Guaranteed message: DMS0683
	64	DMS06C4	File generation group not yet cataloged
	64	DMS06FF	BCAM connection severed
	128	DMS0506	Function not executed due to change in master
	130	DMS0524	System address space full
	130	DMS053C	No space in pubset catalog file Guaranteed messages: DMS053C
	130	DMS0582	File is currently locked or in use and cannot be processed
	130	DMS0585	Error detected during catalog processing or multihost processing
	130	DMS0586	Currently not possible to access or reserve volume
	130	DMS0588	It was not possible to allocate disk space
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

## Examples

*Example 1: Creating a file generation*

```

```

- (1) A group entry is created for the file generation group *MAX.GROUP.1* on the private disk *WORK01*. A maximum of 3 file generations (*MAXIMUM=3*) are to be permitted. If this maximum is exceeded, all existing generations are to be deleted (*OVERFLOW-OPTION=\*DELETE-ALL*).
- (2) The command *SHOW-FILE-ATTRIBUTES* displays the group entry.
- (3) The command *CREATE-FILE-GENERATION* is to be used to create the first file generation.
- (4) The command will be rejected. The command *HELP-MSG-INFORMATION* is used to obtain information on the error (*DMS06DA*) that occurred. The group entry is located on private disk. Since the operand *SUPPORT* was not specified for the file generation *\*0001*, an attempt was made to create the first file generation on public disk.

- (5) The file generations \*0001, \*0002, and \*0003 are created on the private disk *WORK01*.
- (6) The command SHOW-FILE-ATTRIBUTES returns information on the group entry and the associated file generations (since GENERATION=\*YES).
- (7) The command SHOW-FILE-ATTRIBUTES shows the attributes of the group entry that affect file generations (since ORGANIZATION=\*YES).
- (8) The file generation \*0004 is created. Since OVERFLOW-OPTION=\*DELETE-ALL is defined, and the maximum has been reached, the earlier generations should have been deleted in the process.
- (9) The following SHOW-FILE-ATTRIBUTES command indicates that only the group entry and the last created generation (\*0004) exist.

*Example 2: Creating file generations (read password)*

```
/create-file-group group-name=max.group.2,gen-par=(max=3),

```

- (1) A group entry is created for the file generation group *MAX.GROUP.2* on the public disk *WORK01*. A maximum of 3 file generations (MAXIMUM=3) is to be permitted. For each new created generation that would cause the maximum to be exceeded, the oldest existing generation is to be deleted (default value OVERFLOW-OPTION=\*CYCLE-REPLACE). The read password *PAUL* (which is replaced by "P" in logs) is defined for file protection. The protection attributes apply to the group entry and to all generations of the file generation group.
- (2) The command SHOW-FILE-ATTRIBUTES displays the group entry along with its protection and file generation attributes.
- (3) The command CREATE-FILE-GENERATION is to be used to create the first file generation.
- (4) The command will be rejected. The command HELP-MSG-INFORMATION is used to obtain information on the error (*DMS05D8*) that occurred. In this case, the group entry, which is updated on creating a new generation, could not be changed due to the password protection.

- 
- (5) The password *PAUL* is entered into the password table of the task.
  - (6) Generation \*0001 is created.
  - (7) An attempt is made to create generation \*0003.
  - (8) The command will be rejected. In this case, the next generation to be created must be generation \*0002, since no gaps are permitted in generation numbers.
  - (9) Generations \*0002, \*0003, and \*0004 are created.
  - (10) The following SHOW-FILE-ATTRIBUTES commands show the group entry and all existing generations: generation \*0004 exceeded the defined maximum of three generations. That is why the oldest generation was deleted when creating it (default value OVERFLOW-OPTION=\*CYCLE-REPLACE).

---

## 2.75 CREATE-FILE-GROUP

Define name and attributes of new file generation group

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE-GENERATION-GROUP
<b>Privileges:</b>	STD-PROCESSING TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The CREATE-FILE-GROUP command creates the catalog entry for a new file generation group on disk.

File generation groups (FGGs) consist of a group entry and the associated file generations. The group entry is created with the CREATE-FILE-GROUP command and can be modified with the MODIFY-FILE-GROUP-ATTRIBUTES command. File generations are created with the CREATE-FILE-GENERATION command and can be modified with the MODIFY-FILE-GENERATION-SUPPORT command. The file protection and data backup attributes defined in the group entry also apply to the associated file generations. User and systems support information (see USER- and ADM-INFORMATION operands) in the group entry is not “bequeathed” to the generations. This information can be defined separately for each file generation whenever a generation is created or modified.

FGGs can be created on public disks, private disks or in an nonhomogeneous mix, with the group entry on public disk and the associated file generations both on tape and on public disk. FGGs cannot be created on Net-Storage.

FGGs are not saved in the version backup archive, that means the NUM-OF-BACKUP-VERS has the value 0.

FGGs which are held on private volumes and for which there is no catalog entry are designated as exported or “FOREIGN” file generation groups. If such a FGG is to be recataloged, the group entry must be imported first, followed by the associated file generations (using the IMPORT-FILE command).

If no group entry is available for existing file generations (on private volumes or as a result of a system error in the file catalog), the CREATE-FILE-GROUP command can be used to create a new group entry for the existing file generations. This entails specifying where the generations start and finish using the FIRST-GENERATION and LAST-GENERATION operands. If the generations are on private volumes, they must then be imported with the IMPORT-FILE command.

The following must be noted for file generations on tape:

If the FGG is protected by BASIC-ACL or, in conjunction with the SECOS software product, by GUARDS (see the “SECOS” manual [35]), these protection mechanisms are recorded only in the file catalog, not in the tape labels. In this case, the conventional protection mechanisms - standard access control (ACCESS and USER-ACCESS) and passwords - must be used to protect tape files against unauthorized access.

Unlike an FGG which merely has ACCESS=\*READ write protection, an FGG “write protected” by BASIC-ACL or GUARDS cannot be extended by creating a new file generation.

### Privileged functions

Systems support personnel can supplement the user information in the file catalog with one to eight bytes of information about the file generation group (ADM-INFORMATION operand).

By default, systems support (TSOS privilege) is a co-owner of all the files (and can, therefore, create file generation groups under all user logons). When SECOS is used, this co-ownership can be restricted. In conjunction with the SECOS software product a user can allow other user IDs to act as co-owners of the file generation groups of his user ID. Co-owners of a user ID are then also allowed to create file generations under that ID.

### File generation groups in SM pubsets

A file generation group for standard files or for work files can be created in an SM pubset. This is done with the STOR-CLASS-DEFAULT operand, either explicitly (using the WORK-FILE-GROUP operand in the STOR-CLASS-DEFAULT=\*NONE(...)) structure or implicitly by assigning a default storage class with the corresponding WORK-FILE attribute. All the file generations in the FGG must have the same WORK-FILE attribute. The WORK-FILE attribute cannot be modified later.

Assigning a storage class simplifies the automatic management of storage space (for details see the “Introduction to System Administration” [14] or the “System-Managed Storage” manual [45]).

|             |             **\*PARAMETERS**(...)

|             |             |     **READ** = **\*NO / \*YES**

---

**GENERATION-PARAMETER = \*GENERATION-PARAMETER(...)**

Specifies the attributes of the file generation group.

**MAXIMUM = <integer 1..255>**

Defines how many generations of the file generation group may be cataloged at the same time (see the OVERFLOW-OPTION operand).

**OVERFLOW-OPTION = \*CYCLIC-REPLACE / \*REUSE-VOLUME / \*DELETE-ALL / \*KEEP-GENERATION**

Specifies what should be done if the maximum permitted number of file generations (MAXIMUM operand) is exceeded. When the maximum permitted number is reached, the surplus file generations will be deleted regardless of password protection, retention period (EXPIRATION-DATE) and the permitted mode of access (ACCESS).

**OVERFLOW-OPTION = \*CYCLIC-REPLACE**

The current oldest generation is deleted and its storage space, or the tapes it occupies, are released. In the catalog, the entries in the *LAST-GEN* and *FIRST-GEN* output fields (most recent/oldest existing generations) are updated.

**OVERFLOW-OPTION = \*REUSE-VOLUME**

The effect of OVERFLOW-OPTION=\*REUSE-VOLUME depends on the storage medium:

*For FGGs on public disks:* the oldest generation will be deleted and its storage space returned to the system; the group entry is updated (see OVERFLOW-OPTION= \*CYCLIC-REPLACE).

*For FGGs on private disks:* the new generation is created and the oldest generation deleted, the volume being used for storage of the new generation. If the generation which is being deleted extends over several disks, the new generation is cataloged only on the first of these disks. The group entry is updated accordingly. Since the old generation is not deleted until the new generation has been created, lack of storage space on the disk may mean that it is impossible to create the new generation, even though OVERFLOW-OPTION=\*REUSE-VOLUME is specified.

*For FGGs on tape:* the oldest generation is deleted from the catalog, and the new generation is created on the tape thus released. The group entry is updated accordingly. OVERFLOW-OPTION=\*REUSE-VOLUME is not permitted for file generation groups on multifile tapes (file sets).

**OVERFLOW-OPTION = \*DELETE-ALL**

All generations of the FGG are deleted, and the new generation becomes the oldest one in the new series. The group entry is updated accordingly.

**OVERFLOW-OPTION = \*KEEP-GENERATION**

The file generations are not automatically deleted. The oldest file generations which overshoot the maximum will not be deleted until OVERFLOW-OPTION or BASE-NUMBER is modified (MODIFY-FILE-GROUP-ATTRIBUTES command).

**BASE-NUMBER = \*EQUAL-FIRST-GEN / <integer 0..9999>**

Defines a reference point/a base generation to which all relative generation numbers refer. The names of the file generations can be specified with absolute (\*n) or relative ( $\pm n$ ) generation numbers.

**BASE-NUMBER = \*EQUAL-FIRST-GEN**

The starting base is the value specified by FIRST-GENERATION.

---

**FIRST-GENERATION = 0 / <integer 1..9999>**

Specifies the absolute generation number of the oldest existing file generation. The operand should be used only in combination with the LAST-GENERATION operand in order to reconstruct the group entry of a file generation group. This needs to be done in order to work with existing file generations for which no group entry exists (see the "[Function](#)" description).

**LAST-GENERATION = 0 / <integer 0..9999>**

Specifies the absolute generation number of the most recent existing file generation. The operand should be used only in combination with the FIRST-GENERATION operand in order to reconstruct the group entry of a file generation group. This needs to be done in order to work with existing file generations for which no group entry exists (see the "[Function](#)" description).

**DEVICE-TYPE = \*BY-VOLUME / <device>**

The type of device to which the required disk is assigned (if the file generation group is to be created on a private disk).

**DEVICE-TYPE = \*BY-VOLUME**

*File generation groups on public volumes:*

The system itself determines the device type. If the file generation group is being set up on a public disk, (VOLUME=\*PUBLIC), then the only permissible specification is \*BY-VOLUME.

**DEVICE-TYPE = <device>**

*File generation groups on private volumes:*

If the file generation group is being set up on a private disk, then the device type must be explicitly specified here (\*BY-VOLUME is not allowed). Only device types known in the system are accepted. In interactive mode, DEVICE-TYPE=? calls up a list of the available device types. If at least one volume ID is specified with VOLUME, each specification of a disk device type which is known to the system is handled like the STDDISK specification. The permissible specifications for DEVICE-TYPE can also be found in the device table in [section "Device type table"](#) (device type column).

**VOLUME = \*PUBLIC / <alphanum-name 1..6>**

VSN of the public/private disk on which the file generation is to be created.

**VOLUME = \*PUBLIC**

The file generation group will be created on a public disk. The generations which belong to it can also be set up on tapes or tape cartridges.

**VOLUME = <alphanum-name 1..6>**

The file generation group will be created on a private disk. The generations which belong to it must also be set up on a private disk.

**PROTECTION = \*STD / \*PARAMETERS(...)**

The protection attributes for the file.

**PROTECTION = \*STD**

The protection attributes listed below are assigned the values supplied by default protection.

If default protection is not active, the system default values for the operands of the \*PARAMETERS structure are set.

Protection attribute	PROTECTION-ATTR=			
	*FROM-FILE	*STD <sup>1)</sup>	*BY-DEF-PROT-OR-STD	
			Default protection not active <sup>1)</sup>	Default protection active
ACCESS	value from reference file	WRITE	WRITE	values from default protection
USER-ACCESS		OWNER-ONLY	OWNER-ONLY	
BASIC-ACL		NONE	NONE	
DESTROY-BY-DELETE		NO	NO	
GUARDS		NONE	NONE	
SPACE-RELEASE-LOCK		NO	NO	
READ-PASSWORD	NONE	NONE	NONE	
WRITE-PASSWORD	NONE	NONE	NONE	
EXEC-PASSWORD	NONE	NONE	NONE	
FREE-FOR-DELETION	NONE	NONE	NONE	NONE
AUDIT	NONE	NONE	NONE	NONE

<sup>1)</sup> The system default values are entered.

Table 38: Effects of PROTECTION-ATTR on the protection attributes in the case of CREATE-FILE-GROUP

### PROTECTION = \*PARAMETERS(...)

The file generation group is given the specified protection attributes. For descriptions of the PROTECTION-ATTR, ACCESS, USER-ACCESS, BASIC-ACL, GUARDS, WRITE-PASSWORD, READ-PASSWORD, DESTROY-BY-DELETE, AUDIT, SPACE-RELEASE-LOCK and FREE-FOR-DELETION operands, see the corresponding operand descriptions for the CREATE-FILE command.

#### **i** Note the following

Since file generations are not executable (program or procedure), they cannot be protected with an execute password (EXEC-PASSWORD). Likewise for the same reason no execute permission can be set within BASIC-ACL or GUARDS.

**SAVE = ..., MANAGEMENT-CLASS = ..., CODED-CHARACTER-SET = ..., USER-INFORMATION = ..., ADM-INFORMATION = ...**

See the description of the corresponding operand in the CREATE-FILE command.

**STOR-CLASS-DEFAULT = \*STD / <composed-name 1..8> / \*NONE(...)**

*The operand is evaluated only for file generation groups in SM pubsets.* Governs the properties of the storage location if no explicit specification is made when the file generation is created. Only the “work file” attribute is copied from a specified storage class into the group entry, and it then governs whether the associated generations are work files or standard files.

---

The only specification allowed for a file generation group in an SF pubset is `STOR-CLASS-DEFAULT=*NONE`.

The `SHOW-STORAGE-CLASS` command allows users to find out which storage classes of an SM pubset are available to them and which file attributes are set.

Assigning a storage class simplifies the automatic management of storage space in an SM pubset (for details see the “Introduction to System Administration” [14] or the “System-Managed Storage” manual [45]).

**`STOR-CLASS-DEFAULT = *STD`**

The pubset-specific default storage class from the user entry is used as the default storage class for the file generation group. If the file generation group is to be created in an SF pubset or if there is no default storage class defined in the user entry, the file generation group is given the same attributes as with `STOR-CLASS-DEFAULT=*NONE` with default values.

**`STOR-CLASS-DEFAULT = <composed-name 1..8>`**

A file generation group in an SM pubset is assigned the specified storage class. The storage class must exist and be accessible to the user at the time when the assignment is made. This specification is ignored for a file generation group in an SF pubset; the FG is then given the same attributes as with `STOR-CLASS-DEFAULT=*NONE` with default values.

**`STOR-CLASS-DEFAULT = *NONE(...)`**

This value has the same effect as `*STD` if all the following conditions are met:

- The file generation group is created on a volume set intended for permanent storage.
- A default storage class is assigned to the user ID at the SM pubset in question.
- Physical allocation is not permitted.

Only in this case is the `WORK-FILE-GROUP` operand ignored.

In all other cases, no storage class is assigned to the file generation group.

**`WORK-FILE-GROUP = *NO / *YES`**

*The operand is evaluated only for file generation groups in SM pubsets.* Specifies whether the associated file generations are work files which systems support is allowed to delete at a time which it defines.

**`WORK-FILE-GROUP = *NO`**

The associated file generations are not to be work files.

**`WORK-FILE-GROUP = *YES`**

The associated file generations are to be work files.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	DMS06CA	Command executed, but invalid specification in BASE-NUMBER operand ignored
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset Guaranteed messages: DMS051B, DMS0681
	64	DMS051C	User not authorized to access pubset Guaranteed messages: DMS051C, DMS0681
	64	DMS053E	File already cataloged on private volume
	64	DMS0579	Invalid operand for temporary file or work file
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS057F	Renaming of migrated file not permitted
	64	DMS0585	Error detected during catalog processing or multihost processing
	64	DMS0586	Currently not possible to access or reserve volume
	64	DMS0587	Use of specified command restricted by system administrator
	64	DMS0588	It was not possible to allocate disk space
	64	DMS059F	Specified value for number of backup versions invalid
	64	DMS05B5	Guard not available
	64	DMS05CC	File name already cataloged
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS060D	Invalid file name for reference file (PROTECTION-ATTR)

	64	DMS0613	Unknown management class
	64	DMS0618	Unknown storage class
	64	DMS061A	Storage class catalog could not be read
	64	DMS06FF	BCAM connection severed
	128	DMS0506	Function not executed due to change in master
	130	DMS0524	System address space full
	130	DMS053C	No space in pubset catalog file Guaranteed messages: DMS053C
	130	DMS0585	Error detected during catalog processing or multihost processing
	130	DMS0586	Currently not possible to access or reserve volume
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

## Examples

Examples of the use of the CREATE-FILE-GROUP command are given in the examples for the CREATE-FILE-GENERATION command.

---

## 2.76 CREATE-ISAM-POOL

Create ISAM pool or attach task to ISAM pool

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING

### Function

The CREATE-ISAM-POOL command enables the user to create an ISAM pool or to link his or her job (task) with any existing ISAM pool that was created with system-wide scope.

Every ISAM pool is uniquely identified by the following attributes, which are specified at the time that the ISAM pool is created:

- The name of the ISAM pool (POOL-NAME operand)
- The catalog ID of the subset (CAT-ID operand)
- Its scope of applicability (SCOPE operand)
- The type of buffering (WRITE-IMMEDIATE operand)
- Its size (SIZE operand).
- Its performance attribute (RESIDENT operand)

If the task is to be linked with an existing ISAM pool, there should be no conflict between the specifications in the CREATE-ISAM-POOL command and the attributes of the existing ISAM pool. The existing attributes of a previously created ISAM pool can be displayed by using the SHOW-ISAM-POOL-ATTRIBUTES command.

#### *Note for ISAM pools*

As of BS2000/OSD V6.0B cross-task ISAM pools are automatically created on a file specific basis when a file is opened in a data space. The CREATE-ISAM-POOL command with SCOPE=\*USER-ID/\*USER-GROUP is only supported for reasons of compatibility and has the same effect as SCOPE=\*HOST-SYSTEM (for details on ISAM pools in data spaces see the “Introductory Guide to DMS” [13]).

#### *NK-ISAM files in NK2 and NK4 format*

NK-ISAM files in both NK2 format as well as NK4 format can be processed via the ISAM pool. When the first NK-ISAM file to be processed is opened, the ISAM pool is formatted in accordance with that file. If an NK-ISAM file in another format is then opened via the same ISAM pool, the ISAM pool is extended dynamically by an extent equal to its previous size and is formatted according to the new file to be processed. In other words, after the extension, the ISAM pool will consist of one extent for processing NK2-ISAM files and one for processing NK4-ISAM files, thus doubling the actually required memory space to twice the SIZE specification.

To prevent the resulting degradation in performance, it is therefore advisable to only process files of the same format via an ISAM pool.

A detailed description of ISAM pools can be found in the “Introductory Guide to DMS” [13].

## Format

### CREATE-ISAM-POOL

```
POOL-NAME = <name 1..8>
, CAT-ID = *DEFAULT-PUBSET / <cat-id 1..4>
, SCOPE = *TASK (...) / *HOST-SYSTEM(...) / *USER-ID(...) / *USER-GROUP(...)
    *TASK (...)
        | WRITE-IMMEDIATE = *NO / *YES
    *HOST-SYSTEM(...)
        | WRITE-IMMEDIATE = *YES / *NO
        | ,CREATION-MODE = *ANY / *NEW
    *USER-ID(...)
        | WRITE-IMMEDIATE = *YES / *NO
        | ,CREATION-MODE = *ANY / *NEW
    *USER-GROUP(...)
        | WRITE-IMMEDIATE = *YES / NO
        | ,CREATION-MODE = *ANY / NEW
, SIZE = *STD / <integer 32..32767 2Kbyte>
, RESIDENT = *NO / *YES
```

## Operands

### **POOL-NAME** = <name 1..8>

Assigns a name to the ISAM pool which is to be created or which already exists, and to which the task is to be linked. Together with its catalog ID and scope, this allows the pool to be uniquely identified.

### **CAT-ID** = **\*DEFAULT-PUBSET** / <alphanum-name 1..4>

Specifies the catalog ID of the pubset to which the ISAM pool is to be assigned.

The ISAM pool will be set up on the host computer to which this pubset belongs.

The catalog ID can – as in the file name – be regarded as part of the name, i.e. different catalog IDs identify different ISAM pools.

---

**CAT-ID = \*DEFAULT-PUBSET**

The ISAM pool is assigned to the catalog that was set with the system parameter ISPLDEF ( ISAM-POOL-DEFAULT-CATID ):

X'00':	default catalog ID from the user entry (see the SHOW-USER-ATTRIBUTES command, output field <i>DEFAULT-PUBSET</i> )
X'01':	catalog ID of the home pubset

**CAT-ID = <alphanumeric-name 1..4>**

The catalog ID of the pubset to which the ISAM pool is to be assigned.

**SCOPE = \*TASK(...) / \*USER-ID(...) / \*USER-GROUP(...) / \*HOST-SYSTEM(...)**

Specifies the scope of the ISAM pool and governs the possible users:

- task-local, i.e. only for the creating task
- cross-task, for all the tasks of the system

The scope identifies the ISAM pool uniquely, i.e. ISAM pools that have the same name and same catalog ID but different scopes are not the same.

**SCOPE = \*TASK(...)**

The ISAM pool can only be used by the calling job: it is task-local.

**WRITE-IMMEDIATE = \*NO / \*YES**

Specifies whether the blocks which are buffered in the ISAM pool are to be written out immediately after any change, or only when the buffer is required for another block.

**WRITE-IMMEDIATE = \*NO**

For files which are to be processed in this pool, any WRITE-IMMEDIATE specification in an ADD-FILE-LINK command, or as specified in the FCB in the program, will apply. If these contain no specification, then \*NO will be applicable.

**WRITE-IMMEDIATE = \*YES**

For all the files to be processed in this pool, the WRITE-IMMEDIATE function will apply: any amended blocks will immediately be written back to the disk.

It should be noted that this will greatly increase the input/output rate, and performance will be reduced.

**SCOPE = \*HOST-SYSTEM(...)**

The ISAM pool is cross-task and can be used by any job (task).

**WRITE-IMMEDIATE = \*YES / \*NO**

Specifies whether the blocks which are buffered in the ISAM pool are to be written out immediately after any change, or only when the buffer is required for another block.

**WRITE-IMMEDIATE = \*YES**

Activates the WRITE-IMMEDIATE function for all files processed in this pool. In other words, updated blocks are written back to disk immediately.

**WRITE-IMMEDIATE = \*NO**

Modified blocks are not written back to disk until the buffer is required for another block. WRITE-IMMEDIATE=\*NO must be defined in the ADD-FILE-LINK command for any file to be processed via this ISAM pool; otherwise, the file cannot be opened.

---

**CREATION-MODE = \*ANY / \*NEW**

Specifies whether the user wishes to establish a new ISAM pool, or whether a link to an ISAM pool with the same name and catalog ID, which may already exist, may be established.

**CREATION-MODE = \*ANY**

If there is already a cross-task ISAM pool with the same name and catalog ID, the job is linked to this pool. The specified SIZE of the pool is **not** taken into account.

If no such ISAM pool currently exists, a new pool is set up with the size defined in SIZE.

**CREATION-MODE = \*NEW**

A new ISAM pool is to be created. However, if a cross-task ISAM pool with the same name and catalog ID already exists, the command will be rejected with an error message.

**SCOPE = \*USER-ID(...)/ \*USER-GROUP(...)**

The ISAM pool can be used by all jobs (tasks) which belong to the same user group as the task which created it. For a description of the lower-level operands WRITE-IMMEDIATE and CREATION-MODE see SCOPE=\*USER-ID.

**SIZE = \*STD / <integer 32..32767 2Kbyte >**

Defines the size of the new ISAM pool to be created.

**SIZE = \*STD**

A task-local ISAM pool is set up with the default size defined in the ISAM parameter `LCLPS` in the parameter service. An ISAM pool which is cross-task is set up with the size defined in the ISAM parameter `GLBPS`.

**SIZE = <integer 32..524288>**

Defines the size of the ISAM pool to be created in units of 2 Kbytes (PAM pages). The following are possible size specifications:

32 <= SIZE <= 32767 for ISAM pools which are cross-task

32 <= SIZE <= 8192 for task-local ISAM pools

The specified SIZE is rounded internally if required. The rounded value for SIZE is shown in the output of the SHOW-ISAM-POOL-ATTRIBUTES command.

The minimum size of 32 PAM pages means that files with logical blocks of no more than STD(6) can be processed. An ISAM pool of 96 PAM pages is required for files with logical blocks of size STD(16).

NK-ISAM files in both NK2 format as well as NK4 format can be processed via the ISAM pool. When the first NK-ISAM file to be processed is opened, the ISAM pool is formatted in accordance with that file. If an NK-ISAM file in another format is then opened via the same ISAM pool, the ISAM pool is extended dynamically by an extent equal to its previous size and is formatted according to the new file to be processed. To prevent a degradation in performance, only files of one format should be processed via an ISAM pool.

**RESIDENT = \*NO / \*YES**

Performance attribute of the ISAM pool.

Specifies whether the ISAM pool is to be created as a memory-resident pool if the appropriate resources are currently available.

If the task is to be linked to an existing ISAM pool, this specification must match the performance attribute defined for that pool.

**RESIDENT = \*NO**

The memory pages of the ISAM pool are pageable.

---

**RESIDENT = \*YES**

This specification is only possible for users who have the DMS tuning privilege CONCURRENT-USE or EXCLUSIVE-USE for the pubset (see the output field *DMS-TUNING-RESOURCES* in the output of the SHOW-USER-ATTRIBUTES command). Depending on the currently available resources, the memory pages of the ISAM pool are kept resident in memory as far as possible.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
	32	DMS0A17	Internal system error
	64	DMS0A0E	Syntax error in ISAM pool command
	64	DMS0A11	Specified catalog ID does not exist
	64	DMS0A13	Specified pool name is syntactically invalid
	64	DMS0A15	Specified ISAM pool already exists
	64	DMS0A18	Size of ISAM pool invalid
	64	DMS0A1E	Not authorized for resident pool
	64	DMS0A1F	RESIDENT parameters incompatible
	64	DMS0A20	Parameters not permitted for remote BS2000 version
	64	DMS0A21	ISAM pool limit reached
	64	DMS0A22	User group does not exist
	130	DMS0A12	Specified catalog ID not available
	130	DMS0A14	Shortage of memory space for CREATE-ISAM-POOL

## Example

Connecting a task to several ISAM pools

```
/show-isam-pool-attr pool=*all _____ (1)
```

```
%
% CATID      POOLNAME  SCOPE                WROUT   SIZE  EXTENTS  RESIDENT
% =====
% 10SB      SDFPOOLN  TASK                NO      128   --/--    NO
%
```

```
/cre-isam-pool pool-name=poolab01,scope=*host _____ (2)
```

```
/cre-isam-pool pool-name=poolab01,scope=*task _____ (3)
```

```
/show-isam-pool-attr pool=*all _____ (4)
```

```
%
% CATID      POOLNAME  SCOPE                WROUT   SIZE  EXTENTS  RESIDENT
% =====
% 10SB      SDFPOOLN  TASK                NO      128   --/--    NO
% N         POOLAB01  HOST                YES      96    --/--    NO
% N         POOLAB01  TASK                NO       96    --/--    NO
%
```

```
/show-isam-pool-attr pool=poolab01(scope=host),inf=*user-and-attr — (5)
```

```
%
% CATID      POOLNAME  SCOPE                WROUT   SIZE  EXTENTS  RESIDENT
% =====
% N         POOLAB01  HOST                YES      96    --/--    NO
%
% ----- CONNECTED TASKS -----
%                               TSN = 1EUW
%                               TSN = 1EUE
% -----%
%
```

```
/show-isam-pool-attr pool=poolab01(scope=*task),inf=*user-and-attr — (6)
```

```
%
% CATID      POOLNAME  SCOPE                WROUT   SIZE  EXTENTS  RESIDENT
% =====
% N         POOLAB01  TASK                NO       96    --/--    NO
%
% ----- CONNECTED TASKS -----
%                               TSN = 1EUE
% -----%
%
```

- (1) Returns information on all ISAM pools to which the task is connected. There is one existing task-local ISAM pool: *SDFPOOLN*.

- 
- (2) Connects the task to the cross-task ISAM pool *POOLAB01*.
  - (3) Connects the task to the task-local ISAM pool *POOLAB01*. The task-local ISAM pool has the same name as the host-specific ISAM pool; however, the name is considered unique, since the scope differs.
  - (4) Returns information on all ISAM pools to which the task is connected. The output shows that there are three existing ISAM pools: one named *SDFPOOLN* and two with the name *POOLAB01*, of which one is cross-task, and one is task-local. It is evident that no file has been processed with these ISAM pools, since the *EXTENTS* output column does not contain any formatting information.
  - (5) Shows the attributes and the connected task for the cross-task ISAM pool *POOLAB01*. Two tasks are connected to this pool: the ISAM pool which was created earlier by the task with TSN *1EUW*, and the user's own TSN *1EUE*, which is shown as the second task (see also Point 6).
  - (6) Shows the attributes and the connected task for the task-local ISAM pool *POOLAB01*. As expected, only the users' own task (TSN *1EUE*) can be connected to the pool in this case. This ISAM pool was created using the CREATE-ISAM-POOL command (see Point 3).

---

## 2.77 CREATE-JV

Define name and attributes for new job variable

**Component:** JV

**Functional area:** Job variables

**Domain:** JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** \$ (with NBCONOPI=N) or J (with NBCONOPI=Y)

This function is only available to the user if the chargeable software product JV has been loaded as a subsystem.

### Function

The CREATE-JV command generates the catalog entry for a JV whose value is undefined until the first change. The user defines the name of the JV and the following protection attributes:

- read-only or read/write access (ACCESS operand); part of standard access control
- access by foreign user IDs (USER-ACCESS operand); part of standard access control
- explicit assignment of access rights (BASIC-ACL operand); extended access control
- protection by guards (GUARDS operand)
- additional protection via passwords (READ- and WRITE-PASSWORD operands)
- HSMS management class (MANAGEMENT-CLASS operand)

The protection attribute “retention period” is set implicitly. It can only be assigned via the MODIFY-JV-ATTRIBUTES command (RETENTION-PERIOD operand). By default, no retention period is defined for newly created JVs, i.e. the output field *EXPIR-DATE* in the catalog entry contains the creation date (output field *CRE-DATE*). Currently, the output field *EXPIR-TIME* is always set to the value 00:00:00. For the creation time (output field *CRE-TIME*), the actual time of creation is entered.

For temporary JVs, only the preset values are allowed, i.e. they are not shareable, can always be overwritten and cannot be protected by passwords. The protection function BASIC-ACL is likewise not supported. Since only the creating job can access temporary JVs up to LOGOFF processing, no protection is required against foreign access.

When creating permanent JVs, the user cannot exceed the maximum permitted number specified in the user entry for the relevant pubset. If the number of permanent JVs is the same as the maximum permitted number, any further CREATE-JV commands for creating a permanent JV are rejected (see the *JOBVARIABLES* and *JV-NUMBER-LIMIT* output fields of the SHOW-USER-ATTRIBUTES command).

#### *Privileged functions*

By default, systems support (TSOS privilege) is a co-owner of all job variables (and can, therefore, create job variables under all user logons). When SECOS is used, this co-ownership can be restricted for permanent job variables.

## Format

CREATE-JV

| **,WRITE-PASSWORD** = \*BY-PROTECTION-ATTR / \*NONE / \*SECRET /

| <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>

,**MANAGEMENT-CLASS** = \*NONE / <composed-name 1..8>

,**SUPPRESS-ERRORS** = \*NONE / \*JV-EXISTING

## Operands

**JV-NAME** = <filename 1..54 without-gen-vers>

Name of the job variable JV to be created.

Nonprivileged users can create job variables under their own user ID only. The name of a temporary JV begins with the character (# or @) specified in the TEMPFILE system parameter. The internal name is always output by the system (e.g. SHOW-JV-ATTRIBUTES, system messages).

**PROTECTION** = \*STD / \*PARAMETERS(...)

Protection attributes of the JV.

**PROTECTION** = \*STD

The protection attributes listed below are assigned the values supplied by default protection.

If default protection is not active, the system default values for the operands of the \*PARAMETERS structure are set.

PROTECTION-ATTR=	*STD	*BY-DEF-PROT-OR-STD	
		Default protection not active	Default protection active
Protection attribute		(System standard values)	
ACCESS		WRITE	values from default protection
USER-ACCESS		OWNER-ONLY	
BASIC-ACL		NONE	
PASSWORD		NONE	
READ-/WRITE-PASSWORD		NONE	

Table 39: Effects of PROTECTION-ATTR on protection attributes in the case of CREATE-JV

**PROTECTION** = \*PARAMETERS(...)

The protection attributes of the JV are set as follows. If the default value \*NONE or \*NO is specified for an attribute, the corresponding protection function is not activated. The protection attribute ACCESS is implicitly set to WRITE (explicitly only with MODIFY-JV-ATTRIBUTES).

For temporary JVs, only the default values are permitted. They are not shareable, can always be overwritten and cannot be protected by passwords. The protection functions basic ACL and guards are likewise not supported. Since only the creating job can access temporary JVs up to LOGOFF processing, no protection is required against foreign access.

If more than one access control mechanism is specified for a JV, the strongest mechanism activated applies. The following table shows the method used for access control, the protection attributes, and the job variable protection hierarchy (protection levels):

Access control method	Protection attribute	Prot. level
Standard access control	ACCESS and USER-ACCESS	0
Basic access control list	BASIC-ACL	1
Access control via guards	GUARDS and SECOS	2

Table 40: Hierarchy of access control methods

All other protection attributes of a JV (e.g. passwords) are evaluated independently of the protection level.

**PROTECTION-ATTR = \*BY-DEF-PROT-OR-STD / \*STD**

Specifies from where the protection attributes with the value \*BY-PROTECTION-ATTR are to be obtained. For the assignments, see [table "Effects of PROTECTION-ATTR on protection attributes in the case of CREATE-JV"](#).

**PROTECTION-ATTR = \*BY-DEF-PROT-OR-STD**

The values supplied by default protection are entered for the operands with \*BY-PROTECTION-ATTR. If default protection is not active, system default values will be assigned to the relevant operands.

**PROTECTION-ATTR = \*STD**

System default values are set for operands with \*BY-PROTECTION-ATTR.

**ACCESS = \*BY-PROTECTION-ATTR / \*WRITE / \*READ**

Specifies the type of accesses allowed when only standard access control is active (i.e. when there is no BASIC-ACL entry and no protection with GUARDS).

**ACCESS = \*BY-PROTECTION-ATTR**

Standard access control is independent of the value of the PROTECTION-ATTR operand.

**ACCESS = \*WRITE**

Standard access control allows both read and write access.

**ACCESS = \*READ**

Standard access control allows read access only.

**USER-ACCESS = \*BY-PROTECTION-ATTR / \*OWNER-ONLY / \*ALL-USERS**

Specifies whether the accesses allowed with the ACCESS operand are also available to other user IDs when only standard access control is active (i.e. when there is no BASIC-ACL entry and no protection with GUARDS).

**USER-ACCESS = \*BY-PROTECTION-ATTR**

Access is independent of the value of the PROTECTION-ATTR operand.

**USER-ACCESS = \*OWNER-ONLY**

Only the owner (user ID under which the JV is cataloged) and the system administration have access.

**USER-ACCESS = \*ALL-USERS**

All user IDs have access rights.

---

**BASIC-ACL = \*BY-PROTECTION-ATTR / \*NONE / STD / \*PARAMETERS(...)**

Specifies whether a BASIC-ACL entry is to be generated for the JV and whether access control is consequently to be performed through that entry.

**BASIC-ACL = \*BY-PROTECTION-ATTR**

Access control via BASIC-ACL is independent of the value of the PROTECTION-ATTR operand.

**BASIC-ACL = \*NONE**

BASIC-ACL is not activated for the JV. Access control (standard access control) is effected in accordance with the protection attributes USER-ACCESS and ACCESS (see output fields *USER-ACC* and *ACCESS* of the SHOW-JV-ATTRIBUTES command).

**BASIC-ACL = \*STD**

A BASIC-ACL entry with the following values is created for the JV:OWNER = \*PARAMETERS( READ = \*YES, WRITE = \*YES),GROUP = \*NO-ACCESS and OTHERS = \*NO-ACCESS

**BASIC-ACL = PARAMETERS(...)**

A BASIC-ACL entry is created for the JV and access control is then effected via the basic access control list (BACL).

The read and write access rights can be explicitly set or denied for each user class.

User classes are:

- OWNER, i.e. user ID of the owner and systems support
- GROUP, i.e. all user IDs which belong to the group of the owner (except the owner and systems support). Definition of user groups is possible only when the software product SECOS is used. With regard to the possible use of SECOS, the same rights should be allocated for GROUP as for OTHERS.
- OTHERS, i.e. all user IDs which do not belong to the group of the owner.

**OWNER = \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights are to be set for the owner. NO-ACCESS is the default value, i.e. the owner has neither read nor write authorization.

**OWNER = \*PARAMETERS(...)**

The owner's access rights are entered as specified:

**READ = \*NO / \*YES**

Specifies whether read authorization is set.

**WRITE = \*NO / \*YES**

Specifies whether write authorization is specified.

Write authorization does *not* imply read authorization.

**GROUP = \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights are to be set for all user IDs from the group of the owner. NO-ACCESS is the default value, i.e. the user class GROUP has neither read nor write authorization.

**GROUP = \*PARAMETERS(...)**

Access rights are to be set as specified:

**READ = \*NO / \*YES**

Specifies whether read authorization is set.

---

**WRITE = \*NO / \*YES** Specifies whether write authorization is specified.

Write authorization does *not* imply read authorization.

**OTHERS = \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights are to be set for user IDs which do not belong to the group of the owner. If SECOS is not used, access rights should be set as for GROUP with regard to an analysis for future use of SECOS.

\*NO-ACCESS is the default value, i.e. the user class OTHERS has neither read nor write authorization.

**OTHERS = \*PARAMETERS(...)**

Access rights are to be set as specified:

**READ = \*NO / \*YES**

Specifies whether read authorization is set.

**WRITE = \*NO / \*YES**

Specifies whether write authorization is specified.

**GUARDS = \*BY-PROTECTION-ATTR / \*NONE / \*PARAMETERS(...)**

Specifies whether access control is to be performed for the JV using GUARDS.

**GUARDS = \*BY-PROTECTION-ATTR**

Access control using GUARDS is independent of the value of the PROTECTION-ATTR operand.

**GUARDS = \*NONE**

Access to the JV is not to be controlled via GUARDS.

**GUARDS = \*PARAMETERS(...)**

Access to the JV is to be controlled via GUARDS.

Access to the job variable is controlled via a guard, i.e. a specific object identifying all the conditions subject to which access will be granted: such as date, time, time period, user ID. The GUARDS function unit of the chargeable software product SECOS (see the "SECOS" manual [35]) must be installed in order to create and maintain a guard.

Each guard is uniquely identified by its name. Guard names resemble JV names: they are made up of two parts, the user ID (optional) and the name part (up to 8 characters). If no user ID is specified explicitly, the user's own ID is added implicitly.

Each access mode can be controlled by a separate guard. If no guard is assigned for an access mode (\*NONE), access control will refuse any corresponding access (e.g. WRITE=\*NONE prevents all write access). Specifying GUARDS=\*PARAMETERS defines access control via GUARDS with all access modes being set to the default value \*NONE, i.e. neither read access to the JV nor write or execute access is allowed.

The GUARDS subsystem is not required in order to define access control via GUARDS. A check by GUARDS takes place only when JV access occurs:

If a defined guard is not accessible, the mode of access protected by it is not permitted. No access at all is possible if the GUARDS subsystem is not available at the time of access.

**READ = \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard controlling read access (up to 8 characters if no user ID is specified).

The default value is \*NONE, i.e. no read access is granted.

**WRITE = \*NONE / <filename 1..18 without-cat-gen-vers>**

Name of a guard controlling write access (up to 8 characters if no user ID is specified).

The default value is \*NONE, i.e. no write access is granted.

---

**READ-PASSWORD = \*BY-PROTECTION-ATTR / \*NONE / \*SECRET / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>**

Password for protection against unauthorized reading. The READ-PASSWORD operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.
- The password entered is not logged.

**READ-PASSWORD = \*BY-PROTECTION-ATTR**

Allocation of a read password is independent of the value of the PROTECTION-ATTR operand.

**WRITE-PASSWORD = \*BY-PROTECTION-ATTR / \*NONE / \*SECRET / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>**

Write or read password for the JV to be modified. The WRITE-PASSWORD operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.
- The password entered is not logged.

**WRITE-PASSWORD = \*BY-PROTECTION-ATTR**

Allocation of a write password is independent of the value of the PROTECTION-ATTR operand.

**MANAGEMENT-CLASS = \*NONE / <composed-name 1..8>**

*Only for job variables on SM pubsets*

Specifies whether the HSMS functions JV backup and (long-term) archival are to be controlled via a management class defined via HSMS. See the “HSMS” manual [18] for further details.

Assignment of a management class is rejected in the following cases:

- the JV is to be created on an SF pubset
- the specified management class has not been defined for the SM pubset

**SUPPRESS-ERRORS = \*NONE / \*JV-EXISTING**

Specifies whether there is an error if the specified JV exists.

**SUPPRESS-ERRORS = \*NONE**

If the specified JV exists, the command is rejected with an error. The error triggers the spinoff mechanism resp. the SDF-P error handling.

**SUPPRESS-ERRORS = \*JV-EXISTING**

If the specified JV already exists, the command has no effect on the JV. There is no error (error JVS0444 is suppressed).

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	CMD0001	Command executed with a warning
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JVS04E0	Command not executable in the call environment; if possible, remove cause of error (see SYSOUT message JVS04xx)
	130	JVS04E1	Command cannot be executed at this time; for cause see SYSOUT message JVS04xx
	130	CMD2282	Subsystem JV not available for indefinite time

## Examples

```
/create-jv jv=jv.perm.error,prot=*par(user-access=*all-users,write-pass=c'fehl')
/show-jv-attr jv=jv.perm.error,inf=*all-attr
```

```
%0000000 :LEO:$USER1.JV.PERM.ERROR
% USER-ACC  = ALL-USERS  ACCESS      = WRITE
% CRE-DATE  = 2012-03-15 EXPIR-DATE = 2012-03-15
% CRE-TIME  = 09:09:00  EXPIR-TIME = 00:00:00
% READ-PASS = NONE
% WRITE-PASS = YES
%SUM 000001 JV'S; JV-VALUE = 00000000 BYTES
```

The job variable JV.PERM.ERROR is created, i.e. its name is entered in the catalog. The job variable is defined as shareable and protected by a write password.

```
/create-jv jv=jv.perm.error.read,
           prot=(basic-acl=(owner=(read=y,write=y),group=(read=y),others=(read=y)))
/show-jv-attr jv=jv.perm.error.read,inf=*all-attr
```

```
%0000000 :LEO:$TSOS.JV.PERM.ERROR.READ
% USER-ACC  = OWNER-ONLY ACCESS      = WRITE
% OWNER     = R W          GROUP      = R -          OTHERS     = R -
% CRE-DATE  = 2012-01-19 EXPIR-DATE = 2012-01-19
% CRE-TIME  = 18:18:29  EXPIR-TIME = 00:00:00
% READ-PASS = NONE
% WRITE-PASS = NONE
%SUM 000001 JV'S; JV-VALUE = 00000000 BYTES
```

The job variable JV.PERM.ERROR.READ is created. It is not shareable, but read authorization is granted to other users via BASIC-ACL. The owner has both read and write access.

```
/create-jv jv=#jv.temp.work
/show-jv-attr jv=#jv.temp.work,inf=*all-attr
```

```
%0000000 :LEO:$TSOS.S.123.4HM7.JV.TEMP.WORK
% USER-ACC  = OWNER-ONLY ACCESS      = WRITE
% CRE-DATE  = 2012-01-19 EXPIR-DATE = 2012-01-19
% CRE-TIME  = 18:22:44  EXPIR-TIME = 00:00:00
% READ-PASS = NONE
% WRITE-PASS = NONE
%SUM 000001 JV'S; JV-VALUE = 00000000 BYTES
```

The job variable #JV.TEMP.WORK is created temporarily. The protection attributes are set to their default values (different values cannot be specified). Only the creating job has access.

---

## 2.78 CREATE-OPERATOR-ROLE

Define name and routing codes for new operator role

**Component:** SRPMNUC  
**Functional area:** Operator function control  
**Domain:** SECURITY-ADMINISTRATION  
**Privileges:** SECURITY-ADMINISTRATION

### Function

This command is used to compile a list of routing (authorization) codes, to form an “operator role”, and to inform the specified subset of it. An operator role corresponds to an area of work, and gives the exerciser of the role the right to issue the commands assigned to that area of work. Each area of work (= operator role) is represented by a set of authorization (routing) codes specified by the system support staff; this may be any combination of the total of 40 authorization codes used in BS2000.

The creation and issuing of operator roles provides a means of increasing protection against unauthorized access to the operating functions. All dynamic authorization names, i.e. operator identifications, (see “Simplifying system operation” in the “Introduction to System Administration” [14]) are treated like user IDs; for each operator identification there is an entry in the user catalog, which uniquely identifies it. If the application wishes to undertake a system operating task, it must specify an operator identification when it is connected, and then apply to be assigned an operator role, using the command REQUEST-OPERATOR-ROLE. Not until this role is assigned can it function properly as a console. The system support staff creates the link between the operator identification and the operator roles which the application may accept under this operator identification, using the MODIFY-OPERATOR-ATTRIBUTES command.

Operator roles cannot be used for logical consoles with generated authorization names, for physical consoles only if NBCONOPI=Y.

The main console, and therefore a human operator, cannot be covered by these roles.

### Format

<b>CREATE-OPERATOR-ROLE</b>
<b>OPERATOR-ROLE</b> = <name 1..8>
, <b>PUBSET</b> = <u>*HOME</u> / <cat-id 1..4>
, <b>ROUTING-CODES</b> = <u>*NONE</u> / <u>*ALL</u> / list-poss(40): * / <alphanum-name 1..1>

---

## Operands

### **OPERATOR-ROLE = <name 1..8>**

Defines the name of the operator role. This name must be specified by the authorized user programs as soon as they wish to perform the tasks (=routing codes) associated with this role.

### **PUBSET =**

Specifies the pubset into whose catalog the role is to be entered.

### **PUBSET = \*HOME**

The operator role is to be entered into the user catalog for the home pubset.

### **PUBSET = <cat-id 1..4>**

Exact specification of the pubset into whose catalog the new operator role is to be entered.

### **ROUTING-CODES =**

Specifies the routing codes, and hence the area of work, which are assigned to the new operator role.

### **ROUTING-CODES = \*NONE**

Default value: no routing codes will be explicitly assigned to the new operator role. The authorized user program may nevertheless accept the role, as this command will have entered it in the user catalog for the specified pubset; however, the requesting application cannot undertake any tasks.

### **ROUTING-CODES = \*ALL**

All the routing codes known to the system should be assigned to the role.

### *Note*

A table of routing codes will be found in the "Introduction to System Administration" [ 14 ].

### **ROUTING-CODES = list-poss(40): \* / <alphanum-name 1..1>**

Detailed specification of up to 40 routing codes to be assigned to the new operator role.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SRM6001	Command executed with a warning
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error
	130	SRM6030	Command cannot temporarily be executed

---

## 2.79 CREATE-PAGING-FILE

Create paging file on disk

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-MANAGEMENT  
SYSTEM-TUNING  
**Privileges:** OPERATING  
TSOS  
**Routing code:** R

### Function

System support can use the CREATE-PAGING-FILE command to create a paging file on a magnetic disk or on any volume of an SF pubset. It creates a paging file of a specified size.

### Format

#### CREATE-PAGING-FILE

**VOLUME**= \*PUBSET(...) / list-poss(256): <vsn 1..6>

\*PUBSET(...)

| **PUBSET** = list-poss(256): <cat-id 1..4>

,**SIZE** = <integer 1..2097152 *Mbyte*>

### Operands

**VOLUME = \*PUBSET(...)**

Specifies one or more SD pubsets. A paging file of the specified size is to be created on each volume of the specified SF pubsets.

**PUBSET = list-poss(256): <cat-id 1..4>**

Specifies the SF pubsets on which the paging files are to be created by their catalog ID.

**VOLUME = list-poss(256): <vsn 1..6>**

Identifies the magnetic disk on which the paging file of the specified size is to be created by its volume serial number (VSN). Up to 256 disks can be listed.

**SIZE = <integer 1..2097152 *Mbyte*>**

Specifies the size in megabytes of the paging file which is to be created on the disk.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
1	0	CMD0001	Warning: A paging file of the specified size already exists on the magnetic disk. Guaranteed message: EMM2811
	32	EMM2800	The function cannot be executed because of an internal error. Guaranteed messages: EMM2818, EMM2828
	64	EMM2802	The specified pubset or the specified magnetic disk is unknown and cannot be identified in the given configuration. Guaranteed messages: EM2841, EMM2817
	64	EMM2803	Creating the paging file is not permitted for the specified pubset or the specified magnetic disk, the pubset is a shared pubset, the pubset has not been imported. Guaranteed messages: EMM2812, EM2816, EM2820
	64	EMM2805	Operation not permissible: A paging file of a different size already exists on the magnetic disk, the storage space is insufficient, the pubset has not been imported, the SM pubset has not been imported completely, the pubset has not been entered in the MRSCAT. Guaranteed messages: EMM2811, EMM2814, EMM2815, EMM2825, EMM2838, EM2824
	128	EMM2807	The function cannot be executed because of a lack of resources Guaranteed messages: EMM2819, EMM2829

### Note

When lists are specified, command processing is aborted in the event of an error with a return code of EMM2800 or EM2807. In all other cases processing continues.

### Notes

Before issuing the command, make sure that the space required for the paging file is available on the disk. For performance reasons, a contiguous area is preferable. Otherwise, the paging file will consist of various extents.

It may be possible to make enough contiguous space by repositioning files on the disk.

The pubset the disk belongs to must have been imported. It may not be a shared pubset.

The paging file is not backed up by ARCHIVE or HSMS.

### Example

Creating a 32-megabyte paging file on a disk with the volume serial number 2OSW.0:

```
/CREATE-PAGING-FILE VOLUME=2OSW.0,SIZE=32
```

---

## 2.80 CREATE-SNAPSET

Create a Snapset

**Component:** BS2000 OSD/BC

**Functional area:** Pubset and MRSCAT management

**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
SNAPSET

**Privileges:** TSOS  
HSMS-ADMINISTRATION

### Function

The CREATE-SNAPSET command creates a Snapset for an imported pubset. This also includes entering the Snapset in the Snapset catalog and placing it in service. The DELETE-EARLIEST operand controls whether a new Snapset is created and under which conditions the oldest existing Snapset is to be deleted and reused before the Snapset is created (the default is deletion when the Snapset limit is reached).

The command is rejected when a new Snapset is to be created and no free Snapset is available (the setting DELETE-EARLIEST=\*NO prevents the oldest Snapset from being deleted when the Snapset limit is reached).

### Format

**CREATE-SNAPSET**

**PUBSET** = <cat-id 1..4>

**,DELETE-EARLIEST** = \*AT-LIMIT / \*YES / \*NO

### Operands

**PUBSET = <cat-id 1..4>**

Catalog ID of the pubset for which the Snapset is to be created.

**DELETE-EARLIEST = \*AT-LIMIT / \*YES / \*NO**

Specifies whether and under which conditions the oldest Snapset is to be deleted.

**DELETE-EARLIEST = \*AT-LIMIT**

The oldest Snapset is deleted only if the maximum number of Snapsets permissible for the pubset (Snapset limit) has already been reached.

The Snapset limit is entered in the SVL of the pubres/volres of the Control Volume Set using the SET-PUBSET-ATTRIBUTES command.

**DELETE-EARLIEST = \*YES**

The oldest Snapset is always deleted.

**DELETE-EARLIEST = \*NO**

A new Snapset is created. If the Snapset limit has already been reached, the command is rejected.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	32	CMD0216	No authorization
	64	DMS1351	Internal error
	64	DMS1386	Error in the memory request
	64	DMS1389	Error in MSCF communication
	64	DMS138B	No MRSCAT entry
	64	DMS138C	Pubset not accessible
	64	DMS13D6	Snapset limit exceeded
	64	DMS148F	GCF not loaded
1	64	DMS13D7	Internal error in Snapset management: Return code of GCF
2	64	DMS13D7	Internal error in Snapset management: Return code in the case of mount/dismount
3	64	DMS13D7	Internal error in Snapset management: Return code when reading or writing the SVL
4	64	DMS13D7	Internal error in Snapset management: Return code when setting/resetting the reconfiguration lock
5	64	DMS13D7	Internal error in Snapset management: Return code of DPSVLST (create the volume list)
6	64	DMS13D7	Internal error in Snapset management: Return code of SHC-OSD
7	64	DMS13D7	Internal error in Snapset management: Return code of CCOPY
	64	DMS13DF	SHC-OSD subsystem not available

---

## 2.81 CREATE-STORAGE-CLASS

Define storage class for SM pubset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Function

The CREATE-STORAGE-CLASS command allows systems support to define a new storage class for an SM pubset. The SM pubset must have been imported to the local system (in exclusive or shared mode).

An entry for the new storage class is added to the current storage class catalog (file :<sm-pubset-catid>:\$TSOS.SYSCAT.STORCLS). The storage class definition contains a list of file attributes. If it is assigned a volume set list, it also includes the name of the list. The user can assign a storage class to a file in the CREATE-FILE and MODIFY-FILE-ATTRIBUTES commands. The file is then implicitly given all the file attributes defined in the storage class. If there is a volume set list assigned to the storage class, the file will if possible be stored in a volume set from the assigned volume set list.

The SHOW-STORAGE-CLASS command can be used to list the attributes of a storage class.

A storage class can be modified with the MODIFY-STORAGE-CLASS command, and its entry can be removed from the storage class catalog with the DELETE-STORAGE-CLASS command.

Systems support can use the CHANGE-STORAGE-CLASS-CATALOG command to change or, in the event of an error, dynamically load the storage class catalog.

## Format

### CREATE-STORAGE-CLASS

```
STORAGE-CLASS-NAME = <composed-name 1..8>
,PUBSET = <cat-id 1..4>
,FILE-ATTRIBUTES = *STD / *PARAMETERS(...)
    *PARAMETERS(...)
    |   IO-ATTRIBUTES = *STD / *PARAMETERS(...)
    |   *PARAMETERS(...)
    |       |   PERFORMANCE = *STD / *HIGH / *VERY-HIGH
    |       |   ,USAGE = *READ-WRITE / *WRITE / *READ
    |   ,DISK-WRITE = *STD / *IMMEDIATE / *BY-CLOSE
    |   ,AVAILABILITY = *STD / *HIGH
    |   ,FILE-PREFORMAT = *BY-PUBSET-DEFAULT / *K / *NK2 / *NK4
    |   ,WORK-FILE = *NO / *YES
,STORAGE-CLASS-INFO = *NONE / <c-string 1..720 with-low>
,PROTECTION = *NONE / *BY-GUARDS(...)
    *BY-GUARDS(...)
    |   GUARD-NAME = <filename 1..18 without-cat-gen-vers>
,VOLUME-SET-LIST = *NONE / <composed-name 1..8>
```

## Operands

**STORAGE-CLASS-NAME** = <composed-name 1..8>

Defines a name for the new storage class.

**PUBSET** = <cat-id 1..4>

Specifies the catalog ID of the pubset for which the storage class is being created. The pubset must be an SM pubset which has been locally imported (in exclusive or shared mode).

**FILE-ATTRIBUTES** = **\*STD** / **\*PARAMETERS(...)**

Specifies pubset management requirements which can be represented in the form of file attributes. The file attributes apply to all files to which the user assigns the storage class instead of explicit attributes (see the STORAGE-CLASS operand of the CREATE-FILE or MODIFY-FILE-ATTRIBUTES command).

**FILE-ATTRIBUTES** = **\*STD**

Files assigned this storage class are allocated standard pubset management requirements. These correspond to the default values in the FILE-ATTRIBUTES=\*PARAMETERS(...) structure.

---

**FILE-ATTRIBUTES = \*PARAMETERS(...)**

Specifies which file attributes are allocated to files in this storage class.

**IO-ATTRIBUTES = \*STD / \*PARAMETERS(...)**

Specifies which performance requirements apply to files in this storage class.

**IO-ATTRIBUTES = \*STD**

The default values in the \*PARAMETERS(...) structure apply.

**IO-ATTRIBUTES = \*PARAMETERS(...)**

Performance attributes are determined by the specifications in the PERFORMANCE and USAGE operands.

**PERFORMANCE = \*STD / \*HIGH / \*VERY-HIGH**

Specifies the performance attribute for files in this storage class. It indicates the priority required for the I/O operations selected in the USAGE operand.

**PERFORMANCE = \*STD**

No performance requirements are defined for files in this storage class. In this case the USAGE operand has no impact on the processing of the file.

**PERFORMANCE = \*HIGH**

A cache should be used to process files in this storage class (high performance priority).

**PERFORMANCE = \*VERY-HIGH**

A cache should be used to process files in this storage class, and if possible the entire file should be kept permanently in the cache (highest performance priority, only available in the GS cache medium).

**USAGE = \*READ-WRITE / \*WRITE / \*READ**

Specifies the I/O operations for which enhanced performance (caching) is required. The default is \*READ-WRITE, i.e. the requirement applies to both read and write operations.

The requirement may also be applied only to write operations (\*WRITE) or only to read operations (\*READ).

If the file has no special performance attribute (PERFORMANCE=\*STD), the USAGE operand has no impact on processing.

**DISK-WRITE = \*STD / \*IMMEDIATE / \*BY-CLOSE**

Specifies the time at which data consistency is required for files in this storage class after a write operation.

**DISK-WRITE = \*STD**

The default setting of \*STD is equivalent to \*IMMEDIATE for permanent files and to \*BY-CLOSE for temporary files.

**DISK-WRITE = \*IMMEDIATE**

The data in a file must be in a consistent state immediately on completion of a write operation, so a volatile write cache should not be used to process files in this storage class.

**DISK-WRITE = \*BY-CLOSE**

The data in a file does not have to be in a consistent state until after CLOSE processing, so a volatile write cache may be used to process files in this storage class.

**AVAILABILITY = \*STD / \*HIGH**

Specifies availability requirements for files in this storage class.

**AVAILABILITY = \*STD**

There are no special availability requirements.

---

**AVAILABILITY = \*HIGH**

Files in this storage class are required to have high availability (e.g. storage on mirrored disks).

**FILE-PREFORMAT = \*BY-PUBSET-DEFAULT / \*K / \*NK2 / \*NK4**

Governs the preferred file format for files in this storage class. This specification only applies when the catalog entry is created; it is used to automatically determine the storage location.

As long as the file does not yet have a creation date (CRE-DATE=NONE), the storage location is provisional and may still change in the course of OPEN processing.

**FILE-PREFORMAT = \*BY-PUBSET-DEFAULT**

The pubset-global default applies.

**FILE-PREFORMAT = \*K**

File in this storage class are to be created as K files.

**FILE-PREFORMAT = \*NK2**

File in this storage class are to be created as NK2 files.

**FILE-PREFORMAT = \*NK4**

File in this storage class are to be created as NK4 files.

**WORK-FILE = \*NO / \*YES**

Governs whether files in this storage class are work files.

**WORK-FILE = \*NO**

Files in this storage class are created as normal files.

**WORK-FILE = \*YES**

Files in this storage class are created as work files. Systems support can delete work files at appointed times.

**STORAGE-CLASS-INFO = \*NONE / <c-string 1..720 with-low>**

Systems support can compose a brief text describing storage class attributes. It will typically relate to special pubset management requirements which are defined by systems support but cannot be represented in the form of file attributes. This brief text is included in the output of the SHOW-STORAGE-CLASS command to inform the user of any special properties of the storage class.

**STORAGE-CLASS-INFO = \*NONE**

There is to be no explanatory text for the storage class.

**STORAGE-CLASS-INFO = <c-string 1..720 with-low>**

A brief text describing special properties of the storage class as defined by systems support.

**PROTECTION = \*NONE / \*BY-GUARDS(...)**

Specifies whether access to the storage class is to be controlled by guards.

**PROTECTION = \*NONE**

Access to the storage class is not to be controlled by guards.

**PROTECTION = \*BY-GUARDS(...)**

Allocation of the storage class to a file and the listing of the storage class definitions are to be controlled by a guard. The guard named next defines conditions under which a user is allowed to access the storage class.

**GUARD-NAME = <filename 1..18 without-cat-gen-vers>**

Name of the guard.

---

**VOLUME-SET-LIST = \*NONE / <composed-name 1..8>**

Specifies whether a volume set list is to be assigned to the storage class.

The default is \*NONE, i.e. no volume set list is to be assigned to the storage class at this time.

**VOLUME-SET-LIST = <composed-name 1..8>**

The specified volume set list is assigned to the storage class. The volume set list must already exist for this SM pubset.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	1	CMD0202	Syntax error in command
	32	CMD0221	Internal system error
	64	CMD0216	No authorization to issue command
	64	DMS1488	Storage class already defined
	64	DMS1497	Invalid file attribute combination
	64	DMS148B	Volume set list not defined
	64	DMS1485	Pubset not known
	64	DMS1486	Pubset is not a system-managed pubset
	64	DMS1487	Pubset not available
	64	DMS1490	Storage class management not available for this pubset
	64	DMS1483	Storage class catalog invalid
	64	DMS1481	Error accessing storage class catalog
	64	DMS1484	Volume set list catalog invalid
	64	DMS1482	Error accessing volume set list catalog
	129	DMS148D	Not enough class 4/5 memory
	129	DMS148E	Error on MSCF connection to master
	129	DMS148F	GCF subsystem not ready

---

## 2.82 CREATE-TAPE-SET

Generate volume serial number set (tape set)

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING  
**Routing code:** \$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The CREATE-TAPE-SET command is used to create a set of VSNs which can be used for producing tape files. The link with the tape files which are to be processed is set up by the ADD-FILE-LINK command (operand TAPE-SET-NAME). The set of VSNs is entered into the TST (TAPE SET TABLE). Within the TST, the TAPE-SET-NAME performs the same function as does the file link name within the TFT. Information on TST entries can be obtained with the SHOW-FILE-LINK command.

### Format

#### CREATE-TAPE-SET

```
TAPE-SET-NAME = <alphanum-name 1..4>  
,VOLUME = [*ANY](...) / list-poss(255): <alphanum-name 1..6>  
    [*ANY](...  
        | NUMBER-OF-DEVICES = 1 / <integer 1..9>  
,DEVICE-TYPE = *TAPE / <device>
```

### Operands

**TAPE-SET-NAME** = <alphanum-name 1..4>

The name of the tape set; this establishes the link to the TST with the specified name, or creates a new TST.

**i** The tape set name must not be used simultaneously within the same task as a file link name.

**VOLUME** = \***ANY**(...) / list-poss(255): <alphanum-name 1..6>

VSNs of the tapes which are to be allocated to the tape set.

**VOLUME** = \***ANY**(...)

The operator, or MAREN if available, should mount any suitable tapes on the specified device type (no particular VSN is required).

**NUMBER-OF-DEVICES** = 1 / <integer 1..9>

The number of tapes which is required.

---

**DEVICE-TYPE = \*TAPE / <structured-name 1..8>**

The device type to which the tapes are assigned.

The value to be specified is the device type or volume type of the tapes, from which the Device Management System determines the device type which is to be made available for tape processing.

Only device types or volume types known in the system are accepted. In interactive mode, DEVICE-TYPE=? calls up a list of the available device and volume types.

The default value is TAPE, i.e. for tape processing the devices to be used should support a recording density of 1600 or 6250 bpi (bytes per inch). Other permitted specifications will be found in the table in [section "Device types for DMS tape processing"](#).

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS06FF	BCAM connection severed
	130	DMS0524	System address space exhausted
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0594	Not enough virtual memory available

## Example

*Creation of a tape set with subsequent file processing*

```
/cre-tape-set tape-set-name=tap1,vol=(d2312k,d2315k,d2322k),  
              dev-type=tape-c4 _____ (1)  
/show-file-link link=tap1,inf=(vol=*yes) _____ (2)
```

```
%  
%-- LINK-NAME ----- FILE-NAME -----  
% T TAP1                *DUMMY  
% ----- VOLUME -----  
% NUM-OF-VOL = 3          NUM-OF-DEV = 0  
% DEV-TYPE   = TAPE-C4    T-SET-NAME = TAP1  
% T-SET-SHR  = 1          F-SET-ID   = D2312K  
% VSN/DEV    = D2312K      D2315K          D2322K  
% T-SET-VSN  = (D2312K)   D2315K     D2322K
```

```
/cre-file max.tape-file.3,sup=*tape(vol=*no,dev-type=tape-c4,premount=0) - (3)  
/add-file-link link=dmcopy22,file-name=max.tape-file.3,  
              number-of-premounts=0  
              sup=*tape(vol-list=*tape-set(tap1)) _____ (4)  
/show-file-link link=dmcopy22,inf=(file-contr=*yes,vol=*yes) _____ (5)
```

```
%  
%-- LINK-NAME ----- FILE-NAME -----  
% T DMCOPY22          :20S2:$USER1.MAX.TAPE-FILE.3  
% ----- FILE-CONTROL-BLOCK - GENERAL ATTRIBUTES -----  
% ACC-METH   = *BY-PROG   OPEN-MODE = *BY-PROG   REC-FORM   = *BY-PROG  
% REC-SIZE   = *BY-PROG   BUF-LEN   = *BY-PROG   BLK-CONTR  = *BY-PROG

% T-SET-VSN  = (D2312K)   D2315K     D2322K
```

```

/copy-file from=lst.bsp.2,to=max.tape-file.3 _____ (6)
/show-file-attr max.tape-file.3,inf=(alloc=*yes) _____ (7)

```

```

%          :2OS2:$USER1.MAX.TAPE-FILE.3
%  ----- ALLOCATION -----
% SUPPORT   = PVT                               BLK-COUNT = 1
% EXTENTS   VOLUME     DEVICE-TYPE     EXTENTS   VOLUME     DEVICE-TYPE
%           D2312K     TAPE-C4         (         D2315K     TAPE-C4 )
% (         D2322K     TAPE-C4 )
%:2OS2: TAPE :          1 FILE

```

- (1) Creates the tape set *TAP1* containing the three magnetic tape cartridges (volume type TAPE-C6) with the volume IDs *D2312K*, *D2315K*, and *D2322K*.
- (2) Output of the TST entry with the command SHOW-FILE-LINK.
- (3) Creates a catalog entry for a tape file under the file name *MAX.TAPE.FILE.3*. No volume identifier has been defined as yet: TAPE-C6 is specified as the volume type. It is not necessary to reserve a magnetic tape cartridge in this case (NUMBER-OF-PREMOUNTS=0).
- (4) A TFT under the link name *DMCOPY22* is created for the file *MAX.TAPE.FILE*, since the COPY-FILE command is to be used to copy data into this file. At the same time, the TFT entry is linked with the tape set *TAP1* (VOLUME-LIST= \*BY-TAPE-SET).
- (5) Output of the TFT entry with the link name *DMCOPY22*. The output includes relevant information on file processing and volumes.
- (6) The contents of file *LST.BSP.2* are copied to the file *MAX.FILE.3*.
- (7) Returns information from the catalog entry of the file *MAX.FILE.3* showing volume allocation attributes. The file was created on the magnetic tape cartridge *D2312K*. In this case, however, the volume IDs *D2315K* and *D2322K* (from the TST entry) are also entered into the volume list of the catalog entry. These volumes are to be used if the file *MAX.TAPE.3* is extended and the tape cartridge *D2312K* does not have enough space for this purpose.

---

## 2.83 CREATE-VOLUME-SET-LIST

Define volume set list for SM pubset

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

The CREATE-VOLUME-SET-LIST command allows systems support to define a new volume set list for a system-managed pubset (SM pubset). The SM pubset must have been imported to the local system (in exclusive or shared mode).

An entry for the new volume set list is added to the current volume set list catalog (:<sm-pubset-catid>:\$TSOS.SYSCAT.VSETLST). Up to 255 volume sets can be assigned to a volume set list. If the volume set list is associated with a storage class (see the VOLUME-SET-LIST operand in the CREATE- or MODIFY-STORAGE-CLASS command), files in that storage class will if possible be stored in volume sets from the assigned volume set list

The SHOW-VOLUME-SET-LIST command provides information about the composition of volume set lists.

A volume set list can have volume sets added to or removed from it with the MODIFY-VOLUME-SET-LIST command, and its entry can be removed from the volume set list catalog with the DELETE-VOLUME-SET-LIST command.

Systems support can use the CHANGE-VOLUME-SET-LIST-CATALOG command to change or, in the event of an error, dynamically load the volume set list catalog.

### Format

#### CREATE-VOLUME-SET-LIST

```
VOLUME-SET-LIST-NAME = <composed-name 1..8>  
,PUBSET = <cat-id 1..4>  
,VOLUME-SET = *NONE / list-poss (255): <cat-id 1..4>  
,VOLUME-SET-LIST-INFO = *NONE / <c-string 1..720 with-low>
```

### Operands

**VOLUME-SET-LIST-NAME** = <composed-name 1..8>

Defines a name for the new volume set list.

**PUBSET** = <cat-id 1..4>

Specifies the catalog ID of the SM pubset for which the volume set list is being created. The pubset must have been imported to the local system (in exclusive or shared mode).

**VOLUME-SET** = **\*NONE** / list-poss(255): <cat-id 1..4>

Specifies which volume sets are to be assigned to the volume set list.

---

**VOLUME-SET = \*NONE**

No volume sets are to be assigned to the volume set list at this time.

**VOLUME-SET = list-poss(255): <cat-id 1..4>**

The specified volume sets are to be assigned to the volume set list. Up to 255 volume sets can be listed.

The command does not check that the specified volume sets belong to the SM pubset for which the volume set list is being created.

**VOLUME-SET-LIST-INFO = \*NONE / <c-string 1..720 with-low>**

Systems support can compose a brief text describing the volume set list. It will typically relate to differences between volume set lists

The default is \*NONE, i.e. there is to be no explanatory text.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	1	CMD0202	Syntax error in command
	32	CMD0221	Internal system error
	64	CMD0216	No authorization to issue command
	64	DMS1489	Volume set list already defined
	64	DMS1485	Pubset not known
	64	DMS1486	Pubset is not a system-managed pubset
	64	DMS1487	Pubset not available
	64	DMS1490	Storage class management not available for this pubset
	64	DMS1484	Volume set list catalog invalid
	64	DMS1482	Error accessing volume set list catalog
	129	DMS148D	Not enough class 4/5 memory
	129	DMS148E	Error on MSCF connection to master
	129	DMS148F	GCF subsystem not ready

## 2.84 DEACTIVATE-SNAPSHOT

Disable dump generator SNAP

**Component:** BS2000 OSD/BC  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** TSOS  
OPERATING  
**Routing code:** R

### Function

The DEACTIVATE-SNAPSHOT command disables the SNAP dump function. Any suspended SNAP dump will be processed only after the SNAP dump function is enabled again. The command can be executed multiple times, e.g. in order also to delete the SNAP system files retroactively.

DEACTIVATE-SNAPSHOT is executed asynchronously. Message NSP4000 confirms that the command has been received correctly. The SHOW-SNAPSHOT-STATUS command enables you to check the modified settings.

**i** Manual changes to the Snapshot files can lead to undefined statuses when the SNAP dump takes place. Modifications may only be made using the ACTIVATE-SNAPSHOT and DEACTIVATE-SNAPSHOT commands.

### Format

DEACTIVATE-SNAPSHOT

DELETE-FILES = \*NO / \*YES

### Operands

DELETE-FILES = \*NO / \*YES

Specifies whether system files \$TSOS.SNAPFILE and \$TSOS.SNAPFILE.DAT are to be deleted.

DELETE-FILES = \*NO

The SNAP dump function is disabled but the system files are retained.

DELETE-FILES = \*YES

The SNAP dump function is disabled and the system files are deleted.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

## 2.85 DECLARE-PARAMETER

Declare procedure parameters

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

### Function

The DECLARE-PARAMETER command declares procedure parameters in an S procedure together with the method used to pass the parameter values to the procedure (initial value, prompting, etc.).

It is part of the procedure head. If several DECLARE-PARAMETER commands are issued, they must be combined to form a command block (declaration section) by means of BEGIN-PARAMETER-DECLARATION and END-PARAMETER-DECLARATION commands.

#### *Restrictions*

Specification of values other than the defaults for the TYPE and TRANSFER-TYPE operands is possible only if the chargeable SDF-P subsystem has been loaded.

### Format

#### DECLARE-PARAMETER

**NAME** = list-poss(2000): <structured-name 1..20>(…)

<structured-name 1..20>(…)

- | **INITIAL-VALUE** = \*NONE / \*PROMPT(…) / <text 0..1800 with-low *expr*>
- | \*PROMPT(…)
- | | **PROMPT-STRING** = \*STD / <text 0..1800 with-low *string-expr*>
- | | ,**DEFAULT-VALUE** = \*NONE / <text 0..1800 with-low *expr*>
- | | ,**SECRET-INPUT** = \*NO / \*YES
- | ,**TYPE** = \*ANY / \*STRING / \*INTEGER / \*BOOLEAN
- | ,**TRANSFER-TYPE** = \*BY-VALUE / BY-REFERENCE

---

## Operands

### **NAME = list-poss(2000): <structured-name 1..20>(…)**

Defines the names of the procedure parameters used.

Procedure parameters are S variables that are known within the procedure.

The following attributes are declared for each procedure parameter:

#### **INITIAL-VALUE =**

This defines the initial value.

#### **INITIAL-VALUE = \*NONE**

The procedure parameter is not initialized, i.e. no initial value is declared. When the procedure is called a value must be assigned to the procedure parameter (see the CALL-PROCEDURE or ENTER-PROCEDURE command).

#### **INITIAL-VALUE = \*PROMPT(…)**

If no value is declared when the procedure is called, SDF-P queries the value when the procedure parameter occurs for the first time (prompting). Prompting is only possible within a dialog. If prompting is not possible or if no value has been entered to the dialog then the initial value declared in the DEFAULT-VALUE operand is used.

#### **PROMPT-STRING =**

Defines a string that is output as the prompt string. The text specified for DEFAULT-VALUE = . . . is added to the prompt string. The prompt always ends with a colon. The prompt therefore has the following form:

<prompt-string>'BLANK'(DEFAULT = <default-value>)'BLANK':

#### **PROMPT-STRING = \*STD**

By default, the parameter name specified in NAME= . . . (variable name) is output.

#### **PROMPT-STRING = <text 0..1800 with-low *string-expr*>**

Defines the string that is to be output as the prompt string.

#### **DEFAULT-VALUE =**

Defines an initial value for cases where no input (i.e. only [DUE]) is entered to the dialog or the procedure runs in the background. The value is output (for information) as part of the prompt.

#### **DEFAULT-VALUE = \*NONE**

No (default) string is declared.

#### **DEFAULT-VALUE = <text 0..1800 with-low *expr*>**

Expression that is used as the default for the initial value. The specified expression must match the parameter type.

#### **SECRET-INPUT = \*NO / \*YES**

You can specify whether the dialog input is to be protected or entered in a nondisplaying field. In this case, the input is not logged.

#### **INITIAL-VALUE = <text 0..1800 with-low *expr*>**

The procedure parameter has the initial value derived from the specified expression (for permitted expressions see the [section "SDF-P-BASYS"](#)). This initial value is assumed if no other value is declared when the procedure is called.

---

**TYPE = \*ANY / \*STRING / \*INTEGER / \*BOOLEAN**

This defines the variable type of the procedure parameter.

Specification of an operand value other than the default value \*ANY is possible only if the chargeable subsystem SDF-P has been loaded.

**TRANSFER-TYPE = \*BY-VALUE / \*BY-REFERENCE**

This defines the type of parameter transfer.

Specification of an operand value other than the default value \*BY-VALUE is possible only if the chargeable subsystem SDF-P has been loaded.

**Return codes**

The DECLARE-PARAMETER command can only be used within the procedure header of an S procedure. SDF-P detects errors in the procedure head during pre-analysis and terminates the procedure call. The command return codes can only occur if the command is used outside the procedure head.

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SDP0118	Command in incorrect context
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	130	SDP0099	No further address space available

---

## 2.86 DECLARE-VARIABLE

Declare as variable

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

### Function

DECLARE-VARIABLE is used to create variables and set the attributes and possibly an initial value as well.

Job variables can be integrated in SDF-P via the CONTAINER operand.

#### *Restrictions*

If the chargeable SDF-P subsystem is not available, the following restrictions apply:

- Only simple S variables can be declared (TYPE=\*ANY and MULTIPLE-ELEMENTS=\*NO).
- Declarations can only be accepted from a variable container (CONTAINER=<composed-name>). Otherwise, it is only possible to specify CONTAINER=\*STD.
- The scope can be defined with SCOPE=\*CURRENT(...) only. Within the \*CURRENT(...) structure, only the default value IMPORT-ALLOWED=\*NO is allowed.

## Format

**DECLARE-VARIABLE**

Alias: **DCV**

**VARIABLE-NAME** = list-poss(2000): <structured-name 1..20>(…)

<structured-name 1..20>(…)

|     **INITIAL-VALUE** = **\*NONE** / <text 0..1800 with-low *expr*>

|     **,TYPE** = **\*ANY** / **\*STRING** / **\*INTEGER** / **\*BOOLEAN** / **\*STRUCTURE**(…)

|             **\*STRUCTURE**(…)

|             |     **DEFINITION** = **\*DYNAMIC** / **\*BY-SYSCMD** / <structured-name 1..20>

**,MULTIPLE-ELEMENTS** = **\*NO** / **\*ARRAY**(…) / **\*LIST**(…)

**\*ARRAY**(…)

|     **LOWER-BOUND** = **0** / **\*NONE** / <integer -2147483648..2147483647>

|     **,UPPER-BOUND** = **\*NONE** / <integer -2147483648..2147483647>

**\*LIST**(…)

|     **LIMIT** = **\*NONE** / <integer 1..2147483647>

**,SCOPE** = **\*CURRENT**(…) / **\*PROCEDURE**(…) / **\*TASK**(…)

**\*CURRENT**(…)

|     **IMPORT-ALLOWED** = **\*NO** / **\*YES**

**\*PROCEDURE**(…)

|     **IMPORT-ALLOWED** = **\*NO** / **\*YES**

**\*TASK**(…)

|     **STATE** = **\*ANY** / **\*NEW** / **\*OLD**

**,CONTAINER** = **\*STD** / <composed-name 1..64> / **\*VARIABLE**(…) / **\*JV**(…)

**\*VARIABLE**(…)

|     **VARIABLE-NAME** = <structured-name 1..20>

|     **,SCOPE** = **\*VISIBLE** / **\*TASK**

**\*JV**(…)

|     **JV-NAME** = <filename 1..54>

|     **,STATE** = **\*ANY** / **\*NEW** / **\*OLD**

---

## Operands

### **VARIABLE-NAME = list-poss (2000): <structured-name 1..20>(…)**

Declares the variable name, i.e. the name of a simple variable which is not an element in a compound variable, or the name of a compound variable.

#### **INITIAL-VALUE = \*NONE**

The variable is not initialized.

For a new variable, this means that the variable does not contain an initial value. A read access would produce an error.

If the variable is already present, its contents remain unchanged; it is not assigned a new initial value.

#### **INITIAL-VALUE = <text 0..1800 with-low *expr*>**

Assigns an initial value to a new variable; the value must match the data type of the variable and can also be specified as an expression.

The entry is ignored for existing variables; they are not assigned a new initial value. Compound variables cannot be initialized in their entirety, i.e. INITIAL-VALUE cannot be used to assign a new initial value to these variables.

#### **TYPE = \*ANY / \*STRING / \*INTEGER / \*BOOLEAN / \*STRUCTURE(…)**

Assigns the data type to the variable.

#### **TYPE = \*ANY**

The variable can be assigned any value of data types STRING, INTEGER and BOOLEAN.

**i** The operand values \*STRING, \*INTEGER, \*BOOLEAN and \*STRUCTURE(…) can only be specified if the chargeable SDF-P subsystem is loaded. The operand values are completely described in the “SDF-P” manual [34].

### **MULTIPLE-ELEMENTS = \*NO / \*ARRAY(…) / \*LIST(…)**

Specifies whether there can be multiple elements of a variable in an array or a list.

#### **MULTIPLE-ELEMENTS = \*NO**

Indicates that the variable is not an array or list.

**i** The operand values \*ARRAY(…) and \*LIST(…) can only be specified if the chargeable SDF-P subsystem is loaded. The operand values are completely described in the “SDF-P” manual [34].

### **SCOPE = \*CURRENT(…) / \*PROCEDURE(…) / \*TASK(…)**

Defines the variable scope.

#### **SCOPE = \*CURRENT(…)**

The variable is a procedure-local variable.

This corresponds to the PROCEDURE argument in call procedures.

In include procedures, \*CURRENT means that the variable is declared in the current include procedure. It is then visible in this include procedure and in all include procedures on lower nesting levels (= scope: include). The lower-level IMPORT-ALLOWED operand is preset to \*NO (default value), which means that the declared variable cannot be imported using IMPORT-VARIABLE. If the chargeable SDF-P subsystem is not loaded, only this default value is allowed.

**i** The operand values \*PROCEDURE(...) and \*TASK(...) can only be specified if the chargeable SDF-P subsystem is loaded. The operand values are completely described in the “SDF-P” manual [34].

**CONTAINER = \*STD / <composed-name 1..64> / \*VARIABLE(...) / \*JV(...)**

Defines the assignment of the variable to a container.

**CONTAINER = \*STD**

The variable is not assigned a variable container. The value of the variable is stored in class 5 memory.

**CONTAINER = <composed-name 1..64>**

Assigns the variable container specified here to the variable declared with this command. Only a previously opened variable container may be specified. The specification of “STD” is not permissible here because “STD” is not interpreted as a permanent variable container.

**i** The operand values \*VARIABLE(...) and \*JV(...) can only be specified if the chargeable SDF-P subsystem is loaded. The operand values are completely described in the “SDF-P” manual [34].

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No errors
1	0	CMD0001	Warning: Element already declared
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	CMD0216	User does not have required privilege
	64	SDP0091	Semantic error Guaranteed messages: SDP1018, SDP1030
	130	SDP0099	No more address space available

---

## Examples

### *Example 1*

The procedure-local variable DATA of type \*ANY is initialized with the string 'ANTON' and subsequently, the value of the variable is output with the SHOW-VARIABLE command:

```
/declare-variable data(c'Anton',*any)  
/show-variable data
```

```
DATA = Anton
```

### *Example 2*

The variable container MY-CONT is opened. Then the S variable MY-VAR-1 is declared as a container variable. Once a value has been assigned, the variable container (and thus also the S variable) is saved. When the variable container has been closed, the S variable MY-VAR-1 can no longer be accessed:

```
/declare-variable my-var-1, container=my-cont  
/open-variable-container my-cont,from=*lib-elem(lib=my-lib)  
/my-var-1='saved value'  
/show-variable my-var-1
```

```
MY-VAR-1 = saved value  
*END-OF-CMD
```

```
/save-variable-container my-cont  
/...  
/close-variable-container my-cont  
/show-variable
```

```
% SDP1030 CONTAINER / VARIABLE-CONTAINER 'MY-CONT' DOES NOT EXIST  
% SDP0234 OPERAND 'NAME' INVALID
```

---

## 2.87 DECRYPT-FILE

Decrypt an encrypted file

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
TSOS  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT

### Function

The DECRYPT-FILE command converts an encrypted file into an unencrypted file. This is only possible if the crypto password specified for this file in the ENCRYPT-FILE command is entered in to the task-specific crypto password table (see the ADD-CRYPTO-PASSWORD command).

The conversion of an encrypted file is logged by SAT, whereby the output audit attribute is taken from the catalog entry of the converted file (see the CREATE-FILE command, AUDIT operand).

By converting into an encrypted file, the auxiliary file is created and automatically deleted after completion of the function execution. The auxiliary file requires as much storage place as the converting file.

The file name of the auxiliary file has the following structure: S.DMS.<tsn>.<date><time>.CRYPTO

#### *Notes on command execution*

File locking and protection attributes which reject write access to the catalog entry or the content of the file prevent its conversion via the DECRYPT-FILE command.

The file conversion with the DECRYPT-FILE command requests having owner rights for executing operations on the file. The conversion takes place only in the following cases:

- The file is under user ID of the calling task.
- The called task is under a user ID with TSOS privilege.
- The user ID of a called task is a co-owner of the file, and the file is not temporary.

DECRYPT-FILE is rejected if the converted file can be accessed only via RFA.

#### *Privileged functions*

If the called task has the TSOS privilege, the following additional functions are possible:

- Temporary files that belong not to this current task, but to another one can be specified too.
- Temporary files can be allocated on another pubset set as default one for this user ID (such files are not automatically deleted after completion the called task).

## Format

**DECRYPT-FILE**

**FILE-NAME** = <filename 1..54 without-gen>

## Operands

**FILE-NAME** = <filename 1..54 without-gen>

Name of the file to be converted.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
	1	CMD0202	Syntactical or semantic error in the command
1	0	CMD0001	No action required
2	0	DMS05B6	Time conversion UTC to LT errored
2	0	DMS05F5	Defective blocks were not copied
	130	DMS0524	System address space exhausted
	130	DMS0582	The file is currently locked or in use and cannot be processed
	130	DMS0585	An error was detected during catalog processing or during multiprocessor processing.
	130	DMS0588	Disk storage could not be assigned
	130	DMS0594	Insufficient virtual memory available
	32	DMS0584	During processing a status was reported which prevents the function from being continued.
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset Guaranteed message: DMS051B
	64	DMS051C	User does not have access right for pubset Guaranteed message: DMS051C

---

	64	DMS0535	Specified file not shareable
	64	DMS057C	Processing not possible because of HSMS error
	64	DMS057E	File migrated, HSMS not available
	64	DMS0585	An error was detected during catalog processing or during multiprocessor processing.
	64	DMS0588	Disk storage could not be assigned
	64	DMS05FC	Specified user ID not in the home pubset
	64	DMS0609	Access to system file not possible
	64	DMS0681	DMS error while executing job
	64	DMS0684	File does not exist
	64	DMS06B5	File open or catalog entry not updated after system error

---

## 3 DELETE-ALTERNATE-INDEX - LOGOFF

The manual "Commands" is divided into the following chapters:

- General Part
- ACTIVATE-SNAPSHOT - DECRYPT-FILE
- DELETE-ALTERNATE-INDEX - LOGOFF
- MAIL-FILE - MOVE-TASK-TO-CATEGORY
- OPEN-VARIABLE-CONTAINER - SHOW-DSSM-INFORMATION
- SHOW-FILE - SHOW-PUBSET-SPACE-DEFAULTS
- SHOW-RESOURCE-ALLOCATION - WRITE-TEXT

---

## 3.1 DELETE-ALTERNATE-INDEX

Delete secondary indices of NK-ISAM file

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING

### Function

Using the DELETE-ALTERNATE-INDEX command, the user can delete secondary indices in a file. If the command is terminated, the user will be unable to see the specified secondary indices (output produced by SHOW-INDEX-ATTRIBUTES), but there may still be blocks in the file which have not been released. These blocks will be released when a logical copy is made of the file (e.g. using the REPAIR-DISK-FILES command or the PERCON utility program).

### Format

<b>DELETE-ALTERNATE-INDEX</b>
<b>FILE-NAME</b> = <filename 1..54> <b>,KEY-NAME</b> = *ALL / list-poss(30): <name 1..8>

### Operands

**FILE-NAME = <filename 1..54>**

The name of the file from which the specified secondary indices are to be deleted.

**KEY-NAME = \*ALL / list-poss(30): <name 1..8>**

Identifies the secondary index/indices which are to be deleted.

Specifying \*ALL will delete all the secondary indices in the file.

One list may specify the names of up to 30 secondary indices which are to be deleted.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	32	DMS0A37	Internal system error
	32	DMS0A3A	Inconsistent control block found
	32	DMS0A42	Internal error on opening the file

## 3.2 DELETE-FILE

Delete file

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The DELETE-FILE command can be used to delete temporary or permanent files which are cataloged under the user's own user ID, and selected according to criteria which must be specified in the command. A tape file may also be specified, but since an implicit EXPORT-FILE is executed for it, only its catalog entry will be deleted.

There are separate commands for deleting file generations and file generation groups (see DELETE-FILE-GENERATION and DELETE-FILE-GROUP).

The DELETE-FILE command has 4 main functions:

1. *Selection*

With the SELECT operand, the user specifies which files or catalog entries are to be processed. The attributes stored in the catalog entries are used as selection criteria. These selection criteria correspond with those of the SHOW-FILE-ATTRIBUTES command.

2. *Action parameters*

The OPTION operand permits the user to control the internal execution of the DELETE-FILE processing. The scope of the deletions can be specified, i.e. the handling of the catalog entry, the data contained in the file, and the reserved storage space.

3. *Verifying command execution*

The DIALOG-CONTROL, OUTPUT and SUPPRESS-ERRORS operands allow the user to define his own user interface, within certain limits. For example, he may use interactive prompts, request the names of deleted files on SYSOUT, or have DMS errors ignored (for error handling in procedures).

4. *File protection*

The IGNORE-PROTECTION and PASSWORDS-TO-IGNORE operands save the user from having to enter the MODIFY-FILE-ATTRIBUTES or ADD-PASSWORD commands when files which are protected against write access by passwords, retention periods, or active access control need to be deleted.

### Privileged functions

The privileged functions for systems support staff (TSOS privilege) include specification of temporary or cataloged files of any user ID, the ability to ignore protection attributes of the file being deleted and, in the case of a user ID change, to branch to guided dialog. Systems support staff can use wildcards in the user ID. If no catalog ID is specified in such cases, the specified files are deleted from the associated default pubsets of the relevant users. By default, systems support (TSOS privilege) is a co-owner of all the files (and can, therefore, delete files under any user ID). When SECOS is used, this co-ownership can be restricted for permanent files. Systems support can generate files under any user ID (TSOS privilege). In conjunction with the SECOS software product a user can allow other user IDs to act as co-owners. Co-owners of a user ID are also allowed to delete files under that ID.

### Overview of functions

Function / Meaning	Level 1 operands	Level 2/3 operands
Name of file to be deleted	FILE-NAME =	
Selection criteria for the files to be deleted	SELECT = *BY-ATTRIBUTES(...)

## Operands

### **FILE-NAME = \*DUMMY / <filename 1..54 without-gen with-wild(80)>**

The name of the file to be deleted. Only the user's own user ID or a user ID for which the user is co-owner may be specified. If the wildcard "\*" is the first character in a wildcard string, it must be entered twice.

### **FILE-NAME = \*DUMMY**

Designates the dummy file \*DUMMY, which "always exists", and which satisfies all selection criteria. Any other operands, except for the control parameters DIALOG-CONTROL, OUTPUT and SUPPRESS-ERRORS will be checked for their formal correctness, but otherwise ignored. If \*DUMMY is specified, no catalog or data access is necessary. The main use of \*DUMMY is in testing procedures.

### **SELECT = \*ALL**

All the files in the set specified by FILE-NAME are selected.

### **SELECT = \*BY-ATTRIBUTES(...)**

Restricts the files in the set specified in FILE-NAME to files which satisfy the criteria which follow. The default values, \*ANY and ANY, each indicates that the file set is not to be restricted to any particular values for the attribute concerned.

### **CREATION-DATE = \*ANY / \*NONE / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..991231>(...) / <date>(...) / \*INTERVAL(...)**

The user can select the files to be deleted by their creation date. On a given date, the selection can be restricted to a time interval within which the file was created (see the relevant TIME operands in each structure).

On deleting file generation groups and file generations see the DELETE-FILE-GROUP and DELETE-FILE-GENERATION commands. See also the *CRE-DATE* and *CRE-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

### **CREATION-DATE = \*ANY**

The creation date is not to be used as a selection criterion.

### **CREATION-DATE = \*NONE**

Only those files which have the value NONE entered in the CREATION-DATE field in their catalog entry are deleted, i.e. files which have never been opened.

### **CREATION-DATE = \*TODAY(...)**

Only those files which have today's date entered in the CREATION-DATE field in their catalog entry are deleted.

### **TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files for deletion to a time interval related to the specified creation date.

### **TIME = \*INTERVAL(...)**

Deletes only those files which were created on the specified day within the specified time interval that follows.

### **FROM = 00:00:00 / <time>**

Selects files for which the time of creation >= the specified time.

### **TO = 23:59:59 / <time>**

Selects files for which the time of creation <= the specified time.

---

**CREATION-DATE = \*YESTERDAY(...)**

Only those files which have yesterday's date entered in the CREATION-DATE field in their catalog entry are deleted.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified LAST-CHANGE-DATE.

**TIME = \*INTERVAL(...)**

Deletes only those files which were created on the specified day within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of creation >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of creation <= the specified time.

**CREATION-DATE = <integer -99999..991231>(...)**

Only those files which have the specified date entered in the CREATION-DATE field in their catalog entry are deleted. Here, the user can specify the creation date in either of two ways:

1. as an *absolute date value*.  
(6 digits), a specific date in the form yymmdd  
(yy = year, mm = month, dd = day)
2. as a *relative date value*.  
(6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future;  
(YESTERDAY corresponds to -1, TODAY corresponds to ±0)

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified creation date.

**TIME = \*INTERVAL(...)**

Deletes only those files which were created on the specified day within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of creation >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of creation <= the specified time.

**CREATION-DATE = <date>(...)**

Only those files which have the specified date entered in the CREATION-DATE field in their catalog entry are deleted. The user can specify the creation date in the form [yy]yymm-dd.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified creation date.

**TIME = \*INTERVAL(...)**

Deletes only those files which were created on the specified day within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of creation >= the specified time.

---

**TO = 23:59:59 / <time>**

Selects files for which the time of creation <= the specified time.

**CREATION-DATE = \*INTERVAL(...)**

Only those files which were created within the specified time period are deleted. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified using <integer> values). It is also possible to specify limits using the operands FROM (lower limit) and TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for deletion can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = \*EARLIEST / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..991231>(…) / <date>(…)**

Only those files which have been created since the specified date (i.e. CREATION-DATE >= specified date) are deleted. If EARLIEST is specified, the system will use the earliest possible date.

**FROM = \*TODAY(...)**

Deletes only those files which were created after the specified date (i.e. files for which CREATION-DATE >= current date).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files created at or after the specified time are selected.

**FROM = \*YESTERDAY(...)**

Deletes only those files which were created after the specified date (i.e. files for which CREATION-DATE >= date of preceding day).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files created at or after the specified time are selected.

**FROM = <integer -99999..991231>(…)**

Deletes only those files which were created after the specified date (i.e. files for which CREATION-DATE >= specified date).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files created at or after the specified time are selected.

**FROM = <date>(…)**

Deletes only those files which were created after the specified date (i.e. files for which CREATION-DATE >= specified date).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files created at or after the specified time are selected.

**TO = \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..991231>(…) / <date>(…)**

Deletes only those files which were created before the specified date (i.e. files for which CREATION-DATE <= specified date).

**TO = \*TODAY(...)**

Deletes only those files which were created before the specified date (i.e. files for which CREATION-DATE <= current date).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files created at or before the specified time are selected.

---

**TO = \*YESTERDAY(...)**

Deletes only those files which were created before the specified date (i.e. files for which CREATION-DATE <= date of preceding day).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files created at or before the specified time are selected.

**TO = <integer -99999..991231>(…)**

Deletes only those files which were created before the specified date (i.e. files for which CREATION-DATE <= specified date).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files created at or before the specified time are selected.

**TO = <date>(…)**

Deletes only those files which were created before the specified date (i.e. files for which CREATION-DATE <= specified date).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files created at or before the specified time are selected.

**EXPIRATION-DATE = \*ANY / \*NONE / \*TOMORROW(...)/ \*TODAY(...)/ \*YESTERDAY(...)/ <integer -99999..991231>(…)/ <date>(…)/ \*INTERVAL(...)**

The user can select the files to be deleted by their release date (expiration date). The selection can be restricted for a specified date to a time interval in which the last file update occurred (see the TIME operand for each structure). Note that at present the time 00:00:00 is always entered in the file catalog as the time of the expiration date. On deleting file generation groups and file generations see the DELETE-FILE-GROUP and DELETE-FILE-GENERATION commands. See also the *EXPIR-DATE* and *EXPIR-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

**EXPIRATION-DATE = \*ANY**

The expiration date is not to be used as a selection criterion.

**EXPIRATION-DATE = \*NONE**

Only those files which have no expiration date (i.e. the value NONE) entered in the EXPIRATION-DATE field in their catalog entry are deleted.

**EXPIRATION-DATE = \*TOMORROW(...)**

Deletes only those files which have tomorrow's date entered as the EXPIRATION-DATE in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Deletes only those files whose expiration date lies within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration <= the specified time.

**EXPIRATION-DATE = \*TODAY(...)**

Only those files which have today's date entered as the EXPIRATION-DATE in their catalog entry are deleted.

---

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Deletes only those files whose expiration date lies within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration <= the specified time.

**EXPIRATION-DATE = \*YESTERDAY(...)**

Only those files which have yesterday's date entered as the EXPIRATION-DATE in their catalog entry are deleted.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Deletes only those files whose expiration date lies within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration <= the specified time.

**EXPIRATION-DATE = <integer -99999..991231>(...)**

Only those files which have the specified date entered as the EXPIRATION-DATE in their catalog entry are deleted. Here, the user can specify the expiration date in either of two ways:

1. as an *absolute date value*.  
(6 digits), a specific date in the form yymmdd  
(yy = year, mm = month, dd = day)
2. as a *relative date value*.  
(6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future;  
(YESTERDAY corresponds to -1, TODAY corresponds to ±0, TOMORROW corresponds to +1)

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Deletes only those files whose expiration date lies within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration <= the specified time.

---

**EXPIRATION-DATE = <date>(…)**

Only those files which have the specified date entered as the EXPIRATION-DATE in their catalog entry are deleted. The user can specify the expiration date in the form [yy]yy-mm-dd.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(…)**

Deletes only those files whose expiration date lies within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects files for which the time of expiration  $\geq$  the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the time of expiration  $\leq$  the specified time.

**EXPIRATION-DATE = \*INTERVAL(…)**

Only those files for which the expiration date lies within the specified time period, i.e. files for which the retention period ends within the specified time period, will be deleted. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for EXPIRATION-DATE = <integer…>. It is also possible to specify limits using the operands FROM (lower limit) and TO (upper limit)). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for deletion can only be meaningful if the chosen lower limit  $\leq$  the upper limit.

**FROM = EARLIEST / TOMORROW(…) / TODAY(…) / YESTERDAY(…) / <integer -99999..991231>(…) / <date>(…)**

If EARLIEST is specified, the system will use the earliest possible date. Only those files for which the retention period expires on or after the specified date (EXPIRATION-DATE  $\geq$  specified date) are deleted.

**FROM = \*TOMORROW(…)**

Deletes only those files for which the EXPIRATION-DATE  $\geq$  the date of next day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = \*TODAY(…)**

Deletes only those files for which the EXPIRATION-DATE  $\geq$  current date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = \*YESTERDAY(…)**

Deletes only those files for which the EXPIRATION-DATE  $\geq$  date of preceding day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = <integer -99999..991231>(…)**

Deletes only those files for which the EXPIRATION-DATE  $\geq$  the specified date.

---

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = <date>(…)**

Deletes only those files for which the EXPIRATION-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*LATEST / \*TOMORROW(…) / \*TODAY(…) / \*YESTERDAY(…) / <integer -99999..991231>(…) / <date>(…)**

Only files for which the retention period expires on or before the specified date (EXPIRATION-DATE <= specified date) will be deleted.

**TO = \*TOMORROW(…)**

Deletes only those files for which the EXPIRATION-DATE <= date of next day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*TODAY(…)**

Deletes only those files for which the EXPIRATION-DATE <= current date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*YESTERDAY(…)**

Deletes only those files for which the EXPIRATION-DATE <= date of preceding day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = <integer -99999..991231>(…)**

Deletes only those files for which the EXPIRATION-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = <date>(…)**

Deletes only those files for which the EXPIRATION-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

---

**LAST-ACCESS-DATE = \*ANY / \*NONE / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..991231>(…) / <date>(…) / \*INTERVAL(...)**

The user can select the files to be deleted by the date when they were last accessed. On a given date, the selection can be restricted to a time interval within which the file was last accessed (see the relevant TIME operands in each structure). On deleting file generation groups and file generations see the DELETE-FILE-GROUP and DELETE-FILE-GENERATION commands. See also the *ACC-DATE* and *ACC-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

**LAST-ACCESS-DATE = \*ANY**

The date of last access is not to be used as a selection criterion.

**LAST-ACCESS-DATE = \*NONE**

Deletes only those files which have the value NONE entered in the *ACC-DATE* field in their catalog entry, i.e. files which have never been opened.

**LAST-ACCESS-DATE = \*TODAY(...)**

Deletes only those files for which today's date has been entered as the LAST-ACCESS-DATE in the catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection to a time period relative to today's date.

**TIME = \*INTERVAL(...)**

Returns information on files that were last accessed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files that were last accessed after the specified time.

**TO = 23:59:59 / <time>**

Selects files that were last accessed before the specified time.

**LAST-ACCESS-DATE = \*YESTERDAY(...)**

Deletes only those files for which yesterday's date has been entered as the LAST-ACCESS-DATE in the catalog entry.

**TIME = INTERVAL(...)**

Returns information on files that were last accessed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files that were last accessed after the specified time.

**TO = 23:59:59 / <time>**

Selects files that were last accessed before the specified time.

**LAST-ACCESS-DATE = <integer -99999..991231>(…)**

Deletes only those files for which the specified date has been entered as the LAST-ACCESS-DATE in the catalog entry. Here, the user can specify the date of last access in either of two ways:

1. as an *absolute date value*.  
(6 digits), a specific date in the form yymmdd  
(yy = year, mm = month, dd = day)

---

2. as a *relative date value*.

(6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future;  
(YESTERDAY corresponds to -1, TODAY corresponds to ±0)

**TIME = \*INTERVAL(...)**

Returns information on files that were last accessed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files that were last accessed after the specified time.

**TO = 23:59:59 / <time>**

Selects files that were last accessed before the specified time.

**LAST-ACCESS-DATE = <date>(…)**

Deletes only those files for which the specified date has been entered as the LAST-ACCESS-DATE in the catalog entry. The user can specify the creation date in the form [yy]yy-mm-dd.

**TIME = \*INTERVAL(...)**

Returns information on files that were last accessed within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Selects files that were last accessed after the specified time.

**TO = 23:59:59 / <time>**

Selects files that were last accessed before the specified time.

**LAST-ACCESS-DATE = \*INTERVAL(...)**

Only files which were last accessed within the specified time period will be deleted. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified using <integer> values). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for deletion can only be meaningful if the chosen lower limit ≤ the upper limit.

**FROM = \*EARLIEST / \*TODAY(...)/ \*YESTERDAY(...)/ <integer -99999..991231>(…)/ <date>(…)**

Only files which have been accessed since the specified date (i.e. for which LAST-ACCESS-DATE ≥ specified date) will be deleted. If EARLIEST is specified, the system will use the earliest possible date.

**FROM = \*TODAY(...)**

Returns information on files for which the LAST-ACCESS-DATE ≥ date of the current day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files which were last accessed after the specified time are selected.

**FROM = \*YESTERDAY(...)**

Returns information on files for which the LAST-ACCESS-DATE ≥ date of the preceding day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files which were last accessed after the specified time are selected.

**FROM = <integer -99999..991231>(…)**

Returns information on files for which the LAST-ACCESS-DATE ≥ the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files which were last accessed after the specified time are selected.

---

**FROM = <date>(…)**

Returns information on files for which the LAST-ACCESS-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files which were last accessed after the specified time are selected.

**TO = \*TODAY(…) / \*YESTERDAY(…) / <integer -99999..991231>(…) / <date>(…)**

Only those files which were last accessed on or before the specified date (i.e. files for which LAST-ACCESS-DATE <= the specified date) are deleted.

**TO = \*TODAY(…)**

Returns information on files for which the LAST-ACCESS-DATE <= date of the current day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files which were last accessed before the specified time are selected.

**TO = \*YESTERDAY(…)**

Returns information on files for which the LAST-ACCESS-DATE <= date of the preceding day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files which were last accessed before the specified time are selected.

**TO = <integer -99999..991231>(…)**

Returns information on files for which the LAST-ACCESS-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files which were last accessed before the specified time are selected.

**TO = <date>(…)**

Returns information on files for which the LAST-ACCESS-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files which were last accessed before the specified time are selected.

**LAST-CHANGE-DATE = \*ANY / \*NONE / \*TODAY(…) / \*YESTERDAY(…) / <integer -99999..0>(…) / <date>(…) / \*INTERVAL(…)**

The user can select the files to be deleted based on the date on which they were last accessed for writing (i.e. the date they were last changed). On a given date, the selection can be restricted to a time interval within which the file was last changed (see the relevant TIME operands in each structure). On deleting file generation groups and file generations see the DELETE-FILE-GROUP and DELETE-FILE-GENERATION commands. See also the *CHANG-DATE* and *CHANG-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

**LAST-CHANGE-DATE = \*ANY**

The date of the last write access is not to be used as a selection criterion.

**LAST-CHANGE-DATE = \*NONE**

Deletes only those files for which no LAST-CHANGE-DATE has been entered in the catalog entry, i.e. files which have never been opened.

**LAST-CHANGE-DATE = \*TODAY(…)**

Deletes only those files for which today's date has been entered as the LAST-CHANGE-DATE in the catalog entry.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection to a time period relative to today's date.

---

**TIME = \*INTERVAL(...)**

Deletes only those files which were last changed within the specified time interval.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-CHANGE-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-CHANGE-DATE <= the specified time.

**LAST-CHANGE-DATE = \*YESTERDAY(...)**

Deletes only those files for which yesterday's date has been entered as the LAST-CHANGE-DATE in the catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified LAST-CHANGE-DATE.

**TIME = \*INTERVAL(...)**

Deletes only those files which were last changed within the specified time interval.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-CHANGE-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-CHANGE-DATE <= the specified time.

**LAST-CHANGE-DATE = <integer -99999..0>(...)**

Deletes only those files for which the specified date has been entered as the LAST-CHANGE-DATE in the catalog entry. Here, the user can specify the date of the last write access relative to the current date (in the form -n).

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified LAST-CHANGE-DATE.

**TIME = \*INTERVAL(...)**

Deletes only those files which were last changed within the specified time interval.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-CHANGE-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-CHANGE-DATE <= the specified time.

**LAST-CHANGE-DATE = <date>(...)**

Deletes only those files for which the specified date has been entered as the LAST-CHANGE-DATE in the catalog entry. The user can specify the date in the form [yy]jymm-dd.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified LAST-CHANGE-DATE.

**TIME = \*INTERVAL(...)**

Deletes only those files which were last changed within the specified time interval.

**FROM = 00:00:00 / <time>**

Selects files for which the LAST-CHANGE-DATE >= the specified time.

**TO = 23:59:59 / <time>**

Selects files for which the LAST-CHANGE-DATE <= the specified time.

---

**LAST-CHANGE-DATE = \*INTERVAL(...)**

Only files which were last changed within the specified time period will be deleted. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for the operand LAST-CHANGE-DATE= <integer...>). It is also possible to specify only the FROM operand (lower limit) or the TO operand (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = \*EARLIEST / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..0>(…) / <date>(…)**

Only those files which have been changed since the specified date (i.e. LAST-CHANGE-DATE >= specified date) are deleted.

**FROM = \*TODAY(...)**

Deletes only those files for which the LAST-CHANGE-DATE >= current date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE after the specified time are selected.

**FROM = \*YESTERDAY(...)**

Deletes only those files for which the LAST-CHANGE-DATE >= date of preceding day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE after the specified time are selected.

**FROM = <integer -99999..0>(…)**

Deletes only those files for which the LAST-CHANGE-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE after the specified time are selected.

**FROM = <date>(…)**

Deletes only those files for which the LAST-CHANGE-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE after the specified time are selected.

**TO = \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..0>(…) / <date>(…)**

Only those files which were changed on or before the specified date (i.e. LAST-CHANGE-DATE <= specified date) are deleted.

**TO = \*TODAY(...)**

Deletes only those files for which the LAST-CHANGE-DATE <= current date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE before the specified time are selected.

**TO = \*YESTERDAY(...)**

Deletes only those files for which the LAST-CHANGE-DATE <= date of preceding day.

---

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE before the specified time are selected.

**TO = <integer -99999..0>(…)**

Returns information on files for which the LAST-CHANGE-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE before the specified time are selected.

**TO = <date>(…)**

Deletes only those files for which the LAST-CHANGE-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a LAST-CHANGE-DATE before the specified time are selected.

**SUPPORT = \*ANY / list-poss(3): \*PUBLIC-DISK / \*PRIVATE-DISK / \*TAPE**

The user can select which files are to be deleted by the DELETE-FILE command by the type of their volumes. On deleting file generation groups and file generations see the DELETE-FILE-GROUP and DELETE-FILE-GENERATION commands.

**SUPPORT = \*ANY**

The volume type is not to be used as a selection criterion.

**SUPPORT = \*PUBLIC-DISK**

Only files on disks of the pubset or on Net-Storage volumes are deleted.

**SUPPORT = \*PRIVATE-DISK**

Only files on private disks are to be deleted.

**SUPPORT = \*TAPE**

Only files on tape or tape cartridge are to be deleted.

**STORAGE-TYPE = \*ANY / \*PUBLIC-SPACE / \*NET-STORAGE**

The selection criterion is the assigned storage type.

**STORAGE-TYPE = \*ANY**

The storage type is not a selection criterion.

**STORAGE-TYPE = \*PUBLIC-SPACE**

Only files residing on disks of the pubset are deleted.

**STORAGE-TYPE = \*NET-STORAGE(…)**

Only files residing on Net-Storage volumes are deleted.

**FILE-TYPE = \*ANY / \*BS2000 / \*NODE-FILE**

The selection criterion is the file type.

**FILE-TYPE = \*ANY**

The file type is not a selection criterion.

**FILE-TYPE = \*BS2000**

Only BS2000 files on Net-Storage volumes are deleted.

---

**FILE-TYPE = \*NODE-FILE**

Only node files on Net-Storage volumes are deleted.

**VOLUME = \*ANY / <vsn 1..6>**

*For files on private volumes:* by specifying a volume serial number (VSN) the user can limit the deletion of files by the DELETE-FILE command to those files only which are stored on this volume.

**VOLUME = \*ANY**

The volume is not to be used as a selection criterion.

**VOLUME = <vsn 1..6>**

All files which are stored on the specified volume, or which have dummy entries on the volume, are to be deleted. In this case, no file name must be specified under the FILE-NAME operand.

**SIZE = \*ANY / \*FREESIZE / <integer 0..2147483647> / \*INTERVAL(...)**

*Only for files on disks and Net-Storage volumes:* the user can select which files are to be deleted by the DELETE-FILE command according to their size, or the size of their reserved storage area (= number of PAM pages). On deleting file generation groups and file generations see the DELETE-FILE-GROUP and DELETE-FILE-GENERATION commands.

The value of the SIZE operand specifies the number of PAM pages: the upper and lower limits are both included in the range specified.

**SIZE = \*ANY**

The file size is not to be used as a selection criterion.

**SIZE = \*FREESIZE**

Only files for which storage space has been reserved but which do not yet occupy any of it (*HIGH-US-PA=0*) are to be deleted.

**SIZE = <integer 0..2147483647>**

Only files for which the number of PAM pages reserved is exactly equal to the number specified here are to be deleted.

**SIZE = \*INTERVAL(...)**

Only files for which the number of pages lies within the specified range are to be deleted. The upper and lower limits are both included in the range specified (see description of SIZE=<integer...>). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for deletion can only be meaningful if the chosen lower limit <= the upper limit. Only files for which the number of PAM pages reserved is at least equal to the FROM value and at most equal to the TO value will be processed (FROM <= SIZE <= TO).

**FROM = 0 / <integer 0..2147483647>**

Only files for which the number of PAM pages reserved is at least equal to the specified number are to be deleted (SIZE >= specified value).

**TO = 2147483647 / <integer 0..2147483647>**

Only files for which the number of PAM pages reserved is at most equal to the specified number are to be deleted (SIZE <= specified value).

**NUMBER-OF-EXTENTS = \*ANY / <integer 0..65535> / \*INTERVAL(...)**

*Only for files on disks and Net-Storage volumes:* the user can select the files to be processed by DELETE-

---

FILE by the number of extents into which a file is “split”. An extent is a contiguous area on a disk, occupied by one file; the output field *EXTENTS* shows how many extents the file has. On deleting file generation groups and file generations see the DELETE-FILE-GROUP and DELETE-FILE-GENERATION commands.

**NUMBER-OF-EXTENTS = \*ANY**

The number of extents is not to be used as a selection criterion.

**NUMBER-OF-EXTENTS = <integer 0..65535>**

Only disk files with exactly the specified number of extents (*EXTENDS* = integer) are to be deleted.

**NUMBER-OF-EXTENTS = \*INTERVAL(...)**

Selects all the files whose number of extents lies within the specified range. The upper and lower limits are both included in the range specified. It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for deletion can only be meaningful if the chosen lower limit <= the upper limit. Only disk files which have at least as many EXTENTS as specified by the FROM value and at most as many as given by the TO value will be processed (FROM <= *EXTENTS* <= TO).

**FROM = 0 / <integer 0..65535>**

Only files for which the number of extents is at least equal to the specified number are to be deleted (*EXTENTS* >= integer).

**TO = 65535 / <integer 0..65535>**

Only files for which the number of extents is at most equal to the specified number are to be exported (*EXTENTS* <= integer).

**NUMBER-OF-FREE-PAGES = \*ANY / \*SIZE / <integer 0..2147483647> / INTERVAL(...)**

*Only for files on disks and Net-Storage volumes:* the user can select the files to be processed according to their number of free PAM pages, i.e. the number of pages reserved for the file but unused.

**NUMBER-OF-FREE-PAGES = \*ANY**

The number of free PAM pages is not to be used as a selection criterion.

**NUMBER-OF-FREE-PAGES = \*SIZE**

Only files which actually occupy no storage space are to be deleted (i.e. no PAM page has been written yet).

**NUMBER-OF-FREE-PAGES = <integer 0..2147483647>**

Only files which have exactly the number of reserved but unused (=free) PAM pages specified by <integer...> are to be deleted.

**NUMBER-OF-FREE-PAGES = \*INTERVAL(...)**

Selects all files for which the number of unused PAM pages lies within the specified range. The upper and lower limits are both included in the range specified (see description of NUMBER-OF-FREE-PAGES = <integer...>). It is also possible to specify limits using the operands FROM (lower limit) and TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for deletion can only be meaningful if the chosen lower limit <= the upper limit. Only disk files which have at least as many free PAM pages as specified by the FROM value and at most as many as given by the TO value will be deleted (FROM <= FREE <= TO).

**FROM = 0 / <integer 0..2147483647>**

Only files for which the number free PAM pages is at least equal to the specified number are to be deleted (FREE >= integer).

---

**TO = 2147483647 / <integer 0..2147483647>**

Only files for which the number free PAM pages is at most equal to the specified number are to be deleted (FREE <= integer).

**HIGHEST-USED-PAGE = \*ANY / <integer 0..2147483647> / \*INTERVAL(...)**

The number of PAM pages used serves as a selection criterion here, i.e. the last page pointer points to the specified page (see also the *HIGH-US-PA* output field of the SHOW-FILE-ATTRIBUTES command).

**HIGHEST-USED-PAGE = \*ANY**

The number of PAM pages used is not used as a selection criterion.

**HIGHEST-USED-PAGE = <integer 0..2147483647>**

Only the files for which the specified number of PAM pages are used (i.e. files for which the last page pointer points to the specified page) are deleted.

**HIGHEST-USED-PAGE = \*INTERVAL(...)**

Deletes only those files which use a number of pages that falls within the specified range.

**FROM = 0 / <integer 0..2147483647>**

Only the files in which the number of used pages >= the specified number are deleted.

**TO = 2147483647 / <integer 0..2147483647>**

Only the files in which the number of used pages <= the specified number are deleted.

**BLOCK-COUNTER = \*ANY / <integer 0..2147483647> / \*INTERVAL(...)**

The number of blocks occupied by a tape file serves as the selection criterion (see also the *BLK-COUNT* output field of the SHOW-FILE-ATTRIBUTES command).

**BLOCK-COUNTER = \*ANY**

The number of occupied tape blocks is not to be used as a selection criterion.

**BLOCK-COUNTER = <integer 0..2147483647>**

Deletes only those tape files which occupy exactly the specified number of tape blocks.

**BLOCK-COUNTER = \*INTERVAL(...)**

Deletes only those tape files for which the occupied number of tape blocks falls within the specified range.

**FROM = 0 / <integer 0..2147483647>**

Only the tape files for which the number of occupied tape blocks >= the specified number are deleted.

**TO = 2147483647 / <integer 0..2147483647>**

Only the tape files for which the number of occupied tape blocks <= the specified number are deleted.

**ACCESS = \*ANY / \*READ / \*WRITE**

The specified access type will be used as a selection criterion (ACCESS value in the catalog entry.)

**ACCESS = \*ANY**

The ACCESS value is not to be used as a selection criterion.

**ACCESS = \*READ**

Only files for which write access is prevented by ACCESS=READ, i.e. for which only read access is permitted, will be deleted.

**ACCESS = \*WRITE**

Only files for which write and read access are permitted will be deleted.

---

**PASSWORD = \*ANY / list-poss(4): \*NONE / \*READ-PASSWORD / \*WRITE-PASSWORD / \*EXEC-PASSWORD**

The user can select files with specific password types for processing by the DELETE-FILE command.

**PASSWORD = \*ANY**

Password protection is not to be used as a selection criterion.

**PASSWORD = \*NONE**

Only files for which there is no password protection are to be deleted.

**PASSWORD = \*READ-PASSWORD**

Only files which are protected by a read password are to be deleted.

**PASSWORD = \*WRITE-PASSWORD**

Only files which are protected by a write password are to be deleted.

**PASSWORD = \*EXEC-PASSWORD**

Only files which are protected by an execute password are to be deleted.

**USER-ACCESS = \*ANY / list-poss(3): \*OWNER-ONLY / \*ALL-USERS / \*SPECIAL**

The user can select files using their access authorizations as a criterion.

**USER-ACCESS = \*ANY**

The access authorization is not to be used as a selection criterion.

**USER-ACCESS = \*OWNER-ONLY**

Only files which the owner alone may access are to be deleted.

**USER-ACCESS = \*ALL-USERS**

Only files which permit access to all users are to be deleted.

**USER-ACCESS = \*SPECIAL**

Only files which can be accessed by all user IDs including the maintenance IDs (i.e. user IDs with HARDWARE-MAINTENANCE privileges) are to be deleted.

**FILE-STRUCTURE = \*ANY / list-poss(5): \*PAM / \*SAM / \*ISAM / \*BTAM / \*NONE**

The user can select files for processing according to their access method (*FILE-STRUC* output field).

**FILE-STRUCTURE = \*ANY**

The access method is not to be used as a selection criterion.

**FILE-STRUCTURE = \*PAM**

Only PAM files should be processed.

**FILE-STRUCTURE = \*SAM**

Only SAM files are to be processed.

**FILE-STRUCTURE = \*ISAM**

Only ISAM files are to be processed.

**FILE-STRUCTURE = \*BTAM**

Only BTAM files are to be processed. BTAM files are tape files.

**FILE-STRUCTURE = \*NONE**

Only files for which FILE-STRUCTURE=NONE, i.e. files which have not yet been opened, are to be deleted.

---

**BACKUP-CLASS = \*ANY / list-poss(5): \*A / \*B / \*C / \*D / \*E**

The user can select files for deletion by their BACKUP-CLASS level.

**BACKUP-CLASS = \*ANY**

The BACKUP-CLASS level is not to be used as a selection criterion.

**BACKUP-CLASS = \*A**

Only the files for which the value A is entered in the catalog as the BACKUP-CLASS (most frequent backup) are deleted.

**BACKUP-CLASS = \*B**

Only the files for which the value B is entered in the catalog as the BACKUP-CLASS are deleted.

**BACKUP-CLASS = \*C**

Only the files for which the value C is entered in the catalog as the BACKUP-CLASS are deleted.

**BACKUP-CLASS = \*D**

Only the files for which the value D is entered in the catalog as the BACKUP-CLASS are deleted.

**BACKUP-CLASS = \*E**

Only the files for which the value E is entered in the catalog as the BACKUP-CLASS are deleted.

**BLOCK-CONTROL-INFO = \*ANY / list-poss(9): \*NONE / \*NO / \*WITHIN-DATA-BLOCK / \*WITHIN-DATA-2K-BLOCK / \*WITHIN-DATA-4K-BLOCK / \*PAMKEY / \*NK / \*NK2 / \*NK4**

The user can select files for deletion by their block format (*BLK-CONTR* output field).

**BLOCK-CONTROL-INFO = \*ANY**

The BLOCK-CONTROL entry is not to be used as a selection criterion.

**BLOCK-CONTROL-INFO = \*NONE**

Only files for which no BLK-CNTRL value has been defined, i.e. files which have not yet been opened, are to be deleted.

**BLOCK-CONTROL-INFO = \*NO**

Only files which contain no block control field are to be deleted.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-BLOCK**

Only files which were created with BLOCK-CONTROL-INFO=WITHIN-DATA-BLOCK (i.e. files for which block control information is held in a block control field at the start and within the data block) are to be deleted.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-2K-BLOCK**

Only files which were created with BLOCK-CONTROL-INFO=WITHIN-DATA-2K-BLOCK (i.e. files for which block control information is located at the start of each 2K block) are to be deleted.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-4K-BLOCK**

Only files which were created with BLOCK-CONTROL-INFO=WITHIN-DATA-4K-BLOCK (i.e. files for which block control information is located at the start of each 4K block) are to be deleted.

**BLOCK-CONTROL-INFO = \*PAMKEY**

Only files which use a separate PAM key for the block control field (i.e. the block control information is held in a separate key field, outside the PAM block) are to be deleted.

**BLOCK-CONTROL-INFO = \*NK**

Only the NK files are to be deleted, i.e. files which can also be stored on NK volumes (NK2 and NK4).

---

**BLOCK-CONTROL-INFO = \*NK2**

Only files which can also be stored on NK2 volumes (but not NK4 volumes) are to be deleted.

**BLOCK-CONTROL-INFO = \*NK4**

Only files which can also be stored on NK4 volumes are to be deleted.

**MIGRATE = \*ANY / list-poss(3): \*ALLOWED / \*INHIBITED / \*FORBIDDEN**

The user can specify which files are to be processed by the DELETE-FILE command by the migration entry in the catalog (see the CREATE-FILE command, MIGRATE operand).

**MIGRATE = \*ANY**

The specified files are to be deleted, irrespective of the value in the MIGRATE operand in each of their catalog entries.

**MIGRATE = \*ALLOWED**

Only files for which the catalog entry specifies the appropriate operand value, i.e. files which may be migrated to storage levels S1 and S2, are to be deleted.

**MIGRATE = \*INHIBITED**

Only files for which the catalog entry specifies the appropriate operand value are to be processed, i.e. files for which a simple migration lock is declared.

**MIGRATE = \*FORBIDDEN**

Only files for which the catalog entry specifies the appropriate operand value are to be processed, i.e. files for which an intensified migration lock is declared. The files may not even be migrated for a brief period (e.g. for reorganization purposes).

**STORAGE-LEVEL = \*ANY / list-poss(3): \*S0 / \*S1 / \*S2**

Only files at a specific HSMS storage level are to be deleted. Where HSMS (**H**ierarchical **S**torage **M**anagement **S**ystem) is used, there are three possible storage levels for files on shared storage media:

- The processing level, S0. This comprises all subsets to which the user has access according to his user entry.
- The background level, S1. This comprises disks on which HSMS has stored files which have been migrated from the S0 level. When DMS requires access to them, they are fetched back to processing level S0 by HSMS.
- The archival level, S2. This is a tape archive in which HSMS stores files which have been migrated from S0 on a longer term basis. When DMS requires access to them, they are fetched back to the processing level S0, depending on the HSMS operating parameters which have been set, and the availability of tape units.

The user can select files for deletion according to the level in the storage hierarchy (STORAGE-LEVEL) at which they are held. Where HSMS (Hierarchical Storage Management System) is used, the following three storage levels are possible for files on shared storage media:

- S0: implemented as fast access disk storage (for online processing); all the subsets to which his user entry gives him access.
- S1: implemented as high capacity disk storage (background level, available online). These are disks on which HSMS stores files which have been migrated from the S0 level. When DMS requires access to them, they are fetched back to processing level S0 by HSMS.
- S2: implemented as a magnetic tape and tape cartridge archive (background level, available offline). Archive level S2 is a tape archive in which HSMS stores files which are to be migrated from S0 on a

longer-term basis. When DMS requires access to them, they are fetched back to the processing level S0, depending on the HSMS operating parameters which have been set, and the availability of tape units.

**STORAGE-LEVEL = \*ANY**

The specified files are to be deleted, irrespective of the storage level at which they are being held.

**STORAGE-LEVEL = \*S0**

Only files which are being held at level S0 are to be deleted.

**STORAGE-LEVEL = \*S1**

Only files which are being held at level S1 are to be deleted.

**STORAGE-LEVEL = \*S2**

Only files which are being held at level S2 are to be deleted.

**BASIC-ACL = \*ANY / \*NONE / \*YES / \*PARAMETERS(...)**

The BASIC-ACL entry in the file catalog is used as a selection criterion.

**BASIC-ACL = \*ANY**

The BASIC-ACL entry is not to be used as a selection criterion.

**BASIC-ACL = \*NONE**

Only the files that have no BASIC-ACL entry in the catalog are to be deleted.

**BASIC-ACL = \*YES**

Only the files which have a BASIC-ACL entry in the catalog are to be deleted.

**BASIC-ACL = \*PARAMETERS(...)**

Only the files which have the specified BASIC-ACL entry in the catalog are to be deleted. NO-ACCESS means that no access rights were granted.

**i** Access rights specified with the OWNER, GROUP and OTHERS operands within the \*PARAMETERS(...) structure are logically ORed.

**OWNER = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights must already be defined for the owner.

**OWNER = \*PARAMETERS(...)**

Access rights that must be present for the owner (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**GROUP = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for the owner's user group.

**GROUP = \*PARAMETERS(...)**

Access rights that must be present for the owner's user group (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**OTHERS = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for all other users.

**OTHERS = \*PARAMETERS(...)**

Access rights that must be present for all other users (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**GUARDS = \*ANY / \*NO / \*YES / \*PARAMETERS(...)**

The use of GUARDS for access control (see the CREATE-FILE or MODIFY-FILE-ATTRIBUTES command) is used as a selection criterion.

**GUARDS = \*ANY**

Access control with GUARDS is not to be used as a selection criterion.

**GUARDS = \*NO**

Only the files which are not protected by GUARDS against unauthorized access are to be deleted (see also the PROTECTION-LEVEL operand).

**GUARDS = \*YES**

Only the files which are protected by GUARDS against unauthorized access (i.e. files for which access is controlled via the GUARDS function unit) are to be deleted.

**GUARDS = \*PARAMETERS(...)**

Deletes only those files which are protected by GUARDS against unauthorized access as specified, i.e. files for which access control is implemented using GUARDS: Access to the file is controlled by a guard, i.e. a special object which contains all the conditions under which a user is granted access authorization (e.g. date, time, user ID). The GUARDS function unit of the chargeable software product SECOS (see the "SECOS" manual [35]) must be installed in order to create and maintain a guard. Each access mode can be controlled by a separate guard. If no guard (\*NONE) is defined for a given access mode, no corresponding access is permitted. If a defined guard is not accessible, the mode of access protected by it is not permitted. If the GUARDS subsystem is not available at the time of accessing the job variable, no access of any kind is allowed for the job variable.

**i** The values specified for the following READ, WRITE and EXEC operands are logically ORed.

**READ = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Only the files which are protected against unauthorized read access by the specified guard are deleted.

The default value `*ANY` means that the selection of files is not based on read protection with a guard. `*NONE` selects files for which no read access is permitted.

**WRITE = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Only the files which are protected against unauthorized write access by the specified guard are deleted. The default value `*ANY` means that the selection of files is not based on a guard. `*NONE` selects files for which no write access is permitted. These files can be deleted with `IGNORE-PROTECTION=*ACCESS`.

**EXEC = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Only the files which are protected against unauthorized execution by the specified guard are deleted. The default value `*ANY` means that the selection of files is not based on execute access protection by a guard. `*NONE` selects files for which no execution is permitted.

**PROTECTION-ACTIVE = \*ANY / list-poss(3): \*LEVEL-0 / \*LEVEL-1 / \*LEVEL-2**

The highest activated access control method (protection level) is used as a selection criterion. Only the files which have access protection at specified protection level are deleted. When the file is accessed, the highest activated protection level applies. The following table shows the method used for access control, the protection attributes, and the job variable protection hierarchy (protection levels):

Access control	Protection attribute	Prot. level
Standard access control	ACCESS and USER-ACCESS	0
Basic access control list	BASIC-ACL	1
Access control via guards	PASSWORD	2

Table 42: Hierarchy of access control methods

All other protection attributes of the file (e.g. passwords) are evaluated independently, without regard to the implemented protection level.

**PROTECTION-ACTIVE = \*ANY**

The access control method is not to be used as a selection criterion.

**PROTECTION-ACTIVE = \*LEVEL-0**

Only the files for which access is controlled via standard access control are to be deleted.

**PROTECTION-ACTIVE = \*LEVEL-1**

Only the files for which access is controlled via a basic access control list (BASIC-ACL protection) are to be deleted.

**PROTECTION-ACTIVE = \*LEVEL-2**

Only the files for which access takes place via GUARDS are deleted.

**ACCESS-COUNTER = \*ANY / <integer 0..2147483647> / \*INTERVAL(...)**

The access counter for the file is used as a selection criterion (see the `ACC-COUNT` output field of the `SHOW-FILE-ATTRIBUTES` command).

**ACCESS-COUNTER = \*ANY**

The access counter is not to be used as a selection criterion.

**ACCESS-COUNTER = <integer 0..2147483647>**

Only the files for which the access counter exactly matches the specified value are selected for deletion.

**ACCESS-COUNTER = \*INTERVAL(...)**

Deletes only the files for which the access counter lies in the specified value range which follows.

---

**FROM = Q / <integer 0..2147483647>**

Deletes only those files for which the access counter >= the specified value.

**TO = 2147483647 / <integer 0..2147483647>**

Deletes only those files for which the access counter <= the specified value.

**CODED-CHARACTER-SET = \*ANY / \*NONE / <name 1..8>**

The coded character set defined in the catalog entry is used as a selection criterion (see the CREATE-FILE command; if a CCS is defined, see also the *COD-CH-SET* output field of the SHOW-FILE-ATTRIBUTES command).

**CODED-CHARACTER-SET = \*ANY**

The defined character set is not to be used as a selection criterion.

**CODED-CHARACTER-SET = \*NONE**

Only the files for which no coded character set was explicitly defined are selected for deletion.

**CODED-CHARACTER-SET = <name 1..8>**

Only the files for which the specified character set was defined are selected for deletion.

**STATUS = \*ANY / \*PARAMETERS(...)**

The current file status is used as a selection criterion.

**STATUS = \*ANY**

The file status is not to be used as a selection criterion.

**STATUS = \*PARAMETERS(...)**

Only the files which have the specified status are selected for deletion. The following selection criteria are possible:

**i** The selection criteria within the \*PARAMETERS(...) structure are logically ORed.

**CLOSED-OUTPUT = \*ANY / \*YES / \*NO**

Specifies whether the “file closed” status is to be used as a selection criterion.

**CLOSED-OUTPUT = \*YES**

Only the files which have already been closed are deleted.

**CLOSED-OUTPUT = \*NO**

Only the output files which have been opened in a program (OPEN OUTIN, INOUT or OUTPUT) and files which were not closed in an earlier system run or because a job was aborted are selected for deletion.

**CACHED = \*ANY / \*YES / \*NO**

Specifies whether file processing via a cache is to be used as a selection criterion.

**CACHED = \*ANY**

Deletes files regardless of whether or not they are cached.

**CACHED = \*YES**

Only the currently cached files are selected for deletion.

**CACHED = \*NO**

Only the files for which no data has been cached are deleted.

**REPAIR-NEEDED = \*ANY / \*YES / \*NO**

Specifies whether files which were not closed in an earlier system run and not reconstructed with REPAIR-DISK-FILES are to be selected.

---

**REPAIR-NEEDED = \*ANY**

Deletes files regardless of whether or not they need to be repaired.

**REPAIR-NEEDED = \*YES**

Only the files which were not closed in an earlier system run and which have not yet been reconstructed are selected for deletion.

**REPAIR-NEEDED = \*NO**

Only the files which were closed normally or reconstructed with the REPAIR-DISK-FILES command are deleted.

**OPEN-ALLOWED = \*ANY / \*YES / \*NO**

Specifies whether files which could not be opened due to data inconsistency are to be selected.

**OPEN-ALLOWED = \*ANY**

Deletes files regardless of whether or not they can be opened.

**OPEN-ALLOWED = \*YES**

Only the files that can be opened are deleted.

**OPEN-ALLOWED = \*NO**

Only the files which cannot be opened due to data inconsistency are deleted.

**DEFECT-REPORTED = \*ANY / \*YES**

Specifies whether files which may contain defective disk blocks are to be used as a selection criterion.

**DEFECT-REPORTED = \*ANY**

Files are deleted irrespective of whether or not they may contain defective blocks.

**DEFECT-REPORTED = \*YES**

Only files which may contain defective blocks are deleted.

**CACHE-NOT-SAVED = \*ANY / \*YES**

Specifies whether to select files for which updates have not been written out from the cache.

**CACHE-NOT-SAVED = \*ANY**

Files are deleted irrespective of whether or not they contain modified data which could not be written back from the cache.

**CACHE-NOT-SAVED = \*YES**

Only files containing modified data which could not be written back from the cache are deleted.

**TYPE-OF-FILES = \*ANY / list-poss(2): \*FILE / \*PLAM-LIBRARY**

Specifies whether files are to be selected on the basis of information specific to the file type. The files to be exported can restrict to normal files or to PLAM libraries.

**TYPE-OF-FILES = \*ANY**

Deletes files without taking their file type into account.

**TYPE-OF-FILES = \*FILE**

Only files are deleted.

**TYPE-OF-FILES = \*PLAM-LIBRARY**

Only PLAM libraries are deleted.

---

**SPACE-RELEASE-LOCK = \*ANY / \*NO / \*YES**

The lock to prevent the release of unused memory space is used as a selection criterion (see the *SP-REL-LOCK* output field in the SHOW-FILE-ATTRIBUTES command).

**SPACE-RELEASE-LOCK = \*ANY**

The permission to release unused memory space is not used as a selection criterion.

**SPACE-RELEASE-LOCK = \*NO**

Only the files for which unused memory space may be released are selected for deletion.

**SPACE-RELEASE-LOCK = \*YES**

Only the files for which the release of unused memory space is not permitted are selected for deletion.

**IO-ATTRIBUTES = \*ANY / \*PARAMETERS(...)**

The performance attributes defined in the catalog are used as a selection criterion.

**IO-ATTRIBUTES = \*ANY**

The performance attributes are not to be used as a selection criterion.

**IO-ATTRIBUTES = \*PARAMETERS(...)**

Only the files for which the specified performance attributes which follow have been entered in the catalog are selected for deletion.

**PERFORMANCE = \*ANY / list-poss(3): \*STD / \*HIGH / \*VERY-HIGH**

Deletes files with the specified performance attribute (*IO(PERF)* output field).

**PERFORMANCE = \*ANY**

The performance attribute is not a selection criterion.

**PERFORMANCE = \*STD**

Only the files that can be processed without any special performance requirements are deleted.

**PERFORMANCE = \*HIGH**

Only the files which should be processed via a cache (high performance priority) are deleted.

**PERFORMANCE = \*VERY-HIGH**

Only the files which should be processed via a cache and which should be permanently maintained in the cache if possible (highest performance priority) are selected for deletion.

**USAGE = \*ANY / list-poss(3): \*READ-WRITE / \*WRITE / \*READ**

Only the files which have a performance attribute that applies to the specified I/O operations (*IO(USAGE)* output field) are to be deleted.

**USAGE = \*ANY**

The type of I/O operations to which the performance attribute applies is not to be used as a selection criterion.

**USAGE = \*READ-WRITE**

Only the files for which the performance attribute applies to read-write operations are selected for deletion.

**USAGE = \*WRITE**

Deletes files for which the performance attribute applies to only write operations.

**USAGE = \*READ**

Deletes files for which the performance attribute applies to only read operations.

---

**DISK-WRITE = \*ANY / \*IMMEDIATE / \*BY-CLOSE**

The time at which data consistency is required after a write operation is used as a selection criterion (see also the *DISK-WRITE* output field in the SHOW-FILE-ATTRIBUTES command).

**DISK-WRITE = \*ANY**

The point at which data consistency is required is not a selection criterion.

**DISK-WRITE = \*IMMEDIATE**

Deletes files which must be in a consistent state immediately after a write operation.

**DISK-WRITE = \*BY-CLOSE**

Deletes files for which consistency of data is required only after CLOSE processing.

**FREE-FOR-DELETION = \*ANY / \*NONE / \*TOMORROW(...) / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..0>(…) / <date>(…) / \*INTERVAL(...)**

The date of release for deletion (free-for-deletion date) can be used as a selection criterion for the files which are to be deleted. The selection for a specified date can be restricted to a specific period of time on the free-for-deletion date (see the TIME operands in the various structures) On deleting file generation groups and file generations see the DELETE-FILE-GROUP, and DELETE-FILE-GENERATION commands. See also the SHOW-FILE-ATTRIBUTES command, *FREE-DEL-D* and *FREE-DEL-T* output fields.

**FREE-FOR-DELETION = \*ANY**

The free-for-deletion date is not used as a selection criterion.

**FREE-FOR-DELETION = \*NONE**

Only deletes files for which no free-for-deletion date has yet been entered in the catalog.

**FREE-FOR-DELETION = \*TOMORROW(...)**

Only deletes files for which the next day is entered as the free-for-deletion date in the catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the file selection to a period relative to the date of the next day.

**TIME = \*INTERVAL(...)**

Only deletes files with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects files with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects files with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = \*TODAY(...)**

Only deletes files with today's date recorded as the free-for-deletion date in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection to a period of time relative to today's date.

**TIME = \*INTERVAL(...)**

Only deletes files with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects files with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects files with a free-for-deletion date <= the specified time.

---

**FREE-FOR-DELETION = \*YESTERDAY(...)**

Only deletes files with yesterday's date recorded as the free-for-deletion date in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection to a period of time relative to yesterday's date.

**TIME = \*INTERVAL(...)**

Only deletes files with a free-for-deletion date which was changed within the period specified next.

**FROM = 00:00:00 / <time>**

Selects files with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects files with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = \*INTERVAL(...)**

Only deletes files with a free-for-deletion date which falls within the specified period. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for the FREE-FOR-DELETION= <integer...> operand). It is also possible to specify only the FROM operand (lower limit) or the TO operand (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = \*EARLIEST / \*TOMORROW(...) / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..99999>(…) / <date>(…)**

Only deletes files with a free-for-deletion date >= the specified date.

**FROM = \*TOMORROW(...)**

Only deletes files whose free-for-deletion date >= date of the next day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**FROM = \*TODAY(...)**

Only deletes files with a free-for-deletion date >= today's date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**FROM = \*YESTERDAY(...)**

Only deletes files with a free-for-deletion date >= yesterday's date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**FROM = <integer -99999..99999>(…)**

Deletes only those files whose free-for-deletion date >= the specified date (in the form -n for the past or +n for the future).

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**FROM = <date>(…)**

Only deletes files with a free-for-deletion date >= the specified date. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two-digit year specifications < 60, 19 to two-digit year specifications >= 60.

---

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**TO = \*LATEST / \*TODAY(...) / \*TOMORROW(...) / \*YESTERDAY(...) / <integer -99999..99999>(…) / <date>(…)**

Only deletes files with a free-for-deletion date <= the specified date.

**TO = \*LATEST**

There is no upper limit on the selection range based on the free-for-deletion date.

**TO = \*TODAY(…)**

Only deletes file generations with a free-for-deletion date <= today's date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

**TO = \*TOMORROW(…)**

Only deletes files whose free-for-deletion date <= date of the next day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

**TO = \*YESTERDAY(…)**

Only deletes files with a free-for-deletion date <= yesterday's date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

**TO = <integer -99999..99999>(…)**

Deletes only those files whose free-for-deletion date <= the specified date (in the form -n for the past or +n for the future).

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

**TO = <date>(…)**

Only deletes files with a free-for-deletion date <= the specified date. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two-digit year specifications < 60, 19 to two-digit year specifications >= 60.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

**STORAGE-CLASS = \*ANY / \*NONE / <composed-name 1..8>**

The selection criterion is the assigned storage class.

**STORAGE-CLASS = \*ANY**

The storage class is not a selection criterion.

**STORAGE-CLASS = \*NONE**

Only deletes files with no storage class assigned to them.

---

**STORAGE-CLASS = <composed-name 1..8>**

Only deletes files with the specified storage class assigned to them.

**MANAGEMENT-CLASS = \*ANY / \*NONE / <composed-name 1..8>**

The selection criterion is the HSMS management class.

**MANAGEMENT-CLASS = \*ANY**

The HSMS management class is not a selection criterion.

**MANAGEMENT-CLASS = \*NONE**

Only deletes files with no HSMS management class assigned to them.

**MANAGEMENT-CLASS = <composed-name 1..8>**

Only deletes files with the specified HSMS management class assigned to them.

**ADM-INFORMATION = \*ANY / \*NONE / <c-string 1..8 with-low>**

The selection criterion is the information that systems support has added to the catalog.

**ADM-INFORMATION = \*ANY**

The systems support information is not a selection criterion.

**ADM-INFORMATION = \*NONE**

Only deletes files with no systems support information in their catalog.

**ADM-INFORMATION = <c-string 1..8 with-low>**

Only deletes files with the specified string as the systems support information in their catalog.

**USER-INFORMATION = \*ANY / \*NONE / <c-string 1..8 with-low>**

The selection criterion is the information that the user has added to the catalog.

**USER-INFORMATION = \*ANY**

The user information is not a selection criterion.

**USER-INFORMATION = \*NONE**

Only deletes files with no user information in their catalog.

**USER-INFORMATION = <c-string 1..8 with-low>**

Only deletes files with the specified string as the user information in their catalog.

**VOLUME-SET = \*ANY / <cat-id 1..4>**

The selection criterion is the volume set in which the file is stored.

**VOLUME-SET = \*ANY**

The volume set is not a selection criterion.

**VOLUME-SET = <cat-id 1..4>**

Only deletes files stored in the specified volume set.

**AVAILABILITY = \*ANY / list-poss(2): \*STD / \*HIGH**

The selection criterion is the required availability.

**AVAILABILITY = \*ANY**

Availability is not a selection criterion.

**AVAILABILITY = \*STD**

Only deletes files with no high availability requirements.

---

**AVAILABILITY = \*HIGH**

Only deletes files with high availability requirements. The files are typically on disks mirrored by DRV.

**S0-MIGRATION = \*ANY / list-poss(2): \*ALLOWED / \*FORBIDDEN**

The selection criterion is the permissibility of migration within the processing level (S0).

**S0-MIGRATION = \*ANY**

Migration within the processing level is not a selection criterion.

**S0-MIGRATION = \*ALLOWED**

Only deletes files for which migration to other volume sets within the processing level is allowed.

**S0-MIGRATION = \*FORBIDDEN**

Only deletes files for which migration to other volume sets within the processing level is forbidden.

**WORK-FILE = \*ANY / \*NO / \*YES**

The selection criterion is the work file attribute.

**WORK-FILE = \*ANY**

The work file attribute is not a selection criterion.

**WORK-FILE = \*NO**

Only deletes files which are not marked as work files.

**WORK-FILE = \*YES**

Only deletes files which are marked as work files.

**FILE-PREFORMAT = \*ANY / list-poss(4): \*NONE / \*K / \*NK2 / \*NK4**

The selection criterion is the preferred file format.

**FILE-PREFORMAT = \*ANY**

The preferred file format is not a selection criterion.

**FILE-PREFORMAT = \*NONE**

Only deletes files for which no preferred file format has been indicated.

**FILE-PREFORMAT = \*K**

Only deletes files which are intended to be K files.

**FILE-PREFORMAT = \*NK2**

Only deletes files which are intended to be NK files in 2K format.

**FILE-PREFORMAT = \*NK4**

Only deletes files which are intended to be NK files in 4K format.

**ENCRYPTION = \*ANY / list-poss(3): \*NONE / \*AES / \*DES**

The selection criterion is the encryption method.

**ENCRYPTION = \*ANY**

The encryption method is not a selection criterion.

**ENCRYPTION = \*NONE**

Only unencrypted files are deleted.

**ENCRYPTION = \*AES**

Only files which were encrypted using the AES method are deleted.

---

## **ENCRYPTION = \*DES**

Only files which were encrypted using the DES method are deleted.

## **OPTION = \*ALL / \*SPACE / \*DATA / \*DATA-KEEP-ATTRIBUTES / \*DESTROY-ALL**

Controls the deletion of the file.

If *DESTROY-BY-DELETE=YES* was defined in the catalog entry of the file, the file or released storage space will *definitely* be overwritten with binary zeros. If this is not the case and if *OPTION=\*DESTROY-ALL* was also not specified, the file or released storage space will be deleted only logically, rather than being overwritten.

## **OPTION = \*ALL**

All catalog entries for the selected files are deleted.

The storage space *for files on disks and Net-Storage volumes* is also released.

## **OPTION = \*SPACE**

*Only for files on pubset disks and Net-Storage volumes:* The storage space for the deleted files is released and the catalog entry on Net-Storage, if existing, is deleted. The catalog entry in BS2000 is retained, although amended: it is then identical with a catalog entry created with a *CREATE-FILE SUPPORT=\*NONE* command. For *tape files* the default value *ALL* applies; for *private disks* the operand *SPACE* will be rejected.

## **OPTION = \*DATA**

*Only for files on disks and Net-Storage volumes (for tape files the default value ALL applies):* the data in the selected files is “logically deleted”. After this, the user can no longer access the data, since he/she is no longer permitted to access the volume concerned physically. The catalog entry and the storage space allocation are retained.

## **OPTION = \*DATA-KEEP-ATTRIBUTES**

*Only for files on disks and Net-Storage volumes (for tape files the default value ALL applies):* the data of the files involved is “logically deleted” as with *OPTION=\*DATA*, but the data related file attributes are retained. The data can no longer be addressed by the user.

## **OPTION = \*DESTROY-ALL**

*Only for files on disks and Net-Storage volumes (for tape files the default value ALL applies):*

the storage space for the files involved is released and the catalog entry is deleted; in addition, the storage space thus released is overwritten with binary zeros so that, if the space is allocated again, nobody can read the old data (data security). In the case of files on private disks, all the volumes on which the file was stored must be mounted at the time of deletion.

“Data destruction” when a file is deleted can also be permanently recorded in the catalog entry using the *CREATE-FILE* or *MODIFY-FILE-ATTRIBUTES* command (*DESTROY-BY-DELETE=\*YES* operand); a “DESTROY” flag is then set in the catalog entry (*DESTROY=YES* output field). In this case storage space is released and it will be automatically overwritten.

**i** Please also observe the notes in the section “Data protection by data destruction” in the “Introductory Guide to DMS” [13].

## **MOUNT = \*FIRST-DISK / \*ALL-DISK**

*Only for files on private disks:*

specifies whether to mount all private disks containing files which are to be deleted. The user can request that only the first of the required private disks be mounted, or all of them. The *MOUNT* operand should be specified if the options *\*ALL* or *\*DESTROY-ALL* are specified. For tape files or files on public disks or Net-Storage volumes, any *MOUNT* specification will be ignored.

---

**MOUNT = \*FIRST-DISK**

It is only necessary for the first of the private disks, containing the start of the file and its catalog entry, to be online. The associated private disks do not have to be online.

**MOUNT = \*ALL-DISKS**

All the private disks on which parts of the file are held, must be online. If any of the disks is missing, the file will not be deleted; on completion of the DELETE-FILE processing, the spin-off mechanism will be triggered.

**DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*FILE-CHANGE / \*MORE-THAN-ONE-FILE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during the deletion process. A control dialog is only possible in dialog mode but, in this mode, may also be used in procedures. The only operand value that you can specify in batch mode is \*STD or \*NO.

The user can intervene with the following inputs:

Y: the specified file or file set will then be deleted.

N: the specified file or file set will not be deleted.

T: processing of the command will be terminated.

?: the possible responses will be listed, with an explanation of each.

In addition, the following options can be specified, separated by commas:

,CHECK = NO

The DIALOG-CONTROL mode will be changed to '\*NO'.

,CHECK = PVS

The DIALOG-CONTROL mode will be changed to '\*CATALOG-CHANGE'.

,CHECK = MULTIPLE

The DIALOG-CONTROL mode will be changed to '\*MORE-THAN-ONE-FILE'.

,CHECK = SINGLESINGLE

The DIALOG-CONTROL mode will be changed to '\*FILE-CHANGE'.

,CHECK = ERROR\*

The DIALOG-CONTROL mode will be changed to '\*ERROR'.

,IGNORE = list-poss(5): ACCESS / EXDATE / RDPASS / WRPASS / EXPASS

Specifies which protection attributes are to be ignored during deletion. The specification only applies to a single file in the control dialog. RDPASS, WRPASS and EXPASS are available to privileged users only.

,PASSWORD = list-poss(3): <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> Enables password-protected files to be deleted (maximum of 3 passwords). The specification only applies to a single file in the control dialog.

**DIALOG-CONTROL = \*STD**

The default \*STD setting is equivalent to \*MORE-THAN-ONE-FILE in an interactive dialog (when SYSCMD is connected to the terminal) and to \*NO in procedures and in batch mode.

**DIALOG-CONTROL = \*NO**

The user cannot intervene in DELETE-FILE processing; all the specified files will be deleted (without a verification dialog).

---

### **DIALOG-CONTROL = \*ERROR**

If deletion of the selected files proceeds without error, they will be deleted immediately, as when \*NO is specified (i. e. no verification dialog). However, if a user-correctable error occurs, then a verification dialog takes place as for DIALOG-CONTROL=\*FILE-CHANGE. DIALOG-CONTROL=\*ERROR applies implicitly if DIALOG-CONTROL=\*FILE-CHANGE is set. In the event of an error, the user may acknowledge the error message, abort DELETE-FILE processing or attempt to rectify the error. If he wishes, he can also change the DIALOG-CONTROL mode (see also the possible forms of intervention listed under the first DIALOG-CONTROL operand).

### **DIALOG-CONTROL = \*FILE-CHANGE**

For each file which is to be deleted, the user has the intervention options described under the first DIALOG-CONTROL operand. For each file which is to be processed, the user can decide interactively whether it should be deleted or not (response: YES/NO). If in the verification dialog he specifies protection attributes under "IGNORE", or one or more passwords under "PASSWORD", these will be taken into account for any selected file and, if satisfied, the file will be deleted without further queries ("YES" must also be specified). The user can also abort DELETE-FILE processing, or change the DIALOG-CONTROL mode.

### **DIALOG-CONTROL = \*MORE-THAN-ONE-FILE**

If exactly one file is specified, this will be deleted immediately. If the file is specified in partially qualified form, which means that more than one file is selected, or if the file name contains wildcards, the user can decide, each time the catalog ID changes, whether or not files from the new catalog are to be deleted (see the intervention options described for the first of the DIALOG-CONTROL operands). He must respond to the question issued by the system with "YES" or "NO". DIALOG-CONTROL = \*MORE-THAN-ONE-FILE is useful if wildcards are specified for "catid" in the FILE-NAME operand. In the verification dialog, DELETE-FILE processing can be terminated, or the DIALOG-CONTROL mode can be changed.

### **DIALOG-CONTROL = \*CATALOG-CHANGE**

As with DIALOG-CONTROL = \*MORE-THAN-ONE-FILE, the DELETE-FILE processing routine branches to a verification dialog if files in different catalogs (PUBSETS) are affected. The user can determine whether the files in the current PUBSET should be deleted (YES/NO), DELETE-FILE processing should be terminated, or the DIALOG-CONTROL mode should be changed.

### **DIALOG-CONTROL = \*USER-ID-CHANGE**

Whenever the user ID is changed when deleting the files, a branch is made to guided dialog.

### **OUTPUT = \*STD / \*NO / \*SYSOUT**

The user can specify whether a message (DMS0800) with the name of the deleted file is to be output to SYSOUT for each successfully deleted file. The default setting \*STD is equivalent to OUTPUT=\*NO.

### **OUTPUT = \*NO**

No messages are output to SYSOUT for successfully deleted files.

### **OUTPUT = \*SYSOUT**

For each file that is successfully deleted, a message with the name of that file is output to SYSOUT.

### **IGNORE-PROTECTION = \*NONE / list-poss(5): \*ACCESS / \*EXPIRATION-DATE / \*READ-PASSWORD / \*EXEC-PASSWORD**

The user can specify whether any defined file protection against write access or any defined retention period is to be ignored. Systems support staff can also ignore password protection. The specification IGNORE-PROTECTION in the DELETE-FILE command thus makes it unnecessary to issue MODIFY-FILE-ATTRIBUTES commands to reset the protection attributes before the files can be deleted.

---

**IGNORE-PROTECTION = \*NONE**

The protection attributes “read-only” (ACCESS=READ or no write access with BASIC-ACL or GUARDS) and “retention period” (EXPIRATION-DATE) will be observed during deletion.

**IGNORE-PROTECTION = \*ACCESS**

Files for which write access by the owner is not allowed at the highest activated protection level can still be deleted using DELETE-FILE (see the selection criteria PROTECTION-ACTIVE, ACCESS, BASIC-ACL or GUARDS).

**IGNORE-PROTECTION = \*EXPIRATION-DATE**

Files which are still within their retention period (*EXPIR-DATE* > current date) may be deleted using DELETE-FILE.

**IGNORE-PROTECTION = \*WRITE-PASSWORD**

System support staff are authorized to ignore the protection attribute **write password** when deleting the file.

**IGNORE-PROTECTION = \*READ-PASSWORD**

System support staff are authorized to ignore the protection attribute **read password** when deleting the file.

**IGNORE-PROTECTION = \*EXEC-PASSWORD**

System support staff are authorized to ignore the protection attribute **execute password** when deleting the file.

**PASSWORDS-TO-IGNORE = \*NONE / \*SECRET / list-poss(3): <x-string 1..8> / <c-string 1..4> / <integer -2147483648..2147483647>**

The user can specify one or more passwords, which will permit files protected by these passwords to be deleted. The passwords entered here are not recorded in the password table for the job, and are valid only for the current DELETE-FILE processing. Up to 3 passwords may be specified in the form of a list.

In order to delete a password-protected file, the password at the highest access level must be specified (see also the ADD-PASSWORD command).

The operand has the following special characteristics:

The password entered is not logged.

The input field is automatically blanked out in the guided dialog.

In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**PASSWORDS-TO-IGNORE = \*NONE**

No passwords are specified.

**SUPPRESS-ERRORS = \*NONE / list-poss(3): <alphanum-name 7..7>**

In procedures the user can specify whether the spin-off mechanism or SDF-P error handling is to be triggered every time an error occurs (apart from syntax errors), or whether specific error conditions are to be ignored.

**SUPPRESS-ERRORS = \*NONE**

All errors will trigger the spin-off mechanism or SDF-P error handling.

**SUPPRESS-ERRORS = list-poss(3): <alphanum-name 7..7>**

The user can define which errors are to be ignored by means of their DMS error codes (alphanum-name 7..7). If the specified error occurs, the spin-off mechanism will not be triggered. A maximum of 3 error codes may be specified. DMS error code: 7 characters, of which the first three are always “DMS”; the last 4 characters identify the error; the digits 0..9 and letters A..F are permitted. When error codes are entered, no check is made to verify that valid error codes have been specified.

A detailed list of valid DMS error codes can be found on the manual server (URL: <http://bs2manuals.ts.fujitsu.com>) by means of an HTML application and on the “BS2000 SoftBooks” DVD.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
1	0	CMD0001	No action required
2	0	DMS05F7	File generation does not exist, but group entry is updated
2	0	DMS06D6	Error on deleting certain files Guaranteed messages: DMS0800, DMS0801, DMS06D5, DMS0666, DMS05C6, DMS05BF, DMS05C3, DMS053F
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Privilege errors
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset Guaranteed message: DMS051B
	64	DMS051C	User not authorized to access pubset Guaranteed message: DMS051C
	64	DMS0535	Specified file not shareable
	64	DMS055C	The catalog entry could not be found on the assigned volume
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057D	File has been migrated and cannot be recalled without delay
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0609	No access to system file

	64	DMS0640	Access to Net-Storage is rejected by the ONETSTOR subsystem because of communication problems with the net client
	64	DMS0643	Net client reports access error
	64	DMS0644	Net client reports internal error
	64	DMS0645	File does not exist on Net-Storage
	64	DMS0649	Net server reports POSIX-ACL error
	64	DMS064A	Net client reports that access to files is forbidden on the Net-Storage volume
	64	DMS064B	Access to node files not supported by the net client
	64	DMS064C	Directory of the specified user ID does not exist on Net-Server
	64	DMS06FF	BCAM connection severed
	130	DMS0524	System address space exhausted
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0594	Not enough virtual memory available

## Notes

If a file held on a private disk is to be deleted, the device on which this disk is mounted will be requested for the job. After deletion of the file generation, the device will be returned to the system.

For files stored on private disks, if `OPTION=*DESTROY-ALL` or `MOUNT=*ALL-DISK` is specified then all the volumes which hold the file must be already mounted at the time the command is executed. Otherwise, only the first volume which holds the file has to be mounted. The following volumes will not be requested until the command is being executed. This rule also applies if a partially qualified file name is specified in the `DELETE-FILE` command, thus addressing a number of files. In this situation, it is not necessary that all the volumes for all the files are mounted simultaneously. The system will determine which of the files requires the most devices, and will request the corresponding number of devices.

## Examples

*Example 1: Deleting selected files; in this case, files that have names starting with 'D.' followed by one of the numbers from '1' to '8'*

%SYSOPT  : (PRIMARY)
%TASKLIB : (PRIMARY)
```

- (1) Lists all files of the user ID *USER1* on the default pubset *2OS2*. The most important file attributes are shown in condensed form (INFORMATION=\*MINIMUM).
- (2) All files that have names which begin with *D.*, end with one of the numbers from 1 to 8, and which comprise a total of 3 characters are to be deleted. In order to do this, all file catalogs that can be accessed by the user are searched (with the wildcard \* in the catalog ID). In addition, an interactive prompt is to be issued for all selected files to be deleted (DIALOG-CONTROL=\*CATALOG-CHANGE).
- (3) (Prompt to verify whether the searched file set on pubset *2OBU* is to be deleted. The positive response that was indicated with *Y* is rejected, since no files which match the sequence of wildcards exist on the pubset.
- (4) Prompt to verify whether the searched file set on pubset *2ORZ* is to be deleted. The positive response that was indicated with *Y* is rejected, since no files which match the sequence of wildcards exist on the pubset.
- (5) Prompt to verify whether the searched file set on pubset *2OS2* is to be deleted. The *?* is used to request an explanation for the various responses that can be made.
- (6) The response to the prompt to verify whether the searched file set on pubset *2OS2* is to be deleted is *Y*. In addition, the dialog control mode is set to *CHECK=SINGLE*, which means that a prompt is to be displayed for each file that is found.
- (7) The file *D.2* cannot be deleted, since it is protected by a BASIC-ACL and the user (OWNER) has no write authorization, see item (1).
- (8) The file *D.3* cannot be deleted because it is still open, see item (14).
- (9) The file *D.4* is protected against write access using ACCESS=READ. The response to the second prompt for the file is *Y,IGNORE=ACCESS*, so the file can now be deleted.

- 
- (10) The file *D.5* cannot be deleted because it is protected using GUARDS and because the user has no write authorization (see example 2).
  - (11) The file *D.7* cannot be deleted, since it is protected against write access by a password and the user has not yet entered the password into his password table.
  - (12) When the second prompt appears, the required password is also specified. This allows the file to be deleted; however, the specified password is not entered into the password table of the task. The only possible way to do that is by using the ADD-PASSWORD command.
  - (13) Output of all file names beginning with *D*.
  - (14) Output of the system files along with their assignments: The file *D.3* is assigned to the system file SYSDTA and could not be deleted as a result (see item 8).

Example 2: Deleting files which are protected against write access by means of a BASIC-ACL or GUARDS

**/show-file-attr d.<2,5>,inf=(security=\*yes) \_\_\_\_\_ (1)**

```
% DMS06CC NO FILE CORRESPONDING TO SPECIFIED OPERANDS
```

- (1) Shows the protection attributes of the files *D.2* and *D.5*. Access control for the file *D.2* is implemented by a BASIC-ACL. The user (OWNER) has no write authorization, i.e. cannot delete the file without a change in the protection attributes. Access control for the file *D.5* is implemented using GUARDS. Since no guard has been defined for write access, no write access is granted to any user, i.e. the user cannot delete his or her file unless the protection attributes are changed.
- (2) The two files are to be deleted by ignoring any access protection that may have been defined (with ACCESS, BASIC-ACL or GUARDS). The deletion of each file is to be verified by means of a prompt.
- (3) On confirmation of the prompt with *Y*, the file *D.2* is deleted.
- (4) On confirmation of the prompt with *Y*, the file *D.5* is deleted.
- (5) The file catalog now contains no information on these files.

Example 3: Selecting files using wildcards in the file name

```

- (1) Shows all files for which the first partial name is *MAX* or *LST*.
- (2) Selects files for deletion if their first partial name consists of exactly three characters and if the file name ends in *FILE.2*.
- (3) Only one file was selected, i.e. the file *MAX.FILE.2*. Since this was the only file available for selection, it was deleted without confirmation.

---

## 3.3 DELETE-FILE-GENERATION

Delete file generations from file generation group

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE-GENERATION-GROUP
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

With the DELETE-FILE-GENERATION command, a user can delete file generations which are cataloged under his own user ID, and selected according to criteria which must be specified in the command. Specific deletion operations allow the user to release storage space. The user is assisted in doing this by a guided dialog. The operands of the DELETE-FILE-GENERATION command can be divided into four groups, which correspond to the different functional levels of the command (see "[Overview of functions](#)" in section "[DELETE-FILE-GENERATION](#)").

#### *Selection*

Using the selection parameters, the user specifies which files generations/ catalog entries are to be processed. The attributes stored in the group entries are used as selection criteria. For this purpose, [some operands](#) in the DELETE-FILE-GENERATION command correspond with those of the SHOW-FILE-ATTRIBUTES command.

#### *File protection*

File protection parameters make it unnecessary for the user to input a MODIFY-FILE-GROUP-ATTRIBUTES or ADD-PASSWORD command in order to delete files for which file protection attributes such as passwords, retention period, etc. are defined.

#### *Action parameters*

Action parameters control the internal execution of the DELETE-FILE-GENERATION command. The user can, on the one hand, determine the scope of the deletions, and on the other hand, can define conditions for deletion.

#### *Control parameters*

Control parameters permit the user to define his own user interface, within certain limits. For example, he can use interactive prompts in the dialog or can request a SYSOUT log, or have DMS errors ignored (for the spin-off mechanism or SDF-P error handling).

#### *Privileged functions*

The privileged functions for system support staff include specification of any user ID, the ability to ignore protection attributes of the file generations being deleted and, in the case of a user ID change, to branch to guided dialog.

By default, systems support (TSOS privilege) is a co-owner of all the files (and can therefore delete file generations under any user ID). When SECOS is used, this co-ownership can be restricted.

In conjunction with the SECOS software product, a user can allow other user IDs to act as co-owners of the file generation groups of his user ID. Co-owners of a user ID are also allowed to delete file generations under that ID.

**Overview of functions**

Function / Meaning	Level 1 operands	Level 2/3 operands
The name of the file generation which is to be deleted	GENERATION-NAME =	
File generation to be deleted, specified in relative form	DELETE =	
Criteria for selection of the file generations to be deleted	SELECT = *BY-ATTRIBUTES(...)	
Date specification		
<ul style="list-style-type: none"> <li>Expiration date (implicit retention period)               <ul style="list-style-type: none"> <li>Time</li> </ul> </li> </ul>		EXPIRATION-DATE =

```

---

## Operands

### **GENERATION-NAME = \*DUMMY / <filename 1..54 without-vers with-wild(80)>**

The name of a reference generation, from which or up to which the files are to be deleted (see the DELETE operand). Only the user's own user ID or a user ID for which the user is co-owner may be specified.

### **GENERATION-NAME = \*DUMMY**

Designates the dummy generation \*DUMMY, which "always exists", and which satisfies all selection criteria. Any other operands (except for DIALOG-CONTROL, OUTPUT, and SUPPRESS-ERRORS) will be checked for their formal correctness, but otherwise ignored. The main use of \*DUMMY is in testing procedures.

### **DELETE = \*GENERATIONS-BEFORE / GENERATIONS-AFTER**

Specifies which file generations are to be deleted: all those whose number is less than the reference generation, or all those whose number is greater than it.

### **SELECT = \*ALL**

All the files in the set specified by GENERATION-NAME are selected.

### **SELECT = \*BY-ATTRIBUTES(...)**

Restricts the files in the set specified in GENERATION-NAME to files which satisfy the criteria which follow. The default values, \*ANY and ANY, each indicates that the set of file generations is not to be restricted to any particular values for the attribute concerned.

### **EXPIRATION-DATE = \*ANY / \*NONE / \*TOMORROW(...) / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..991231>(…) / <date>(…) / \*INTERVAL(...)**

The user can select the file generation to be deleted on the basis of the expiration date. A retention period exists if the expiration date is greater than the current date. The selection can be restricted for a specified date to a time interval in which the last file update occurred (see the TIME operand for each structure). Note that at present the time 00:00:00 is always entered in the file catalog as the time of the expiration date. See also the *EXPIR-DATE* and *EXPIR-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

### **EXPIRATION-DATE = \*ANY**

The expiration date is not to be used as a selection criterion.

### **EXPIRATION-DATE = \*NONE**

Only the file generations for which no release date (NONE) has been entered as the EXPIRATION-DATE in the group entry will be deleted, i.e. file generations which have never been opened.

### **EXPIRATION-DATE = \*TOMORROW(...)**

Only those file generations which have tomorrow's date entered as the EXPIRATION-DATE in their group entry are deleted.

### **TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

### **TIME = \*INTERVAL(...)**

Deletes only those file generations whose expiration date lies within the specified time interval that follows.

### **FROM = 00:00:00 / <time>**

Selects file generations for which the time of expiration >= the specified time.

### **TO = 23:59:59 / <time>**

Selects file generations for which the time of expiration <= the specified time.

---

**EXPIRATION-DATE = \*TODAY(...)**

Only those file generations which have today's date entered as the EXPIRATION-DATE in their group entry are deleted.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Deletes only those file generations whose expiration date lies within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects file generations for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects file generations for which the time of expiration <= the specified time.

**EXPIRATION-DATE = \*YESTERDAY(...)**

Only those file generations which have yesterday's date entered as the EXPIRATION-DATE in their group entry are deleted.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Deletes only those file generations whose expiration date lies within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects file generations for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects file generations for which the time of expiration <= the specified time.

**EXPIRATION-DATE = <integer -99999..991231>(...)**

Only those file generations which have the specified date entered as the EXPIRATIONDATE in their group entry are deleted. Here, the user can specify the expiration date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form *yymmdd* (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits, with preceding sign) the number of days from today's date, in the form *-n* for dates in the past, and *+n* for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0, TOMORROW corresponds to +1)

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = INTERVAL(...)**

Deletes only those file generations whose expiration date lies within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects file generations for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Selects file generations for which the time of expiration <= the specified time.

---

**EXPIRATION-DATE = <date>(…)**

Only those file generations which have the specified date entered as the EXPIRATION-DATE in their group entry are deleted. The user can specify the expiration date in the form [yy]yy-mm-dd.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of files to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(…)**

Deletes only those file generations whose expiration date lies within the specified time interval that follows.

**FROM = 00:00:00 / <time>**

Selects file generations for which the time of expiration  $\geq$  the specified time.

**TO = 23:59:59 / <time>**

Selects file generations for which the time of expiration  $\leq$  the specified time.

**EXPIRATION-DATE = \*INTERVAL(…)**

Only file generations whose release date lies within the specified time period, i.e. whose retention period ends within the specified time period, will be deleted. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for EXPIRATION-DATE = <integer...>. It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for deletion can only be meaningful if the chosen lower limit  $\leq$  the upper limit.

**FROM = \*EARLIEST / \*TOMORROW(…) / \*TODAY(…) / \*YESTERDAY(…) / <integer -99999..991231>(…) / <date>(…)**

If EARLIEST is specified, the system will use the earliest possible date. Only those file generations for which the retention period expires on or after the specified date (EXPIRATION-DATE  $\geq$  specified date) are deleted.

**FROM = \*TOMORROW(…)**

Deletes only those file generations for which the EXPIRATION-DATE  $\geq$  date of next day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = \*TODAY(…)**

Deletes only those file generations for which the EXPIRATION-DATE  $\geq$  current date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = \*YESTERDAY(…)**

Deletes only those file generations for which the EXPIRATION-DATE  $\geq$  date of preceding day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

---

**FROM = <integer -99999..991231>(…)**

Deletes only those file generations for which the EXPIRATION-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = <date>(…)**

Deletes only those file generations for which the EXPIRATION-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*LATEST / \*TOMORROW(…) / \*TODAY(…) / \*YESTERDAY(…) / <integer -99999..991231>(…) / <date>(…)**

Only those file generations for which the retention period expires on or before the specified date (EXPIRATION-DATE <= specified date) will be deleted.

**TO = \*TOMORROW(…)**

Deletes only those file generations for which the EXPIRATION-DATE <= date of next day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*TODAY(…)**

Deletes only those file generations for which the EXPIRATION-DATE <= current date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*YESTERDAY(…)**

Deletes only those file generations for which the EXPIRATION-DATE <= date of preceding day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = <integer -99999..991231>(…)**

Deletes only those file generations for which the EXPIRATION-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = <date>(…)**

Deletes only those file generations for which the EXPIRATION-DATE <= the specified date.

---

**TIME = 23:59:59 / <time>**

Time on the specified date. All file generations that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**SUPPORT = \*ANY / \*PRIVATE-DISK**

The user can select which file generations are to be deleted by the type of their volumes.

**SUPPORT = \*ANY**

The volume type is not to be used as a selection criterion.

**SUPPORT = \*PRIVATE-DISK**

Only file generations on private disks are to be deleted.

**ACCESS = \*ANY / \*READ / \*WRITE**

The specified access type will be used as a selection criterion (ACCESS value in the group entry.)

**ACCESS = ANY**

The ACCESS value is not to be used as a selection criterion.

**ACCESS = \*READ**

Only file generations for which write access is prevented by ACCESS=READ, i.e. for which only read access is permitted, will be deleted.

**PASSWORD = \*ANY / list-poss(4): \*NONE / \*READ-PASSWORD / \*WRITE-PASSWORD / \*EXEC-PASSWORD**

The user can select file generations by specific password types for processing.

**PASSWORD = \*ANY**

Password protection is not to be used as a selection criterion.

**PASSWORD = \*NONE**

Only file generations for which there is no password protection are to be deleted.

**PASSWORD = \*READ-PASSWORD**

Only file generations which are protected by a read password are to be deleted.

**PASSWORD = \*WRITE-PASSWORD**

Only file generations which are protected by a write password are to be deleted.

**USER-ACCESS = \*ANY / list-poss(2): \*OWNER-ONLY / \*ALL-USERS**

The user can select file generations using their access authorizations as a criterion.

**USER-ACCESS = \*ANY**

The access authorization is not to be used as a selection criterion.

**USER-ACCESS = \*OWNER-ONLY**

Only file generations which the owner alone may access are to be deleted.

**USER-ACCESS = \*ALL-USERS**

Only file generations which permit access to all users are to be deleted.

**BACKUP-CLASS = \*ANY / list-poss(5): \*A / \*B / \*C / \*D / \*E**

The user can select file generations for deletion by their BACKUP-CLASS level.

**BACKUP-CLASS = \*ANY**

The BACKUP-CLASS level is not to be used as a selection criterion.

---

**BACKUP-CLASS = \*A**

Only file generations for which the group entry contains the value BACKUP=A (most frequent backup) are to be processed.

**BACKUP-CLASS = \*B**

Only file generations for which the group entry contains the value BACKUP=B are to be processed.

**BACKUP-CLASS = \*C**

Only file generations for which the group entry contains the value BACKUP=C are to be processed.

**BACKUP-CLASS = \*E**

Only file generations for which the group entry contains the value BACKUP=E are to be processed.

**MIGRATE = \*ANY / list-poss(3): \*ALLOWED / \*INHIBITED / \*FORBIDDEN**

The user can select which file generations are to be processed by the migration entry for the group (see the CREATE-FILE-GROUP command, MIGRATE operand).

**MIGRATE = \*ANY**

The specified file generations are to be deleted, irrespective of the value in the MIGRATE operand in each of their group entries.

**MIGRATE = \*ALLOWED**

Only file generations for which the group entry specifies the appropriate operand value, i.e. file generations which may be migrated to storage levels S1 and S2, are to be deleted.

**MIGRATE = \*INHIBITED**

Only file generations for which the group entry specifies the appropriate operand value are to be processed, i.e. file generations which may not be migrated.

**MIGRATE = \*FORBIDDEN**

Only file generations for which the catalog entry specifies the appropriate operand value are to be processed, i.e. file generations for which an intensified migration lock is declared. The file generations may not even be migrated for a brief period (e.g. for reorganization purposes).

**CODED-CHARACTER-SET = \*ANY / \*NONE / <name 1..8>**

The coded character set defined in the group entry is used as a selection criterion (see the CREATE-FILE command for an explanation; if a CCS is defined, see also the *COD-CH-SET* output field of the SHOW-FILE-ATTRIBUTES command).

**CODED-CHARACTER-SET = \*ANY**

The defined character set is not to be used as a selection criterion.

**CODED-CHARACTER-SET = \*NONE**

Only the file generations for which no coded character set was explicitly defined are selected for deletion.

**CODED-CHARACTER-SET = <name 1..8>**

Only the files for which the specified character set was defined are selected for deletion.

**SPACE-RELEASE-LOCK = \*ANY / \*NO / \*YES**

The lock to prevent the release of unused memory space is used as a selection criterion (see the *SP-REL-LOCK* output field in the SHOW-FILE-ATTRIBUTES command).

**SPACE-RELEASE-LOCK = \*ANY**

The permission to release unused memory space is not used as a selection criterion.

---

**SPACE-RELEASE-LOCK = \*NO**

Only the file generations for which unused memory space may be released are selected for deletion.

**SPACE-RELEASE-LOCK = \*YES**

Only the file generations for which the release of unused memory space is not permitted are selected for deletion.

**BASIC-ACL = \*ANY / \*NONE / \*YES / \*PARAMETERS(...)**

The BASIC-ACL entry in the file catalog is used as a selection criterion.

**BASIC-ACL = \*ANY**

The BASIC-ACL entry is not to be used as a selection criterion.

**BASIC-ACL = \*NONE**

Only the file generations that have no BASIC-ACL entry in the catalog are to be deleted.

**BASIC-ACL = \*YES**

Only the file generations which have a BASIC-ACL entry in the catalog are to be deleted.

**BASIC-ACL = \*PARAMETERS(...)**

Only the file generations which have the specified BASIC-ACL entry in the catalog are to be deleted. NO-ACCESS means that no access rights were granted.

**i** Access rights specified with the OWNER, GROUP and OTHERS operands within the \*PARAMETERS(...) structure are logically ORed.

**OWNER = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights must already be defined for the owner.

**OWNER = \*PARAMETERS(...)**

Access rights that must be present for the owner (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**GROUP = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for the owner's user group.

**GROUP = \*PARAMETERS(...)**

Access rights that must be present for the owner's user group (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**OTHERS = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for all other users.

**OTHERS = \*PARAMETERS(...)**

Access rights that must be present for all other users (logically ORed together):

---

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**GUARDS = \*ANY / \*NO / \*YES / \*PARAMETERS(...)**

The use of GUARDS for access control (see the CREATE-FILE-GROUP or MODIFY-FILE-GROUP-ATTRIBUTES command) is used as a selection criterion.

**GUARDS = \*ANY**

Access control with GUARDS is not to be used as a selection criterion.

**GUARDS = \*NO**

Only the file generations which are not protected by GUARDS against unauthorized access are to be deleted (see also the PROTECTION-LEVEL operand).

**GUARDS = \*YES**

Only the file generations which are protected by GUARDS against unauthorized access (i.e. files for which access is controlled via the GUARDS function unit) are to be deleted.

**GUARDS = \*PARAMETERS(...)**

Deletes only those file generations which are protected by GUARDS against unauthorized access as specified, i.e. files for which access control is implemented using GUARDS: Access to the file generation is controlled by a guard, i.e. a special object which contains all the conditions under which a user is granted access authorization (e.g. date, time, user ID). The GUARDS function unit of the chargeable software product SECOS (see the "SECOS" manual [35]) must be installed in order to create and maintain a guard.

Each access mode can be controlled by a separate guard. If no guard (\*NONE) is defined for a given access mode, no corresponding access is permitted. If a defined guard is not accessible, the mode of access protected by it is not permitted. If the GUARDS subsystem is not available at the time of accessing the job variable, no access of any kind is allowed for the job variable.

**i** The values specified for the following READ and WRITE operands are logically ORed.

**READ = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Only the file generations which are protected against unauthorized read access by the specified guard are deleted. The default value \*ANY means that the selection of file generations is not based on read access protection by a guard. \*NONE selects file generations for which no read access is permitted.

**WRITE = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Only the file generations which are protected against unauthorized write access by the specified guard are deleted. The default value \*ANY means that the selection of file generations is not based on write access protection by a guard. \*NONE selects file generations for which no write access is permitted. These file generations can be deleted with IGNORE-PROTECTION=\*ACCESS.

**MANAGEMENT-CLASS = \*ANY / \*NONE / <composed-name 1..8>**

The selection criterion is the HSMS management class.

**MANAGEMENT-CLASS = \*ANY**

The HSMS management class is not a selection criterion.

**MANAGEMENT-CLASS = \*NONE**

Only deletes file generations with no HSMS management class assigned to them.

---

**MANAGEMENT-CLASS = <composed-name 1..8>**

Only deletes file generations with the specified HSMS management class assigned to them.

**FREE-FOR-DELETION = \*ANY / \*NONE / \*TOMORROW(...) / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..0>(…) / <date>(…) / \*INTERVAL(...)**

The date of release of deletion (free-for-deletion date) can be used as a selection criterion for the file generations which are to be deleted. The selection for a specified date can be restricted to a specific period of time on the free-for-deletion date (see the TIME operands in the various structures) See also the SHOW-FILE-ATTRIBUTES command, *FREE-DEL-D*, and *FREE-DEL-T* output fields.

**FREE-FOR-DELETION = \*ANY**

The free-for-deletion date is not used as a selection criterion.

**FREE-FOR-DELETION = \*NONE**

Only deletes file generations for which no free-for-deletion date has yet been entered in the catalog.

**FREE-FOR-DELETION = \*TOMORROW(...)**

Only deletes file generations for which the next day is entered as the free-for-deletion date in the catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the file selection to a period relative to the date of the next day.

**TIME = \*INTERVAL(...)**

Only deletes file generations with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects files with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects files with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = \*TODAY(...)**

Only deletes file generations with today's date recorded as free-for-deletion date in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection to a period of time relative to today's date.

**TIME = \*INTERVAL(...)**

Only deletes file generations with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects file generations with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects file generations with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = \*YESTERDAY(...)**

Only deletes file generations with yesterday's date recorded as free-for-deletion date in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection to a period of time relative to yesterday's date.

**TIME = \*INTERVAL(...)**

Only deletes file generations with a free-for-deletion date which was changed within the period specified next.

---

**FROM = 00:00:00 / <time>**

Selects file generations with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects file generations with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = <integer -99999..99999>(…)**

Only deletes file generations with the specified free-for-deletion date recorded in their catalog entry. The free-for-deletion date is specified relative to today's date (in the form -n for the past or +n for the future).

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection to a period of time relative to the specified date.

**TIME = \*INTERVAL(…)**

Only deletes file generations with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects file generations with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects file generations with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = <date>(…)**

Only deletes file generations with exactly the specified date recorded as free-for-deletion date in their catalog entry. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two-digit year specifications < 60, 19 to two-digit year specifications >=

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection to a period of time relative to the specified date.

**TIME = \*INTERVAL(…)**

Only deletes file generations with a free-for-deletion date which falls within the period specified next.

**FROM = 00:00:00 / <time>**

Selects file generations with a free-for-deletion date >= the specified time.

**TO = 23:59:59 / <time>**

Selects file generations with a free-for-deletion date <= the specified time.

**FREE-FOR-DELETION = \*INTERVAL(..)**

Only deletes file generations with a free-for-deletion date which falls within the specified period. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for the FREE-FOR-DELETION= <integer...> operand). It is also possible to specify only the FROM operand (lower limit) or the TO operand (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = \*EARLIEST / \*TOMORROW(…) / \*TODAY(…) / \*YESTERDAY(…) / <integer -99999..99999>(…) / <date>(…)**

Only deletes file generations with a free-for-deletion date >= the specified date.

**FROM = \*TOMORROW(…)**

Only deletes file generations whose free-for-deletion date >= date of the next day.

---

**TIME = 00:00:00 / <time>**

Time on the specified date. All files that have a free-for-deletion date after the specified time are selected.

**FROM = \*TODAY(...)**

Only deletes file generations with a free-for-deletion date >= today's date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All file generations that have a free-for-deletion date after the specified time are deleted.

**FROM = \*YESTERDAY(...)**

Only deletes file generations with a free-for-deletion date >= yesterday's date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All file generations that have a free-for-deletion date after the specified time are deleted.

**FROM = <integer -99999..99999>(...)**

Deletes only those file generations whose free-for-deletion date >= the specified date (in the form -n for the past or +n for the future).

**TIME = 00:00:00 / <time>**

Time on the specified date. All file generations that have a free-for-deletion date after the specified time are deleted.

**FROM = <date>(...)**

Only deletes file generations with a free-for-deletion date >= the specified date. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two-digit year specifications < 60, 19 to two-digit year specifications >= 60.

**TIME = 00:00:00 / <time>**

Time on the specified date. All file generations that have a free-for-deletion date after the specified time are deleted.

**TO = \*LATEST / \*TODAY(...) / \*TOMORROW(...) / \*YESTERDAY(...)  
<integer -99999..99999>(...)  
<date>(...)**

Only deletes file generations with a free-for-deletion date <= the specified date.

**TO = \*LATEST**

There is no upper limit on the selection range based on the free-for-deletion date.

**TO = \*TODAY(...)**

Only deletes file generations with a free-for-deletion date <= today's date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All file generations that have a free-for-deletion date before the specified time are deleted.

**TO = \*TOMORROW(...)**

Only deletes file generations whose free-for-deletion date <= date of the next day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All files that have a free-for-deletion date before the specified time are selected.

---

**TO = \*YESTERDAY(...)**

Only deletes file generations with a free-for-deletion date <= yesterday's date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All file generations that have a free-for-deletion date before the specified time are deleted.

**TO = <integer -99999..99999>(...)**

Deletes only those file generations whose free-for-deletion date <= the specified date (in the form -n for the past or +n for the future).

**TIME = 23:59:59 / <time>**

Time on the specified date. All file generations that have a free-for-deletion date before the specified time are deleted.

**TO = <date>(...)**

Only deletes file generations with a free-for-deletion date <= the specified date. The date is specified in the form [yy]yy-mm-dd. 20 is automatically prefixed to two-digit year specifications < 60, 19 to two-digit year specifications >= 60.

**TIME = 23:59:59 / <time>**

Time on the specified date. All file generations that have a free-for-deletion date before the specified time are deleted.

**WORK-FILE-GROUP = \*ANY / \*NO / \*YES**

The selection criterion is the work file attribute.

**WORK-FILE-GROUP = \*ANY**

The work file attribute is not a selection criterion.

**WORK-FILE-GROUP = \*NO**

Only deletes file generations which are not marked as work files.

**WORK-FILE-GROUP = \*YES**

Only deletes file generations which are marked as work files.

**OPTION = \*ALL / \*SPACE / \*DATA / \*DATA-KEEP-ATTRIBUTES / \*DESTROY-ALL**

Controls the deletion of the file.

If `DESTROY-BY-DELETE=YES` was defined in the catalog entry of the file, the file or released storage space will *definitely* be overwritten with binary zeros. If this is not the case and if `OPTION=DESTROY-ALL` was also not specified, the file or released storage space will be deleted only logically, rather than being overwritten.

**OPTION = \*ALL**

The default setting for disk files.

The catalog entries for the selected file generations are to be deleted and their storage space will also be released.

**OPTION = \*SPACE**

*Only for file generations on public disks (for tape files the default setting ALL applies):* the storage space for the file generations deleted by `DELETE-FILE-GENERATION` is released, but the catalog entry is retained, although amended: it is then identical with a catalog entry created by a `CREATE-FILE-GENERATION` command and `SUPPORT=*NONE`.

*For private disks, the SPACE operand will be rejected.*

### **OPTION = \*DATA**

*Only for disk files (for tape files the default value ALL applies):* The data in the selected files is “logically deleted”. After this, the user can no longer access the data, since he is no longer permitted to physically access the volume concerned. The group entry and storage space allocation still exist. The catalog entry is identical to that for a file generation which was created using CREATE-FILE-GENERATION but which has not yet been opened (*FILE-STRUC=NONE, CRE-DATE=NONE*).

### **OPTION = \*DATA-KEEP-ATTRIBUTES**

*Only for disk files (the default ALL applies for tape files):*

The data of the file generations involved is “logically deleted” as with OPTION=\*DATA, but the data-related file attributes are retained. The data can no longer be addressed by the user.

### **OPTION = \*DESTROY-ALL**

*Only for disk files (for tape files the default value ALL applies):*

the storage space for the affected file generations is released and the group entry is deleted; in addition, the storage space thus released is overwritten with binary zeros so that, if the space is allocated again, nobody can read the old data (data protection). In the case of files on private disks, all the volumes on which the file was stored must be mounted at the time of deletion.

When a file is deleted, the action parameters are evaluated first. See the EXPORT-FILE command for details of exporting file generations. “Data destruction” when a file is deleted can also be permanently recorded in the group entry for the file using the command

CREATE-FILE-GROUP; in the group entry a “DESTROY” indicator is then set (DESTROY=YES). In this case storage space is released and it will be automatically overwritten.

Please also observe the notes in the section “Data protection by data destruction” in the “Introductory Guide to DMS” [13].

### **MOUNT = \*FIRST-DISK / \*ALL-DISKS**

*Only for files on private disks:*

Specifies whether or not to mount all the private disks which hold any part of the file which is to be deleted.

The user can request that only the first of the required private disks be mounted, or all of them. The MOUNT operand should be specified if the operands ALL or DESTROY-ALL are specified. For tape files or files on public disks, any MOUNT specification will be ignored.

### **MOUNT = \*FIRST-DISK**

It is only necessary for the first of the private disks, containing the start of the file generation and its group entry, to be online. The associated private disks do not have to be online.

### **MOUNT = \*ALL-DISKS**

All the private disks on which parts of the file are held, must be online. If any of the disks is missing, the file generation will not be deleted; on completion of the DELETE-FILE-GENERATION processing, the spin-off mechanism will be triggered.

### **DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*FILE-CHANGE / \*MORE-THAN-ONE-FILE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during the deletion process. The verification dialog mechanism is available only in interactive mode, though that does include procedures. The only operand value that you can specify in batch mode is \*STD or \*NO.

---

The user can intervene with the following inputs:

- Y: the specified file or file set will then be deleted.
- N: the specified file or file set will not be deleted.
- T: processing of the command will be terminated.
- ?: the possible responses will be listed, with an explanation of each.

In addition, the following options can be specified, separated by commas:

- ,CHECK = NO The DIALOG-CONTROL mode will be changed to '\*NO'.
- ,CHECK = PVS The DIALOG-CONTROL mode will be changed to '\*CATALOG-CHANGE'.
- ,CHECK = MULTIPLE The DIALOG-CONTROL mode will be changed to '\*MORE-THAN-ONE-FILE'.
- ,CHECK = SINGLE The DIALOG-CONTROL mode will be changed to '\*FILE-CHANGE'.
  - ,CHECK = ERROR The DIALOG-CONTROL mode will be changed to '\*ERROR'.
  - ,IGNORE = list-poss(4): ACCESS / EXDATE / RDPASS / WRPASS Specifies which protection attributes are to be ignored during deletion. Only applies to a verification dialog for a single file. RDPASS and WRPASS are available to privileged users only.
  - ,PASSWORD = list-poss(3): <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> Enables password-protected files to be deleted (maximum of 3 passwords). Only applies to a verification dialog for a single file.

#### **DIALOG-CONTROL = \*STD**

The default value \*STD corresponds to \*MORE-THAN-ONE-FILE in interactive mode (SYSCMD is allocated to the terminal), and in procedures or in batch mode it corresponds to \*NO.

#### **DIALOG-CONTROL = \*NO**

The user cannot intervene in DELETE-FILE-GENERATION processing; all the specified file generations will be deleted (without a verification dialog).

#### **DIALOG-CONTROL = \*ERROR**

If deletion of the selected file generations proceeds without error, they will be deleted immediately, as when NO is specified (i.e. no verification dialog). However, if a user-correctable error occurs, then a verification dialog takes place as for DIALOG-CONTROL = \*FILE-CHANGE. DIALOG-CONTROL = \*ERROR applies implicitly if DIALOG-CONTROL = \*FILE-CHANGE is set. In the event of an error, the user may acknowledge the error message, abort DELETE-FILE-GENERATION processing or attempt to rectify the error. If he wishes, he can also change the DIALOG-CONTROL mode.

#### **DIALOG-CONTROL = \*FILE-CHANGE**

For each file generation which is to be deleted, the user has the intervention options described under the first DIALOG-CONTROL operand. For each file generation which is to be processed, the user can decide in a dialog whether it should be deleted or not (response: YES/NO). If in the dialog he specifies protection attributes under "IGNORE", or one or more passwords under "PASSWORD", these will be taken into account for any selected file generation and, if satisfied, the file generation will be deleted without further queries ("YES" must also be specified). The user can also abort DELETE-FILE-GENERATION processing, or change the DIALOG-CONTROL mode. The file generations which have been deleted will be listed in alphanumeric order.

#### **DIALOG-CONTROL = \*MORE-THAN-ONE-FILE**

If exactly one file generation is specified, this will be deleted immediately. If GENERATION-NAME is partially qualified, which means that more than one file generation is selected, or if GENERATION-NAME contains

---

wildcards, the user can decide, each time the catalog ID changes, whether or not file generations from the new catalog are to be deleted (see the intervention options described for the first of the DIALOG-CONTROL operands). He must respond to the question issued by the system with "YES" or "NO". DIALOG-CONTROL =\*MORE-THAN-ONE-FILE is useful if wildcards are specified for "catid" in the GENERATION-NAME operand. In the dialog, DELETE-FILE-GENERATION processing can be terminated, or the DIALOG-CONTROL mode can be changed.

**DIALOG-CONTROL = \*CATALOG-CHANGE**

As for DIALOG-CONTROL = \*MORE-THAN-ONE-FILE, the system starts a dialog if file generations in different catalogs (pubsets) are affected by DELETE-FILE-GENERATION processing. The user can determine whether the file generations in the current subset should be deleted (YES/NO), DELETE-FILE-GENERATION processing should be terminated, or the DIALOG-CONTROL mode should be changed.

**DIALOG-CONTROL = \*USER-ID-CHANGE**

Whenever the user ID is changed when deleting the file generations, a branch is made to guided dialog.

**OUTPUT = \*STD / \*NO / \*SYSOUT**

The user can specify whether a message (DMS0800) with the name of the deleted file generation is to be output to SYSOUT for each successful deletion. The default setting \*STD is equivalent to OUTPUT=\*NO.

**OUTPUT = \*NO**

No messages are output to SYSOUT for successfully deleted file generations.

**OUTPUT = \*SYSOUT**

For each file generation that is successfully deleted, a message with the name of that file generation is output to SYSOUT.

**IGNORE-PROTECTION = \*NONE / list-poss(4): \*ACCESS / \*EXPIRATION-DATE / \*WRITE-PASSWORD / \*READ-PASSWORD**

The user can specify whether any defined protection against write access or any defined retention period is to be ignored. Systems support staff can also ignore password protection. The specification IGNORE-PROTECTION in the DELETE-FILE-GENERATION command thus makes it unnecessary to issue MODIFY-FILE-GENERATION-ATTRIBUTES commands to reset the protection attributes before the file generations can be deleted.

**IGNORE-PROTECTION = \*NONE**

The protection attributes "read-only" (ACCESS=READ) and "retention period" (EXPIRATION-DATE) will be observed during deletion.

**IGNORE-PROTECTION = \*ACCESS**

File generations for which protection against writing is defined by ACCESS=READ can still be deleted using DELETE-FILE-GENERATION.

**IGNORE-PROTECTION = EXPIRATION-DATE**

File generations which are still within their retention period (EXDATE > current date) may nevertheless be deleted using DELETE-FILE-GENERATION.

**IGNORE-PROTECTION = \*WRITE-PASSWORD**

System support staff are authorized to ignore the protection attribute **write password** when deleting the file generation.

**IGNORE-PROTECTION = \*READ-PASSWORD**

System support staff are authorized to ignore the protection attribute **read password** when deleting the file generation.

---

**PASSWORDS-TO-IGNORE = \*NONE / \*SECRET / list-poss(3): <x-string 1..8> / <c-string 1..4> / <integer -2147483648..2147483647>**

The user can specify one or more passwords, which will permit files protected by these passwords to be deleted. The passwords entered here are not recorded into the password table for the job, and are valid only for the current DELETE-FILE-GENERATION processing. Up to 3 passwords may be specified in the form of a list.

In order to delete a password-protected file, the password at the highest access level must be specified (see the ADD-PASSWORD command).

The operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.
- The password entered is not logged.

**PASSWORDS-TO-IGNORE = \*NONE**

No passwords are specified.

**SUPPRESS-ERRORS = \*NONE / list-poss(3): <alphanum-name 7..7>**

In procedures the user can specify whether the spin-off mechanism or SDF-P error handling is to be triggered every time an error occurs (apart from syntax errors), or whether specific error conditions are to be ignored.

**SUPPRESS-ERRORS = \*NONE**

All errors will trigger the spin-off mechanism or SDF-P error handling.

**SUPPRESS-ERRORS = list-poss(3): <alphanum-name 7..7>**

The user can define which errors are to be ignored by means of their DMS error codes (alphanum-name 7..7). If the specified error occurs, the spin-off mechanism will not be triggered. A maximum of 3 error codes may be specified. DMS error code: 7 characters, of which the first three are always "DMS"; the last 4 characters identify the error; the digits 0..9 and letters A..F are permitted. When error codes are entered, no check is made to verify that valid error codes have been specified.

A detailed list of valid DMS error codes can be found on the manual server (URL: <http://bs2manuals.ts.fujitsu.com>) by means of an HTML application and on the "BS2000 SoftBooks" DVD.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
1	0	CMD0001	No action required
2	0	DMS05F7	File generation does not exist, but group entry is updated
2	0	DMS06D6	Error on deleting certain files Guaranteed messages: DMS0800, DMS0801, DMS06D5, DMS0666, DMS05C6, DMS05BF, DMS05C3, DMS053F
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0535	Specified file not shareable
	64	DMS055C	Catalog entry not found on specified private disk
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057D	File has been migrated and cannot be recalled without delay
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS0585	Error detected during catalog processing or multihost processing
	64	DMS0586	Currently not possible to access or reserve volume
	64	DMS0587	Use of specified command restricted by system administrator
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0609	Access to system file not permitted
	64	DMS06FF	BCAM connection severed

	130	DMS0524	System address space full
	130	DMS0582	File is currently locked or in use and cannot be processed

## Notes

- If it is necessary to delete a file generation which is held on a private disk, then the device on which this disk is mounted will be requested for the job. After deletion of the file generation, the device will be returned to the system.
- For file generations stored on private disks, if DESTROY-ALL or MOUNT=\*ALL-DISK is specified then all the volumes which hold the file generation must be already mounted at the time the command is executed. Otherwise, only the first volume which holds the file generation has to be mounted. The following volumes will not be requested until the command is being executed.

This rule also applies if a partially qualified file generation name is specified in the DELETE-FILE-GENERATION command, thus addressing a number of files. In this situation, it is not necessary that all the volumes for all the file generations are mounted simultaneously. The system will determine which of the file generations requires the most devices, and will request the corresponding number of devices.

## Example

```
/show-file-attr max.group.4,select=(generation=*yes) _____ (1)
```

```
%      0 :2OS2:$USER1.MAX.GROUP.4 (FGG)

%      3 :2OS2:$USER1.MAX.GROUP.4 (*0006)
%:2OS2: PUBLIC:      6 FILES RES=      15 FRE=      15 REL=      15 PAGES
```

- (1) The SHOW-FILE-ATTRIBUTES command returns information on the file generation group MAX.GROUP and all associated generations.
- (2) The DELETE-FILE-GENERATION command is used to delete all generations that were created prior to generation \*0002. The message sent to SYSOUT indicates that generation \*0001 was deleted (see the operand OUTPUT=\*SYSOUT).
- (3) The DELETE-FILE-GENERATION command is used to delete all generations that were created after generation \*0006. The message sent to SYSOUT indicates that generations \*0007 and \*0008 were deleted (see the operand OUTPUT=\*SYSOUT).
- (4) The DELETE-FILE-GENERATION command is issued for generation \*0002 without a specification for the DELETE operand.
- (5) The above command is rejected, since the DELETE operand is mandatory. The DELETE-FILE-GENERATION command is used to delete generations that were created before or after the specified generation.
- (6) The SHOW-FILE-INFORMATION command returns information on the current catalog entries for the file generation group and for its existing generations.

---

## 3.4 DELETE-FILE-GROUP

Delete file generation group and generations

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE-GENERATION-GROUP
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

With the DELETE-FILE-GROUP command, a user can delete file generation groups, and their associated file generations, which are cataloged under his own user ID, and selected according to criteria which must be specified in the command. If the specified file is neither a file generation group nor a file generation, it will still be deleted. Specific deletion operations allow the user to release storage space. The user is assisted in doing this by a guided dialog. The operands of the DELETE-FILE-GROUP command can be divided into four groups, which correspond to the different functional levels of the command (see ["Overview of functions" in section "DELETE-FILE-GROUP"](#)).

#### *Selection*

Using the selection parameters, the user specifies which file generation groups/catalog entries are to be processed. The attributes stored in the catalog entries are used as selection criteria. For this purpose, some of the operands in the DELETE-FILE-GROUP command correspond with those of the SHOW-FILE-ATTRIBUTES command.

#### *File protection*

File protection parameters make it unnecessary for the user to input a MODIFY-FILE-GROUP-ATTRIBUTES or ADD-PASSWORD command in order to delete files for which file protection attributes such as passwords, retention period, etc. are defined.

#### *Action parameters*

Action parameters control the internal execution of the DELETE-FILE-GROUP command. The user can, on the one hand, determine the scope of the deletions, and on the other hand can define conditions for deletion.

#### *Control parameters*

Control parameters permit the user to define his own user interface, within certain limits. For example, he can use interactive prompts in the dialog, or can request a SYSOUT log, or have DMS errors ignored (for the spin-off mechanism or SDF-P error handling).

#### *Privileged functions*

The privileged functions for system support staff include specification of any user ID, the ability to ignore protection attributes of the file generations being deleted and, in the case of a user ID change, to branch to guided dialog.

By default, systems support (TSOS privilege) is a co-owner of all the files (and can, therefore, delete file generation groups under any user ID). When SECOS is used, this co-ownership can be restricted.

In conjunction with the SECOS software product, a user can allow other user IDs to act as co-owners of the file generation groups of his user ID. Co-owners of a user ID are then also allowed to delete file generation groups.

## Overview of functions

## Operands

### **GROUP-NAME = \*DUMMY / <filename 1..54 without-gen-vers with-wild(80)>**

The name of the file generation group (FGG) which is to be deleted. If the specified file is not a file generation group (and also not a file generation), then it will still be deleted. Only the user's own user ID or a user ID for which the user is co-owner may be specified.

### **GROUP-NAME = \*DUMMY**

Designates the dummy file generation group \*DUMMY, which "always exists", and which satisfies all selection criteria. Any other operands (except for DIALOG-CONTROL, OUTPUT, and SUPPRESS-ERRORS) will be checked for their formal correctness, but otherwise ignored. If \*DUMMY is specified, no catalog or data access is necessary. The main use of \*DUMMY is in testing procedures.

### **SELECT = \*ALL**

All the files in the set specified by GROUP-NAME are selected.

### **SELECT = \*BY-ATTRIBUTES(...)**

Restricts the files in the set specified by GROUP-NAME to FGGs for which the fields in the group entry satisfy the criteria which follow. The default values, \*ANY and ANY, each indicate that the file set is not to be restricted to any particular values for the attribute concerned.

For descriptions of the selection criteria see the DELETE-FILE-GENERATION command, which is used to delete file generations only.

### **OPTION = \*ALL / \*SPACE / \*DATA / DATA-KEEP-ATTRIBUTES / \*DESTROY-ALL**

Controls the deletion of the file.

If DESTROY-BY-DELETE=YES was defined in the catalog entry of the file, the file or released storage space will *definitely* be overwritten with binary zeros. If this is not the case and if OPTION=DESTROY-ALL was also not specified, the file or released storage space will be deleted only logically, rather than being overwritten.

### **OPTION = \*ALL**

The default setting for disk files.

The group entry and the catalog entries for the selected file generations are to be deleted and their storage space will also be released.

### **OPTION = \*SPACE**

*Only for file generations on public disks (for tape files the default value \*ALL applies):*

The storage space for the file generations deleted by DELETE-FILE-GROUP is released, but the catalog entry is retained, although amended: it is then identical with a catalog entry created by a CREATE-FILE-GROUP command. *For private disks, the SPACE operand will be rejected.*

### **OPTION = \*DATA**

*Only for disk files (for tape files the default value \*ALL applies):*

The data in the selected files is "logically deleted". After this, the user can no longer access the data, since he is no longer permitted to physically access the volume concerned. The group entry and storage space allocation still exist. The catalog entries for the file generation are identical to those for a file generation which was created using CREATE-FILE-GENERATION but which has not yet been opened (*FILE-STRUC=NONE, CRE-DATE=NONE*).

### **OPTION = \*DATA-KEEP-ATTRIBUTES**

*Only for disk files (for tape files the default value \*ALL applies):*

The data of the file generations involved is "logically deleted" as with OPTION=\*DATA, but the data-related file attributes are retained. The data can no longer be addressed by the user.

### **OPTION = \*DESTROY-ALL**

*Only for disk files (for tape files the default value ALL applies):* The storage space for the affected file generations is released and the group entry is deleted and the catalog entries of the file generation are deleted; in addition, the storage space thus released is overwritten with binary zeros so that, if the space is allocated again, nobody can read the old data (data protection). In the case of files on private disks, all the volumes on which the file was stored must be mounted at the time of deletion.

When a file is deleted, the action parameters are evaluated first. See the command EXPORT-FILE for details of exportation of file generations. "Data destruction" when a file is deleted can also be permanently recorded in the group entry for the file using the command CREATE-FILE-GROUP; in the group entry a "DESTROY" indicator is then set (DESTROY=YES). In this case storage space is released and it will be automatically overwritten.

**i** Please also observe the notes in the section "Data protection by data destruction" in the "Introductory Guide to DMS" [13].

### **MOUNT = \*FIRST-DISK / \*ALL-DISKS**

*Only for files on private disks:* Specifies whether to mount all the private disks which hold any part of the file which is to be deleted. The user can request that only the first of the required private disks be mounted, or all of them. The MOUNT operand should be specified if the operands ALL or DESTROY-ALL are specified. For tape files or files on public disks, any MOUNT specification will be ignored.

#### **MOUNT = \*FIRST-DISK**

It is only necessary for the first of the private disks, containing the start of the file generation and its group entry, to be online. The associated private disks do not have to be online.

#### **MOUNT = \*ALL-DISKS**

All the private disks on which parts of the file are held must be online. If any of the disks are missing, the file will not be deleted; on completion of the DELETE-FILE-GROUP processing, the spin-off mechanism will be triggered.

### **DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*FILE-CHANGE / \*MORE-THAN-ONE-FILE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during the deletion process. The verification dialog mechanism is available only in interactive mode, though that does include procedures. The only operand value that you can specify in batch mode is \*STD or \*NO.

The user can intervene with the following inputs:

- Y: the specified file or file set will then be deleted.
- N: the specified file or file set will not be deleted.
- T: processing of the command will be terminated.
- ?: the possible responses will be listed, with an explanation of each.

In addition, the following options can be specified, separated by commas:

- ,CHECK = NO The DIALOG-CONTROL mode will be changed to '\*NO'.
- ,CHECK = PVS The DIALOG-CONTROL mode will be changed to '\*CATALOG-CHANGE'.
- ,CHECK = MULTIPLE The DIALOG-CONTROL mode will be changed to '\*MORE-THAN-ONE-FILE'.
- ,CHECK = SINGLE The DIALOG-CONTROL mode will be changed to '\*FILE-CHANGE'.
- ,CHECK = ERROR The DIALOG-CONTROL mode will be changed to '\*ERROR'.

- 
- ,IGNORE = list-poss(4): ACCESS / EXDATE / RDPASS/ WRPASS Specifies which protection attributes are to be ignored during deletion. Only applies to a verification dialog for a single file generation group. RDPASS and WRPASS are available to privileged users only.
  - ,PASSWORD = list-poss(3): <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> Enables password-protected files to be deleted (maximum of 3 passwords). Only applies to a verification dialog for a single file generation group.

#### **DIALOG-CONTROL = \*STD**

The default value \*STD corresponds to \*MORE-THAN-ONE-FILE in interactive mode (SYSCMD is allocated to the terminal), and in procedures or in batch mode it corresponds to \*NO.

#### **DIALOG-CONTROL = \*NO**

The user cannot intervene in DELETE-FILE-GROUP processing; all the specified file generation groups will be deleted (without a verification dialog).

#### **DIALOG-CONTROL = \*ERROR**

If deletion of the selected file generation groups proceeds without error, they will be deleted immediately, as when \*NO is specified (i.e. no verification dialog). However, if a user-correctable error occurs, then a verification dialog takes place as for DIALOG-CONTROL = \*FILE-CHANGE. DIALOG-CONTROL = \*ERROR applies implicitly if DIALOG-CONTROL = \*FILE-CHANGE is set. In the event of an error, the user may acknowledge the error message, abort processing of DELETE-FILE-GROUP or attempt to rectify the error. If he wishes, he can also change the DIALOG-CONTROL mode.

#### **DIALOG-CONTROL = \*FILE-CHANGE**

For each file generation group which is to be deleted, the user has the intervention options described under the first DIALOG-CONTROL operand. For each file generation group which is to be processed, the user can decide in a verification dialog whether it should be deleted or not (response: YES/NO). If in the dialog he specifies protection attributes under "IGNORE", or one or more passwords under "PASSWORD", these will be taken into account for any selected file generation group and, if satisfied, the file generation group will be deleted without further queries ("YES" must also be specified). The user can also abort DELETE-FILE-GROUP processing, or change the DIALOG-CONTROL mode.

The file generations which have been deleted will be listed in alphanumeric order.

#### **DIALOG-CONTROL = \*MORE-THAN-ONE-FILE**

If exactly one file generation group is specified, this will be deleted immediately. If GROUP-NAME is partially qualified, which means that more than one group is selected, or if GROUP-NAME contains wildcards, the user can decide, each time the catalog ID changes, whether the file generation groups from the new catalog are to be deleted (see also the intervention options described under the first DIALOG-CONTROL operand). He must respond to the question issued by the system with "YES" or "NO". DIALOG-CONTROL = \*MORE-THAN-ONE-FILE is useful if wildcards are specified for the catalog ID in the GROUP-NAME. In the dialog, DELETE-FILE-GROUP processing can be terminated, or the DIALOG-CONTROL mode can be changed.

#### **DIALOG-CONTROL = \*CATALOG-CHANGE**

As for DIALOG-CONTROL = \*MORE-THAN-ONE-FILE, the system starts a dialog if file generation groups in different catalogs (pubsets) are affected by the DELETE-FILE-GROUP processing. The user can determine whether the file generation groups in the current subset should be deleted (YES/NO), DELETE-FILE-GROUP processing should be terminated, or the DIALOG-CONTROL mode should be changed.

#### **DIALOG-CONTROL = \*USER-ID-CHANGE**

Each time the user ID changes during the deletion of the file generation group, the system branches into the guided dialog.

---

**OUTPUT = \*STD / \*NO / \*SYSOUT**

The user can specify whether a message (DMS0800) with the name of the deleted file generation group is to be output to SYSOUT for each successful deletion. The default setting \*STD is equivalent to OUTPUT=\*NO.

**OUTPUT = \*NO**

No messages are output to SYSOUT for successfully deleted file generation groups.

**OUTPUT = \*SYSOUT**

For each file generation group that is successfully deleted, a message with the name of that file generation group is output to SYSOUT.

**IGNORE-PROTECTION = \*NONE / list-poss(4): \*ACCESS / \*EXPIRATION-DATE / \*WRITE-PASSWORD / \*READ-PASSWORD**

The user can specify whether any defined protection against write access or any defined retention period is to be ignored. Systems support staff can also ignore password protection. The specification of IGNORE-PROTECTION in the DELETE-FILE-GROUP command thus makes it unnecessary to issue MODIFY-FILE-GROUP-ATTRIBUTES commands to reset the protection attributes before the files can be deleted.

**IGNORE-PROTECTION = \*NONE**

The protection attributes “read-only” (ACCESS=READ) and “retention period” (EXPIRATION-DATE) will be observed during deletion.

**IGNORE-PROTECTION = \*ACCESS**

File generation groups for which protection against writing is defined by ACCESS=READ can still be deleted using DELETE-FILE-GROUP.

**IGNORE-PROTECTION = \*EXPIRATION-DATE**

File generation groups which are still within their retention period (EXDATE > current date) may nevertheless be deleted using DELETE-FILE-GROUP.

**IGNORE-PROTECTION = \*WRITE-PASSWORD**

Systems support staff are authorized to ignore the protection attribute **write password** when deleting the file generation group.

**IGNORE-PROTECTION = \*READ-PASSWORD**

System support staff are authorized to ignore the protection attribute **read password** when deleting the file generation group.

**PASSWORDS-TO-IGNORE = \*NONE / \*SECRET / list-poss(3): <x-string 1..8> / <c-string 1..4> / <integer -2147483648..2147483647>**

The user can specify one or more passwords, which will permit file generation groups protected by these passwords to be deleted. The passwords entered here are not recorded into the password table for the job and are valid only for the current DELETE-FILE-GROUP processing. Up to 3 passwords may be specified in the form of a list. In order to delete a password-protected file generation group, the password at the highest access level must be specified (see the ADD-PASSWORD command).

The operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password .
- The password entered is not logged.

**PASSWORDS-TO-IGNORE = \*NONE**

No passwords are specified.

**SUPPRESS-ERRORS = \*NONE / list-poss(3): <alphanum-name 7..7>**

In procedures the user can specify whether the spin-off mechanism or SDF-P error handling is to be triggered every time an error occurs (apart from syntax errors), or whether specific error conditions are to be ignored.

**SUPPRESS-ERRORS = \*NONE**

All errors will trigger the spin-off mechanism or SDF-P error handling.

**SUPPRESS-ERRORS = list-poss(3): <alphanum-name 7..7>**

The user can define which errors are to be ignored by means of their DMS error codes (alphanum-name 7..7). If the specified error occurs, the spin-off mechanism will not be triggered. A maximum of 3 error codes may be specified.

DMS error code: 7 characters, of which the first three are always "DMS"; the last 4 characters identify the error; the digits 0..9 and letters A..F are permitted. When error codes are entered, no check is made to verify that valid error codes have been specified.

A detailed list of valid DMS error codes can be found on the manual server (URL: <http://bs2manuals.ts.fujitsu.com>) by means of an HTML application and on the "BS2000 SoftBooks" DVD.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
1	0	CMD0001	No action required
2	0	DMS05F7	File generation does not exist, but group entry is updated
2	0	DMS06D6	Error on deleting certain files Guaranteed messages: DMS0800, DMS0801, DMS06D5, DMS0666, DMS05C6,DMS05BF, DMS05C3, DMS053F
	1	CMD0202	Syntactical or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Privileges error
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not available
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset

	64	DMS0535	Specified file not shareable
	64	DMS055C	Catalog entry not found on specified private disk
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error
	64	DMS057D	File has been migrated and cannot be recalled without delay
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS0585	Error detected during catalog processing or multihost processing
	64	DMS0586	Currently not possible to access or reserve volume
	64	DMS0587	Use of specified command restricted by system administrator
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0609	Access to system file not permitted
	64	DMS06FF	BCAM connection severed
	130	DMS0524	System address space full
	130	DMS0582	File is currently locked or in use and cannot be processed
	130	DMS0585	Error detected during catalog processing or multihost processing
	130	DMS0586	Currently not possible to access or reserve volume
	130	DMS0594	Not enough virtual memory available

## Notes

- If it is required to delete an FGG which is held on a private disk, then the device on which this disk is mounted will be requested for the job.
- For files stored on private disks, if OPTION=\*DESTROY-ALL is specified then all the volumes which hold the file group must be already mounted at the time the command is executed or, if DATA is specified, only the first volume which holds the file group has to be mounted. This rule also applies if a partially qualified file name is specified in the DELETE-FILE-GROUP command, thus addressing a number of files. In this situation, it is not necessary that all the volumes for all the files are mounted simultaneously. The system will determine which of the files requires the most devices and will request the corresponding number of devices.
- If an error arises during the deletion of a file generation group or some of the generations in a group, then any remaining file generations which are present will not be deleted, and the catalog entry for the file generation group will be updated.

## Example

```
/show-file-attr max.group.4,select=(generation=*yes) _____ (1)
```

```
%      0 :2OS2:$USER1.MAX.GROUP.4 (FGG)
%      3 :2OS2:$USER1.MAX.GROUP.4(*0002)
%      3 :2OS2:$USER1.MAX.GROUP.4(*0003)
%      3 :2OS2:$USER1.MAX.GROUP.4(*0004)
%      3 :2OS2:$USER1.MAX.GROUP.4(*0005)
%      3 :2OS2:$USER1.MAX.GROUP.4(*0006)
%:2OS2: PUBLIC:      6 FILES RES=      15 FRE=      15 REL=      15 PAGES
```

```
/del-file-gr group-name=max.group.4,output=*sysout _____ (2)
```

```
% DMS0800 SPECIFIED FILE ':2OS2:$USER1.MAX.GROUP.4(*0002)' DELETED _____ (3)
% DMS0800 SPECIFIED FILE ':2OS2:$USER1.MAX.GROUP.4(*0003)' DELETED
% DMS0800 SPECIFIED FILE ':2OS2:$USER1.MAX.GROUP.4(*0004)' DELETED
% DMS0800 SPECIFIED FILE ':2OS2:$USER1.MAX.GROUP.4(*0005)' DELETED
% DMS0800 SPECIFIED FILE ':2OS2:$USER1.MAX.GROUP.4(*0006)' DELETED
% DMS0800 SPECIFIED FILE ':2OS2:$USER1.MAX.GROUP.4' DELETED
```

```
/show-file-attr max.group.4,select=(gen=*yes) _____ (4)
```

```
% DMS0533 REQUESTED FILE NOT CATALOGED IN PUBSET '2OS2'.COMMAND TERMINATED
```

- (1) The SHOW-FILE-INFORMATION command returns information on the catalog entries for the file generation group *MAX.GROUP.4* and its existing generations.
- (2) The DELETE-FILE-GROUP command is to be used to delete the file generation group, i.e. all generations as well as the group entry. A separate message is to be output to SYSOUT for each deleted catalog entry (operand OUTPUT=\*SYSOUT).
- (3) The messages sent to SYSOUT indicate the generations \*0002 to \*0006 and the group entry for the file generation group *MAX.GROUP.4* have been deleted.
- (4) The SHOW-FILE-ATTRIBUTES command confirms that all catalog entries for the file generation group *MAX.GROUP.4* have been deleted.

---

## 3.5 DELETE-ISAM-POOL

Delete ISAM pool or link to ISAM pool

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING

### Function

The DELETE-ISAM-POOL command enables users to delete task-specific ISAM pools which they have created or to cancel links between their jobs and shareable ISAM pools (with scopes of USER-ID, USER-GROUP and HOST-SYSTEM). If the link between a shareable ISAM pool and the last job to which it was connected is canceled, the ISAM pool is automatically deleted.

An ISAM pool is uniquely identified by the specified name, the catalog ID (see the CAT-ID operand) and the scope (see the SCOPE operand). If an ISAM pool named in the command does not exist, the command is rejected with an error message. The user can check the ISAM pools to which his or her job is linked by using the SHOW-ISAM-POOL-ATTRIBUTES command.

Before it is possible to delete an ISAM pool, or the link between a job and a pool, the command REMOVE-ISAM-POOL-LINK must be issued to delete all entries for the pool concerned from the pool table of the job. Otherwise, if a pool is still linked to the pool table by its pool link name, the DELETE-ISAM-POOL command will be rejected with an error message. Entries in the pool table can be displayed by means of the SHOW-ISAM-POOL-LINK command.

#### *Note on ISAM pools*

Cross-task ISAM pools are automatically created on a file-specific basis when a file is opened in a data space. The CREATE-ISAM-POOL command with SCOPE=\*USER-ID/\*USER-GROUP is only supported for reasons of compatibility and has the same effect as SCOPE=\*HOST-SYSTEM (for details on ISAM pools in data spaces see the “Introductory Guide to DMS” [13]).

A detailed description of the ISAM pool can be found in the manuals “Introductory Guide to DMS” [13] and “DMS Macros” [12].

### Format

#### **DELETE-ISAM-POOL**

**POOL-NAME** = \*ALL / <name 1..8>(…)

<name 1..8>(…)

| **CAT-ID** = \*DEFAULT-PUBSET / <cat-id 1..4>

| **SCOPE** = \*TASK / \*HOST-SYSTEM / \*USER-ID / \*USER-GROUP

---

## Operands

### **POOL-NAME = \*ALL / <name 1..8>(…)**

Specifies whether it is only particular ISAM pools, or all those which are linked to the job, which are to be released.

### **POOL-NAME = \*ALL**

All the ISAM pools which are linked to the calling job are to be deleted or – for shareable pools – all the links to the ISAM pool are to be canceled. If the pool link names still define links between pools and files for the calling job, the command will be rejected with an error message.

### **POOL-NAME = <name 1..8>(…)**

The specified ISAM pool is to be deleted. The ISAM pool is uniquely identified by the name, the catalog ID (see the CAT-ID operand) and the scope (see the SCOPE operand). If no ISAM pool was created as specified or no link to the pool was established (see the CREATE-ISAM-POOL command), the command is rejected with an error message.

### **CAT-ID = \*DEFAULT-PUBSET / <alphanumeric-name 1..4>**

Catalog ID of the pubset to which the ISAM pool is assigned.

### **CAT-ID = \*DEFAULT-PUBSET**

The ISAM pool is assigned to the catalog that was set with the ISPLDEFB system parameter ISPLDEFB (ISAM-POOL-DEFAULT-CATID):

X'00':	default catalog ID from the user entry (see the SHOW-USER-ATTRIBUTES command, <i>DEFAULT-PUBSET</i> output field)
X'01':	catalog ID of the home pubset

### **CAT-ID = <alphanumeric-name 1..4>**

Catalog ID of the specified ISAM pool.

### **SCOPE = \*TASK / \*HOST-SYSTEM / \*USER-ID / \*USER-GROUP**

Scope of the specified ISAM pool.

### **SCOPE = \*TASK**

The corresponding task-local ISAM pool, which can only be used by its own task, is to be deleted.

### **SCOPE = \*HOST-SYSTEM**

The corresponding cross-task ISAM pool, which can be used by all tasks, is to be deleted.

### **SCOPE = \*USER-ID / USER-GROUP**

These scopes are only supported for reasons of compatibility (see the "Note on ISAM pools" in section "DELETE-ISAM-POOL").

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	32	DMS0A17	Internal system error
	64	DMS0A0E	Syntax error in ISAM pool command
	64	DMS0A11	Specified catalog ID does not exist
	64	DMS0A13	Specified pool name is syntactically invalid
	64	DMS0A19	Specified ISAM pool does not exist
	64	DMS0A1A	Pool links to ISAM pool still exist
	64	DMS0A21	ISAM pool limit reached
	64	DMS0A22	User group does not exist
	130	DMS0A12	Specified catalog ID not available

## Examples

See the ADD-ISAM-POOL-LINK command.

---

## 3.6 DELETE-JV

Delete job variable

<b>Component:</b>	JV
<b>Functional area:</b>	Job variables
<b>Domain:</b>	JOB-VARIABLES
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or J (with NBCONOPI=Y)

This function is only available to the user if the chargeable software product JV has been loaded as a subsystem.

### Function

The DELETE-JV command is used to delete job variables cataloged under the user's own ID. Job variables that monitor a job (SET-LOGON-PARAMETERS, ENTER-JOB, ENTER-PROCEDURE) cannot be deleted until the job is completed (status indicator: \$T or \$A) or unless job monitoring is prematurely terminated with the MODIFY-JV-ATTRIBUTES command (MONJV-PROTECTION operand).

Job variables that are used in conditional job control (CJC) commands and macros are likewise protected against deletion (information can be obtained with the SHOW-CJC-STATUS command), i.e. a condition formulated in the ADD-CJC-ACTION or WAIT-EVENT commands or in the ONEVT macro continues to apply.

#### *Privileged functions*

The privileged functions for systems support (TSOS privilege) include specification of temporary or cataloged files of any user ID, the ability to ignore protection attributes of the job variable being deleted and, in the case of a user ID change, to branch to guided dialog.

By default, systems support (TSOS privilege) is a co-owner of all the job variables (and can, therefore, delete job variables under any user ID). When SECOS is used, this co-ownership can be restricted for permanent job variables.

```

## Operands

**JV-NAME = <filename 1..54 without-gen-vers with-wild(80)> / \*LINK(...)**

Specification identifying the job variable to be deleted. JVs to be deleted can be identified by name or link name. If the JV is protected by a password, the password must be specified (in the ADD-PASSWORD command). The password with the higher protection function should always be specified (write before read password).

**JV-NAME = <filename 1..54 without-gen-vers with-wild(80)>**

Name of the JV to be deleted. Nonprivileged users may only specify their own user ID without using wildcards. If no catalog ID is specified, the default catalog ID of the user ID concerned is selected. If the first character in the string is "\*", then it has to be entered twice.

**JV-NAME = \*LINK(...)**

The JV to be deleted is identified by a link name.

**LINK-NAME = <alphanum-name 1..7>**

Link name of the JV to be deleted.

The JV to be deleted must be cataloged under the user's own ID.

**IGNORE-PROTECTION = \*NONE / list-poss(4): \*ACCESS / \*EXPIRATION-DATE / \*READ-PASSWORD / \*WRITE-PASSWORD**

Specifies which protection attributes are to be ignored during deletion of a JV. The \*ACCESS entry also applies to BASIC-ACL and GUARDS protection.

*Only systems support (TSOS privilege) can delete JVs by entering the operand values \*READ-PASSWORD and \*WRITE-PASSWORD without entering the password.*

**PASSWORDS-TO-IGNORE = \*NONE / \*SECRET / list-poss(3): <x-string 1..8> / <c-string 1..4> / <integer -2147483648..2147483647>**

Allows the deletion of job variables that are protected by the specified passwords (write before read password). No entry is made in the password table.

The operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.
- The password entered is not logged.

**DIALOG-CONTROL =**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during the deletion process. Verification is advisable if the job variable name is partially qualified or specified with wildcards, thus enabling more than one job variable to be deleted (also unintentionally).

The verification dialog mechanism is available only in interactive mode, though that does include procedures. Each verification query can be answered with `response [ ,CHECK=mode ]`.

Answer	Effects
Y	The JV or JV set displayed in the query is to be deleted.
N	The JV or JV set displayed is not to be deleted.
T	The verification dialog is aborted. The job variables concerned are not deleted.
Other values	Same effect as "N"
<b>Optional suffix:</b>	<b>Effects</b>
,CHECK=mode	CHECK enables the setting for the verification dialog to be changed (corresponds to DIALOG-CONTROL). The following values can be specified for <mode>:
	SINGLE : corresponds to DIALOG-CONTROL=*JV-CHANGE
	MULTIPLE : corresponds to DIALOG-CONTROL=*USER-ID-CHANGE
	PVS : corresponds to DIALOG-CONTROL=*CATALOG-CHANGE
	NO : corresponds to DIALOG-CONTROL=*NO
	STD : corresponds to DIALOG-CONTROL=*STD

**DIALOG-CONTROL = \*STD**

Default value: corresponds to \*USER-ID-CHANGE in true interactive mode and to \*NO in procedures and in batch mode.

**DIALOG-CONTROL = \*NO**

All selected job variables are deleted without a verification dialog.

**DIALOG-CONTROL = \*JV-CHANGE**

A verification query occurs for each job variable to be deleted (message JVS0469).

---

**DIALOG-CONTROL = \*USER-ID-CHANGE**

A verification query occurs in each case for all job variables under one user ID that are to be deleted (message JVS0465). The query does not occur if only one job variable is to be deleted.

**DIALOG-CONTROL = \*CATALOG-CHANGE**

A verification query occurs in each case for all job variables of a subset that are to be deleted (message JVS0468). The query does not occur if only one job variable is to be deleted.

**OPTION = \*ALL / \*DATA**

Specifies whether the job variable entry or only the contents are to be deleted.

**OUTPUT = \*NO / \*SYSOUT**

Specifies whether the names of the deleted job variables are to be output.

**SUPPRESS-ERRORS = \*NONE / list-poss(3): <alphanumeric 7..7>**

In procedures, the user can specify whether the spin-off mechanism or SDF-P error handling is to be triggered every time an error occurs (apart from syntax errors), or whether specific error conditions are to be ignored.

**SUPPRESS-ERRORS = \*NONE**

All errors will trigger the spin-off mechanism or SDF-P error handling.

**SUPPRESS-ERRORS = list-poss(3): <alphanumeric 7..7>**

The user can define which errors are to be ignored by means of their DMS error codes (alphanumeric 7..7). If the specified error occurs, the spin-off mechanism will not be triggered. A maximum of 3 error codes may be specified. DMS error code: 7 characters, of which the first three are always "DMS"; the last 4 characters identify the error; the digits 0..9 and letters A..F are permitted. When error codes are entered, no check is made to verify that valid error codes have been specified.

A detailed list of valid JVS error codes can be found in the "JV" manual [20] or on the manual server (URL: <http://manuals.ts.fujitsu.com>) by means of an HTML application and on the "BS2000 SoftBooks" DVD.

**SELECT = \*ALL / \*BY-ATTRIBUTES(...)**

The job variable selection criteria. The following selection criteria are not relevant for displaying special job variables.

**SELECT = \*ALL**

Deletes all the job variables which the user is authorized to access.

**SELECT = \*BY-ATTRIBUTES(...)**

Restricts the job variables selected from the set specified by JV-NAME to those which satisfy the following specifications. The default value \*ANY for an attribute means that the job variable set is not to be restricted to particular values of that attribute.

**ACCESS = \*ANY / \*READ / \*WRITE**

Deletes job variables depending on the permitted access type.

**ACCESS = \*READ**

Deletes only those job variables for which write access is prohibited by ACCESS=READ, i.e. to which only read access is permitted.

**ACCESS = \*WRITE**

Deletes only those job variables for which write access is permitted.

**USER-ACCESS = \*ANY / list-poss(2): \*OWNER-ONLY / \*ALL-USERS**

Deletes job variables depending on whether they are shareable. If a user ID other than the user's own is specified, then implicitly USER-ACCESS=ALL-USERS.

---

**USER-ACCESS = \*OWNER-ONLY**

Deletes job variables which only the owner or co-owner may access.

**USER-ACCESS = \*ALL-USERS**

Deletes job variables which may also be accessed under other user IDs.

**PASSWORD = \*ANY / list-poss(3): \*NONE / \*READ-PASSWORD / \*WRITE-PASSWORD**

Deletes job variables depending on the password protection defined. If several types of password are specified as a list, the system will link them by logical Or, and will return information on all the job variables which satisfy any one of the specified conditions.

**PASSWORD = \*NONE**

Deletes job variables which have no password protection.

**PASSWORD = \*READ-PASSWORD**

Deletes job variables which are protected by a read password.

**PASSWORD = \*WRITE-PASSWORD**

Deletes job variables which are protected by a write password

**CREATION-DATE = \*ANY / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..991231>(…) / <date>(…) / \*INTERVAL(...)**

Deletes job variables on the basis of their creation date (CREATION-DATE); range specifications are inclusive of the specified limit values. It is meaningless to specify a CREATION-DATE which lies in the future!

**CREATION-DATE = \*TODAY(...)**

Deletes job variables which have today's date entered as the CREATION-DATE in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of job variables to a time interval related to the specified creation date.

**TIME = \*INTERVAL(...)**

Deletes job variables that were created on the specified day within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Deletes job variables for which the time of creation >= the specified time.

**TO = 23:59:59 / <time>**

Deletes job variables for which the time of creation >= the specified time.

**CREATION-DATE = \*YESTERDAY(...)**

Deletes job variables which have yesterday's date entered as the CREATION-DATE in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of job variables to a time interval related to the specified creation date.

**TIME = \*INTERVAL(...)**

Deletes job variables that were created on the specified day within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Deletes job variables for which the time of creation >= the specified time.

**TO = 23:59:59 / <time>**

Deletes job variables for which the time of creation >= the specified time.

---

**CREATION-DATE = <integer -99999..991231>(…)**

Deletes job variables which were created on the specified date. Here, the user can specify the creation date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0)

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of job variables to a time interval related to the specified creation date.

**TIME = \*INTERVAL(…)**

Deletes job variables that were created on the specified day within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Deletes job variables for which the time of creation >= the specified time.

**TO = 23:59:59 / <time>**

Deletes job variables for which the time of creation >= the specified time.

**CREATION-DATE = <date>(…)**

Deletes job variables which were created on the specified date.

The user can specify the creation date in the form [yy]yy-mm-dd.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of job variables to a time interval related to the specified creation date.

**TIME = \*INTERVAL(…)**

Deletes job variables that were created on the specified day within the specified time interval which follows.

**FROM = 00:00:00 / <time>**

Deletes job variables for which the time of creation >= the specified time.

**TO = 23:59:59 / <time>**

Deletes job variables for which the time of creation >= the specified time.

**CREATION-DATE = \*INTERVAL(…)**

Deletes job variables which were created within the specified time period. The upper and lower limits are both included in the range specified. See also the explanation of how dates are specified in the EXPIRATION-DATE=<integer ...> operand. It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = 1950-01-01 / <integer -99999..991231>(…) / \*TODAY(…) / \*YESTERDAY(…) / <date>(…)**

Deletes job variables which were created after the specified date (i.e. CREATION-DATE >= specified date).

**FROM = <integer -99999..991231>(…)**

Deletes job variables which were created after the specified date (i.e. CREATION-DATE >= specified date).

---

**TIME = 00:00:00 / <time>**

Time on the specified date. All job variables created at or after the specified time are selected.

**FROM = \*TODAY(...)**

Deletes job variables which were created after the specified date (i.e. CREATION-DATE >= current date).

**TIME = 00:00:00 / <time>**

Time on the specified date. All job variables created at or after the specified time are selected.

**FROM = \*YESTERDAY(...)**

Deletes job variables which were created after the specified date (i.e. CREATION-DATE >= date of preceding day).

**TIME = 00:00:00 / <time>**

Time on the specified date. All job variables created at or after the specified time are selected.

**FROM = <date>(…)**

Deletes job variables which were created after the specified date (i.e. CREATION-DATE >= specified date).

**TIME = 00:00:00 / <time>**

Time on the specified date. All job variables created at or after the specified time are selected.

**TO = \*TODAY(...)/ \*YESTERDAY(...)/ <integer -99999..991231>(…)/ <date>(…)**

Deletes job variables which were created before the specified date (i.e. CREATION-DATE <= specified date).

**TO = \*TODAY(...)**

Deletes job variables which were created before the specified date (i.e. CREATION-DATE <= current date).

**TIME = 23:59:59 / <time>**

Time on the specified date. All job variables created at or before the specified time are selected.

**TO = \*YESTERDAY(...)**

Deletes job variables which were created before the specified date (i.e. CREATION-DATE <= date of preceding day).

**TIME = 23:59:59 / <time>**

Time on the specified date. All job variables created at or before the specified time are selected.

**TO = <integer -99999..991231>(…)**

Deletes job variables which were created before the specified date (i.e. CREATION-DATE <= specified date).

**TIME = 23:59:59 / <time>**

Time on the specified date. All job variables created at or before the specified time are selected.

**TO = <date>(…)**

Deletes job variables which were created before the specified date (i.e. CREATION-DATE <= specified date).

**TIME = 23:59:59 / <time>**

Time on the specified date. All job variables created at or before the specified time are selected.

---

**EXPIRATION-DATE = \*ANY / \*TOMORROW(...) / \*TODAY(...) / \*YESTERDAY(...) / <integer -99999..991231>(…) / <date>(…) / \*INTERVAL(...)**

The EXPIRATION-DATE operand deletes job variables as a function of the “expiration date” (*EXPIR-DATE* output field), i.e. the date from which write accesses to the job variable are allowed. It is meaningful to specify a date in the future if retention periods are being queried.

**EXPIRATION-DATE = \*TOMORROW(...)**

Deletes job variables which have tomorrow’s date entered as the EXPIRATION-DATE in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of job variables to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Deletes job variables for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Deletes job variables for which the time of expiration  $\geq$  the specified time.

**TO = 23:59:59 / <time>**

Deletes job variables for which the time of expiration  $\leq$  the specified time.

**EXPIRATION-DATE = \*TODAY(...)**

Deletes only job variables which have today’s date entered as the EXPIRATION-DATE in their catalog entry

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of job variables to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Deletes job variables for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Deletes job variables for which the time of expiration  $\geq$  the specified time.

**TO = 23:59:59 / <time>**

Deletes job variables for which the time of expiration  $\leq$  the specified time.

**EXPIRATION-DATE = \*YESTERDAY(...)**

Deletes only job variables which have yesterday’s date entered as the EXPIRATION-DATE in their catalog entry.

**TIME = \*ANY / \*INTERVAL(...)**

Restricts the selection of job variables to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(...)**

Deletes job variables for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Deletes job variables for which the time of expiration  $\geq$  the specified time.

**TO = 23:59:59 / <time>**

Deletes job variables for which the time of expiration  $\leq$  the specified time.

---

**EXPIRATION-DATE = <integer -99999..991231>(…)**

Here, the user can specify the expiration date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits with preceding sign), the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0, TOMORROW corresponds to +1)

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of job variables to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(…)**

Deletes job variables for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Deletes job variables for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Deletes job variables for which the time of expiration <= the specified time.

**EXPIRATION-DATE = <date>(…)**

Deletes job variables for which exactly the specified date is entered as the EXPIRATION-DATE in the catalog entry. The user can specify the expiration date in the form [yy]yy-mm-dd.

**TIME = \*ANY / \*INTERVAL(…)**

Restricts the selection of job variables to a time interval related to the specified expiration date. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TIME = \*INTERVAL(…)**

Deletes job variables for which the expiration date lies within the specified interval that follows.

**FROM = 00:00:00 / <time>**

Deletes job variables for which the time of expiration >= the specified time.

**TO = 23:59:59 / <time>**

Deletes job variables for which the time of expiration <= the specified time.

**EXPIRATION-DATE = \*INTERVAL(…)**

Deletes only job variables whose expiration dates lie within the period specified below, i.e. files whose retention period expires after the specified period. The upper and lower limits are both included in the range specified. See also the explanation of how dates are specified in the EXPIRATION-DATE=<integer ...> operand. It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for information output can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = 1950-01-01 / <integer -99999..991231>(…) / <date>(…) / \*TOMORROW(…) / \*TODAY(…) / \*YESTERDAY(…)**

Deletes job variables for which the EXPIRATION-DATE >= the specified date.

**FROM = <integer -99999..991231>(…)**

Deletes job variables for which the EXPIRATION-DATE >= the specified date.

---

**TIME = 00:00:00 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = <date>(…)**

Deletes job variables for which the EXPIRATION-DATE >= the specified date.

**TIME = 00:00:00 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = TOMORROW(…)**

Deletes job variables for which the EXPIRATION-DATE >= date of the next day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = \*TODAY(…)**

Deletes job variables for which the EXPIRATION-DATE >= date of the current day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**FROM = \*YESTERDAY(…)**

Deletes job variables for which the EXPIRATION-DATE >= date of the preceding day.

**TIME = 00:00:00 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE after the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*ANY / \*TODAY(…) / \*TOMORROW(…) / \*YESTERDAY(…) / <integer -99999..991231>(…) / <date>(…)**

Deletes job variables for which the EXPIRATION-DATE <= the specified date.

**TO = \*ANY**

Specifies an open interval that starts with the EXPIRATION-DATE but has no upper limit.

**TO = \*TODAY(…)**

Deletes job variables for which the EXPIRATION-DATE <= date of the current day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*TOMORROW(…)**

Deletes job variables for which the EXPIRATION-DATE <= date of the next day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = \*YESTERDAY(...)**

Deletes job variables for which the EXPIRATION-DATE <= date of the preceding day.

**TIME = 23:59:59 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = <integer -99999..991231>(...)**

Deletes job variables for which the EXPIRATION-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**TO = <date>(...)**

Deletes job variables for which the EXPIRATION-DATE <= the specified date.

**TIME = 23:59:59 / <time>**

Time on the specified date. All job variables that have an EXPIRATION-DATE before the specified time are selected. Note that the time stamp for the EXPIRATION-DATE is always set to 00:00:00 at present!

**BASIC-ACL = \*ANY / \*NONE / \*YES / \*PARAMETERS(...)**

Deletes job variables whose BASIC-ACL entry matches the specified values.

**BASIC-ACL = \*NONE**

Deletes job variables that have no BASIC-ACL entry in the catalog.

**BASIC-ACL = \*YES**

Deletes job variables that have a BASIC-ACL entry in the catalog.

**BASIC-ACL = \*PARAMETERS(...)**

Deletes job variables for which the specified access rights are defined in the BASIC-ACL entry. NO-ACCESS means that no access rights have been defined.

**i** Access rights specified with the OWNER, GROUP and OTHERS operands within the \*PARAMETERS(...) structure are logically ORed.

**OWNER = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights must already be defined for the owner.

**OWNER = \*PARAMETERS(...)**

Access rights that must be present for the owner (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**GROUP = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for the owner's user group.

**GROUP = \*PARAMETERS(...)**

Access rights that must be present for the owner's user group (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**OTHERS = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for all other users.

**OTHERS = \*PARAMETERS(...)**

Access rights that must be present for all other users (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**GUARDS = \*ANY / \*NONE / \*YES / \*PARAMETERS(...)**

Deletes job variables for which access is controlled using GUARDS (see the CREATE-FILE or MODIFY-FILE-ATTRIBUTES command).

**GUARDS = \*NONE**

Deletes job variables that are not protected by GUARDS against unauthorized access.

**GUARDS = \*YES**

Deletes job variables that are protected by GUARDS against unauthorized access, i.e. for which access is controlled via GUARDS.

**GUARDS = \*PARAMETERS(...)**

Deletes job variables which are protected by GUARDS against unauthorized access as specified, i.e. job variables for which access control is implemented using GUARDS: Access to the job variable is controlled by a guard, i.e. a special object which contains all the conditions under which a user is granted access authorization (e.g. date, time, user ID). The GUARDS function unit of the chargeable software product SECOS (see the "SECOS" manual [35]) must be installed in order to create and maintain a guard. Each access mode can be controlled by a separate guard. If no guard (\*NONE) is defined for a given access mode, no corresponding access is permitted. If a defined guard is not accessible, the mode of access protected by it is not permitted. If the GUARDS subsystem is not available at the time of accessing the job variable, no access of any kind is allowed for the job variable.

**i** The values specified for the following READ and WRITE operands will be linked by logical AND.

**READ = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Deletes job variables which are protected against unauthorized read access by the specified guard. The default value \*ANY means that the selection of job variables is not based on read protection with a guard. \*NONE selects job variables for which no read guard was defined, i.e. job variables for which no read access is permitted.

**WRITE = \*ANY / \*NONE / <filename 1..18 without-cat-gen-vers>**

Deletes job variables which are protected against unauthorized write access by the specified guard. The default value \*ANY means that the selection of job variables is not based on a guard. \*NONE selects job variables for which no guard was defined, i.e. job variables for which no write access is permitted.

**MANAGEMENT-CLASS = \*ANY / \*NONE / <composed-name 1..8>**

Deletes job variables assigned the specified HSMS management class.

**MANAGEMENT-CLASS = \*NONE**

Deletes job variables with no HSMS management class assigned to them

**MANAGEMENT-CLASS = <composed-name 1..8>**

Deletes job variables assigned the specified HSMS management class.

**PROTECTION-ACTIVE = \*ANY / list-poss(3): \*LEVEL-0 / \*LEVEL-1 / \*LEVEL-2**

Deletes job variables for which the specified protection level is the highest activated access control.

When the job variable is accessed, the highest activated protection level applies. The following table shows the method used for access control, the protection attributes, and the job variable protection hierarchy (protection levels):

Access control method	Protection attribute	Prot. level
Standard access control	ACCESS and USER-ACCESS	0
Basic access control list	BASIC-ACL	1
Access control via guards	PASSWORD	2

Table 45: Hierarchy of access control methods

All other protection attributes of the job variable (e.g. passwords) are evaluated independently, without regard to the implemented protection level.

**PROTECTION-ACTIVE = \*LEVEL-0**

Deletes job variables for which access is controlled via standard access control.

**PROTECTION-ACTIVE = \*LEVEL-1**

Deletes job variables for which access is controlled via a basic access control list (BASIC-ACL protection)

**PROTECTION-ACTIVE = \*LEVEL-2**

Deletes job variables which are accessed via GUARDS.

**SIZE = \* ANY / <integer 0..256> / \*INTERVAL(...)**

Requests information on job variables depending on the length of their value.

**SIZE = <integer 0..256>**

Deletes job variables whose value is the specified number of bytes in length.

**SIZE = \*INTERVAL(...)**

Deletes job variables for which the length of the job variable value lies within the specified range. The upper and lower limits are both included in the range specified. See also the explanation of the operand **SIZE = <integer>** It is also possible to specify limits using only the operand **FROM** (lower limit) or **TO** (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for information output can only be meaningful if the chosen lower limit  $\leq$  the upper limit. Information will only be returned about job variables for which the length of the value is at least equal to the **FROM** value and at most equal to the **TO** value ( $\text{FROM} \leq \text{SIZE} \leq \text{TO}$ ).

**FROM = 0 / <integer 0..256>**

Deletes job variables for which the length of the value is at least the specified number of bytes (**SIZE**  $\geq$  specified value).

**TO = 256 / <integer 0..256>**

Deletes job variables for which the length of the value is at most the specified number of bytes (**SIZE**  $\leq$  specified value).

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	CMD0001	No action necessary
2	0	CMD0001	Command executed with a warning
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JVS04E0	Command not executable in the call environment; if possible, remove cause of error (see SYSOUT message JVS04xx)
	130	JVS04E1	Command cannot be executed at this time; for cause see SYSOUT message JVS04xx
	130	CMD2282	Subsystem JV not available for indefinite time

---

## 3.7 DELETE-OPERATOR-ROLE

Delete operator role

<b>Component:</b>	SRPMNUC
<b>Functional area:</b>	Operator function control
<b>Domain:</b>	SECURITY-ADMINISTRATION
<b>Privileges:</b>	SECURITY-ADMINISTRATION

### Function

This command is used to delete a list of routing (authorization) codes which has been compiled to form an “operator role” and stored in the user catalog of a pubset. An operator role corresponds to an area of work, and gives the exerciser of the role the right to issue the commands assigned to that area of work. Each area of work (= operator role) is represented by a set of authorization (routing) codes specified by the system administration; this may be any combination of the total of 40 authorization codes used in BS2000. The system administration uses the MODIFY-OPERATOR-ATTRIBUTES command to assign to each operator identification the operator roles which it may undertake.

The DELETE-OPERATOR-ROLE command can only be used to delete roles which are not assigned to any operator identification.

### Format

<b>DELETE-OPERATOR-ROLE</b>
<b>OPERATOR-ROLE</b> = list-poss(20): <name 1..8>
, <b>PUBSET</b> = <u>*HOME</u> / <cat-id 1..4>

### Operands

**OPERATOR-ROLE = list-poss(20): <name 1..8>**

Names of the operator roles to be deleted. In total, the names of 20 operator roles may be specified. These roles must not be assigned to any user ID (= operator identification) in the user catalog.

**PUBSET =**

Specifies the pubset from whose user catalog the role is to be deleted.

**PUBSET = \*HOME**

The operator role is to be deleted from the user catalog of the home pubset.

**PUBSET = <cat-id 1..4>**

Exact specification of the pubset from whose catalog the operator role is to be deleted.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
2	0	SRM6001	Command executed with a warning
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error
	130	SRM6030	Command cannot temporarily be executed

---

## 3.8 DELETE-PAGING-FILE

Delete paging file from disk

**Component:** BS2000 OSD/BC

**Functional area:** System control and optimization

**Domain:** SYSTEM-MANAGEMENT  
SYSTEM-TUNING

**Privileges:** OPERATING  
TSOS

**Routing code:** R

### Function

System support can use the DELETE-PAGING-FILE command to delete the paging file on a magnetic disk or on any volume of an SF pubset.

When the paging file is deleted, the space it was occupying is overwritten with binary zeros.

### Format

#### DELETE-PAGING-FILE

**VOLUME** = \***PUBSET**(...) / list-poss(256): <vsn 1..6>

\***PUBSET**(...)

| **PUBSET** = list-poss(256): <cat-id 1..4>

,**FORCE** = \***NO** / \***YES**

### Operands

**VOLUME** = \***PUBSET**(...)

Specifies one or more SD pubsets. The paging file is to be deleted on each volume of the specified SF pubsets.

**PUBSET** = list-poss(256): <cat-id 1..4>

Specifies the SF pubsets on which the paging files are to be deleted by their catalog ID.

**VOLUME** = list-poss(256): <vsn 1..6>

Identifies the disk from which the paging file is to be deleted by its volume serial number (VSN).

Up to 256 disks can be listed.

**FORCE** = \***NO** / \***YES**

Specifies whether the deletion of paging files on the home pubset or on volumes specified in the PAGING parameter service of the current system run should be forced. Other paging files are deleted irrespective of the specification made via the FORCE operand.

The default \*NO causes the command to be rejected for the paging files mentioned above if the startup paging area is smaller than 200 MB.

## FORCE = \*YES

*This setting should be selected only in exceptional circumstances.*

Paging files on the home pubset or on volumes specified on the PAGING parameter service of the current system run are deleted irrespective of the minimum size of the paging area.

**i** If the startup paging area is smaller than 200 MB, system startup is only possible in DIALOG mode. The paging volumes have to be entered individually.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command processing start without error
	32	EMM2800	Internal error Guaranteed messages: EMM2818, EMM2828
	64	EMM2802	The specified pubset is unknown and cannot be identified in the given configuration. Guaranteed message: EM2841
	64	EMM2805	Possible errors: <ul style="list-style-type: none"><li>• The pubset has not been imported.</li><li>• The MRSCAT entry of the pubset is missing.</li></ul> Guaranteed messages: EMM2820, EMM2824, EMM2838
	128	EMM2807	Operation cannot be performed due to lack of resources Guaranteed messages: EMM2819, EMM2829

### Note

When lists are specified, command processing is aborted in the event of an error with a return code of EMM2800 or EMM2807.

---

## Notes

- The pubset the disk belongs to must have been imported.
- Processing of the command may take a number of minutes. For that reason it is not executed in the calling task, but is delegated to a server task created specially for the purpose. The job completion message is delivered to the calling task asynchronously. If the calling task terminates before the completion message is delivered, the message is sent to the console instead.
- If more than one volume is specified (explicitly or by specifying a pubset) when the command is issued, a separate job is started for each volume.
- The deletion of paging files on the home pubset or on volumes specified in the PAGING parameter service of the current system run is critical in those cases, where the total size of the startup paging area is below 200 MB. This can happen if, during ongoing operation, paging files that are not used during startup are added with the EXTEND-PAGING-AREA command and if other paging files are deleted.

If the startup paging area is smaller than 200 MB, system startup is only possible in DIALOG mode. The paging volumes have to be entered individually. To avoid this, the home pubset should have paging files of sufficient size (>200 MB) or, in the case of the PAGING parameter service, the volume specification in the parameter file should get changed to still existing paging files.

## Example

Deleting the paging file from a disk with the volume serial number 2OSW.0:

```
/DELETE-PAGING-FILE VOLUME=2OSW.0
```

## 3.9 DELETE-SNAPSET

Delete Snapset

**Component:** BS2000 OSD/BC

**Functional area:** Pubset and MRSCAT management

**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
SNAPSET

**Privileges:** TSOS  
HSMS-ADMINISTRATION

### Function

The DELETE-SNAPSET command deletes one or all existing Snapsets for an imported pubset. When a Snapset is deleted, the individual volumes of the Snapset are cleared and removed from the Snapset catalog. When all existing Snapsets are deleted, the context required for Snapset operation is also removed: the Snapset catalog is deleted and the Snapset limit is set to zero.

### Format

**DELETE-SNAPSET**

**PUBSET** = <cat-id 1..4>

,**SNAPSET** = \*EARLIEST / <name 1..1 with-low> / <integer -52..-1> / \*ALL

### Operands

**PUBSET** = <cat-id 1..4>

Catalog ID of the pubset for which the specified Snapset is to be deleted.

**SNAPSET** = \*EARLIEST / <name 1..1 with-low> / <integer -52..-1> / \*ALL

Specifies which Snapsets are to be deleted.

When an ETERNUS is used, only the oldest Snapset can be deleted. This must be borne in mind when a Snapset which is to be deleted is specified explicitly using the Snapset ID or the relative age.

**SNAPSET** = \*EARLIEST

The oldest Snapset is deleted.

**SNAPSET** = <name 1..1 with-low>

Specifies the Snapset explicitly by means of the Snapset ID. The maximum of 52 pubsets are distinguished by means of Snapset IDs specified which comprise letters from the 26 lowercase letters a to z and the 26 uppercase letters A to Z.

**SNAPSET** = <integer -52..-1>

The Snapset to be deleted is specified by means of its relative age. The value -1 specifies the latest Snapset here.

**SNAPSET** = \*ALL

All Snapsets are deleted and the context for Snapset operation of this pubset is removed.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without errors
	32	CMD0216	No authorization
	64	DMS1351	Internal error
	64	DMS1386	Error in the memory request
	64	DMS1389	Error in MSCF communication
	64	DMS138B	No MRSCAT entry
	64	DMS138C	Pubset not accessible
	64	DMS13D5	The Snapset specified does not exist on the pubset
	64	DMS148F	GCF not loaded
1	64	DMS13D7	Internal error in Snapset management: Return code of GCF
2	64	DMS13D7	Internal error in Snapset management: Return code in the case of mount/demount
3	64	DMS13D7	Internal error in Snapset management: Return code when reading or writing the SVL
4	64	DMS13D7	Internal error in Snapset management: Return code when setting/resetting the reconfiguration lock
6	64	DMS13D7	Internal error in Snapset management: Return code of SHC-OSD
7	64	DMS13D7	Internal error in Snapset management: Return code of CCOPY
	64	DMS13DF	Subsystem SHC-OSD not available

---

## 3.10 DELETE-STORAGE-CLASS

Delete storage class definition

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Functions

The DELETE-STORAGE-CLASS command enables systems support to delete storage classes from the storage class catalog. If more than one storage class is specified, the SELECT operand can be used to restrict the set of storage classes being deleted to those with specific attributes. The DIALOG-CONTROL operand defines the conditions under which a dialog is conducted to verify that objects are to be deleted.

The SM pubset must have been imported to the local system (in exclusive or shared mode).

Before deleting a storage class, note that references to that storage class may still exist. The following types of reference are possible:

The storage class is already assigned to existing files. You can find out which files these are with the SHOW-FILE-ATTRIBUTES command and the STORAGE-CLASS selection criterion. Before deleting the storage class you should assign these files to another class or cancel their storage class assignment. Otherwise, the files might be given an inappropriate storage location if migrated with HSMS and then recalled.

The storage class is assigned to user IDs as their default storage class (see the MODIFY-USER-PUBSET-ATTRIBUTES command). You can find out which user IDs these are with the SHOW-USER-ATTRIBUTES command. Before deleting the storage class you should assign these user IDs a different default storage class or cancel the default storage class assignment. Otherwise, the users affected will have to specify a storage class or the file attributes explicitly when creating files in the pubset in question.

## Format

### DELETE-STORAGE-CLASS

```
STORAGE-CLASS-NAME = *ALL / <composed-name 1..8 with-wild>
,PUBSET = <cat-id 1..4>
,SELECT = *ALL / *PARAMETERS(...)
  *PARAMETERS(...)
    | FILE-ATTRIBUTES = *ANY / *PARAMETERS(...)
    |   *PARAMETERS(...)
    |     | IO-ATTRIBUTES = *ANY / *PARAMETERS(...)
    |     |   *PARAMETERS(...)
    |     |     | PERFORMANCE = *ANY / list-poss(3): *STD / *HIGH / *VERY-HIGH
    |     |     | ,USAGE = *ANY / list-poss(3): *READ-WRITE / *WRITE / *READ
    |     |     | ,DISK-WRITE = *ANY / list-poss(3): *STD / *IMMEDIATE / *BY-CLOSE
    |     |     | ,AVAILABILITY = *ANY / list-poss(2): *STD / *HIGH
    |     |     | ,FILE-PREFORMAT = *ANY / list-poss(4): *BY-PUBSET-DEFAULT / *K / *NK2 / *NK4
    |     |     | ,WORK-FILE = *ANY / list-poss(2): *NO / *YES
    |     |     | ,VOLUME-SET-LIST = *ANY / *NONE / <composed-name 1..8>
    | ,DIALOG-CONTROL = *STD / *NO / *ERROR / *CLASS-CHANGE / *MORE-THAN-ONE-CLASS
```

## Operands

**STORAGE-CLASS-NAME** = \***ALL** / <composed-name 1..8 with-wild>

Specifies which storage classes to delete.

**STORAGE-CLASS-NAME** = \***ALL**

The storage classes to delete are all those which are assigned to the pubset specified in the PUBSET operand and which also meet the selection criteria defined in the SELECT operand.

**STORAGE-CLASS-NAME** = <composed-name 1..8 with-wild>

Name of the storage class that is to be deleted. Wildcards can be used to select more than one storage class. The storage classes to delete are all those specified here which are assigned to the pubset specified in the PUBSET operand and which also meet the selection criteria defined in the SELECT operand.

**PUBSET** = <cat-id 1..4>

Catalog ID of the associated SM pubset. The SM pubset must have been imported to the local system (in exclusive or shared mode).

---

**SELECT = \*ALL / \*PARAMETERS(...)**

Specifies whether the set of storage classes specified in the STORAGE-CLASS-NAME operand is to be restricted by selection criteria.

**SELECT = \*ALL**

There is no restriction on the set of storage classes specified in the STORAGE-CLASS-NAME operand.

**SELECT = \*PARAMETERS(...)**

Defines selection criteria to restrict the set of storage classes specified in the STORAGE-CLASS-NAME operand. Only those storage classes which possess all the attributes specified next are to be deleted. The default value, \*ANY, means that the attribute in question is not a selection criterion.

**FILE-ATTRIBUTES = \*ANY / \*PARAMETERS(...)**

Specifies whether the selection of storage classes to delete is to be based on the file attributes defined in them.

**FILE-ATTRIBUTES = \*ANY**

The file attributes are not a selection criterion.

**FILE-ATTRIBUTES = \*PARAMETERS(...)**

The storage classes which are to be deleted are selected on the basis of the file attributes specified next.

**IO-ATTRIBUTES = \*ANY / \*PARAMETERS(...)**

Specifies whether the performance attributes are to be a selection criterion.

**IO-ATTRIBUTES = \*PARAMETERS(...)**

The storage classes which are to be deleted must have definitions containing the performance attributes specified next.

**PERFORMANCE = \*ANY / list-poss(3): \*STD / \*HIGH / \*VERY-HIGH**

Deletes all storage classes which possess one of the specified performance attributes.

**PERFORMANCE = \*ANY**

The performance attribute is not a selection criterion.

**PERFORMANCE = \*STD**

Deletes only those storage classes which have their performance attribute set to \*STD (no special performance requirement).

**PERFORMANCE = \*HIGH**

Deletes only those storage classes which have their performance attribute set to \*HIGH (high performance requirement).

**PERFORMANCE = \*VERY-HIGH**

Deletes only those storage classes which have their performance attribute set to \*VERY-HIGH (highest performance requirement).

**USAGE = \*ANY / list-poss(3): \*READ-WRITE / \*WRITE / \*READ**

Deletes all storage classes which have the performance attribute set for one of the specified I/O operations.

**USAGE = \*ANY**

The I/O operation mode is not a selection criterion.

**USAGE = \*READ-WRITE**

Deletes only those storage classes which have their performance attribute set for read/write operations.

---

**USAGE = \*WRITE**

Deletes only those storage classes which have their performance attribute set for write operations.

**USAGE = \*READ**

Deletes only those storage classes which have their performance attribute set for read operations.

**DISK-WRITE = \*ANY / list-poss(3): \*STD / \*IMMEDIATE / \*BY-CLOSE**

Specifies whether the attribute governing the time when data consistency is required after write operations is to be a selection criterion.

**DISK-WRITE = \*ANY**

The point at which data consistency is required is not a selection criterion.

**DISK-WRITE = \*STD**

Deletes only those storage classes which have their consistency point defined as DISK-WRITE=\*STD.

**DISK-WRITE = \*IMMEDIATE**

Deletes only those storage classes which have their consistency point defined as immediately after completion of write operations.

**DISK-WRITE = \*BY-CLOSE**

Deletes only those storage classes which have their consistency point defined as only after CLOSE processing.

**AVAILABILITY = \*ANY / list-poss(2): \*STD / \*HIGH**

Specifies whether the availability attribute is to be a selection criterion.

**AVAILABILITY = \*ANY**

The required availability is not to be a selection criterion.

**AVAILABILITY = \*STD**

Deletes only those storage classes for which no special availability requirements are defined.

**AVAILABILITY = \*HIGH**

Deletes only those storage classes for which high availability requirements are defined.

**FILE-PREFORMAT = \*ANY / list-poss(4): \*BY-PUBSET-DEFAULT / \*K / \*NK2 / \*NK4**

Specifies whether the attribute for preferred file format is to be a selection criterion.

**FILE-PREFORMAT = \*ANY**

The preferred file format is not to be a selection criterion.

**FILE-PREFORMAT = \*BY-PUBSET-DEFAULT**

Deletes only those storage classes for which the preferred file format is defined as the pubset-global default.

**FILE-PREFORMAT = \*K**

Deletes only those storage classes in which files are set to be created as K files.

**FILE-PREFORMAT = \*NK2**

Deletes only those storage classes in which files are set to be created as NK2 files.

**FILE-PREFORMAT = \*NK4**

Deletes only those storage classes in which files are set to be created as NK4 files.

---

**WORK-FILE = \*ANY / list-poss(2): \*NO / \*YES**

Specifies whether the work file attribute is to be a selection criterion.

**WORK-FILE = \*ANY**

The work file attribute is not to be a selection criterion.

**WORK-FILE = \*NO**

Deletes only those storage classes in which files are created as normal files.

**WORK-FILE = \*YES**

Deletes only those storage classes in which files are created as work files.

**VOLUME-SET-LIST = \*ANY / \*NONE / <composed-name 1..8>**

Specifies whether the storage classes are to be selected on the basis of volume set list assignment.

**VOLUME-SET-LIST = \*ANY**

Volume set list assignment is not to be a selection criterion.

**VOLUME-SET-LIST = \*NONE**

Deletes only those storage classes to which no volume set list is assigned.

**VOLUME-SET-LIST = <composed-name 1..8>**

Deletes only those storage classes to which the specified volume set list is assigned.

**DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*CLASS-CHANGE / \*MORE-THAN-ONE-CLASS**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during the deletion process.

The verification dialog mechanism is available only in interactive mode, though that does include procedures. In batch mode, all values have the same effect as \*NO.

Systems support can intervene with the following inputs:

Y	the specified storage class or storage class set will then be deleted.
N	the specified storage class or storage class set will not be deleted.
T	processing of the command will be terminated.
S	the specified storage class or storage class set will be displayed. The verification dialog will then be repeated.
?	the possible responses will be listed, with an explanation of each.

**DIALOG-CONTROL = \*STD**

The default \*STD setting is equivalent to \*MORE-THAN-ONE-FILE in an interactive dialog (when SYSCMD is connected to the terminal) and to \*NO in procedures and in batch mode.

**DIALOG-CONTROL = \*NO**

Systems support cannot intervene in DELETE-STORAGE-CLASS processing; all the specified files will be deleted (without a verification dialog).

**DIALOG-CONTROL = \*ERROR**

If deletion of the selected storage classes proceeds without error, all the storage classes will be deleted

immediately, as when \*NO is specified (i.e. no verification dialog). However, if a correctable error occurs during deletion, then a verification dialog takes place for each storage class which it was not possible to delete. In batch mode, this value has the same effect as \*NO.

**DIALOG-CONTROL = \*CLASS-CHANGE**

A verification dialog is conducted for each storage class selected. In batch mode this value has the same effect as \*NO.

**DIALOG-CONTROL = \*MORE-THAN-ONE-CLASS**

If exactly one storage class is specified or identified by the selection criteria, this will be deleted immediately. If more than one storage class is to be deleted, a verification dialog is conducted for the set which is to be deleted. In batch mode, this value has the same effect as \*NO.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	1	CMD0202	Syntax error in command
	32	CMD0221	Internal system error
	64	CMD0216	No authorization to issue command
	64	DMS1481	Error accessing storage class catalog
	64	DMS1483	Storage class catalog invalid
	64	DMS1485	Pubset not known
	64	DMS1486	Pubset is not a system-managed pubset
	64	DMS1487	Pubset not available
	64	DMS148A	Storage class not defined
	64	DMS1490	Storage class management not available for this pubset
	64	DMS149A	No storage classes meet the selection criteria
	64	DMS149C	No storage class exists for the specified pubset
	129	DMS148D	Not enough class 4/5 memory
	129	DMS148E	Error on MSCF connection to master
	129	DMS148F	GCF subsystem not ready

---

## 3.11 DELETE-SYSTEM-FILE

Delete system file

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job processing File processing
<b>Domain:</b>	FILE JOB PROCEDURE PROGRAM
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The DELETE-SYSTEM-FILE command deletes the contents of a system file logically. If a file has been allocated to the system file to be deleted, the contents of that file will be logically deleted, but the allocation will remain in effect. This enables the user to delete an allocated file without removing the allocation to a system file. The DELETE-FILE command cannot be used on the allocated file since the file is open.

If the logical system file SYSLST is specified, only the part that was created after the last COPY-SYSTEM-FILE command can be deleted, regardless of whether the COPY-SYSTEM-FILE command was executed successfully.

See [section "System files" in chapter "Volume 1: General Part"](#) and the description of the COPY-SYSTEM-FILE command.

## Format

**DELETE-SYSTEM-FILE**

Alias: **DLSF**

**SYSTEM-FILE** = \*SYSLST / \*SYSOUT / \*OMF / \*SYSLST-NUMBER(...) / \*ALL-SYS(...)

\*SYSLST-NUMBER(...)

| **SYSLST-NUMBER** = <integer 1..99> / <filename 1..2 with-wild(73)>

\*ALL-SYS(...)

| **SYS-IDENTIFIER** = <filename 1..3 with-wild(76)>

,**DIALOG-CONTROL** = \*STD / \*NO / \*ERROR / \*FILE-CHANGE / \*MORE-THAN-ONE-FILE

,**OUTPUT** = \*STD / \*NO / \*SYSOUT

,**SUPPRESS-ERRORS** = \*NONE / list-poss(3): <alphanum-name 7..7>

## Operands

**SYSTEM-FILE = \*SYSLST / \*SYSOUT / \*OMF / \*SYSLST-NUMBER(...) / \*ALL-SYS(...)**

The name of the system file to be deleted.

The contents of the specified system file, or the (cataloged) SAM file allocated to it, will be logically deleted.

Any existing allocation will be retained. After its deletion, data will be written to the file starting at its beginning.

**SYSTEM-FILE = \*SYSLST**

The contents of the specified system file, or the (cataloged) SAM file allocated to it, will be logically deleted.

**SYSTEM-FILE = \*SYSOUT**

The contents of the specified system file, or the (cataloged) SAM file allocated to it, will be logically deleted.

**SYSTEM-FILE = \*OMF**

Deletes the EAM object module file, which is produced and used by the language processor, for the job currently running. If this file is empty, the command will be ignored. This case does not trigger a spin-off mechanism or SDF-P error handling in procedures.

**SYSTEM-FILE = \*SYSLST-NUMBER(...)**

The contents of the allocated SAM file will be logically deleted. The existing allocation will be retained; after its deletion, data will be written to the file starting at its beginning. The command will be rejected if the system file SYSLST-NUMBER is not allocated to a (cataloged) SAM file.

**SYSLST-NUMBER = <integer 1..99> / <filename 1..2 with-wild(73)>**

The number of the SYSLST file which is to be deleted. This must always be given as a two-digit number. Several numbers may be specified by using a sequence of wildcards.

**SYSTEM-FILE = \*ALL-SYS(...)**

Enables several system output files to be deleted simultaneously.

**SYS-IDENTIFIER = <filename 1..3 with-wild(76)>**

Deletes one or more system output files, which can be specified by a sequence of wildcards. The name of the system file is specified without its SYS prefix, e.g. LST for the SYSLST system file.

---

## **DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*FILE-CHANGE /\*MORE-THAN-ONE-FILE**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during the deletion process.

The verification dialog mechanism is available only in interactive mode, though that does include procedures. The only operand value that you can specify in batch mode is \*STD or \*NO.

The user can intervene with the following inputs:

- Y: the specified file or file set will then be deleted.
- N: the specified file or file set will not be deleted.
- T: processing of the command will be terminated.
- ?: the possible responses will be listed, with an explanation of each.

In addition, the following options can be specified, separated by commas:

- ,CHECK = NO  
The DIALOG-CONTROL mode will be changed to '\*NO'.
- ,CHECK = MULTIPLE  
The DIALOG-CONTROL mode will be changed to '\*MORE-THAN-ONE-FILE'.
- ,CHECK = SINGLE  
The DIALOG-CONTROL mode will be changed to '\*FILE-CHANGE'.
- ,CHECK = ERROR  
The DIALOG-CONTROL mode will be changed to '\*ERROR'.
- ,IGNORE = list-poss(2): ACCESS / EXDATE  
Specifies which protection attributes are to be ignored during deletion.
- ,PASSWORD = list-poss(3): <c-string 1..4> / <x-string 1..8> /<integer -2147483648..2147483647>  
Enables password-protected files to be deleted (maximum of 3 passwords).

### **DIALOG-CONTROL = \*STD**

The default \*STD setting is equivalent to \*MORE-THAN-ONE-FILE in an interactive dialog (when SYSCMD is connected to the terminal) and to \*NO in procedures and in batch mode.

### **DIALOG-CONTROL = \*NO**

The user cannot intervene in DELETE-SYSTEM-FILE processing; all the specified files will be deleted.

### **DIALOG-CONTROL = \*ERROR**

If deletion of the selected files proceeds without error, they will be deleted immediately, as when \*NO is specified (i. e. no verification dialog). However, if a user-correctable error occurs, then a verification dialog takes place as for DIALOG-CONTROL=\*FILE-CHANGE. In the event of an error, the user may acknowledge the error message, abort DELETE-SYSTEM-FILE processing or attempt to rectify the error. If he wishes, he can also change the DIALOG-CONTROL mode (see also the possible forms of intervention listed under the first DIALOG-CONTROL operand).

### **DIALOG-CONTROL = \*FILE-CHANGE**

For each system file to be deleted, the user has the intervention options described under the first DIALOG-CONTROL operand. For each file which is to be processed, the user can decide in a dialog whether it should be deleted or not (response: YES/NO). If in the dialog he specifies protection attributes under "IGNORE", or one or more passwords under "PASSWORD", these will be taken into account for any selected file and, if satisfied, the file will be deleted without further queries ("YES" must also be specified). The user can also abort DELETE-SYSTEM-FILE processing, or change the DIALOG-CONTROL mode.

---

**DIALOG-CONTROL = \*MORE-THAN-ONE-FILE**

If exactly one system file is specified, this file will be deleted immediately. If SYSTEM-FILE is partially qualified, which means that more than one file is selected, or if "pathname" contains wildcards, the user can decide, each time the catalog ID changes, whether files from the new catalog are to be deleted (see the intervention options described for the first of the DIALOG-CONTROL operands). He must respond to the question issued by the system with "YES" or "NO". DIALOG-CONTROL = \*MORE-THAN-ONE-FILE is useful if wildcards are specified for "catid" in the FILE-NAME operand. In the dialog, DELETE-SYSTEM-FILE processing can be terminated, or the DIALOG-CONTROL mode can be changed.

**OUTPUT = \*STD / \*NO / \*SYSOUT**

The user can specify whether a message (DMS0800) with the name of the deleted file is to be output to SYSOUT for each successful deletion. The default setting \*STD is equivalent to OUTPUT=\*NO.

**OUTPUT = \*NO**

No messages are output to SYSOUT for successfully deleted files.

**OUTPUT = \*SYSOUT**

For each file that is successfully deleted, a message with the name of that file is output to SYSOUT.

**SUPPRESS-ERRORS = \*NONE / list-poss(3): <alphanum-name 7..7>**

In procedures the user can specify whether the spin-off mechanism or SDF-P error handling is to be triggered every time an error occurs (apart from syntax errors), or whether specific error conditions are to be ignored.

**SUPPRESS-ERRORS = \*NONE**

All errors will trigger the spin-off mechanism or SDF-P error handling. The deletion of an empty system file is not treated as an error.

**SUPPRESS-ERRORS = list-poss(3): <alphanum-name 7..7>**

The user can define which errors are to be ignored by means of their DMS error codes (alphanum-name 7..7). If the specified error occurs, the spin-off mechanism will not be triggered. A maximum of 3 error codes may be specified. DMS error code: 7 characters, of which the first three are always "DMS"; the last 4 characters identify the error; the digits 0..9 and letters A..F are permitted. When error codes are entered, no check is made to verify that valid error codes have been specified.

A detailed list of valid DMS error codes can be found on the manual server (URL: <http://bs2manuals.ts.fujitsu.com>) by means of an HTML application and on the "BS2000 SoftBooks" DVD.

---

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
1	0	CMD0001	No action required
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing.
	64	DMS0572	SYSLST file not allocated to DMS file
	64	DMS0574	DMS error when deleting a system file Guaranteed message: DMS0574
	64	DMS0587	Use of the specified command has been restricted by systems support
	130	DMS0524	System address space exhausted
	130	DMS0594	Not enough virtual memory available

## 3.12 DELETE-TAPE-SET

Release volume serial number set (tape set)

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING  
**Routing code:** \$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The DELETE-TAPE-SET command is used to release the set of volumes specified by means of the CREATE-TAPE-SET or EXTEND-TAPE-SET command.

### Format

**DELETE-TAPE-SET**

**TAPE-SET-NAME** = <alphanum-name 1..4>

### Operands

**TAPE-SET-NAME** = <alphanum-name 1..4>

Name of the tape set.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	During processing a status was reported that renders continuation of the function impossible.
	32	CMD05C7	Unexpected internal error in DMS
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS06FF	BCAM connection severed
	130	DMS0524	System address space exhausted

---

## 3.13 DELETE-VARIABLE

Delete variable

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

### Function

DELETE-VARIABLE deletes the declaration of an S variable within the current scope, i.e. including the declarations of imported task variables.

The name of the S variable can no longer be used, and its value is deleted.

Either simple or complex variables can be deleted, but not individual elements of complex variables.

The following variable declarations cannot be deleted using DELETE-VARIABLE:

- procedure parameters
- elements of complex variables
- system variables (e.g. SYSWITCH)
- container JVs
- nonpermanent container variables
- structure layouts

#### *Note*

In such cases, error message SDP1098 is only output if no wildcards are specified in the variable name.

### Format

<b>DELETE-VARIABLE</b>
<b>VARIABLE-NAME</b> = <structured-name 1..20 with-wild(40)> / list-poss(2000): <structured-name 1..20>

---

## Operands

### **VARIABLE-NAME =**

Name of the S variable to be deleted.

### **VARIABLE-NAME = <structured-name 1..20 with-wild(40)>**

All the S variables which match this search pattern are deleted.

### **VARIABLE-NAME = list-poss(2000):<structured-name 1..20>**

List of S variables to be deleted.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	CMD0001	Warning; nothing executed
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	CMD0216	Do not have required privilege
	64	SDP0091	Semantic error
	130	SDP0099	No further address space available

---

## 3.14 DELETE-VOLUME-SET-LIST

Delete volume set list

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

The DELETE-VOLUME-SET-LIST command enables systems support to delete volume set lists from the volume set list catalog. If more than one volume set list is specified, the SELECT operand can be used to restrict the set of volume set lists being deleted to those containing specific volume sets. The DIALOG-CONTROL operand defines the conditions under which a dialog is conducted to verify that objects are to be deleted.

The SM pubset must have been imported to the local system (in exclusive or shared mode).

### Format

#### DELETE-VOLUME-SET-LIST

```
VOLUME-SET-LIST-NAME = *ALL / <composed-name 1..8 with-wild>  
,PUBSET = <cat-id 1..4>  
,SELECT = *ALL / *BY-VOLUME-SET(...)  
    *BY-VOLUME-SET(...)  
        | ENTRY = list-poss(255): <cat-id 1..4>  
,DIALOG-CONTROL = *STD / *NO / *ERROR / *LIST-CHANGE / *MORE-THAN-ONE-LIST
```

### Operands

**VOLUME-SET-LIST-NAME = \*ALL / <composed-name 1..8 with-wild>**

Specifies which volume set lists to delete.

**VOLUME-SET-LIST-NAME = \*ALL**

The volume set lists to delete are all those which are assigned to the pubset specified in the PUBSET operand and which also meet the selection criteria defined in the SELECT operand.

**VOLUME-SET-LIST-NAME = <composed-name 1..8 with-wild>**

Name of the volume set list that is to be deleted. Wildcards can be used to select more than one volume set list.

The volume set lists to delete are all those specified here which are assigned to the pubset specified in the PUBSET operand and which also meet the selection criteria defined in the SELECT operand.

---

**PUBSET = <cat-id 1..4>**

Catalog ID of the associated SM pubset. The SM pubset must have been imported to the local system (in exclusive or shared mode).

**SELECT = \*ALL / \*BY-VOLUME-SET(...)**

Specifies whether the set of volume set lists specified in the VOLUME-SET-LIST-NAME operand is to be restricted by selection criteria.

**SELECT = \*BY-VOLUME-SET(...)**

The selection is to be restricted to volume set lists which contain any of the volume sets specified next.

**ENTRY = list-poss(255): <cat-id 1..4>**

Volume set ID.

Up to 255 volume sets can be listed.

**DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*LIST-CHANGE / \*MORE-THAN-ONE-LIST**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during the deletion process.

The verification dialog mechanism is available only in interactive mode, though that does include procedures. In batch mode all values have the same effect as \*NO.

Systems support can intervene with the following inputs:

Y	the specified volume set list or set of volume set lists will then be deleted.
N	the specified volume set list or set of volume set lists will not be deleted.
T	processing of the command will be terminated.
S	the specified volume set list or set of volume set lists will be displayed. The verification dialog will then be repeated.
?	the possible responses will be listed, with an explanation of each.

**DIALOG-CONTROL = \*STD**

The default \*STD setting is equivalent to \*MORE-THAN-ONE-FILE in an interactive dialog (when SYSCMD is connected to the terminal) and to \*NO in procedures and in batch mode.

**DIALOG-CONTROL = \*NO**

Systems support cannot intervene in DELETE-VOLUME-SET-LIST processing; all the specified volume set lists will be deleted (without a verification dialog).

**DIALOG-CONTROL = \*ERROR**

If deletion of the selected volume set lists proceeds without error, all the volume set lists will be deleted immediately, as when \*NO is specified (i.e. no verification dialog). However, if a correctable error occurs during deletion, then a verification dialog takes place for each volume set list which it was not possible to delete.

In batch mode this value has the same effect as \*NO.

**DIALOG-CONTROL = \*LIST-CHANGE**

A verification dialog is conducted for each volume set list selected.

In batch mode this value has the same effect as \*NO.

---

**DIALOG-CONTROL = \*MORE-THAN-ONE-LIST**

If exactly one volume set list is specified or identified by the selection criteria, this will be deleted immediately. If more than one volume set list is to be deleted, a verification dialog is conducted for the set which is to be deleted. In batch mode this value has the same effect as \*NO.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	1	CMD0202	Syntax error in command
	32	CMD0221	Internal system error
	64	CMD0216	No authorization to issue command
	64	DMS1482	Error accessing volume set list catalog
	64	DMS1484	Volume set list catalog invalid
	64	DMS1485	Pubset not known
	64	DMS1486	Pubset is not a system-managed pubset
	64	DMS1487	Pubset not available
	64	DMS148B	Volume set list not defined
	64	DMS1490	Storage class management not available for this pubset
	64	DMS149B	No volume set lists meet the selection criteria
	64	DMS149C	No volume set list exists for the specified pubset
	129	DMS148D	Not enough class 4/5 memory
	129	DMS148E	Error on MSCF connection to master
	129	DMS148F	GCF subsystem not ready

---

## 3.15 DETACH-DEVICE

Detach hardware units

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Device management
<b>Domain:</b>	DEVICE
<b>Privileges:</b>	OPERATING
<b>Routing code:</b>	G

### Function

This command enables the operator to detach one or more hardware units, i.e. prohibit the operating system from using these units.

#### *Effect of the DETACH-DEVICE command*

1. Each of the hardware units specified assumes (if permitted) the state “detached explicitly”. In this case, the hardware units cannot be used by the system for input/output.
2. All relevant outward connections assume the state “removed implicitly”. These connections cannot be used.
3. Each outer unit none of whose internal connections is in the “included” state is placed in the state “detached implicitly”. The unit cannot be used.
4. If the units to be detached are hardware units with corresponding SVP actions, these actions are initiated. The units are placed in the configuration state “detached”, regardless of whether these actions are successful.
5. If a device which is capable of forming a path group is detached then the path group for this device is eliminated. If a channel or controller is detached then the path groups of all the connected devices are eliminated.
6. If a PAV device (**P**arallel **A**ccess **V**olumes, see the “Introduction to System Administration” [14]) is detached then the following applies:  
If a base device is detached, the associated alias devices switch to the “not ready” status and are implicitly detached. Alias devices can also be explicitly detached by means of the DETACH-DEVICE command.
7. If a FastDPAV base device is detached, all associated alias devices are not detached implicitly (see the manual “Introduction to System Administration” [14]).
8. For a FastDPAV alias device in the configuration state ENABLED, the state DISABLED can be set by means of the DETACH-DEVICE command.

## Format

### DETACH-DEVICE

**UNIT** = \*CPU(...) / \*EXTRA-CPU(...) / \*CHANNEL(...) / \*CONTROLLER(...) /

\*CHANNEL-RANGE(...) / \*DEVICE-RANGE(...) / \*PUBSET-DEVICES(...) /

list-poss(255): <alphanum-name 2..2> / <x-text 4..4>

\*CPU(...)

| **CPU-IDENTIFIER** = list-poss(16): <x-text 2..2>

\*EXTRA-CPU(...)

| **CPU-IDENTIFIER** = \*ALL / \*ANY / <x-text 2..2>

\*CHANNEL(...)

| **CHANNEL-PATH-ID** = list-poss(16): <x-text 2..2>

| **,SCOPE** = \*OWN-SYSTEM-ONLY / \*VM2000-GLOBAL

\*CONTROLLER(...)

| **CONTROLLER-UNIT** = list-poss(16):<alphanum-name 2..2> / <x-text 4..4>

| **,SCOPE** = \*OWN-SYSTEM-ONLY / \*VM2000-GLOBAL

\*CHANNEL-RANGE(...)

| **FROM** = <x-text 2..2>

| **,TO** = <x-text 2..2>

| **,SCOPE** = \*OWN-SYSTEM-ONLY / \*VM2000-GLOBAL

\*DEVICE-RANGE(...)

| **FROM** = <alphanum-name 2..2> / <x-text 4..4>

| **,TO** = <alphanum-name 2..2> / <x-text 4..4>

\*PUBSET-DEVICES(...)

| **PUBSET** = list-poss(255): <cat-id 1..4> / \*BY-PUBRES-DEVICE(...)

| \*BY-PUBRES-DEVICE(...)

| **UNIT** = list-poss(255): <alphanum-name 2..2> / <x-text 4..4>

**,FORCE** = \*STD / \*YES / \*NO(...) / \*UNCONDITIONAL-OFFLINE

\*NO(...)

| **WAIT** = \*NO / \*STD / <integer 1..32767>(…)

---

	<integer 1..32767>(…)
	<b>DIM = *STD / *MIN / *SEC</b>

## Operands

### UNIT =

Specifies the hardware units to be detached from the system.

### UNIT = \*CPU(…)

Specifies the CPU to be detached.

#### **CPU-IDENTIFIER = list-poss(16): <x-text 2..2>**

Specifies the CPU identifier.

### UNIT = \*EXTRA-CPU(…)

Specifies the extra CPU that is to be detached.

#### **CPU-IDENTIFIER = \*ALL / \*ANY / <x-text 2..2>**

Specifies the identifier of the extra CPU. \*ANY detaches one available extra CPU. \*ALL detaches all available extra CPUs.

### UNIT = \*CHANNEL(…)

Specifies the channel to be detached.

#### **CHANNEL-PATH-ID = list-poss(16): <x-text 2..2>**

Specifies the channel path ID of the channel. In the case of channels, the device code (MN) is the same as the hexadecimal channel path ID.

#### **SCOPE =**

Specifies how the command is to be executed under VM2000.

#### **SCOPE = \*OWN-SYSTEM-ONLY**

The command is only executed in the local system.

#### **SCOPE = \*VM2000-GLOBAL**

If entered on the Monitor System (SU /390 and S server), the command is executed on all guest systems. If entered at another guest system or at the Monitor System (SU x86), the command is rejected with the message NKR0178.

The command is rejected if one of the guest systems is protected against global detachment (system parameter VMGIORAL=NO) and the channel that is to be detached does not yet possess the status DETACHED (unless FORCE= \*UNCONDITIONAL-OFFLINE has been specified).

### UNIT = \*CONTROLLER(…)

Specifies the controller to be detached.

#### **CONTROLLER-UNIT = list-poss(16): <alphanum-name 2..2> / <x-text 4..4>**

Specifies the mnemonic device code (MN) of the controller to be detached.

#### **SCOPE =**

Specifies how the command is to be executed under VM2000.

#### **SCOPE = \*OWN-SYSTEM-ONLY**

The command is only executed in the local system.

---

**SCOPE = \*VM2000-GLOBAL**

If entered on the Monitor System (SU /390 and S server), the command is executed on all guest systems. If entered at another guest system or at the Monitor System (SU x86), the command is rejected with the message NKR0178.

The command is rejected if one of the guest systems is protected against global detachment (system parameter VMGIORAL=NO) and the controller that is to be detached does not yet possess the status DETACHED.

**UNIT = \*CHANNEL-RANGE(...)**

Specifies a set of channels to be detached.

*Note*

In the case of channels, the device code (MN) is the same as the hexadecimal channel path ID.

**FROM = <x-text 2..2>**

Specifies the channel path ID of the first channel in the set of channels to be detached.

**TO = <x-text 2..2>**

Specifies the channel path ID of the first (FROM) and last (TO) channel in the set of channels to be detached. The following rules apply:  $chn_1 -id < chn_2 -id$  and  $chn_2 -id - chn_1 -id < 64$ , i.e. a maximum of 64 channels can be detached at a time.

**SCOPE =**

Specifies how the command is to be executed under VM2000.

**SCOPE = \*OWN-SYSTEM-ONLY**

The command is only executed in the local system.

**SCOPE = \*VM2000-GLOBAL**

If entered on the Monitor System (SU /390 and S server), the command is executed on all guest systems. If entered at another guest system or at the Monitor System (SU x86), the command is rejected with the message NKR0178.

The command is rejected if one of the guest systems is protected against global detachment (system parameter VMGIORAL=NO) and the channels that are to be detached do not yet possess the status DETACHED (unless FORCE= \*UNCONDITIONAL-OFFLINE has been specified).

**UNIT = \*DEVICE-RANGE(...)**

Specifies a number of up to 256 devices that are to be detached. The device type codes specified in the range do not have to be contiguous. If no device is generated for one of the device type codes, then processing continues with the next device type code that follows.

**FROM = <alphanum-name 2..2> / <x-text 4..4>**

Specifies the device type code of the first device in the range of devices to be detached.

**TO = <alphanum-name 2..2> / <x-text 4..4>**

Specifies the device type code of the last device in the range of devices to be detached.

**UNIT = PUBSET-DEVICES(...)**

Specifies that a pubset's disks are to be detached. The pubset must have been imported at least once. The mnemonic device codes (MNs) of the associated disks are administered in the system disk's SVL. This entry is made on IMPORT-PUBSET, EXPORT-PUBSET or MODIFY-PUBSET-PROCESSING.

As many disks as possible are always detached. If pubset disks are mirrored then the following should be noted:

- 
- In the case of mirroring with DRV, both disks are detached.
  - In the case of mirroring in external disk storage systems (see the “SHC-OSD” User Guide [37]) then only the standard disks (source or normal unit) are detached. If the mirror disks are to be detached, then the mirror disk (target or additional mirror unit) of the system disk (pubres) must be specified in the PUBSET operand.

**PUBSET = list-poss(255): <cat-id 1..4> / \*BY-PUBRES-DEVICE(...)**

Designates the pubset whose disks are to be detached. The pubset can be specified via its catalog ID or the device code of its system disk.

**PUBSET = <cat-id 1..4>**

Specifies the pubset’s catalog ID. There must be a corresponding entry in the MRS catalog. If no such entry exists then the disks can only be detached by specifying the system disk (see PUBSET=\*BY-PUBRES-DEVICE).

**PUBSET = \*BY-PUBRES-DEVICE(...)**

Specifies the pubset’s system disk (pubres).

**UNIT = list-poss(255): <alphanum-name 2..2> / <x-text 4..4>**

Mnemonic device code (MN) of the pubres.

**UNIT = list-poss(16): <alphanum-name 2..2> / <x-text 4..4>**

Specifies the mnemonic device code (MN) if a controller or a device is to be detached.

**FORCE =**

Specifies the execution mode.

**FORCE = \*STD**

The reconfiguration job is to be executed only if the unit is not being used. There is a maximum wait time of 15 minutes for release of the unit. During the wait time the unit is in the DETACH-PENDING state. If it is released within 15 minutes, the unit switches to the DETACHED state, otherwise it returns to the ATTACHED state.

**FORCE = \*YES**

The reconfiguration job is to be executed immediately. This setting is **not** permitted for detaching CPU (see notes).

**FORCE = \*NO(...)**

The reconfiguration job is only to be executed immediately if the unit is not being used. Otherwise the time specified in the WAIT operand must elapse before the unit is released. The device then switches to the DETACH-PENDING state. If the unit is released within the specified period, it switches to the DETACHED state; if not, it switches to the ATTACHED state.

**WAIT =**

Specifies the maximum wait time for execution of the reconfiguration job in execution mode FORCE=\*NO.

**WAIT = \*NO**

No maximum wait time is specified for execution of the reconfiguration job.

**WAIT = \*STD**

The maximum wait time for execution of the reconfiguration job is set to 15 minutes.

**WAIT = <integer 1..32767>(…)**

Specifies the maximum wait time.

**DIM =**

Specifies whether the value defined for the wait time is to be interpreted in minutes or seconds.

**DIM = \*STD**

Wait time as for DIM=\*MIN.

**DIM = \*MIN**

Specifies the maximum wait time in minutes. Possible values: 1 <= <integer> <= 546

**DIM = \*SEC**

Specifies the maximum wait time in seconds. Possible values: 1 <= <integer> <= 32767

**FORCE = \*UNCONDITIONAL-OFFLINE**

The reconfiguration job should always be performed immediately. Unlike FORCE=\*YES, the hardware action associated with the job should always be executed immediately. This setting is only permitted for the detachment of channels (CHANNEL or CHANNEL-RANGE).

The protection of any of the guest systems against global detachment (system parameter VMGIORAL=NO) is ignored if this operand is specified.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	64	ETMRK..	Command execution faulty
2	64	ETMRK..	Command partially processed without error
4	64	NKR0...	Hardware unit was already detached
12	64	NKR0...	Internal check negative
16	64	NKR0...	Caller error
20	64	NKR0...	Software error

If there is an error in command termination, the maincode contains the message code of the message output during command processing. The command return codes with the ETMRK.. maincodes occur only if the hardware unit to be reconfigured is a CPU.

**Notes**

- If the reconfiguration job cannot be executed with FORCE=\*NO within the specified maximum wait time, it is rejected with the following message:

```
NKR0037 DEVICE=mn MAY CURRENTLY NOT BE DETACHED
NKR0049 unit-class=mn DETACHMENT REJECTED
```

In this case the operator should take one of the following actions:

- Request more detailed information with the SHOW command, terminate all tasks which have reserved the device, or assign other devices.
- Repeat the reconfiguration job in execution mode FORCE=\*YES.
- Regardless of the execution mode set, a reconfiguration job is not executed if the unit affected is highly essential for the system. The system requires the following units:
  - the only or the last CPU ready for operation

- the only or the last console
- the only or the last controller for the public disks
- a disk drive for a public disk.
- The “detach pending” state can be terminated by means of the appropriate command ATTACH-DEVICE or DETACH-DEVICE ..., FORCE=\*YES.
- A CPU may only be detached with FORCE=\*YES.
- The following steps are performed when detaching hardware units in the execution mode FORCE=\*NO(...):
  1. if the command is permitted, message NKR0092 is issued,
  2. if the unit is being used neither by the system nor by user jobs, the command is executed immediately,
  3. if the unit concerned is being used, the command is executed when the unit is no longer occupied. If execution is not possible within the period specified by WAIT, the following messages are issued:
 

```
NKR0037 DEVICE=mn MAY CURRENTLY NOT BE DETACHED
NKR0049 unit-class=mn DETACHMENT REJECTED
```
  4. the command /DET <unit>,FORCE=\*NO(...) can be canceled by /ATT <unit>
- For all devices, connections, etc., 2 alphanumeric characters are valid as ‘mn’. In the case of disk/tape devices and controllers, ‘mn’s comprising 4 hexadecimal characters (which must be specified in alphanumeric notation without ‘X’) are also valid. Restrictions see the “System Installation” manual [46].

## Examples

1. Detach channels 41, 51 and 23 as soon as possible; wait state: 5 minutes

```
/DETACH *CH( ( 41 , 51 , 23 ) ) , FORCE=*NO( WAIT=5( DIM=*MIN ) )
```

2. Immediate unconditional detaching of channel 30

```
/DETACH *CH( 30 ) , FORCE=*UNCONDITIONAL-OFFLINE
```

3. Detach CPU 0

```
/DETACH-DEVICE UNIT=*CPU( CPU-IDENTIFIER=00 ) or /DET *CPU( 00 )
```

## 3.16 DISCONNECT-CMD-SERVER

Delete/modify entry in operator command table

**Component:** BS2000 OSD/BC  
**Functional area:** Operator function control  
**Domain:** not allocated  
**Privileges:** OPERATING  
**Routing code:** @

### Function

The DISCONNECT-CMD-SERVER command deletes the link between an operator command and a command server running as a \$CONSOLE application.

**i** The DISCONNECT-CMD-SERVER command is only permitted for \$CONSOLE applications and is only ever effective for the command-issuing \$CONSOLE application.

### Format

**DISCONNECT-CMD-SERVER**

**CMD-NAME** = <structured-name 1..30>

### Operands

**CMD-NAME = <structured-name 1..30>**

Specifies the command name for which an entry in the command table is to be deleted. The command name may be up to 30 characters long and must comply with the naming convention for command names.

The entry with the highest priority, i.e. the entry assigned to the command-issuing \$CONSOLE application, is deleted. If the command was entered in the list of operator commands using the CONNECT-CMD-SERVER command, the command name and all aliases are deleted from the list of operator commands when the last link is deleted.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	NBR1114	Link involved does not exist
	1	CMD0202	Syntax error

---

## 3.17 EDIT-FILE-ATTRIBUTES

Start guided dialog for MODIFY-FILE-ATTRIBUTES

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING

### Function

This command starts the guided dialog mechanism for the MODIFY-FILE-ATTRIBUTES command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified file.

### Format

<b>EDIT-FILE-ATTRIBUTES</b>	Alias: <b>EDFA</b>
-----------------------------	--------------------

<b>FILE-NAME</b> = <filename 1..54>
-------------------------------------

### Operands

FILE-NAME = <filename 1..54>

Name of the file for which guided dialog is required. The operands are assigned the values specifically applicable to the named file.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error

In addition, all the return codes of the MODIFY-FILE-ATTRIBUTES and SHOW-FILE-ATTRIBUTES commands can be returned.

If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.18 EDIT-FILE-GENERATION-SUPPORT

Start guided dialog for MODIFY-FILE-GENERATION-SUPPORT

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE-GENERATION-GROUP  
**Privileges:** STD-PROCESSING

### Function

This command starts the guided dialog mechanism for the MODIFY-FILE-GENERATION-SUPPORT command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified file generation.

### Format

<b>EDIT-FILE-GENERATION-SUPPORT</b>
-------------------------------------

<b>GENERATION-NAME</b> = <filename 1..54 without-vers>
--

### Operands

**GENERATION-NAME = <filename 1..54 without-vers>**

Name of the file generation for which guided dialog is required. The operands are assigned the values specifically applicable to the named file generation.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error

In addition, all the return codes of the MODIFY-FILE-GENERATION-SUPPORT and SHOW-FILE-ATTRIBUTES commands can returned.

If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.19 EDIT-FILE-GROUP-ATTRIBUTES

Start guided dialog for MODIFY-FILE-GROUP-ATTRIBUTES

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE-GENERATION-GROUP  
**Privileges:** STD-PROCESSING

### Function

This command starts the guided dialog mechanism for the MODIFY-FILE-GROUP-ATTRIBUTES command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified file generation group.

### Format

<b>EDIT-FILE-GROUP-ATTRIBUTES</b>
-----------------------------------

<b>GROUP-NAME</b> = <filename 1..47 without-gen-vers>
---

### Operands

**GROUP-NAME** = <filename 1..47 without-gen-vers>

Name of the file generation group for which guided dialog is required. The operands are assigned the values specifically applicable to the named file generation group.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error

In addition, all the return codes of the MODIFY-FILE-GROUP-ATTRIBUTES and SHOW-FILE-ATTRIBUTES commands can be returned.

If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.20 EDIT-FILE-LINK

Start guided dialog for ADD-FILE-LINK

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING

### Function

This command starts the guided dialog mechanism for the ADD-FILE-LINK command. Where technically possible and helpful, the predefined default operand values are each replaced by values from the TFT entry corresponding to the specified link name.

This command does not cause the existing TFT entry to be modified; it creates a new entry and implicitly releases the “old” TFT entry (see the ADD-FILE-LINK command).

The command is rejected if there is no TFT entry for the specified link name.

### Format

**EDIT-FILE-LINK**

Alias: **EDFL**

**LINK-NAME** = <filename 1..8 without-gen>

### Operands

**LINK-NAME** = <filename 1..8 without-gen>

Link name for guided dialog is required.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error

In addition, all the return codes of the ADD-FILE-LINK and SHOW-FILE-LINK commands can returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.21 EDIT-JOB

Start guided dialog for MODIFY-JOB

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** STD-PROCESSING  
OPERATING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

This command starts the guided dialog for the MODIFY-JOB command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified job.

### Format

<b>EDIT-JOB</b>	Alias: <b>EDJ</b>
<b>JOB-IDENTIFICATION</b> = *TSN(...) / *MONJV(...)	
*TSN(...)	
<b>TSN</b> = <alphanum-name 1..4>	
*MONJV(...)	
<b>MONJV</b> = <filename 1..54 without-gen-vers>	

### Operands

#### **JOB-IDENTIFICATION =**

Type of job allocation. Jobs can be identified by their TSN or monitoring JV.

#### **JOB-IDENTIFICATION = \*TSN(...)**

**TSN** = <alphanum-name 1..4>

Task serial number of the required job.

#### **JOB-IDENTIFICATION = \*MONJV(...)**

**MONJV** = <filename 1..54 without-gen-vers>

Name of the JV which monitors the required job.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-JOB and SHOW-JOB-STATUS commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.22 EDIT-JOB-OPTIONS

Start guided dialog for MODIFY-JOB-OPTIONS

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
OPERATING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION  
TSOS

### Function

This command starts the guided dialog for the MODIFY-JOB-OPTIONS command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified job.

### Format

<b>EDIT-JOB-OPTIONS</b>	Alias: <b>EDJO</b>
<b>JOB-IDENTIFICATION</b> = <b>*OWN</b> / <b>*TSN(...)</b> / <b>*MONJV(...)</b>	
<b>*TSN(...)</b>	
<b>TSN</b> = <alphanum-name 1..4>	
<b>*MONJV(...)</b>	
<b>MONJV</b> = <filename 1..54 without-gen-vers>	

### Operands

#### **JOB-IDENTIFICATION =**

*This operand is available only to privileged users.*

Specifies the job for which job monitoring is to be modified. The job can be identified by the TSN or by the job variable which monitors it.

#### **JOB-IDENTIFICATION = \*OWN**

Job monitoring is to be modified for the user's own task. The settings for INFORMATION-LEVEL, OPERATOR-INTERACTION, SYSLST-LIMIT and LOGGING can only be modified for the user's own task.

#### **JOB-IDENTIFICATION = \*TSN(...)**

**TSN** = <alphanum-name 1..4>

Task serial number of the required job.

---

**JOB-IDENTIFICATION = \*MONJV(...)**

**MONJV = <filename 1..54 without-gen-vers>**

Name of the JV which monitors the required job.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-JOB-OPTIONS, SHOW-JOB-OPTIONS and SHOW-JOB-STATUS commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.23 EDIT-JV

Start guided dialog for MODIFY-JV

**Component:** JV

**Functional area:** Job variables

**Domain:** JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
OPERATING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

This function is only available to the user if the chargeable software product JV has been loaded as a subsystem.

### Function

This command starts the guided dialog for the MODIFY-JV command. Where technically possible (a JV can contain up to 256 characters, but MODIFY-JV can only set a maximum of 254), the current content of the JV is predefined as the new content and can thus be edited.

### Format

<b>EDIT-JV</b>	Alias: <b>EDJV</b>
<b>JV-NAME</b> = <filename 1..54 without-gen-vers>	
, <b>OUTPUT-FORMAT</b> = <b>*CHARACTER</b> / <b>*HEXADECIMAL</b>	
, <b>PASSWORD</b> = <b>*NONE</b> / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>	

### Operands

**JV-NAME** = <filename 1..54 without-gen-vers>

Name of the JV for which guided dialog is required. The SET-VALUE operand is assigned the current JV content.

**OUTPUT-FORMAT** =

Determines the output format.

**OUTPUT-FORMAT** = **\*CHARACTER**

Output in character format.

**OUTPUT-FORMAT** = **\*HEXADECIMAL**

Output in hexadecimal format.

**PASSWORD** = **\*NONE** / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>

Read or write password of the JV. The PASSWORD operand has the following special characteristics:

- The input field is automatically blanked out in the guided dialog.
- The password entered is not logged.

---

**PASSWORD = \*NONE**

The JV has no password or the password was already specified in the ADD-PASSWORD command.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-JV and SHOW-JV -ATTRIBUTES commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.24 EDIT-JV-ATTRIBUTES

Start guided dialog for MODIFY-JV-ATTRIBUTES

**Component:** JV

**Functional area:** Job variables

**Domain:** JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
AT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

This function is only available to the user if the chargeable software product JV has been loaded as a subsystem.

### Function

This command starts the guided dialog for the MODIFY-JV-ATTRIBUTES command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified JV.

### Format

<b>EDIT-JV-ATTRIBUTES</b>	Alias: <b>EDJVA</b>
<b>JV-NAME</b> = <filename 1..54 without-gen-vers>	

### Operands

**JV-NAME** = <filename 1..54 without-gen-vers>

Name of the JV for which guided dialog is required. The operands are assigned the values specifically applicable to the named JV.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-JV-ATTRIBUTES and SHOW-JV-ATTRIBUTES commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.25 EDIT-MASTER-CATALOG-ENTRY

Start guided dialog for MODIFY-MASTER-CATALOG-ENTRY

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

This command starts the guided dialog for the MODIFY-MASTER-CATALOG-ENTRY command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified pubset.

### Format

<b>EDIT-MASTER-CATALOG-ENTRY</b>
----------------------------------

<b>PUBSET</b> = <cat-id 1..4>
-------------------------------

### Operands

**PUBSET = <cat-id 1..4>**

Identifies the pubset for which guided dialog is required. The operands are assigned the values specifically applicable to the named pubset.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-MASTER-CATALOG-ENTRY and SHOW-MASTER-CATALOG-ENTRY commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

## 3.26 EDIT-POSIX-USER-ATTRIBUTES

Start guided dialog for MODIFY-POSIX-USER-ATTRIBUTES

**Component:** SRPMNUC

**Functional area:** User management  
POSIX administration and application

**Domain:** USER-ADMINISTRATION

**Privileges:** STD-PROCESSING  
POSIX-ADMINISTRATION  
USER-ADMINISTRATION

### Function

This command starts the guided dialog for the MODIFY-POSIX-USER-ATTRIBUTES command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified user.

### Format

**EDIT-POSIX-USER-ATTRIBUTES**

**USER-IDENTIFICATION** = <name 1..8>

,**PUBSET** = \*HOME / <cat-id 1..4>

### Operands

**USER-IDENTIFICATION** = <name 1..8>

BS2000 user ID whose POSIX user attributes are to be modified.

**PUBSET** = \*HOME / <cat-id 1..4>

Pubset in whose user catalog the POSIX user attributes are to be modified.

**PUBSET** = \*HOME

The change is made on the home pubset.

**PUBSET** = <cat-id 1..4>

The change is made on the specified pubset.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-POSIX-USER-ATTRIBUTES and SHOW-POSIX-USER-ATTRIBUTES commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P command return codes are supplied.

---

## 3.27 EDIT-POSIX-USER-DEFAULTS

Start guided dialog for MODIFY-POSIX-USER-DEFAULTS

**Component:** SRPMNUC

**Functional area:** User management  
POSIX administration and application

**Domain:** USER-ADMINISTRATION

**Privileges:** STD-PROCESSING  
POSIX-ADMINISTRATION  
USER-ADMINISTRATION

### Function

This command starts the guided dialog for the MODIFY-POSIX-USER-DEFAULTS command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified pubsets.

### Format

<b>EDIT-POSIX-USER-DEFAULTS</b>
---------------------------------

<b>PUBSET = *HOME / &lt;cat-id 1..4&gt;</b>
---

### Operands

**PUBSET = \*HOME / <cat-id 1..4>**

Pubset in whose user catalog the POSIX default user attributes are to be modified.

**PUBSET = \*HOME**

The change is made on the home pubset.

**PUBSET = <cat-id 1..4>**

The change is made on the specified pubset.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-POSIX-USER-DEFAULTS and SHOW-POSIX-USER-DEFAULTS commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.28 EDIT-PUBSET-CACHE-ATTRIBUTES

Start guided dialog for MODIFY-PUBSET-CACHE-ATTRIBUTES

**Component:** BS2000 OSD/BC

**Functional area:** Caching media control  
Pubset and MRSCAT management

**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT

**Privileges:** TSOS

### Function

This command starts the guided dialog for the MODIFY-PUBSET-CACHE-ATTRIBUTES command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified pubset.

### Format

**EDIT-PUBSET-CACHE-ATTRIBUTES**

**PUBSET** = <cat-id 1..4>

,**PUBSET-TYPE** = \*SINGLE-FEATURE / \*SYSTEM-MANAGED(...)

    \*SYSTEM-MANAGED(...)

        |     **VOLUME-SET** = <cat-id 1..4>

### Operands

**PUBSET** = <cat-id 1..4>

Identifies the pubset for which guided dialog is required. The operands are assigned the values specifically applicable to the named pubset.

**PUBSET-TYPE** = \*SINGLE-FEATURE / \*SYSTEM-MANAGED(...)

Specifies the type of pubset for which a new entry is to be created in the MRSCAT.

**PUBSET-TYPE** = \*SINGLE-FEATURE

The pubset is an SF pubset.

**PUBSET-TYPE** = \*SYSTEM-MANAGED(...)

The pubset is an SM pubset. The PFA cache configuration is defined or modified for the volume set specified next.

**VOLUME-SET** = <cat-id 1..4>

Identifies the volume set.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	64	DMS140C	Pubset type conflict Wrong pubset type specified

In addition, all the return codes of the MODIFY-PUBSET-CACHE-ATTRIBUTES and SHOW-PUBSET-CACHE-ATTRIBUTES commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.29 EDIT-PUBSET-DEFINITION-FILE

Start guided dialog for MODIFY-PUBSET-DEFINITION-FILE

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

This command starts the guided dialog for the MODIFY-PUBSET-DEFINITION-FILE command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified pubset.

### Format

**EDIT-PUBSET-DEFINITION-FILE**

**PUBSET** = <cat-id 1..4>

,**VOLUME-SET** = <cat-id 1..4>

### Operands

**PUBSET = <cat-id 1..4>**

Identifies the pubset for which guided dialog is required. The operands are assigned the values specifically applicable to the named pubset.

**VOLUME-SET = <cat-id 1..4>**

Identifies the volume set.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	64	DMS1486	Pubset is not a system-managed pubset

In addition, all the return codes of the MODIFY-PUBSET-DEFINITION-FILE and SHOW-PUBSET-DEFINITION-FILE commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P command return codes are returned.

---

## 3.30 EDIT-PUBSET-SPACE-DEFAULTS

Start guided dialog for MODIFY-PUBSET-SPACE-DEFAULTS

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management System control and optimization
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS

### Function

This command starts the guided dialog for the MODIFY-PUBSET-SPACE-DEFAULTS command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified pubset.

### Format

<b>EDIT-PUBSET-SPACE-DEFAULTS</b>
<b>PUBSET</b> = <cat-id 1..4>
<b>,SCOPE</b> = <u>*TEMPORARY</u> / *PERMANENT / *NEXT-PUBSET-SESSION

### Operands

**PUBSET = <cat-id 1..4>**

Identifies the pubset for which guided dialog is required. The operands are assigned the values specifically applicable to the named pubset.

**SCOPE = \*TEMPORARY / \*PERMANENT / \*NEXT-PUBSET-SESSION**

Defines how long the setting applies and when it comes into effect.

**SCOPE = \*TEMPORARY**

The setting takes immediate effect and applies only for the duration of the current pubset session, i.e. until the pubset is taken out of service.

**SCOPE = \*PERMANENT**

The setting takes immediate effect and applies until the next modification.

**SCOPE = \*NEXT-PUBSET-SESSION**

The setting applies until the next permanent modification. However, the setting does not take effect until the start of the next pubset session.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-PUBSET-SPACE-DEFAULTS and SHOW-PUBSET-SPACE-DEFAULTS commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.31 EDIT-SPACE-SATURATION-LEVELS

Start guided dialog for MODIFY-SPACE-SATURATION-LEVELS

**Component:** BS2000 OSD/BC

**Functional area:** Pubset and MRSCAT management  
System control and optimization

**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT

**Privileges:** TSOS

### Function

This command starts the guided dialog for the MODIFY-SPACE-SATURATION-LEVELS command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified pubset or volume set.

### Format

#### EDIT-SPACE-SATURATION-LEVELS

**PUBSET** = <cat-id 1..4>

,**PUBSET-TYPE** = \*SINGLE-FEATURE / **SYSTEM-MANAGED(...)**

**SYSTEM-MANAGED(...)**

| **VOLUME-SET** = <cat-id 1..4>

,**SCOPE** = \*TEMPORARY / \*PERMANENT / \*NEXT-PUBSET-SESSION

### Operands

**PUBSET** = <cat-id 1..4>

Identifies the pubset for which guided dialog is required. The operands are assigned the values specifically applicable to the named pubset.

**PUBSET-TYPE** = \*SINGLE-FEATURE / \*SYSTEM-MANAGED(...)

Specifies whether the pubset is an SF or SM pubset.

**PUBSET-TYPE** = \*SINGLE-FEATURE

The pubset is an SF pubset. The thresholds are defined on a pubset-global basis.

**PUBSET-TYPE** = \*SYSTEM-MANAGED(...)

The pubset is an SM pubset. The thresholds are defined for the volume set specified next.

**VOLUME-SET** = <cat-id 1..4>

Identifies the volume set.

**SCOPE** = \*TEMPORARY / \*PERMANENT / \*NEXT-PUBSET-SESSION

Defines how long the setting applies and when it comes into effect.

---

**SCOPE = \*TEMPORARY**

The setting takes immediate effect and applies only for the duration of the current pubset session, i.e. until the pubset is taken out of service.

**SCOPE = \*PERMANENT**

The setting takes immediate effect and applies until the next modification.

**SCOPE = \*NEXT-PUBSET-SESSION**

The setting applies until the next permanent modification. However, the setting does not take effect until the start of the next pubset session.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	64	DMS140C	Pubset type conflict: Wrong pubset type specified

In addition, all the return codes of the MODIFY-SPACE-SATURATION-LEVELS and SHOW-SPACE-SATURATION-LEVELS commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.32 EDIT-STORAGE-CLASS

Start guided dialog for MODIFY-STORAGE-CLASS

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

This command starts the guided dialog for the MODIFY-STORAGE-CLASS command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the storage class.

### Format

**EDIT-STORAGE-CLASS**

**STORAGE-CLASS-NAME** = <composed-name 1..8>

**,PUBSET** = <cat-id 1..4>

### Operands

**STORAGE-CLASS-NAME** = <composed-name 1..8>

Name of the storage class for which guided dialog is required. The operands are assigned the values specifically applicable to the named storage class.

**PUBSET** = <cat-id 1..4>

Identifies the pubset for which the storage class was created. The pubset must have been imported to the local system (in exclusive or shared mode).

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-STORAGE-CLASS and SHOW-STORAGE-CLASS commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.33 EDIT-USER-ATTRIBUTES

Start guided dialog for MODIFY-USER-ATTRIBUTES

**Component:** SRPMNUC  
**Functional area:** User management  
**Domain:** USER-ADMINISTRATION  
**Privileges:** STD-PROCESSING  
USER-ADMINISTRATION

### Function

This command starts the guided dialog for the MODIFY-USER-ATTRIBUTES command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified user.

### Format

<b>EDIT-USER-ATTRIBUTES</b>
<b>USER-IDENTIFICATION</b> = <name 1..8> , <b>PUBSET</b> = <u>*HOME</u> / <cat-id 1..4>

### Operands

**USER-IDENTIFICATION** = <name 1..8>

Name of the user ID whose entry is to be modified.

**PUBSET** = \*HOME / <cat-id 1..4>

(SM) pubset in whose user catalog the pubset-specific user attributes are to be modified.

**PUBSET** = \*HOME

The change is made on the home pubset.

**PUBSET** = <cat-id 1..4>

The change is made on the specified pubset.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-USER-ATTRIBUTES and SHOW-USER-ATTRIBUTES commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P return codes are supplied.

---

## 3.34 EDIT-USER-PUBSET-ATTRIBUTES

Start guided dialog for MODIFY-USER-PUBSET-ATTRIBUTES

<b>Component:</b>	SRPMNUC
<b>Functional area:</b>	User management Pubset and MRSCAT management
<b>Domain:</b>	USER-ADMINISTRATION
<b>Privileges:</b>	STD-PROCESSING USER-ADMINISTRATION

### Function

This command starts the guided dialog for the MODIFY-USER-PUBSET-ATTRIBUTES command. Where technically possible and helpful, the predefined default operand values are each replaced by values currently applicable to the specified user.

### Format

<b>EDIT-USER-PUBSET-ATTRIBUTES</b>
<b>USER-IDENTIFICATION</b> = <name 1..8> , <b>PUBSET</b> = * <b>HOME</b> / <cat-id 1..4>

### Operands

**USER-IDENTIFICATION** = <name 1..8>

Name of the user ID whose pubset-specific user attributes are to be modified.

**PUBSET** = \***HOME** / <cat-id 1..4>

(SM) pubset in whose user catalog the pubset-specific user attributes are to be modified.

**PUBSET** = \***HOME**

The change is made on the home pubset

**PUBSET** = <cat-id 1..4>

The change is made on the specified pubset.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error

In addition, all the return codes of the MODIFY-USER-PUBSET-ATTRIBUTES and SHOW-USER-ATTRIBUTES commands can be returned. If errors occur while S variables are being processed, the corresponding SDF-P command return codes are returned.

---

## 3.35 ELSE

Initiate ELSE branch

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

### Function

ELSE is an SDF-P control flow command and serves to initiate the ELSE branch in IF blocks. The ELSE branch (the commands between ELSE and END-IF) is processed if the test fails to meet any of the conditions set by the IF command or any ELSE-IF commands that are included (ELSE-IF command are chargeable).

In an IF-BLOCK-ERROR block or a (chargeable) IF-CMD-ERROR block, the ELSE branch is taken if no error occurs.

#### *Restrictions*

Users with SECURITY-ADMINISTRATION, SAT-FILE-EVALUATION or SAT-FILE-MANAGEMENT privilege can use the command in procedures only.

### Format

<b>ELSE</b>

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SDP0118	Command in incorrect context
	1	SDP0223	Incorrect environment
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	SDP0091	Semantic error
	130	SDP0099	No further address space available

## Example

See IF command.

---

## 3.36 ENCRYPT-FILE

Encrypt an unencrypted file

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING TSOS SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT

Use of this command makes sense only when the CRYPT subsystem has been loaded for performing the encryption.

### Function

The ENCRYPT-FILE command converts an unencrypted file into an encrypted file. The encryption method used for conversion is set using the system parameter FILECRYP and is stored in the catalog entry (see the *ENCRYPTION* output field in the SHOW-FILE-ATTRIBUTES command).

Within a file generation group either all generations are unencrypted or all generations except tape generations are encrypted. Within a file generation group all encrypted generations have the same crypto password and the same encryption method.

When a file is converted into an encrypted file the read and execute passwords are implicitly deleted, but the write password remains unchanged. With files that are already encrypted the assignment of read and execute passwords is ignored.

Encrypting the files with last-byte pointer is rejected.

Encrypted files are protected against unauthorized decryption:

The encrypted file contents can only be accessed if the user knows the crypto password specified for encryption. The relevant crypto password must be entered into the crypto password table (see the ADD-CRYPTO-PASSWORD command) both for explicit decryption (DECRYPT-FILE command) and for implicit decryption while a file is being accessed or processed.

File encryption does not, however, include greater protection against deletion, overwriting or destruction of the file contents. File encryption can thus not replace data protection and security.

The conversion into an encrypted file is logged by SAT. The output AUDIT attribute is taken from the catalog entry of the converted file (see CREATE-FILE, AUDIT operand).

By converting in an encrypted file, an auxiliary file is created and automatically deleted after completion of the function. The auxiliary file requires as much storage place as the converted file.

The file name of the auxiliary file has the following structure: S.DMS.<tsn>.<date><time>.CRYPTO

---

### Notes on command execution

File locking and protection attributes which reject write access to the catalog entry or the content of the file prevent its conversion via the ENCRYPT-FILE command.

The file conversion with the ENCRYPT-FILE command requests having owner rights for executing operations on the file. The conversion takes place only in the following cases:

- The file is under user ID of the calling task.
- The called task is under a user ID with TSOS privileges.
- The user ID of a called task is a co-owner of the file, and the file is not temporary.

The command is rejected in the following cases:

- The command refers to a file with a last byte pointer.
- The converted file can be accessed only via RFA.

### Privileged functions

When the called task has the privilege TSOS, the following additional functions are possible:

- Temporary files that belong not to this, but to another task can be input too.
- Temporary files can be allocated on another pubset as the default one for this user ID (such files are not automatically deleted after finishing the called task).

## Format

### ENCRYPT-FILE

**FILE-NAME** = <filename 1..54 without-gen>

,**CRYPTO-PASSWORD** = <c-string 1..8> / <x-string 1..16> / \***SECRET** / \***FROM-FILE**(...)

\***FROM-FILE**(...)

|     **FILE-NAME** = <filename 1..54 without-gen>

,**CONFIRM-PASSWORD** = \***NOT-SPECIFIED** / <c-string 1..8> / <x-string 1..16> / \***SECRET**

## Operands

**FILE-NAME** = <filename 1..54 without-gen>

Name of the file to be converted. It must satisfy the following requirements:

- It must already have a catalog entry.
- The pubset on which it is cataloged must be accessible locally.
- It may not yet be encrypted.
- It may not reside on a private disk.
- No tape type may be entered.

---

**CRYPTO-PASSWORD = <c-string 1..8> / <x-string 1..16> / \*SECRET / \*FROM-FILE(...)**

Crypto password for protecting against unauthorized decryption. To permit access to the unencrypted file content this password must be entered into the job's crypto password table. The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**CRYPTO-PASSWORD = <c-string 1..8> / <x-string 1..16>**

Direct specification of the crypto password. If the system parameter FREFCRYP contains a user ID, direct specification of a crypto password is permitted only for files of this user ID. Only a reference file may be specified for files of other user IDs (CRYPTO-PASSWORD=\*FROM-FILE).

**CRYPTO-PASSWORD = \*FROM-FILE(...)**

The crypto password is to be taken over from a reference file. If the password has not been entered into the job's crypto password table (with ADD-CRYPTO-PASSWORD), it must be confirmed in the CONFIRM-PASSWORD operand.

**FILE-NAME = <filename 1..54 without-gen>**

Reference file from which the crypto password is taken over.

The subset on which the reference file is cataloged must be locally accessible.

**CONFIRM-PASSWORD = \*NOT-SPECIFIED / <c-string 1..8> / <x-string 1..16> / \*SECRET**

Confirmation of the password entry to guard against typos.

The CONFIRM-PASSWORD operand has the following special features:

- The value entered is not logged.
- In guided dialog the entry field is automatically blanked out.
- If \*SECRET or ^ is specified, in unguided dialog and in foreground procedures SDF provides a nondisplaying entry field for concealed entry of the password.

The default is \*NOT-SPECIFIED, i.e. the password need not be acknowledged. This operand value is, however, only allowed if the crypto password is taken over from a reference file and this crypto password is entered into the job's crypto password table (with ADD-CRYPTO-PASSWORD or temporarily with ENCRYPT-FILE).

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	DMS05B6	Time conversion UTC to LT errored
2	0	DMS05F5	Defective blocks were not copied
	1	CMD0202	Syntactical or semantic error in the command
	32	DMS0584	During processing a status was reported which prevents the function from being continued.
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0216	Privileges error
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset Guaranteed message: DMS051B
	64	DMS051C	User does not have access right for pubset Guaranteed message: DMS051C
	64	DMS0535	Specified file not shareable
	64	DMS057C	Processing not possible because of HSMS error
	64	DMS057E	File migrated, HSMS not available
	64	DMS0585	An error was detected during catalog processing or during multiprocessor processing.
	64	DMS0588	Disk storage could not be assigned
	64	DMS05FC	Specified user ID not in the home pubset
	64	DMS0609	Access to system file not possible
	64	DMS060D	Invalid file name for reference file
	64	DMS0663	File encryption not permitted
	64	DMS0667	File cannot be used as reference file
	64	DMS0669	Protection attribute modified implicitly
	64	DMS066A	Crypto password cannot be used
	64	DMS066D	Crypto password entry restricted
	64	DMS0681	DMS error while executing job

---

	64	DMS0684	File does not exist
	64	DMS0691	Crypto password list has reached maximum size
	64	DMS0692	Maximum number of crypto passwords per task has been reached
	64	DMS06B5	File open or catalog entry not updated after system error
	130	DMS0524	System address space exhausted
	130	DMS0582	The file is currently locked or in use and cannot be processed
	130	DMS0585	An error was detected during catalog processing or during multiprocessor processing.
	130	DMS0588	Disk storage could not be assigned
	130	DMS0594	Insufficient virtual memory available

---

## 3.37 END-CJC-ACTION

Mark end of CJC command sequence

**Component:** JV

**Functional area:** Job variables

**Domain:** JOB-VARIABLES

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

This function is available to the user only if the chargeable software product JV has been loaded as a subsystem.

### Function

The END-CJC-ACTION command is the last command in a CJC command sequence. As soon as it is issued, the ADD-CJC-ACTION command becomes effective, i.e. the specifications contained in it are evaluated. (For structure and execution of the CJC command sequences, and also notes, see the ADD-CJC-ACTION command description.)

### Format

<b>END-CJC-ACTION</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
0	1	CMD0202	No CJC command sequence was initiated

#### *Note*

Command return codes referring to a CJC command sequence are not returned until after completion of the CJC command sequence with the END-CJC-ACTION command. Possible values are indicated in the description of the ADD-CJC-ACTION command.

---

## 3.38 END-IF

Mark end of IF command block

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

### Function

END-IF is an SDF-P control flow command and serves to terminate a command block initiated by means of an IF, IF-BLOCK-ERROR or IF-CMD-ERROR command. Procedure execution then continues with the command that follows END-IF.

#### *Restrictions*

Users with SECURITY-ADMINISTRATION, SAT-FILE-EVALUATION or SAT-FILE-MANAGEMENT privilege can use the command in procedures only.

### Format

<b>END-IF</b>
<b>BLOCK</b> = * <u>LAST</u> / <structured-name 1..255>

---

## Operands

### **BLOCK = \*LAST / <structured-name 1..255>**

This terminates the command block initiated by means of an IF, IF-BLOCK-ERROR or IF-CMD-ERROR command.

The default value is \*LAST, i.e. the last command block to have been initiated is now terminated.

When a block name is specified, SDF-P checks whether this name was assigned to the last command block to have been initiated. If the specified name and the label do not tally, SDF-P rejects the END-IF command with an error message. Specifying a block name is therefore useful for consistency checking and for documentation.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SDP0118	Command in incorrect context
	1	SDP0223	Incorrect environment
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	SDP0091	Semantic error
	130	SDP0099	No further address space available

## 3.39 END-PARAMETER-DECLARATION

Mark end of parameter declarations

**Component:** SDF-P-BASYS

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
OPERATING  
HARDWARE-MAINTENANCE  
SECURITY-ADMINISTRATION  
SAT-FILE-MANAGEMENT  
SAT-FILE-EVALUATION

### Function

END-PARAMETER-DECLARATION is an SDF-P control flow command and serves to terminate the parameter declarations initiated by means of the BEGIN-PARAMETER-DECLARATION command. It is the last command in the procedure head.

### Format

<b>END-PARAMETER-DECLARATION</b>

### Return codes

The END-PARAMETER-DECLARATION command can only be used as the last command in the procedure head of an S procedure. SDF-P detects errors in the procedure head during pre-analysis and terminates the procedure call. The command return codes can only occur if the command is used outside the procedure head.

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SDP0118	Command in incorrect context
	1	SDP0139	Maximum number of backward jumps reached
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	SDP0091	Semantic error
	130	SDP0099	No further address space available

---

## 3.40 END-PROCEDURE

Mark end of non-S procedure file

**Component:** SYSFILE

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The END-PROCEDURE command must appear as the last record in a non-S procedure file. It terminates execution of the procedure and causes processing to return to the point of interruption in the calling procedure - if there was one; otherwise it causes a return to primary command input (the terminal in interactive mode, ENTER file in batch mode). The system files, including TASKLIB, are given the allocations in force at the time of interruption. A file that was assigned by means of ASSIGN-SYSLST in the procedure is closed with END-PROCEDURE.

The END-PROCEDURE command may be used in procedure files only and therefore does not appear in the menu.

### Format

END-PROCEDURE

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	SSM2039	Error on closing output system file; the SYSOUT message contains the DMS error code as an insert
	64	SSM1013	No procedure has been called

---

## Notes

- Commands in procedure files:

If an error in the command sequence activates the spin-off mechanism, processing branches to the next of the following commands:

END-PROCEDURE, LOGOFF, EXIT-JOB, SET-JOB-STEP, CANCEL-PROCEDURE or EXIT-PROCEDURE.

- The effect of an END-PROCEDURE command in ESCAPE mode is described under the HOLD-PROCEDURE command (figure "Nesting of ESCAPE levels" in [section "HOLD-PROCEDURE"](#)).
- If a procedure is called in ESCAPE mode, the following message is issued when control is returned:

```
TASK IS IN ESCAPE-MODE AT LEVEL NUMBER i
```

where i = number of the procedure level to which processing has returned. When primary command input is reached (level 0), this message is not issued.

## Examples

See the BEGIN-PROCEDURE, CANCEL-PROCEDURE, HOLD-PROCEDURE and RESUME-PROCEDURE commands.

---

## 3.41 ENDP-RESUME

Terminate non-S procedure run and resume loaded program

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE SDF
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The ENDP-RESUME command terminates execution of a non-S procedure and resumes a program loaded during the procedure.

In S procedures, the EXIT-PROCEDURE command with RESUME-PROGRAM=\*YES must be used for this function.

#### *Method of operation*

ENDP-RESUME is used when a program call is to be implemented as a command, e.g. a call to the PROG.EDIT problem program:

/START-EXE-PROG FROM-FILE=PROG.EDIT is to be implemented as the command /X-EDIT:

- In a user syntax file a command must, for example, be defined under the name X-EDIT and implemented as a procedure (SDF-A statement ADD-COMMAND; for further details see the “SDF-A” manual [33]). The path name of the procedure file is also defined in the process.
- The user syntax file must be activated (MODIFY-SDF-OPTIONS command). The user must be authorized to execute the procedure file. The procedure file may have the following contents:

```
/BEGIN-PROC  
/LOAD-EXEPROG FROM-FILE=PROG.EDIT  
/ENDP-RESUME
```

### Format

<b>ENDP-RESUME</b>

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SSM2039	Error on closing output system file; the SYSOUT message contains the DMS error code as an insert
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	SSM1013	No procedure has been called
	130	SDP0099	No further address space available

---

## 3.42 ENTER-JOB

Start command sequence (ENTER file) as batch job

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job processing
<b>Domain:</b>	JOB
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE OPERATING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION
<b>Routing code:</b>	P

### Function

The ENTER-JOB command enables another batch job (ENTER job) to be initiated from an interactive or batch job. This new batch job is independent of the issuing job and is assigned its own task sequence number (TSN) by the system. The batch job is also called an ENTER job (see [figure "ENTER-JOB starts ENTER job" in section "ENTER-JOB"](#)). The former term ENTER procedure, on the other hand, is regarded as obsolete because it is too reminiscent of the ENTER-PROCEDURE command. However, this command expects a different file format.

#### *Restrictions*

Users with SECURITY-ADMINISTRATION, SAT-FILE-EVALUATION or SAT-FILE-MANAGEMENT privilege can use the command in procedures only.

#### *Privileged functions*

An operator can start the ENTER file on the console with the job attributes which are specified in the SET-LOGON-PARAMETERS command of the ENTER file (see default values \*STD) or modify or add job attributes. This special function is linked to the consoles and user IDs with the OPERATING privilege (see also the [DEFAULT-FROM-FILE](#) operand. If the command is issued from a user ID which is not equipped with the OPERATING privilege, job attributes from the SET-LOGON-PARAMETERS command of the ENTER file are ignored.

#### *Method*

The commands for the ENTER job must be stored in a file. The first command of such an ENTER file must always be SET-LOGON-PARAMETERS, and the last EXIT-JOB or LOGOFF. The name of the file must be specified in the ENTER-JOB command. When the command is accepted, a message containing the task sequence number (TSN) which assigned the system to the new ENTER job is issued as the job confirmation. The ENTER job does not have to start immediately as the systems support can restrict the number and runtime of the batch jobs in the system. If this is the case, the ENTER job is entered in the job queue and remains there until it can be processed by the system.

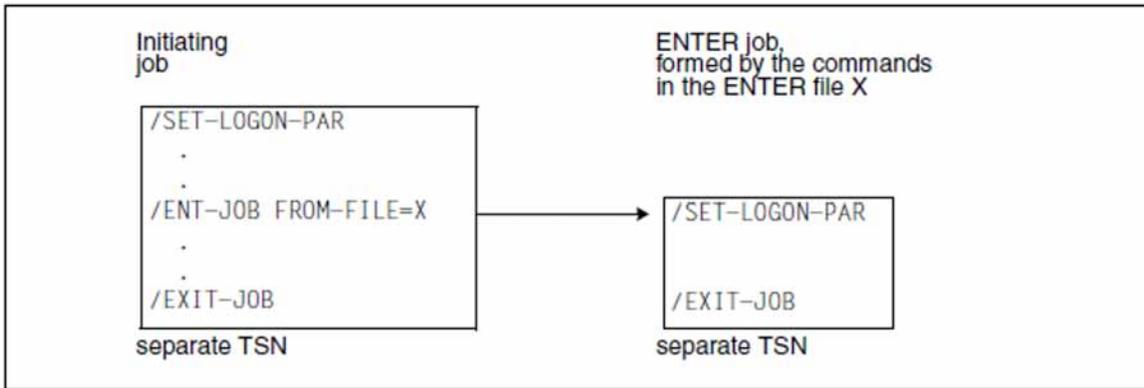

Figure 4: ENTER-JOB starts ENTER job

## Format

**,PROTECTION = \*NONE / \*CANCEL**

## Operands

**FROM-FILE = \*LIBRARY-ELEMENT(...)** / <filename 1..54 without-gen>

Name of the ENTER file.

**i** If the file/library name is specified without a catalog/user ID and if it is not cataloged in the user ID, the system tries to access a file or library of the same name in the system default ID. (For information on this “secondary read” function see the “Introductory Guide to DMS” [13].)

If the job submitter is not the file owner (differing user IDs), the file must be accessible (see the **USER-ACCESS=\*ALL-USERS** operand in the **CREATE-FILE** and **MODIFY-FILE-ATTRIBUTES** commands). The job submitter must in any case have at least execution privileges if the file is protected by a basic ACL or **GUARDS**.

If the file has an execute password, the password must be specified in the **FILE-PASSWORD** operand.

**FROM-FILE = \*LIBRARY-ELEMENT(...)**

The ENTER file is stored in a PLAM library.

**LIBRARY = <filename 1..51 without-gen-vers>**

Name of the library containing the ENTER file as an element. The specification of a library list (see the “LMS” manual [21]) instead of a library file is not supported.

**ELEMENT = <composed-name 1..38>**

Name of the element.

The following applies for the sum of the lengths of the library and member names:

- Without catalog and user IDs the sum may amount to at most 39 characters.
- In the case of a multi-character catalog ID, the sum with the full path name of the library including the catalog and user IDs may amount to at most 52 characters.

---

### **PROCESSING-ADMISSION =**

Specifies the user ID under which the batch job is to run (target user ID).

### **PROCESSING-ADMISSION = \*STD**

The batch job is to run under the user's own user ID (i.e. the one under which ENTER-JOB was specified).

The following applies if the batch job is started on the console by an operator:

The batch job runs under the user ID which is contained in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file. If no user ID is specified there, a distinction must be made between the following two cases:

- If the operator LOGON function is not enabled (compatible mode), the console has no user ID of its own and the batch job is rejected.
- If the operator LOGON function is enabled (incompatible mode), the batch job runs under the operator's user ID.

### **PROCESSING-ADMISSION = \*PARAMETERS(...)**

Parameters defining the LOGON authorization of the target user ID.

#### **USER-IDENTIFICATION = \*NONE / <name 1..8>**

User ID under which the batch job should run.

#### **ACCOUNT = \*NONE / <alphanum-name 1..8>**

Account number of the user ID.

#### **PASSWORD = \*NONE / <c-string 1..8> / <c-string 9..32> / <x-string 1..16> / \*SECRET**

Password for the user ID.

The long password mechanism is supported (<c-string 9..32>). See the MODIFY-USER-PROTECTION command for details of the long password mechanism.

The PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

### **PROCESSING-ADMISSION = \*FROM-CALLER(...)**

*This specification is only permissible for tasks with the OPERATING privilege.*

The batch job is to run under the user ID of the calling task. However, the option of specifying a different account number is available.

#### **ACCOUNT = \*STD / <alphanum-name 1..8>**

Account number for job execution. Default value =\*STD, i.e. job execution is billed under the account number of the calling task.

### **DEFAULT-FROM-FILE = \*STD / \*NO / \*YES**

*This operand is only available for tasks with the OPERATING privilege.*

Specifies whether the job attributes from the SET-LOGON-PARAMETERS command of the ENTER file are to be taken over when the default value is specified implicitly or explicitly in the ENTER-JOB command (see also the section "Privileged functions", "ENTER-JOB").

---

**DEFAULT-FROM-FILE = \*STD**

If the ENTER-JOB command is called from the console, attributes with which the default value is specified are taken over from the ENTER file (corresponds to DEFAULT-FROM-FILE=\*YES). With all other calls, the specification corresponds to DEFAULT-FROM-FILE=\*NO.

**DEFAULT-FROM-FILE = \*NO**

When the default value is specified, the job attributes are not taken over from the ENTER file.

**DEFAULT-FROM-FILE = \*YES**

Job attributes which are specified in the SET-LOGON-PARAMETERS command of the ENTER file are taken over when the default value is specified implicitly or explicitly for the various attributes in the ENTER-JOB command.

**FILE-PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / \*SECRET**

Password with which the ENTER file is protected against writing or execution (see also the DELETE operand). The password specified is ignored for password-protected PLAM elements.

The FILE-PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**CRYPTO-PASSWORD = \*NONE / <c-string 1..8> / <x-string 1..16> / \*SECRET**

Password used when encrypting the ENTER file. For an encrypted ENTER file a temporary copy is created which is decrypted with the help of the crypto password.

The CRYPTO-PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**DELETE = \*NO / \*YES**

Specifies whether the ENTER file is to be deleted after the batch job has been processed. Deletion is only possible if the job submitter also has write access. If the file is protected against write accesses by a password, this password must be contained in the password table for the job (see note "ENTER-JOB") or in the FILE-PASSWORD operand.

**HOST =**

Host on which the batch job is to run.

The host can be identified by the host name or the catalog ID (\*CATALOG). It must be in the "active" state, otherwise the command is rejected. Operand values other than \*STD are available only to users who have the HIPLEX MSCF (multiprocessor systems) software product.

**HOST = \*STD**

The ENTER job is running on the local host.

**HOST = <c-string 1..8>**

Host name of the host the ENTER job is to run on.

**HOST = <filename 1..54 without-gen-vers>**

Name of a job variable which has the host's name as its content.

---

**HOST = \*ANY**

Allowed only on an XCS network. For details see the “HIPLEX MSCF” manual [25].

**HOST = \*CATALOG(...)****IDENTIFICATION = <c-string 1..4>**

Catalog ID of the host on which the batch job is to run.

The catalog must be accessible, otherwise the command is rejected.

**IDENTIFICATION = <filename 1..54 without-gen-vers>**

Name of a job variable which has the host's catalog ID as its content.

**JOB-CLASS = \*STD / <name 1..8> / \*BY-USER**

Job class in which the batch job is to run. The job class must be permitted for batch jobs. The user can ascertain the job classes he/she is allowed to use from his/her user entry for the home pubset (which can be queried using the SHOW-USER-ATTRIBUTES command). This also displays the default job class that is preset with \*STD. Users can obtain information about the characteristics of job classes (job class definition) by means of the SHOW-JOB-CLASS command.

**JOB-CLASS = \*STD**

Default job class of the target user ID.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**JOB-CLASS = <name 1..8>**

The ENTER job runs on the local computer.

**JOB-CLASS = \*BY-USER-ID**

*This specification is only possible with the OPERATING privilege.*

The batch job is to run in the default job class of the target user ID.

**JOB-NAME = \*NO / <name 1..8>**

Name for the ENTER job. The ENTER job can be addressed using this name (e.g. with SHOW-JOB-STATUS). The name is also printed on the header page of the printer listing. For the sake of compatibility an attempt is made sequentially to take over one of the following values as the name of the ENTER job:

1. *Not when started from the console:* A job name specified here which is not equal to \*NO
2. *Not when started from the console:* A marker located before the ENTER-JOB command (/.<name> ENTER-JOB ...)
3. The job name from the SET-LOGON-PARAMETERS command in the ENTER file
4. A marker located before the SET-LOGON-PARAMETERS command in the ENTER file
5. *Not when started from the console:* The name of the command-submitting job

If none of these values is available, the ENTER job is assigned no name, which is shown in the outputs with \*NONE, (NONE) or blanks.

**MONJV = \*NONE / <filename 1..54 without-gen-vers>**

Specifies whether the batch job is to be monitored by a JV.

**MONJV = \*NONE**

The batch job is not monitored.

When the batch job is started by the operator on the console, the specification in the operand of the same name in

---

the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can use the DEFAULT-FROM-FILE operand to set this default mechanism.

**MONJV = <filename 1..54 without-gen-vers>**

Name of the JV which is to monitor the batch job. A JV can only be defined if the chargeable subsystem JV is available (see also the “Job Variables” manual [20]).

Job monitoring is only started if the batch job is accepted by the system’s job management (JOB ACCEPTED).

The job originator must have write authorization because he instructs the system to write to the JV. If the JV is not accessible at the time of command processing, an error message is output to SYSOUT and the command is rejected. If the specified JV does not yet exist, it is - if the requisite authorization exists - created and made available for all users (ACCESS=\*WRITE and USER-ACCESS=\*ALL-USERS). The user can address his/her batch job using the specified JV.

The system sets the status display of the JV to appropriate values while the batch job is being processed:

\$S Job on queue

\$R Job running

\$T Job terminated

\$A Job aborted

\$M Job exported with MOVE-JOBS

**JV-PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

Password for the JV.

The operand is only evaluated when job monitoring has been defined (see the MONJV operand).

The operand JV-PASSWORD is defined as “secret”:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**JOB-PRIORITY = \*STD / <integer 1..9> / \*BY-JOB-CLASS**

Job priority to be given to the batch job.

The lower the value, the higher the priority. The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

**JOB-PRIORITY = \*STD**

The standard priority specified for the job class applies.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**JOB-PRIORITY = \*BY-JOB-CLASS**

*This specification is only possible with the OPERATING privilege..*

The batch job is to be assigned the default priority specified for the job class.

**RERUN-AFTER-CRASH = \*STD / \*NO / \*YES**

Specifies whether the batch job is to be restarted during the next system session if processing has been aborted as

---

the result of a system error or termination of the system session.

The operand is not evaluated if job repetition is enabled in the REPEAT-JOB operand.

**RERUN-AFTER-CRASH = \*STD**

RERUN-AFTER-CRASH=\*NO applies.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**FLUSH-AFTER-SHUTDOWN = \*STD / \*NO / \*YES**

Specifies whether the batch job is to be removed from the job queue if it has not been processed by the end of the session.

The operand is not evaluated if job repetition is enabled in the REPEAT-JOB operand. The specification FLUSH-AFTER-SHUTDOWN=\*YES with the warning JMS0056 is ignored for calendar jobs.

**FLUSH-AFTER-SHUTDOWN = \*STD**

FLUSH-AFTER-SHUTDOWN=\*NO applies.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**SCHEDULING-TIME = \*STD / \*PARAMETERS(...) / \*BY-CALENDAR(...)**

Defines how scheduling times are specified for the batch job.

**SCHEDULING-TIME = \*STD**

The default settings for START and REPEAT-JOB scheduling time specifications for the selected job class apply (see the operands of the SCHEDULING-TIME=\*PARAMETERS(...) structure).

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**SCHEDULING-TIME = \*PARAMETERS(...)**

Defines scheduling time (start time) for the batch job. It is also possible to define job repeats (repeat job).

**START =**

Starting time for the batch job. Values other than \*STD are appropriate only if permitted in accordance with the job class definition (see the SHOW-JOB-CLASS command). Only the value \*IMMEDIATELY can also be permitted as an alternative by means of the user properties (see the SHOW-USER-ATTRIBUTES command).

**START = \*STD**

The default value for the chosen job class applies.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**START = \*BY-JOB-CLASS**

*This specification is only possible with the OPERATING privilege.*

The batch job is to be assigned the start time defined for the job class.

**START = \*SOON**

The job is to be started as soon as possible, in accordance with its priority.

**START = \*IMMEDIATELY**

The job is to be started immediately.

---

**START = \*AT-STREAM-STARTUP**

The job is to be started after the next startup of the job scheduler.

**START = \*WITHIN(...)**

The job is to be started within the specified time period.

**HOURS = 0 / <integer 0..23 hours >**

Number of hours.

**MINUTES = 0 / <integer 0..59 minutes >**

Number of minutes.

**START = \*AT(...)**

The job is to be started exactly at the time specified in the following.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes. Seconds are not interpreted.

**START = \*EARLIEST(...)**

The job is to be started no earlier than the time specified.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications.

20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes. Seconds are not interpreted.

**START = \*LATEST(...)**

The job is to be started no later than the time specified.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications.

20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes. Seconds are not interpreted.

**REPEAT-JOB =**

Time interval at which the batch job is to be repeated. Values other than \*STD are appropriate only if permitted in accordance with the job class definition (see the SHOW-JOB-CLASS command). The time interval for the repetitions depends on the specification in the START operand; see the note in this regard, "Combinations of the START and REPEAT-JOB operands". For the repetitions, the following applies:

- The i-th repetition (i >= 1) of a job is not started until the (i-1)th repetition has ended.
- Cancellation of the currently executing job (i) has no effect on the start of (i+1); (i >= 0).

- 
- Cancellation of the entire job: Both the currently executing job (i) and the subsequent job (i+1) must be canceled, (i >= 0); (CANCEL-JOB command, or make job (i) the last job in the series using the command MODIFY-JOB ...,REPEAT-JOB=\*NO).

**REPEAT-JOB = \*STD**

The default value for the chosen job class applies.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**REPEAT-JOB = \*BY-JOB-CLASS**

*This specification is only possible with the OPERATING privilege.*

The batch job is to be assigned the default value defined for the job class.

**REPEAT-JOB = \*NO**

The batch job is not repeated.

**REPEAT-JOB = \*DAILY**

Daily repetition at the time specified with START.

**REPEAT-JOB = \*WEEKLY**

Weekly repetition at the time specified with START.

**REPEAT-JOB = \*AT-STREAM-STARTUP**

Repetition following each startup of the job scheduler.

**REPEAT-JOB = \*PERIOD(...)**

Repetition after the specified time interval.

**HOURS = 0 / <integer 0..23 hours >**

Number of hours.

**MINUTES = 0 / <integer 0..59 minutes >**

Number of minutes.

**SCHEDULING-TIME = \*BY-CALENDAR(...)**

The batch job scheduling time and any repeat jobs are specified in the form of a symbolic date defined in a calendar file (calendar job). The entries in a calendar file can be listed with the SHOW-CALENDAR command. Creation of calendar files with the CALENDAR utility is described in the "Calendar" manual [4].

**CALENDAR-NAME = <filename 1..20 without-cat-user-gen-vers>**

Name of the calendar file.

**SYMBOLIC-DATE = <filename 1..20 without-cat-user-vers> / <partial-filename 2..20 without-cat-user>**

Symbolic date which defines the scheduling time and any repetition cycles within the calendar file. The symbolic date may also be given in partially qualified mode. In this way, several scheduling times can be defined for one calendar day with the appropriate definition of SYSDATs.

*Example:* Definition of SYMDATs in the calendar file:

- WORK.DAY.1 (every other day at 06:00 hrs)
- WORK.DAY.2 (every other day at 6:00 PM hrs)
- WORK.WEEK.1 (every Friday at 21:00 hrs)

A calendar job considering all three scheduling points is started with SYMBOLIC-DATE=WORK..

---

**LIMIT = \*STD / <integer 1..32767> / \*BY-DATE(...)**

Governs how long a calendar job remains in existence. This limit applies in addition to the limits set by the calendar.

**LIMIT = \*STD**

The duration of the calendar job depends entirely on the symbolic date entry in the calendar.

**LIMIT = <integer 1..32767>**

*This specification is only permitted for calendar jobs.*

Maximum number of repetitions of the calendar job.

On termination, a check is performed to determine whether the run counter has reached or exceeded the maximum value. If this is the case, the entire calendar job is terminated. Otherwise the run counter is incremented by 1.

**LIMIT = \*BY-DATE(...)**

*This specification is only permitted for calendar jobs.*

Entries in the calendar file are only taken into account up to the specified limit. No further repeat job is generated for calendar entries after the limit; the calendar job terminates.

The limit refers solely to the schedule entries in the file, not to the real runtime of the jobs. Repeat jobs with a "permissible" start date are not subject to any further restrictions and are, for example, also started after the specified date if this was not possible earlier because of delays in the job scheduler.

The date specification consists of the day and the time:

**DATE = <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day.

**RESOURCES = PARAMETERS(...)**

Values for run priority, CPU time and maximum number of SYSLST records.

**RUN-PRIORITY = \*STD / <integer 30..255> / \*BY-JOB-CLASS**

Run priority the batch job is to be given. The lower the value, the higher the priority. The maximum permissible priority value is the lesser of the two values (i.e. the more favorable of the values) from the user catalog and the job class definition.

If no maximum value is defined for the job class, the following rules apply:

- If the value specified explicitly is numerically lower than the value in the user entry, the message JMS0045 is issued. The batch job is assigned the higher of the two values (i.e. the less favorable value) for the run priority from the user entry and the default run priority for the job class.
- If no value is specified or if \*STD or \*BY-JOB-CLASS is explicitly specified, the batch job is assigned the standard run priority of the job class.

The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

**RUN-PRIORITY = \*STD**

The standard run priority specified for the job class applies.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

---

**RUN-PRIORITY = \*BY-JOB-CLASS**

*This specification is only possible with the OPERATING privilege.* The batch job is to be assigned the default value defined for the job class.

**CPU-LIMIT = \*STD / \*NO / <integer 1..32767 seconds> / \*BY-JOB-CLASS**

Maximum CPU time, in seconds, that the batch job may consume. The maximum time permitted depends on the job class specified. See also [section "Time limits in BS2000" in chapter "Volume 1: General Part "](#).

**CPU-LIMIT = \*STD**

The default value for the chosen job class applies.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**CPU-LIMIT = \*NO**

The ENTER job is to run with no time limit (NTL).

This operand value is permitted only if the requisite authorization exists in the user entry or the job class definition.

**CPU-LIMIT = \*BY-JOB-CLASS**

*This specification is only possible with the OPERATING privilege.*

The batch job is to be assigned the default value defined for the job class.

**SYSLST-LIMIT = \*STD / \*NO / <integer 0..999999> / \*BY-JOB-CLASS**

Specifies the maximum number of records the job is allowed to output to the system files SYSLST, SYSLST01, SYSLST02, ..., SYSLST99 and SYSOUT. The records for SYSOUT are counted separately from the records for SYSLST files. In the case of SYSLST, SYSOUT records are not taken into account, even if the setting LISTING=\*YES has been made to ensure that they are also written to SYSLST.

This value must not be above the limit set in the job class definition. This limit may be queried using the SHOW-JOB-CLASS command.

If the limit is exceeded, the ENTER job is terminated abnormally.

**SYSLST-LIMIT = \*STD**

The default value for the chosen job class applies.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**SYSLST-LIMIT = \*NO**

Sets no limit on the number of records output.

**SYSLST-LIMIT = \*BY-JOB-CLASS**

*This specification is only possible with the OPERATING privilege.*

The batch job is to be assigned the default value defined for the job class.

**LOGGING = \*PARAMETERS(...)**

Controls the logging of the job progress.

**LISTING = \*STD / \*NO / \*YES**

Specifies whether the job run is also to be logged on SYSLST.

**LISTING = \*STD**

LISTING=\*NO applies.

When the batch job is started by the operator on the console, the specification in the operand of the same

---

name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**JOB-PARAMETER =**

Specifies additional attributes for the selected job class - assuming that systems support has defined some and made them known.

**JOB-PARAMETER = \*STD**

JOB-PARAMETER=\*NO applies.

When the batch job is started by the operator on the console, the specification in the operand of the same name in the SET-LOGON-PARAMETERS command of the ENTER file is evaluated.

Tasks with the OPERATING privilege can set this default mechanism in the DEFAULT-FROM-FILE operand.

**JOB-PARAMETER = \*NO**

No additional attributes.

**JOB-PARAMETER = <c-string 1..127>**

Arbitrary sequence of characters defined by the system administrator to identify additional job class attributes.

**PROTECTION = \*NONE / \*CANCEL**

Specifies whether the batch job is to be protected against accidental termination with the CANCEL-JOB command.

**PROTECTION = \*NONE**

The batch job is not protected against accidental termination.

**PROTECTION = \*CANCEL**

The batch job is protected against unintentional cancellation. In interactive jobs and on consoles which wish to terminate this batch job with the CANCEL-JOB command, the system additionally requests confirmation. Accidental termination of the batch job due to incorrect specification of the job number should thus be prevented.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	CMD0002	Command executed with a warning e.g. DELETE=*YES ignored for repeat job or when a library member is specified
	1	CMD0202	Syntax error in command
	32	CMD0221	system error
	64	JMS0630	Semantic or privilege error, e.g. host, catalog ID, job class unknown; MONJV not accessible, maximum number of jobs reached
	64	JMS0640	ENTER file faulty or not accessible, e.g. missing SET-LOGON-PARAMETERS, not a SAM or ISAM file, file empty, no access right
	64	JMS0670	Error in a remote job
	130	JMS0620	No further storage space or TSN available, or specified MONJV already monitoring a job
	130	JMS0650	MSCF not available or no connection to the specified host or the specified catalog is currently not available

## Notes

- Combinations of the START and REPEAT-JOB operands:

START	REPEAT-JOB		
	AT-STREAM-STARTUP	DAILY or WEEKLY	PERIOD
IMMEDIATELY or SOON	a)	c)	c)
AT or EARLIEST	a)	d)	f)
LATEST or WITHIN	a)	c)	g)
AT-STREAM-STARTUP	b)	e)	e)

Table 46: Combination of the START and REPEAT-JOB operands in the ENTER-JOB command

- The first and all subsequent starts of the job take place as specified.
- The first start of the job is made with START=\*AT-STREAM-STARTUP. All further starts take place after the startup of the job scheduler with START=\*SOON.
- The base time for the repetition cycle is the time the job is accepted.
- The specified point in time (START=..., TIME=...) is the base time for the repetition cycle.
- The first start of the job follows startup of the job scheduler. This point in time is the base time for the repetition cycle. Further starts take place with START=\*SOON.

- 
- f. The specified point in time (START=..., TIME=...) is the base time for the repetition cycle. The second and all further starts take place with START=\*SOON.
  - g. The base time for the repetition cycle is the time the job is accepted. All further starts take place with START=\*SOON.
- The following applies to the \*WITHIN, \*AT and \*LATEST entries in the START operand: After the specified point in time or period of time, jobs that have not been started are treated in the same way as jobs started with START=\*SOON and highest job priority.

### *Example*

A job with START=\*LATEST(...) could not be started by the desired time because the job scheduler was not active. It will then be started (within the same session) as soon as possible after the next startup of the job scheduler.

- Determining the scheduling time of a calendar job:
  - In the first version of the calendar job, the symbolic date (SYMDAT) specified in the SYMBOLIC-DATE operand is passed on to the CALENDAR component in the evaluation of the job attributes. The CALENDAR component returns the next point in time (date and time), with regard to the current point in time, specified by the SYMDATs defined in the calendar file.  
In the case of partially qualified SYMDATs, scheduling time is returned for each SYMDAT beginning with the character string, and the calendar job is started at each of these scheduling times.
  - The scheduling times of the following versions are determined according to the same procedure while the previous jobs are processed.

As a consequence, any modifications made to the calendar file only take effect on calendar job versions whose scheduling time is determined after the update of the calendar file. In particular, the number of calendar job versions started by means of a partially qualified SYMDAT can be extended (by defining new SYMDATs) or reduced (by deleting SYMDATs).

- Creation of a temporary copy of the ENTER file (S.IN file):  
A temporary copy of the ENTER file is created in the following cases under a file name with the prefix S.IN (supplemented by partial name for TSN, date and time or library, member and time):
  - if the file is located on private disk.
  - if the file is cataloged under a different user ID.
  - if the file is a temporary file.
  - if the file is a library member.
  - if the file is encrypted.

Special characteristics of the S.IN file:

- The S.IN file is protected by a file lock for the duration of the batch job. Note the following: the file lock is set when the pubset on which the files are located is imported. The file locks only consider files to which batch jobs from the current job pool (on the home pubset) refer. If the files are located on a shared pubset, the file locks are coordinated from the master computer.
- An S.IN file is always unencrypted. It must, therefore, be possible to decrypt the ENTER file when the command is processed, i.e. the crypto password must be specified in the CRYPTO-PASSWORD operand.

- 
- ENTER files can be protected by means of read, write and execute passwords. The execute password or a higher-ranking password must be specified in the FILE-PASSWORD operand if an ENTER-JOB command is issued. The write password must be specified when the file is to be deleted after it has been executed (DELETE=\*YES). The passwords are checked for correctness as soon as the ENTER-JOB command is processed. If a user subsequently changes the passwords, the successful check still applies and the file is executed.
  - When the ENTER job is started on a remote system (HOST not equal to \*STD), all the passwords used (CRYPTO-PASSWORD, FILE-PASSWORD, and JV-PASSWORD) must be specified directly in the ENTER-JOB command. Passwords which were entered in the job submitting task's password list with the ADD-PASSWORD and ADD-CRYPTO-PASSWORD commands apply only when the job is started locally (HOST = \*STD).
  - ENTER files can be SAM or ISAM files and have a variable record length. 72 characters are interpreted per record. In the case of ISAM files, the key field can occur in any position in the record as it will be hidden.
  - Any LOGON operands specified in the ENTER file are ignored if the command is not entered on the console or with DEFAULT-FROM-FILE=\*YES specified (see "[Privileged functions](#)").
  - DELETE operand: Despite DELETE=\*YES being entered, the file is not deleted when
    - the job submitter is not the (co-)owner of the file,
    - the file is a library member,
    - the job terminates abnormally,
    - the job is aborted.

The last two cases do not apply for the following files:

- files on private disk
  - temporary files
  - files which are cataloged under a different user ID from that under which the ENTER job is to execute
- In these cases the ENTER file is deleted immediately after the S.IN file has been created. This enables, for instance, the private disk to be removed before the ENTER job has executed.
- A batch job which is to run on a remote system can be accessed via a MONJV only when the catalog ID of the partner system's home pubset is entered in the MRSCAT of the systems concerned.
  - In the case of repeat jobs which were started with REPEAT-JOB=\*PERIOD(...), compliance with the time interval has priority over compliance with the start time. Consequently, the start time shifts in the event of time changes.
  - In nonprivileged job classes, up to 32767 waiting jobs are permissible. Any ENTER jobs in excess of this number are rejected.

---

## 3.43 ENTER-PROCEDURE

Start command sequence (procedure file) as batch job

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job processing Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE

### Function

Using the ENTER-PROCEDURE command, the user can start a procedure as a batch job. In contrast to the ENTER-JOB command, the user does not have to create a separate ENTER file. The procedure parameters are consequently variable at every asynchronous procedure execution (background procedure). ENTER files can only be started with the ENTER-JOB command.

#### *Method*

1. The procedure file is created as a copy under the name `S.PROC.tsn.date.time`, where *date* has the format `yyyy-mm-dd` and *time* has the format `hh.mm.ss`.
2. An ENTER file with the name `S.E.tsn.date.time` and the following contents is created:

```
/SET-LOGON-PARAMETERS
...
/CALL-PROCEDURE FROM-FILE=S.PROC.tsn.date.time, -
/          PROCEDURE-PARAMETERS= (parameter)
...
/EXIT-JOB SYSTEM-OUTPUT= option
```

The value of *parameter* corresponds to the entry in the PROCEDURE-PARAMETERS operand. The value of *option* is set in accordance with the entry in the SYSTEM-OUTPUT operand. After procedure execution, the copy of the procedure file is deleted.

3. The ENTER file is started with ENTER-JOB. Entries for the operands PROCESSING-ADMISSION, JOB-CLASS, JOB-NAME, MONJV, JV-PASSWORD, JOB-PRIORITY, RERUN-AFTER-CRASH, FLUSH-AFTER-SHUTDOWN, SCHEDULING-TIME, START, REPEAT-JOB, LIMIT, RESOURCES, LISTING, and JOB-PARAMETER are transferred to the ENTER-JOB command.

## Format

ENTER-PROCEDURE

Alias: **ENP**

**FROM-FILE** = <filename 1..54 without-gen> / \***LIBRARY-ELEMENT**(...)

\***LIBRARY-ELEMENT**(...)

## Operands

**FROM-FILE** = **\*LIBRARY-ELEMENT**(...) / <filename 1..54 without-gen>

Name of the file or PLAM library element which contains the procedure.

**i** If the file/library name is specified without a catalog/user ID and if it is not cataloged in the user ID, the system tries to access a file or library of the same name in the system default ID. (For information on this “secondary read” function see the “Introductory Guide to DMS” [13].)

The procedure must not begin with the SET-LOGON-PARAMETERS or LOGON command, i.e. it must not be an ENTER file.

If the job submitter is not the file owner (differing user IDs), the file must be accessible (see the operand PROTECTION=PARAMETERS in the CREATE-FILE and MODIFY-FILE-ATTRIBUTES commands).

The job submitter must in any case have at least execution privileges if the file is protected by a basic ACL or GUARDS.

If the file has an execute password, the password must be specified in the PROCEDURE-PASSWORD operand.

**FROM-FILE** = **\*LIBRARY-ELEMENT**(...)

The procedure is stored in a PLAM library.

**LIBRARY** = <filename 1..51 without-gen-vers>

Name of the library containing the procedure as an element. The specification of a library list (see the “LMS” manual [21]) instead of a library file is not supported.

**ELEMENT** = <composed-name 1..38>

Name of the element.

The following applies for the sum of the lengths of the library and member names:

- Without catalog and user IDs the sum may amount to at most 39 characters.
- In the case of a multi-character catalog ID, the sum with the full path name of the library including the catalog and user IDs may amount to at most 52 characters.

**PROCEDURE-PARAMETERS** = **\*NO** / <text 0..1800 with-low>

Parameter values which are to be set instead of the appropriate symbolic parameters. Parameter values must be enclosed in parentheses. Input is carried out as described in the CALL-PROCEDURE command.

**PROCESSING-ADMISSION** =

Specifies the user ID under which the batch job is to run.

**PROCESSING-ADMISSION** = **\*SAME**

The batch job should run under the current user ID (i.e. the one under which ENTER-PROCEDURE was specified).

**PROCESSING-ADMISSION** = **\*PARAMETERS**(...)

Parameters defining the LOGON authorization of the destination user ID.

---

**USER-IDENTIFICATION = \*NONE / <name 1..8>**

User ID under which the batch job should run.

**ACCOUNT = \*NONE / <alphanum-name 1..8>**

Account number of the user ID.

**PASSWORD = \*NONE / <c-string 1..8> / <c-string 9..32> / <x-string 1..16> / \*SECRET**

Password for the user ID.

The long password mechanism is supported (<c-string 9..32>). A hash algorithm converts the long password to the internal 8-byte representation. See the MODIFY-USER-PROTECTION command for details of the long password mechanism.

The PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password .

**PROCEDURE-PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

Password protecting the procedure file from being executed. The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**CRYPTO-PASSWORD = \*NONE / <c-string 1..8> / <x-string 1..16> / \*SECRET**

Password used when encrypting the procedure file. The copy of the procedure file (S.PROC file) is decrypted with the aid of the crypto password.

The CRYPTO-PASSWORD operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**HOST =**

Specifies the host the job is to run on. Operand values other than \*STD are available only to users who have the HIPLEX MSCF (multiprocessor systems) software product.

**HOST = \*STD**

The job is to run on the local host.

**HOST = <c-string 1..8>**

Host name of the host the ENTER job is to run on.

**HOST = \*ANY**

Allowed only on an XCS network. For details see the "HIPLEX MSCF" manual [25].

---

**JOB-CLASS = \*STD / <name 1..8>**

Job class into which the job is to be placed. The SHOW-USER-ATTRIBUTES or SHOW-JOB-CLASS command can be used to query authorization for the various job classes.

**JOB-NAME = \*NO / <name 1..8>**

Name for the ENTER job. The ENTER job can be addressed using this name (e.g. with SHOW-JOB-STATUS). The name is also printed on the header page of the printer listing. If \*NO is specified, the ENTER job is assigned the name of the job issuing the command, for reasons of compatibility. Only if this job has no name as well, the ENTER job is assigned no name, which is shown in the outputs with \*NONE, (NONE) or blanks.

**MONJV = \*NONE / <filename 1..54 without-gen-vers>**

Specifies whether the batch job is to be monitored by a JV.

**MONJV = \*NONE**

The batch job is not monitored.

**MONJV = <filename 1..54 without-gen-vers>**

*Only possible if the chargeable JV subsystem is loaded (see also the "Job Variables" manual [ 20 ]).*

Name of the job variable (JV) that is to monitor the batch job. The user can address the batch job via this JV. If the specified JV does not yet exist, it is - if the requisite authorization exists - created and made available for all users (ACCESS=\*WRITE and USER-ACCESS=\*ALL-USERS).

The system sets the JV to appropriate values while the batch job is being processed:

\$S Job on queue

\$R Job running

\$T Job terminated

\$A Job aborted

\$M Job exported with MOVE-JOBS

**JV-PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647> / \*SECRET**

Password for the JV.

The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**JOB-PRIORITY = \*STD / <integer 1..9>**

Job priority to be given to the batch job.

The lower the value, the higher the priority. The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

**JOB-PRIORITY = \*STD**

The standard priority specified for the job class applies.

---

**RERUN-AFTER-CRASH = \*NO / \*YES**

Specifies whether the batch job is to be restarted during the next system session if processing has been aborted as the result of a system error or termination of the system session.

*Note*

The operand is not evaluated if job repetition is enabled in the REPEAT operand.

**FLUSH-AFTER-SHUTDOWN = \*NO / \*YES**

Specifies whether the batch job is to be removed from the job queue if it has not been processed by the end of the session.

*Note*

The operand is not evaluated if job repetition is enabled in the REPEAT operand. The specification FLUSH-AFTER-SHUTDOWN=\*YES with the warning JMS0056 is ignored for calendar jobs.

**SCHEDULING-TIME = \*STD / \*PARAMETERS(...) / \*BY-CALENDAR(...)**

Defines how scheduling times are specified for the batch job.

**SCHEDULING-TIME = \*STD**

The default settings for START and REPEAT-JOB scheduling time specifications for the selected job class apply (see the operands of SCHEDULING-TIME=\*PARAMETERS(...)).

**SCHEDULING-TIME = \*PARAMETERS(...)**

Defines scheduling time (start time) for the batch job. It is also possible to define job repeats (repeat job).

**START =**

Starting time for the batch job. Values other than \*STD are ignored unless they are permitted by virtue of the job class definition (see the SHOW-JOB-CLASS command).

**START = \*STD**

The default value for the chosen job class applies.

**START = \*SOON**

The job is to be started as soon as possible, in accordance with its priority.

**START = \*IMMEDIATELY**

The job is to be started immediately.

**START = \*AT-STREAM-STARTUP**

The job is to be started after the next startup of the job scheduler.

**START = \*WITHIN(...)**

The job is to be started within the specified time period.

**HOURS = 0 / <integer 0..23 hours >**

Number of hours.

**MINUTES = 0 / <integer 0..59 minutes >**

Number of minutes.

**START = \*AT(...)**

The job is to be started exactly at the time specified in the following.

---

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes. Seconds are not interpreted.

**START = \*EARLIEST(...)**

The job is to be started no earlier than the time specified.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes. Seconds are not interpreted.

**START = \*LATEST(...)**

The job is to be started no later than the time specified.

**DATE = \*TODAY / <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day in the format hh:mm, where hh = hours and mm = minutes. Seconds are not interpreted.

**REPEAT-JOB =**

Time interval at which the batch job is to be repeated. Values other than \*STD are ignored unless they are permitted by virtue of the job class definition (see the SHOW-JOB-CLASS command). The time interval for the repetitions depends on the specification in the START operand; see the note in this regard, "Combinations of the START and REPEAT-JOB operands". For the repetitions, the following applies:

- The i-th repetition (i >= 1) of a job is not started until the (i-1)th repetition has ended.
- Cancellation of the currently executing job (i) has no effect on the start of (i+1); (i >= 0).
- Cancellation of the entire job: Both the currently executing job (i) and the subsequent job (i+1) must be canceled, (i >= 0); (CANCEL-JOB command, or make job (i) the last job in the series using the command MODIFY-JOB ...,REPEAT-JOB=\*NO).

**REPEAT-JOB = \*STD**

The default value for the chosen job class applies.

**REPEAT-JOB = \*NO**

The batch job is not repeated.

**REPEAT-JOB = \*DAILY**

Daily repetition at the time specified with START.

**REPEAT-JOB = \*WEEKLY**

Weekly repetition at the time specified with START.

---

**REPEAT-JOB = \*AT-STREAM-STARTUP**

Repetition following each startup of the job scheduler.

**REPEAT-JOB = \*PERIOD(...)**

Repetition after the specified time interval.

**HOURS = 0 / <integer 0..23 hours >**

Number of hours.

**MINUTES = 0 / <integer 0..59 minutes >**

Number of minutes.

**SCHEDULING-TIME = \*BY-CALENDAR(...)**

The batch job scheduling time and any repeat jobs are specified in the form of a symbolic date defined in a calendar file (calendar job). The entries in a calendar file can be listed with the SHOW-CALENDAR command. Creation of calendar files with the CALENDAR utility is described in the "Calendar" manual [4].

**CALENDAR-NAME = <filename 1..54 without-cat-user-gen-vers>**

Name of the calendar file.

**SYMBOLIC-DATE = <filename 1..20 without-cat-user-vers> /  
<partial-filename 2..20 without-cat-user>**

Symbolic date which defines the scheduling time and any repetition cycles within the calendar file. The symbolic date may also be given in partially qualified mode. In this way, several scheduling times can be defined for one calendar day with the appropriate definition of SYSDATs.

*Example:* Definition of SYMDATs in the calendar file:

- WORK.DAY.1 (every other day at 06:00 hrs)
- WORK.DAY.2 (every other day at 6:00 PM hrs)
- WORK.WEEK.1 (every Friday at 21:00 hrs)

A calendar job considering all three scheduling points is started with SYMBOLIC-DATE=WORK..

**LIMIT = \*STD / <integer 1..32767> / \*BY-DATE(...)**

Governs how long a calendar job remains in existence. This limit applies in addition to the limits set by the calendar.

**LIMIT = \*STD**

The duration of the calendar job depends entirely on the symbolic date entry in the calendar.

**LIMIT = <integer 1..32767>**

*This specification is only permitted for calendar jobs.*

Maximum number of repetitions of the calendar job.

On termination, a check is performed to determine whether the run counter has reached or exceeded the maximum value. If this is the case, the entire calendar job is terminated. Otherwise the run counter is incremented by 1.

**LIMIT = \*BY-DATE(...)**

*This specification is only permitted for calendar jobs.*

Entries in the calendar file are only taken into account up to the specified limit. No further repeat job is generated for calendar entries after the limit; the calendar job terminates.

The limit refers solely to the schedule entries in the file, not to the real runtime of the jobs. Repeat jobs with a

---

"permissible" start date are not subject to any further restrictions and are, for example, also started after the specified date if this was not possible earlier because of delays in the job scheduler.

The date specification consists of the day and the time:

**DATE = <date>**

Date. This can be specified in the form [yy]yy-mm-dd. Only the last two digits of the year are evaluated, which means that the century is ignored in four-digit year specifications. 20 is automatically prefixed to two-digit year specifications < 80, 19 to two-digit year specifications >= 80.

**TIME = <time>**

Time of day.

**RESOURCES = \*PARAMETERS(...)**

Values for run priority, CPU time and maximum number of SYSLST records.

**RUN-PRIORITY = \*STD / <integer 30..255>**

Run priority the batch job is to be given. The lower the value, the higher the priority. The maximum permissible priority value is the lesser of the two values (i.e. the more favorable of the values) from the user catalog and the job class definition.

If no maximum value is defined for the job class, the following rules apply:

- If the value specified explicitly is numerically lower than the value in the user entry, the message JMS0045 is issued. The batch job is assigned the higher of the two values (i.e. the less favorable value) for the run priority from the user entry and the default run priority for the job class.
- If no value is specified or if \*STD or \*BY-JOB-CLASS is explicitly specified, the batch job is assigned the standard run priority of the job class.

The values can be queried with the SHOW-USER-ATTRIBUTES and SHOW-JOB-CLASS commands.

**RUN-PRIORITY = \*STD**

The standard priority specified for the job class applies.

**CPU-LIMIT = \*STD / \*NO / <integer 1..32767 seconds >**

Maximum CPU time, in seconds, that the batch job may consume. The maximum time permitted depends on the job class specified. See also [section "Time limits in BS2000" in chapter "Volume 1: General Part "](#).

**CPU-LIMIT = \*STD**

The default value for the chosen job class applies.

**CPU-LIMIT = \*NO**

The ENTER job is to run with no time limit (NTL). This operand value is permitted only if the requisite authorization exists in the user entry or the job class definition.

**SYSLST-LIMIT = \*STD / \*NO / <integer 0..999999>**

Specifies the maximum number of records the job is allowed to output to the system files SYSLST, SYSLST01, SYSLST02, ..., SYSLST99 and SYSOUT . The records for SYSOUT are counted separately from the records for SYSLST files. In the case of SYSLST, SYSOUT records are not taken into account, even if the setting LISTING=\*YES has been made to ensure that they are also written to SYSLST.

This value must not be above the limit set in the job class definition. This limit may be queried using the SHOW-JOB-CLASS command.

**SYSLST-LIMIT = \*STD**

The default value for the chosen job class applies. If the specified number is exceeded, the batch job is terminated abnormally.

---

**SYSLST-LIMIT = \*NO**

Sets no limit on the number of records output.

**LISTING = \*NO / \*YES**

Specifies whether the job run is also to be logged on SYSLST.

**LOGGING =**

Controls logging of job execution. For non-S procedures the LOGGING operand is ignored because logging is defined in the BEGIN-PROCEDURE in that instance.

**LOGGING = \*STD**

Logging only takes place if the procedure file is not read-protected.

**LOGGING = \*YES**

Job execution is logged. Execution of a file can only be logged if the correct password has been entered into the password table of the job originator or is specified in the PROCEDURE-PASSWORD operand.

**LOGGING = \*NO**

Job execution is not logged.

**JOB-PARAMETER =**

Specifies additional attributes for the selected job class - assuming that systems support has defined some and made them known.

**JOB-PARAMETER = \*NO**

No additional attributes.

**JOB-PARAMETER = <c-string 1..127>**

Arbitrary sequence of characters defined by the system administrator to identify additional job class attributes.

**SYSTEM-OUTPUT =**

Controls output of the system files SYSLST and SYSOUT on job termination (see also the EXIT-JOB command, SYSTEM-OUTPUT operand).

**SYSTEM-OUTPUT = \*STD**

Outputs the system files SYSLST and SYSOUT to printer or in an email (see \*STDOUT) in the event of errored execution.

**SYSTEM-OUTPUT = \*STDOUT**

Depending on the setting of the system parameter SSMOUT, the system files SYSLST and SYSOUT are output to printer (see \*PRINT) or sent by email (see \*MAIL). In the case of cross-system command processing, the system parameter of the target system is evaluated.

**SYSTEM-OUTPUT = \*PRINT**

Outputs the system files SYSLST and SYSOUT to printer.

**SYSTEM-OUTPUT = \*MAIL**

The system files SYSLST and SYSOUT are sent by email. The receiver address(es) is/are taken over from the user entry of the user ID of the terminated job. How the receiver address is selected from an address list in accordance with the job name is described under the MAIL-FILE command.

If transfer by email is not possible (e.g. no email address in the user ID), the system files are output to printer.

**SYSTEM-OUTPUT = \*DELETE**

Output of the system files SYSLST and SYSOUT is suppressed.

---

**ASSIGN-SYSTEM-FILES =**

Specifies which allocation should apply to the system files SYSLST and SYSOUT at the start of the batch job. The operand supports the assignment of cataloged files to the two system files during an asynchronous procedure run. Consequently, the procedure file can, for instance, continue output to SYSOUT in interactive mode while directing output to a cataloged file in batch mode. The assignment to dummy files (\*DUMMY) is also supported (see also FILE-NAME=\*DUMMY in the ADD-FILE-LINK command).

**ASSIGN-SYSTEM-FILES = \*STD**

The primary allocation for SYSLST and SYSOUT is preset, i.e. output on printer at the end of the task (dependent on SYSTEM-OUTPUT), if there has been no change in allocation within the procedure.

**ASSIGN-SYSTEM-FILES = \*PARAMETERS(...)**

Specifies which allocation should apply to SYSLST and SYSOUT at the start of the batch job.

**SYSLST = \*STD / \*PRIMARY / \*DUMMY / <filename 1..54>**

Output destination to which the system file SYSLST is to be assigned. The default value is \*STD, i.e. the existing assignment is unchanged.

**SYSOUT = \*STD / \*PRIMARY / \*DUMMY / <filename 1..54>**

Output destination to which the system file SYSOUT is to be assigned. The default value is \*STD, i.e. the existing assignment is unchanged.

**PROTECTION = \*NONE / \*CANCEL**

Specifies whether the batch job is to be protected against accidental termination with the CANCEL-JOB command.

**PROTECTION = \*NONE**

The batch job is not protected against accidental termination.

**PROTECTION = \*CANCEL**

The batch job is not protected against accidental termination. In interactive jobs and on consoles which wish to terminate this batch job with the CANCEL-JOB command, the system additionally requests confirmation. Accidental termination of the batch job due to incorrect specification of the job number should thus be prevented.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	CMD0002	Command executed with warning, e.g. DELETE=*YES ignored for repeat job or when a library member is specified
	1	CMD0202	Syntax error in command
	32	CMD0221	system error
	64	JMS0630	Semantic or privilege error, e.g. host, catalog ID, job class unknown; MONJV not accessible, maximum number of jobs reached
	64	JMS0640	Error when accessing the procedure file, e.g. not a SAM or ISAM file, file empty, no access right
	64	JMS0670	Error in a remote job
	130	JMS0620	No further storage space or TSN available, or specified MONJV already monitoring a job
	130	JMS0650	MSCF non available or no connection to the specified host

## Notes

- Combinations of the START and REPEAT-JOB operands:

START	REPEAT-JOB		
	AT-STREAM-STARTUP	DAILY or WEEKLY	PERIOD
IMMEDIATELY or SOON	a)	c)	c)
AT or EARLIEST	a)	d)	f)
LATEST or WITHIN	a)	c)	g)
AT-STREAM-STARTUP	b)	e)	e)

Table 47: START and REPEAT-JOB operand combinations in the ENTER-PROCEDURE command

- The first and all subsequent starts of the job take place as specified.
  - The first start of the job is effected with START=\*AT-STREAM-STARTUP. All further starts take place after the startup of the job scheduler with START=\*SOON.
  - The base time for the repetition cycle is the time the job is accepted.
  - The specified point in time (START=..., TIME=...) is the base time for the repetition cycle.
  - The first start of the job follows startup of the job scheduler. This point in time is the base time for the repetition cycle. All further starts take place with START=\*SOON.
  - The specified point in time (START=..., TIME=...) is the base time for the repetition cycle. The second and all further starts take place with START=\*SOON.
  - The base time for the repetition cycle is the time the job is accepted. All further starts take place with START=\*SOON.
- The following applies to the \*WITHIN, \*AT and \*LATEST entries in the START operand: After the specified point in time or period of time, jobs that have not been started are treated in the same way as jobs started with START=\*SOON and highest job priority.

### Example

A job with START=\*LATEST(...) could not be started by the desired time because the job scheduler was not active. It will then be started (within the same session) as soon as possible after the next startup of the job scheduler.

- Determining the scheduling time of a calendar job:
- In the first version of the calendar job, the symbolic date (SYMDAT) specified in the SYMBOLIC-DATE operand is passed on to the CALENDAR component in the evaluation of the job attributes. The CALENDAR component returns the next point in time (date and time), with regard to the current point in time, specified by the SYMDATs defined in the calendar file. In the case of partially qualified SYMDATs, scheduling time is returned for each SYMDAT beginning with the character string, and the calendar job is started at each of these scheduling times.
- The scheduling times of the following versions are determined according to the same procedure while the previous jobs are processed.

As a consequence, any modifications made to the calendar file only take effect on calendar job versions whose scheduling time is determined after the update of the calendar file. In particular, the number of calendar job versions started by means of a partially qualified SYMDAT can be extended (by defining new SYMDATs) or reduced (by deleting SYMDATs).

- A batch job which is to run on a remote system can be accessed via a MONJV only when the catalog ID of the partner system's home pubset is entered to the MRSCAT of the systems concerned.
- Access to procedure files via RFA is not possible.
- To ensure availability of the procedure file at execution time (start of the batch job), a copy of the file with the prefix S.PROC. is always created.
- Essentially the operands are identical with those of the ENTER-JOB command. Only the following operands of the ENTER-JOB command are not supported:

FILE-PASSWORD	The generated ENTER file is assigned a random password with which the FILE-PASSWORD is supplied.
DELETE	DELETE=*YES always applies

- The ENTER file created is always started with DELETE=\*YES. The ENTER file and the copy of the procedure file (S.PROC file) are not automatically deleted if the job is to be repeated (REPEAT operand).
- The copy of the procedure file (S.PROC file) is password-protected, but may be deleted by the owner without entry of the password. The user can thus delete S.PROC files that were not deleted on account of a system error. The user may not delete S.PROC files for repeat jobs. The same applies to password protection on the S.E file.
- The S.PROC and S.E files are set up with DESTROY-BY-DELETE=\*YES depending on the system parameter DESTLEV.
- Procedure files can be protected by means of read, write and execute passwords. The execute password or a higher-ranking password must be specified in the PROCEDURE-PASSWORD operand. A read password must be specified if job execution is to be logged. The passwords are validated on processing the ENTER-PROCEDURE command. If the passwords are subsequently changed, the successful validation during ENTER-PROCEDURE processing remains in force and the procedure file can be executed. If the procedure to be executed is a PLAM library element, a password specified in the PROCEDURE-PASSWORD operand is interpreted as a password only for accessing the PLAM library.
- S.IN files are always unencrypted. It must, therefore, be possible to encrypt the procedure file when the command is processed, i.e. the crypto password must be specified in the CRYPTO-PASSWORD operand.
- When the batch job is started on a remote host (HOST not equal to \*STD), all the passwords used (CRYPTO-PASSWORD, PROCEDURE-PASSWORD and JV-PASSWORD) must be specified directly in the ENTER-PROCEDURE command. Passwords which were entered in the job submitting task's password list with the ADD-PASSWORD, and ADD-CRYPTO-PASSWORD commands apply only when the job is started locally (HOST = \*STD).
- The S.PROC and the S.E files are protected by a file lock for the duration of the batch job. Note the following: the file locks are set when the pubset is imported on which the files are located. The file locks only consider files to which batch jobs from the current job pool (on the home pubset) refer. If the files are located on a shared pubset, the file locks are coordinated from the master computer.
- In nonprivileged job classes, up to 32767 waiting jobs are permissible. Any ENTER jobs in excess of this number are rejected.

---

## 3.44 EOF

Generate EOF condition for SYSDTA system input file

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Job processing File processing
<b>Domain:</b>	JOB PROCEDURE PROGRAM
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The EOF command generates an EOF condition for the system input file SYSDTA. In interactive mode, the EOF command in conjunction with the ESCAPE function (e.g. K2 key) terminates the reading in of data at the terminal (SYSDTA = SYSCMD).

In a user program, the EOF command terminates data input (SYSDTA = input file) if the data record that has just been read is equivalent to an EOF command and a corresponding instruction is used in the program. Control then passes to the routine for end-of-file processing.

### Format

EOF

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	32	EXC0041	System error
	130	CMD2282	Command not executed because no program is loaded

## 3.45 EXECUTE-POSIX-CMD

Call POSIX commands from BS2000

<b>Component:</b>	POSIX-BC
<b>Functional area:</b>	POSIX administration and application
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING

### Function

The EXECUTE-POSIX-CMD command enables the user to call POSIX commands directly in BS2000 without first calling a POSIX shell explicitly to permit their execution. The user can specify a single command, a list of commands (command sequence) or the name of a BS2000 file which contains a script.

The user must satisfy the requirements for calling a POSIX shell (see the START-POSIX-SHELL command).

The commands specified are forwarded to a POSIX shell without a syntax check being performed and called using the dot command. The environment variable EXECUTE\_POSIX\_CMD="YES" is set in the shell. Querying variables (e.g. in */etc/profile* or *.profile*) enables unwanted outputs to be suppressed when EXECUTE-POSIX-CMD is executed.

Processing of the EXECUTE-POSIX-CMD command ends only when all the commands which have been passed have been processed (i.e. all background processes which have been started are terminated). Processing can be aborted by pressing the K2 key twice.

The POSIX commands specified can optionally be logged in a BS2000 file (INPUT-LOG-FILE operand) and, if required, can be called again from this file.

By default, the command's outputs are directed to SYSOUT (OUTPUT operand), but they can also be written to a file.

Details of permissible inputs (scope of the POSIX commands supported) and general information about working with the POSIX shell are provided in the "POSIX (Commands)" manual [28].

### Format

<b>EXECUTE-POSIX-CMD</b>	Alias: <b>ECXCMD</b>
<b>CMD</b> = <filename 1..54> / list-poss(15): <c-string 1..100 with-low>	
, <b>INPUT-LOG-FILE</b> = <u>*NONE</u> / <filename 1..54 without-gen-vers>(…)	
<filename 1..54 without-gen-vers>(…)	
<b>WRITE-MODE</b> = <u>*REPLACE</u> / <u>*EXTEND</u>	
, <b>OUTPUT</b> = <u>*SYSOUT</u> / <filename 1..54>	

---

## Operands

### **CMD=**

Specifies the commands or scripts to be executed.

### **CMD = <filename 1..54>**

Name of the BS2000 file from which the commands/command sequences are to be read.

### **CMD = list-poss (15): <c-string 1..100 with-low>**

The command is specified explicitly. Multiple commands can be specified within a list in the form of a command sequence.

### **INPUT-LOG-FILE =**

Specifies whether the inputs are to be logged.

### **INPUT-LOG-FILE = \*NONE**

The inputs are not logged.

### **INPUT-LOG-FILE = <filename 1..54 without-gen-vers>(…)**

The inputs are logged in the specified BS2000 file.

### **WRITE-MODE = \*REPLACE / \*EXTEND**

Specifies whether a file that has already been cataloged is to be overwritten or updated.

### **OUTPUT =**

Specifies the place to which the command outputs are to be directed.

### **OUTPUT = \*SYSOUT**

Output is directed to the SYSOUT system file (i.e. in interactive mode, output on the monitor if nothing else is assigned).

### **OUTPUT = <filename 1..54>**

The command outputs are to be written to the specified BS2000 file.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
x	64	CCM0999	The shell command, command sequence or script supplies an exit status with the value x (not equal 0) which can be obtained from the SC2.

---

## Notes

- Commands/scripts which are executed using EXECUTE-POSIX-CMD cannot read from the standard input because the latter is closed before a command/script is executed. Consequently, such commands/scripts receive EOF when they attempt to read from the standard input.  
The POSIX commands which may under some circumstances read from the standard input (in the case of queries) are: *rm*, *mv*, *bs2cp*, *mailx*
- In the case of EXECUTE-POSIX-CMD, *stdout* and *stderr* are not connected to a terminal but to a pipe. Commands/scripts which require *stdout* and *stderr* to be connected to a terminal therefore work either not at all or incorrectly. These commands/scripts use the CRTE functions *isatty()* and *ttyname()* to determine whether or to which terminal *stdout* and *stderr* are connected.  
The POSIX commands which consequently might not work at all or only incorrectly are: *tty*, *tabs*, *mesg*, *write*, *talk*, *more*, *patch*, *pax*, *nohup*, *ls*, *fg*, *bg*
- When the shell command *exec* is executed with EXECUTE-POSIX-CMD, the current shell is unloaded and the mechanisms for forwarding outputs and/or the exit value of forked processes may be disabled.
- The *fc* command is only effective for inputs outside scripts; it is therefore not suitable for use under /EXECUTE-POSIX-CMD.
- The shell commands executed using EXECUTE-POSIX-CMD are not logged in the usual command memory ( *\$HOME/.sh\_history*) but in a separate short command memory (*HISTSIZE=100*) under */tmp/.ecxcmd\_sh\_history\_<user-name>*.  
As a result, the *fc* command only accesses the history of the EXEC-POSIX-CMD calls.
- Under EXECUTE-POSIX-CMD, command substitutions by means of '*command*' or *\$(command)* are always executed in a subshell. In the POSIX shell, on the other hand, a number of commands are available which are substituted within the shell itself. Consequently, individual commands can behave differently from in the POSIX shell if the results are process-specific (e.g. *ftyp* and *bs2file* and accesses to variables or functions which have not been exported).
- In the command sequence the definition of alias names using the *alias* command has no effect because the command sequence is executed using the dot command. If alias names are to be defined and used, the command sequence must be copied to a (temporary) POSIX file. The file must be assigned Execute permission and executed (not using the dot command).
- The command sequence called using EXECUTE-POSIX-CMD is executed in a subshell which is generated internally by means of *fork*. The SYSDIR environment of the calling procedure is not available in this subshell. This can have an influence on BS2000 commands which are called using *bs2cmd* and on the POSIX commands *lp*, *lpstat* and *cancel*.

## 3.46 EXIT-JOB

Terminate current job

**Component:** BS2000 OSD/BC  
**Functional area:** Job processing  
**Domain:** JOB  
**Privileges:** all privileges  
**Routing code:** @ (only with NBCONOPI=Y)

### Function

The EXIT-JOB command terminates the current job. The virtual memory pages and devices occupied by the job are subsequently released and the system output files are readied for output.

If new file generations have been created during the job, the system outputs the names of the file generations concerned, their base values, and the names of the first and current file generations.

**i** Unlike the LOGOFF command, EXIT-JOB does not support output of the system files to tape.

### Notes on Operator LOGON

If the “Operator LOGON” function is used (incompatible mode; system parameter NBCONOPI=Y), the EXIT-JOB command can also be issued on a physical operator terminal (console) or from an authorized user program with dynamic authorization names, but operands are not allowed in either case.

On a physical operator terminal the EXIT-JOB command revokes the authorization to enter commands; with an authorized user program it results in disconnection.

In both cases EXIT-JOB also implies the RELEASE-OPERATOR-ROLE command with OPERATOR-ROLE=\*ALL, which means that all routing codes are relinquished and message subscription/suppression is canceled.

Operator activities on a physical operator terminal cannot be resumed until authentication has been carried out again using SET-LOGON-PARAMETERS under a user ID with the OPERATING privilege.

### Format

#### EXIT-JOB

**MODE** = \*NORMAL / \*ABNORMAL

,**SYSTEM-OUTPUT** = \*ALL / \*NONE / \*STDOUT / \*PARAMETERS(...)

\*PARAMETERS(...)

|     **SYSLST-OUTPUT** = \*NONE / \*PRINTER / \*MAIL / \*STDOUT

|     **SYSOUT-OUTPUT** = \*NONE / \*PRINTER / \*MAIL / \*STDOUT

,**KEEP-CONNECTION** = \*NO / \*YES

---

## Operands

### **MODE =**

Specifies whether the job is to be terminated normally or abnormally.

### **MODE = \*NORMAL**

The job is terminated normally. The status indicator of a monitoring job variable is set to '\$T'.

### **MODE = \*ABNORMAL**

The job is terminated abnormally. The status indicator of a monitoring job variable is set to '\$A'. Whether a dump is taken depends on the test options defined within the task (see MODIFY-TEST-OPTIONS command, DUMP operand).

### **SYSTEM-OUTPUT =**

Controls output of the system files SYSLST and SYSOPT, and for batch jobs also output of the system file SYSOUT. Empty system files are not output.

### **SYSTEM-OUTPUT = \*ALL**

The system files SYSLST and SYSOUT are output to printer (see \*PRINTER) or transferred by email (see \*MAIL) depending on the settings of the system parameter SSMOUT.

### **SYSTEM-OUTPUT = \*NONE**

Output of the system files is suppressed.

### **SYSTEM-OUTPUT = \*STDOUT**

Depending on the setting of the system parameter SSMOUT, the system files SYSLST and SYSOUT are output to printer (see \*PRINTER) or sent by email (see \*MAIL).

### **SYSTEM-OUTPUT = \*PARAMETERS(...)**

Controls which of the two system files (SYSLST or SYSOUT) is output.

#### **SYSLST-OUTPUT = \*NONE**

SYSLST is not output.

#### **SYSLST-OUTPUT = \*PRINTER**

The system file SYSLST is to be output to printer. However, the output can be suppressed by systems support using the system parameters SSMLGOF1 and SSMLGOF2. The following applies:

- SSMLGOF1=NO-SPOOL

In batch jobs output is suppressed.

In interactive jobs the output is suppressed if SSMLGOF2=NO. Output takes place when SSMLGOF2=SPOOL and the SPOOL subsystem is available. In all other cases an inquiry is displayed on the terminal.

- SSMLGOF1=REQ-SPOOL

Output is to printer. If SPOOL is not available, the job waits and the status in a job-monitoring MONJV remains \$R. Only when SPOOL is available and printout can take place does the job terminate.

- SSMLGOF1=STA-SPOOL

Printout takes place if SPOOL is available, otherwise it is suppressed.

---

**SYSLST-OUTPUT = \*MAIL**

SYSLST is sent by email. The receiver address(es) is/are taken over from the user entry of the job's user ID. How the receiver address is selected from an address list in accordance with the job name is described under the MAIL-FILE command.

If transfer by email is not possible (e.g. no email address in the user ID), output takes place in accordance with SYSLST-OUTPUT=\*PRINTER.

**SYSLST-OUTPUT = \*STDOUT**

Depending on the setting of the system parameter SSMOUT, the system file SYSLST is output to printer (see \*PRINT) or sent by email (see \*MAIL).

**SYSOUT-OUTPUT = \*NONE**

SYSOUT is not output.

**SYSOUT-OUTPUT = \*PRINTER**

The system file SYSOUT is to be output to printer. However, the output can be suppressed by systems support (see SYSLST-OUTPUT=\*PRINTER).

**SYSOUT-OUTPUT = \*MAIL**

SYSOUT is sent by email. The receiver address(es) is/are taken over from the user entry of the job's user ID. How the receiver address is selected from an address list in accordance with the job name is described under the MAIL-FILE command.

If transfer by email is not possible (e.g. no email address in the user ID), output takes place to printer.

**SYSOUT-OUTPUT = \*STDOUT**

Depending on the setting of the system parameter SSMOUT, the system file SYSOUT is output according to SYSOUT-OUTPUT=\*PRINTER.

**KEEP-CONNECTION =**

Specifies whether the processor connection is to be retained, enabling a new job to be started immediately. This operand is permitted only in interactive mode; it is ignored in batch mode.

**KEEP-CONNECTION = \*NO**

Clears down the processor connection.

**KEEP-CONNECTION = \*YES**

Retains the processor connection. A new job can be started immediately.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed <sup>1)</sup>
	1	CMD0202	Syntax error
	32	CMD0221	System error; no message is sent to SYSOUT

<sup>1)</sup> Cannot be evaluated since in this case the task is terminated!

---

## Note

If an EXIT-JOB command is issued while a program is loaded, an ABEND-STXIT routine (if defined) will be activated. This does not happen if the EXIT-JOB command is called via the CMD macro (see the “Executive Macros” manual [22]).

## Examples

*Example 1: Abnormal job termination and test option DUMP=\*STD*

```
/mod-test-opt dump=*std  
/exit-job mode=*abnormal,keep-conn=*yes
```

```
% IDA0N51 PROGRAM INTERRUPT AT LOCATION '00000000 (NONAME), (CDUMP), EC=50'  
% IDA0N45 DUMP DESIRED? REPLY (Y=USER-/AREADUMP TO DISK;  
Y,<VOLUMETYPE>=USER-/AREADUMP TO TAPE; Y,SYSTEM=SYSTEMDUMP; N=NO)?n  
% EXC0419 /LOGOFF AT 1621 ON 17-11-26 FOR TSN '9VKP'  
% EXC0421 CPU TIME USED: 0.2166  
% JMS0150 INSTALLATION ' S210-40', BS2000 VERSION 'V200', HOST 'D016ZE07':  
PLEASE ENTER '/SET-LOGON-PARAMETERS' OR '?'
```

*Example 2: Abnormal job termination and test option DUMP=\*YES*

```
/mod-test-opt dump=*yes  
/exit-job mode=*abnormal,keep-connection=*yes
```

```
% IDA0N51 PROGRAM INTERRUPT AT LOCATION '00000000 (NONAME), (CDUMP), EC=50'  
% IDA0N53 DUMP BEING PROCESSED. PLEASE HOLD ON  
% IDA0N54 'USERDUMP' WRITTEN TO FILE '$USER1.DUMP.9VKP.00001'  
% IDA0N55 TITLE: 'TSN-9VKP UID-USER1 AC#-89001 USERDUMP PC-00000000 EC-  
50 VERS-150 DUMP-TIME 16:21:26 17-11-26'  
% EXC0419 /LOGOFF AT 1621 ON 17-11-26 FOR TSN '9VKP'  
% EXC0421 CPU TIME USED: 0.2166  
% JMS0150 INSTALLATION ' S210-40', BS2000 VERSION 'V200', HOST 'D016ZE07':  
PLEASE ENTER '/SET-LOGON-PARAMETERS' OR '?'
```

---

## 3.47 EXIT-PROCEDURE

Terminate procedure run (return to caller)

<b>Component:</b>	SYSFILE
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The EXIT-PROCEDURE command is an SDF-P control flow command. It terminates procedure execution and returns control to the caller, i.e. the procedure level from which the call was made. If EXIT-PROCEDURE terminates the last procedure, control returns to the primary command input (corresponding to procedure level 0):

In interactive mode, command input (SYSCMD) is assigned primarily to the terminal, in batch mode to the ENTER file.

The system files (including TASKLIB) receive the assignment in force at the interrupt point. A file that was assigned by means of ASSIGN-SYSLST in the procedure is closed by EXIT-PROCEDURE.

The ERROR operand can be used to pass a command return code to the caller. This code can be evaluated with SDF-P facilities (see IF-BLOCK-ERROR command).

The RESUME-PROGRAM operand can be used to specify that a loaded program may be continued after termination of the procedure. This function corresponds to the ENDP-RESUME command.

If an EOF condition is encountered (physical end of the procedure file is reached during command processing), the procedure is terminated as if an EXIT-PROCEDURE command had been issued. The caller receives a return code corresponding to the current error status on termination.

The effect of an EXIT-PROCEDURE command in ESCAPE mode is described under the HOLD-PROCEDURE command.

If errors occur in an *S procedure*, the EXIT-PROCEDURE command is *not* recognized.

## Format

### EXIT-PROCEDURE

**ERROR** = \*NO (...) / \*YES(...)

\*NO(...)

|     **SUBCODE2** = 0 / <integer 0..255>

|     , **MAINCODE** = CMD0001 / <alphanum-name 7..7>

\*YES(...)

|     **SUBCODE1** = 64 / <integer 0..255>

|     , **SUBCODE2** = 0 / <integer 0..255>

|     , **MAINCODE** = SDP0018 / <alphanum-name 7..7>

, **RESUME-PROGRAM** = \*NO / \*YES

## Operands

### **ERROR** =

This specifies which information on procedure execution the caller is to receive.

### **ERROR** = \*NO(...)

The caller receives the return code of class "NO-ERROR". Additional information can be passed via the SUBCODE2 and MAINCODE operands:

#### **SUBCODE2** = 0 / <integer 0..255>

This passes additional information in SUBCODE2. The default value is zero, i.e. there is no additional information.

#### **MAINCODE** = CMD0001 / <alphanum-name 7..7>

This passes a message code. The caller can request an explanation of the message by means of the HELP-MSG-INFORMATION command.

The default value is CMD0001, i.e. procedure terminated without errors.

### **ERROR** = \*YES(...)

The caller receives a return code indicating an error. The operands SUBCODE1, SUBCODE2, and MAINCODE can be used to identify the error class and any additional information:

#### **SUBCODE1** = 64 / <integer 0..255>

This indicates the error class of the relevant error.

**i** SUBCODE1=0 is also possible for reasons of compatibility. Because the convention (see "Return codes" in section "Language for SDF output" in chapter "Volume 1: General Part ") specifies that this value stands for "no error", ERROR=\*YES(SUBCODE1=0) is executed like ERROR=\*NO.

---

**SUBCODE2 = 0 / <integer 0..255>**

This passes additional information in SUBCODE2. The default value is zero, i.e. there is no additional information.

**MAINCODE = SDP0018 / <alphanumeric-name 7..7>**

This passes a message code. The caller can request an explanation of the message by means of the HELP-MSG-INFORMATION command.

**RESUME-PROGRAM = \*NO / \*YES**

This specifies whether a loaded program is to be resumed when the procedure is terminated. If \*YES is specified, the most recently loaded program can be resumed when the procedure is terminated.

**Note**

If a procedure is called in ESCAPE mode, the following message is issued when control is returned:

```
TASK IS IN ESCAPE-MODE AT LEVEL NUMBER i
```

where i = number of the procedure level to which processing has returned.

When primary command input is reached (level 0), this message is not issued.

**Return codes**

With the ERROR operand, the EXIT-PROCEDURE command can report any command return code to the caller. From the caller's viewpoint, this is the return code from the CALL-PROCEDURE or INCLUDE-PROCEDURE command. However, if execution of the EXIT-PROCEDURE command itself results in an error, control does not return to the caller but one of the following return codes is supplied and error handling within the procedure is activated.

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SSM2039	Error on closing output system file; the SYSOUT message contains the DMS error code as an insert
	1	CMD0202	Syntax error
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	SSM1013	No procedure has been called

**Examples**

See the CANCEL-PROCEDURE and HOLD-PROCEDURE commands.

---

## 3.48 EXPORT-FILE

Delete catalog entry of files (file export)

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION  
TSOS

**Routing code:** \$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The EXPORT-FILE command deletes the catalog entries for files which are contained on a private volume or Net-Storage volume (i.e. exports files). The storage space and data in the files is retained.

By default, the command exports files to private disk. When files on a Net-Storage volume are to be exported, either the volume or the storage type \*NET-STORAGE must be specified explicitly.

The IMPORT-FILE command allows their catalog entries to be recreated (i.e. the files to be imported).

#### *Privileged functions*

System support staff may export files belonging to any user ID. It may ignore the passwords of protected files and also branch to guided dialog whenever the user ID is changed.

By default, systems support (TSOS privilege) is a co-owner of all the files (and can therefore export files under any user ID). When SECOS is used, this co-ownership can be restricted.

Systems support can generate files under any user ID (TSOS privilege). In conjunction with the SECOS software product a user can allow other user IDs to act as co-owners. Co-owners of a user ID are then also allowed to export a file.

## Overview of functions

Function / Meaning	Level 1 operands	Level 2/3 operands
Identifier of the volume to be exported	VOLUME =	
Name of the file or file generation to be exported	FILE =	
<ul style="list-style-type: none"> <li>file name</li> </ul>	=*NAME	
<ul style="list-style-type: none"> <li>file generation; all older generations are exported</li> </ul>	=*GENERATIONS-BEFORE	
<ul style="list-style-type: none"> <li>file generation; all younger generations are exported</li> </ul>	=*GENERATIONS-AFTER	
Selection criteria for the files to be deleted	SELECT = *BY-ATTRIBUTES(...)

## Operands

**VOLUME = \*ANY / <alphanum-name 1..6>**

The VSN of the volume on which the file to be exported is stored. From the set of files selected by the FILE operand, only the files which are held on the specified volume will be exported. The VOLUME operand must not be used for file generation groups on tape.

If a file generation is to be exported from a private disk specified in the VOLUME operand, which holds a file generation group including the generation to be exported, but does not hold the group entry, gaps can result in the generation group. This gap will only be in the catalog entry; the file generation group remains complete on the disks.

**VOLUME = \*ANY**

All the files identified by the FILE operand and contained on private volumes or Net-Storage volumes will be exported.

**FILE = \*NAME(...) / \*GENERATIONS-BEFORE(...) / \*GENERATIONS-AFTER**

Specifies the files or file generation groups to be exported. \*DUMMY designates a dummy file, or dummy generations which “always exist” and which satisfy all the selection criteria. Any other operands (except for DIALOG-CONTROL, OUTPUT and SUPPRESS-ERRORS) will be checked for their formal correctness, but otherwise ignored. The main use of \*DUMMY is in testing procedures.

**FILE = \*NAME(...)**

From within the volumes identified by VOLUME, the files named as follows will be selected:

**FILE-NAME = \*ALL / <filename 1..54 with-wild(80)> / \*DUMMY**

The name of the file to be exported. Only the user’s own user ID or a user ID for which the user is co-owner may be specified.

**FILE = \*GENERATIONS-BEFORE(...)**

From within the volumes identified by VOLUME, all the file generations which are older than the one whose identification follows will be exported:

---

**GENERATION-NAME = <filename 1..54 with-wild(80)> / \*DUMMY**

The name of a reference generation. All those file generations which have a number less than the reference generation will be exported.

**FILE = \*GENERATIONS-AFTER(...)**

From within the volumes identified by VOLUME, all the file generations which are younger than the one whose identification follows will be exported:

**GENERATION-NAME = <filename 1..54 with-wild(80)> / \*DUMMY**

The name of a reference generation. All those file generations which have a number greater than the reference generation will be exported.

**SELECT = \*ALL**

All the files in the set specified by the FILE-NAME operand are selected.

**SELECT = \*BY-ATTRIBUTES(...)**

Restricts the files in the set specified in the FILE-NAME operand to files which satisfy the criteria which follow. The default values, \*ANY and ANY, each indicates that the file set is not to be restricted to any particular values for the attribute concerned.

**CREATION-DATE = \*ANY / \*NONE / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date> / \*INTERVAL(...)**

The user can select the files to be exported by their creation date. See also the *CRE-DATE* and *CRE-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

**CREATION-DATE = \*ANY**

The creation date is not to be used as a selection criterion.

**CREATION-DATE = \*NONE**

Only those files which have the value NONE entered in the CREATION-DATE field in their catalog entry are exported, i.e. files which have never been opened.

**CREATION-DATE = \*TODAY**

Only those files which have today's date entered in the CREATION-DATE field in their catalog entry are exported.

**CREATION-DATE = \*YESTERDAY**

Only those files which have yesterday's date entered in the CREATION-DATE field in their catalog entry are exported.

**CREATION-DATE = <integer -99999..991231>**

Only those files which have the specified date entered in the CREATION-DATE field in their catalog entry are exported. Here, the user can specify the creation date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0)

**CREATION-DATE = <date>**

Only those files which have the specified date entered in the CREATION-DATE field in their catalog entry are exported. The user can specify the creation date in the form [yy]yy-mm-dd.

**CREATION-DATE = \*INTERVAL(...)**

Only those files which were created within the specified time period are exported. The range of dates covered

---

by the specification includes the two end dates (see also the explanation of how dates are specified using <integer> values). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = \*EARLIEST / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Only those files which have been created since the specified date (i.e. CREATION-DATE >= specified date) are exported. If EARLIEST is specified, the system will use the earliest possible date.

**FROM = \*TODAY**

Exports only those files which were created on the current date.

**FROM = \*YESTERDAY**

Exports only those files which were created as of yesterday's date (i.e. files for which CREATION-DATE >= date of preceding day).

**FROM = <integer -99999..991231>**

Exports only those files which were created after the specified date (i.e. files for which CREATION-DATE >= specified date).

**FROM = <date>**

Exports only those files which were created after the specified date (i.e. files for which CREATION-DATE >= specified date).

**TO = \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Exports only those files which were created before the specified date (i.e. files for which CREATION-DATE <= specified date).

**TO = \*TODAY**

Exports only those files which were created up to today's date (i.e. files for which CREATION-DATE <= current date).

**TO = \*YESTERDAY**

Exports only those files which were created up to yesterday's date (i.e. files for which CREATION-DATE <= date of preceding day).

**TO = <integer -99999..991231>**

Exports only those files which were created before the specified date (i.e. files for which CREATION-DATE <= specified date).

**TO = <date>**

Exports only those files which were created before the specified date (i.e. files for which CREATION-DATE <= specified date).

**EXPIRATION-DATE = \*ANY / \*NONE / \*TOMORROW / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date> / \*INTERVAL(...)**

The user can select the files to be exported by their release date (expiration date). See also the *EXPIR-DATE* and *EXPIR-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

**EXPIRATION-DATE = \*ANY**

The expiration date is not to be used as a selection criterion.

**EXPIRATION-DATE = \*NONE**

Only those files which have no expiration date (i.e. the value NONE) entered in the EXPIRATION-DATE field in their catalog entry are exported.

---

**EXPIRATION-DATE = \*TOMORROW**

Only those files which have tomorrow's date entered as the EXPIRATION-DATE in their catalog entry are exported.

**EXPIRATION-DATE = \*TODAY**

Only those files which have today's date entered as the EXPIRATION-DATE in their catalog entry are exported.

**EXPIRATION-DATE = \*YESTERDAY**

Only those files which have yesterday's date entered as the EXPIRATION-DATE in their catalog entry are exported.

**EXPIRATION-DATE = <integer -99999..991231>**

Only those files which have the specified date entered as the EXPIRATION-DATE in their catalog entry are exported. Here, the user can specify the expiration date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits with preceding sign), the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0, TOMORROW corresponds to +1)

**EXPIRATION-DATE = <date>**

Only those files which have the specified date entered as the EXPIRATION-DATE in their catalog entry are exported. The user can specify the expiration date in the form [yy]yy-mm-dd.

**EXPIRATION-DATE = \*INTERVAL(...)**

Only those files for which the expiration date lies within the specified time period, i.e. files for which the retention period ends within the specified time period, will be exported. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for EXPIRATION-DATE = <integer...>). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = \*EARLIEST / \*TOMORROW / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

If EARLIEST is specified, the system will use the earliest possible date. Only those files for which the retention period expires on or after the specified date (EXPIRATION-DATE >= specified date) are exported.

**FROM = \*TOMORROW**

Exports only those files for which the EXPIRATION-DATE >= the next day.

**FROM = \*TODAY**

Exports only those files for which the EXPIRATION-DATE >= the current date.

**FROM = \*YESTERDAY**

Exports only those files for which the EXPIRATION-DATE >= the specified date.

**FROM = <integer -99999..991231>**

Exports only those files for which the EXPIRATION-DATE >= the specified date.

**FROM = <date>**

Exports only those files for which the EXPIRATION-DATE >= the specified date.

**TO = \*LATEST / \*TOMORROW / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Only files for which the retention period expires on or before the specified date (EXPIRATION-DATE <= specified date) will be exported.

---

**TO = \*TOMORROW**

Exports only those files for which the EXPIRATION-DATE <= the next day.

**TO = \*TODAY**

Exports only those files for which the EXPIRATION-DATE <= the current date.

**TO = \*YESTERDAY**

Exports only those files for which the EXPIRATION-DATE <= yesterday's date.

**TO = <integer -99999..991231>**

Exports only those files for which the EXPIRATION-DATE <= the specified date.

**TO = <date>**

Exports only those files for which the EXPIRATION-DATE <= the specified date.

**LAST-ACCESS-DATE = \*ANY / \*NONE / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date> / \*INTERVAL(...)**

The user can select the files to be exported by the date when they were last accessed. See also the *ACC-DATE* and *ACC-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

**LAST-ACCESS-DATE = \*ANY**

The date of last access is not to be used as a selection criterion.

**LAST-ACCESS-DATE = \*NONE**

Exports only those files which have the value NONE entered in the LADATE field in their catalog entry, i.e. files which have never been opened.

**LAST-ACCESS-DATE = \*TODAY**

Exports only those files for which today's date has been entered as the LAST-ACCESS-DATE in the catalog entry.

**LAST-ACCESS-DATE = \*YESTERDAY**

Exports only those files for which yesterday's date has been entered as the LAST-ACCESS-DATE in the catalog entry.

**LAST-ACCESS-DATE = <integer -99999..991231>**

Exports only those files for which the specified date has been entered as the LAST-ACCESS-DATE in the catalog entry. Here, the user can specify the last access date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0)

**LAST-ACCESS-DATE = <date>**

Exports only those files for which the specified date has been entered as the LAST-ACCESS-DATE in the catalog entry. The user can specify the creation date in the form [yy]yy-mm-dd.

**LAST-ACCESS-DATE = \*INTERVAL(...)**

Only files which were last accessed within the specified time period will be exported. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified using <integer> values). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit.

---

**FROM = \*EARLIEST / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Only files which have been accessed since the specified date (i.e. for which LAST-ACCESS-DATE >= specified date) will be exported. If EARLIEST is specified, the system will use the earliest possible date.

**FROM = \*TODAY**

Exports only those files which have been accessed up to the date of the current date.

**FROM = \*YESTERDAY**

Exports only those files which have been accessed up to the date of the preceding day. Returns information on files for which the LAST-ACCESS-DATE >= the specified date.

**FROM = <integer -99999..991231>**

Exports only those files for which the LAST-ACCESS-DATE >= the specified date.

**FROM = <date>**

Exports only those files for which the LAST-ACCESS-DATE >= the specified date.

**TO = \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Only those files which were last accessed on or before the specified date (i.e. files for which LAST-ACCESS-DATE <= the specified date) are exported.

**TO = \*TODAY**

Exports only those files which have been accessed up to the current date.

**TO = \*YESTERDAY**

Exports only those files which have been accessed up to the date of the preceding day.

**TO = <integer -99999..991231>**

Exports only those files which were most recently accessed up to the specified date.

**TO = <date>**

Exports only those files which were most recently accessed up to the specified date.

**SUPPORT = \*ANY / list-poss(2): \*PRIVATE-DISK / \*TAPE**

The user can select which files are to be exported by the EXPORT-FILE command by the type of their volumes.

**SUPPORT = \*ANY**

The volume type is not to be used as a selection criterion.

**SUPPORT = \*PRIVATE-DISK**

Only files on private disks are to be exported.

**SUPPORT = \*TAPE**

Only files on tape or tape cartridge are to be exported.

**STORAGE-TYPE = \*ANY / \*NET-STORAGE(...)**

The user can select which files are to be exported with EXPORT-FILE by the type of the storage location of the file.

**STORAGE-TYPE = \*ANY**

The storage type is not a selection criterion.

**STORAGE-TYPE = \*NET-STORAGE(...)**

Only files on a Net-Storage volume are exported.

**FILE-TYPE = \*ANY / \*BS2000 / \*NODE-FILE**

The user can select which files are to be exported with EXPORT-FILE by the file type.

---

**FILE-TYPE = \*ANY**

The file type is not a selection criterion.

**FILE-TYPE = \*BS2000**

Only BS2000 files on Net-Storage volumes are exported.

**FILE-TYPE = \*NODE-FILE**

Only node files on Net-Storage volumes are exported.

**SIZE = \*ANY / \*FREESIZE / <integer 0..2147483647> / \*INTERVAL(...)**

*Only for files on disks and Net-Storage volumes:* the user can select which files are to be exported by the EXPORT-FILE command on the basis of their size or the size of their reserved storage area (= number of PAM pages).

The value of the SIZE operand specifies the number of PAM pages: the upper and lower limits are both included in the range specified.

**SIZE = \*ANY**

The file size is not to be used as a selection criterion.

**SIZE = \*FREESIZE**

Only files for which storage space has been reserved but which do not yet occupy any of it (*HIGH-US-PA=0*) are to be exported.

**SIZE = <integer 0..2147483647>**

Only files for which the number of PAM pages reserved is exactly equal to the number specified here are to be exported.

**SIZE = \*INTERVAL(...)**

Only files for which the number of pages lies within the specified range are to be exported. The upper and lower limits are both included in the range specified (see description of SIZE=<integer...>). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit. Only files for which the number of PAM pages reserved is at least equal to the FROM value and at most equal to the TO value will be processed (FROM <= SIZE <= TO).

**FROM = 0 / <integer 0..2147483647>**

Only files for which the number of PAM pages reserved is at least equal to the specified number are to be exported (SIZE >= specified value).

**TO = 2147483647 / <integer 0..2147483647>**

Only files for which the number of PAM pages reserved is at most equal to the specified number are to be exported (SIZE <= specified value).

**NUMBER-OF-EXTENTS = \*ANY / <integer 0..65535> / \*INTERVAL(...)**

*Only for disk files:* the user can select the files to be processed by EXPORT-FILE by the number of extents into which the file is "split". An extent is a contiguous area on a disk, occupied by one file; the output field *EXTENTS* shows how many extents the file has.

**NUMBER-OF-EXTENTS = \*ANY**

The number of extents is not to be used as a selection criterion.

**NUMBER-OF-EXTENTS = <integer 0..65535>**

Only disk files with exactly the specified number of extents (*EXTENDS* = integer) are to be exported.

**NUMBER-OF-EXTENTS = \*INTERVAL(...)**

Selects all the files whose number of extents lies within the specified range. The upper and lower limits are both

---

included in the range specified. It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit. Only disk files which have at least as many EXTENTS as specified by the FROM value and at most as many as given by the TO value will be processed (FROM <= EXTENTS <= TO).

**FROM = 0 / <integer 0..65535>**

Only files for which the number of extents is at least equal to the specified number are to be exported ( EXTENTS >= integer).

**TO = 65535 / <integer 0..65535>**

Only files for which the number of extents is at most equal to the specified number are to be exported ( EXTENTS <= integer).

**NUMBER-OF-FREE-PAGES = \*ANY / \*SIZE / <integer 0..2147483647> / \*INTERVAL(...)**

*Only for files on disks and Net-Storage volumes:* the user can select the files to be processed according to their number of free PAM pages, i.e. the number of pages reserved for a file but unused.

**NUMBER-OF-FREE-PAGES = \*ANY**

The number of free PAM pages is not to be used as a selection criterion.

**NUMBER-OF-FREE-PAGES = \*SIZE**

Only files which actually occupy no storage space are to be exported (i.e. no PAM page has been written yet).

**NUMBER-OF-FREE-PAGES = <integer 0..2147483647>**

Only files which have exactly the number of reserved but unused (=free) PAM pages specified by <integer...> are to be exported.

**NUMBER-OF-FREE-PAGES = \*INTERVAL(...)**

Selects all files for which the number of unused PAM pages lies within the specified range. The upper and lower limits are both included in the range specified (see description of NUMBER-OF-FREE-PAGES = <integer...>). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit.

Only disk files which have at least as many free PAM pages as specified by the FROM value and at most as many as given by the TO value will be exported (FROM <= FREE <= TO).

**FROM = 0 / <integer 0..2147483647>**

Only files for which the number free PAM pages is at least equal to the specified number are to be exported ( FREE >= integer).

**TO = 2147483647 / <integer 0..2147483647>**

Only files for which the number free PAM pages is at most equal to the specified number are to be exported ( FREE <= integer).

**ACCESS = \*ANY / \*READ / \*WRITE**

The specified access type will be used as a selection criterion ( ACCESS output field).

**ACCESS = \*ANY**

The ACCESS value is not to be used as a selection criterion.

**ACCESS = \*READ**

Only files for which write access is prevented by ACCESS=READ, i.e. for which only read access is permitted, will be exported.

---

**ACCESS = \*WRITE**

Only files for which write access is permitted will be exported.

**PASSWORD = \*ANY / list-poss(4): \*NONE / \*READ-PASSWORD / \*WRITE-PASSWORD / \*EXEC-PASSWORD**

The user can select files with specific password types for processing by the EXPORT-FILE command.

**PASSWORD = \*ANY**

Password protection is not to be used as a selection criterion.

**PASSWORD = \*NONE**

Only files for which there is no password protection are to be exported.

**PASSWORD = \*READ-PASSWORD**

Only files which are protected by a read password are to be exported.

**PASSWORD = \*WRITE-PASSWORD**

Only files which are protected by a write password are to be exported.

**PASSWORD = \*EXEC-PASSWORD**

Only files which are protected by an execute password are to be exported.

**USER-ACCESS = \*ANY / listposs(3): \*OWNER-ONLY / \*ALL-USERS / \*SPECIAL**

The user can select files using their access authorizations as a criterion.

**USER-ACCESS = \*ANY**

The access authorization is not to be used as a selection criterion.

**USER-ACCESS = \*OWNER-ONLY**

Only files which the owner alone may access are to be exported.

**USER-ACCESS = \*ALL-USERS**

Only files which can be accessed by all users are to be exported.

**USER-ACCESS = \*SPECIAL**

Only files which can be accessed by all user IDs including the maintenance IDs (i.e. user IDs with HARDWARE-MAINTENANCE privilege) are to be exported.

**FILE-STRUCTURE = \*ANY / list-poss(5): \*PAM / \*SAM / \*ISAM / \*BTAM / \*NONE**

The user can select files for processing according to their access method (*FILE-STRUC* output field).

**FILE-STRUCTURE = \*ANY**

The access method is not to be used as a selection criterion.

**FILE-STRUCTURE = \*PAM**

Only PAM files should be processed.

**FILE-STRUCTURE = \*SAM**

Only SAM files are to be processed.

**FILE-STRUCTURE = \*ISAM**

Only ISAM files are to be processed.

**FILE-STRUCTURE = \*BTAM**

Only BTAM files are to be processed. BTAM files are tape files.

---

**FILE-STRUCTURE = \*NONE**

Only files for which FILE-STRUC=NONE, i.e. files which have not yet been opened, are to be exported.

**BACKUP-CLASS = \*ANY / list-poss(5): \*A / \*B / \*C / \*D / \*E**

The user can select files for export by their BACKUP-CLASS level.

**BACKUP-CLASS = \*ANY**

The BACKUP-CLASS level is not to be used as a selection criterion.

**BACKUP-CLASS = \*A**

Only the files for which the value A is entered in the catalog as the BACKUP-CLASS (most frequent backup) are exported.

**BACKUP-CLASS = \*B**

Only the files for which the value B is entered in the catalog as the BACKUP-CLASS are exported.

**BACKUP-CLASS = \*C**

Only the files for which the value C is entered in the catalog as the BACKUP-CLASS are exported.

**BACKUP-CLASS = \*D**

Only the files for which the value D is entered in the catalog as the BACKUP-CLASS are exported.

**BACKUP-CLASS = \*E**

Only the files for which the value E is entered in the catalog as the BACKUP-CLASS are exported.

**BLOCK-CONTROL-INFO = ANY / list-poss(4): NONE / NO / WITHIN-DATA-BLOCK / WITHIN-DATA-2K-BLOCK / WITHIN-DATA-4K-BLOCK / PAMKEY / NK / NK2 / NK4**

The user can select files for export by their file format ( *BLK-CONTR* output field).

**BLOCK-CONTROL-INFO = \*ANY**

The BLOCK-CONTROL entry is not to be used as a selection criterion.

**BLOCK-CONTROL-INFO = \*NONE**

Only files for which no BLK-CNTRL value has been defined, i.e. files which have not yet been opened, are to be exported.

**BLOCK-CONTROL-INFO = \*NO**

Only files which contain no block control field are to be exported.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-BLOCK**

Only files which were created with BLOCK-CONTROL-INFO=WITHIN-DATA-BLOCK (i.e. files for which block control information is held in a block control field at the start and within the data block) are to be exported.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-2K-BLOCK**

Only files which were created with BLOCK-CONTROL-INFO=WITHIN-DATA-2K-BLOCK (i.e. files for which block control information is located at the start of each 2K block) are to be exported.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-4K-BLOCK**

Only files which were created with BLOCK-CONTROL-INFO=WITHIN-DATA-4K-BLOCK (i.e. files for which block control information is located at the start of each 4K block) are to be exported.

**BLOCK-CONTROL-INFO = \*PAMKEY**

Only files which use a separate PAM key for the block control field (i.e. the block control information is held in a separate key field, outside the PAM block) are to be exported.

---

**BLOCK-CONTROL-INFO = \*NK**

Only the NK files are to be exported, i.e. files which can also be stored on NK volumes (NK2 and NK4).

**BLOCK-CONTROL-INFO = \*NK2**

Only files which can also be stored on NK2 volumes (but not NK4 volumes) are to be exported.

**BLOCK-CONTROL-INFO = \*NK4**

Only files which can also be stored on NK4 volumes are to be exported.

**MIGRATE = \*ANY / list-poss(2): \*ALLOWED / \*INHIBITED / \*FORBIDDEN**

The user can specify which files are to be processed by the EXPORT-FILE command by the migration entry in the catalog (see the CREATE-FILE command, MIGRATE operand).

**MIGRATE = \*ANY**

The specified files are to be exported, irrespective of the value in the MIGRATE operand in each of their catalog entries.

**MIGRATE = \*ALLOWED**

Only files for which the catalog entry specifies the appropriate operand value, i.e. files which may be migrated to storage levels S1 and S2, are to be exported.

**MIGRATE = \*INHIBITED**

Only files for which the catalog entry specifies the appropriate operand value, i.e. files which may not be migrated, are to be processed.

**MIGRATE = \*FORBIDDEN**

Only files for which the catalog entry specifies the appropriate operand value are to be exported, i.e. files for which an intensified migration lock is declared. The files may not even be migrated for a brief period (e.g. for reorganization purposes).

**STATUS = \*ANY / \*PARAMETERS(...)**

The current file status is used as a selection criterion.

**STATUS = \*ANY**

The file status is not to be used as a selection criterion.

**STATUS = \*PARAMETERS(...)**

Only the files which have the specified status are selected for export. The following selection criteria are possible:

**i** The selection criteria within the \*PARAMETERS(...) structure are logically ORed.

**CLOSED-OUTPUT = \*ANY / \*YES / \*NO**

Specifies whether the “file closed” status is to be used as a selection criterion.

**CLOSED-OUTPUT = \*YES**

Only the files which have already been closed are exported.

**CLOSED-OUTPUT = \*NO**

Only the output files which have been opened in a program (OPEN OUTIN, INOUT or OUTPUT) and files which were not closed in an earlier system run or because a job was aborted are selected for export.

**REPAIR-NEEDED = \*ANY / \*YES**

Specifies whether files which were not closed in an earlier system run and not reconstructed with REPAIR-DISK-FILES are to be selected.

---

**REPAIR-NEEDED = \*ANY**

Exports files regardless of whether they need to be repaired.

**REPAIR-NEEDED = \*YES**

Only the files which were not closed in an earlier system run and which have not yet been reconstructed are selected for export.

**BASIC-ACL = \*ANY / \*NONE / \*YES / \*PARAMETERS(...)**

The BASIC-ACL entry in the file catalog is used as a selection criterion.

**BASIC-ACL = \*ANY**

The BASIC-ACL entry is not to be used as a selection criterion.

**BASIC-ACL = \*NONE**

Only the files that have no BASIC-ACL entry in the catalog are to be exported.

**BASIC-ACL = \*YES**

Only the files which have a BASIC-ACL entry in the catalog are to be exported.

**BASIC-ACL = \*PARAMETERS(...)**

Only the files which have the specified BASIC-ACL entry in the catalog are to be exported. NO-ACCESS means that no access rights were granted.

**i** Access rights specified with the OWNER, GROUP, and OTHERS operands within the \*PARAMETERS (...) structure are logically ORed.

**OWNER = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights must already be defined for the owner.

**OWNER = \*PARAMETERS(...)**

Access rights that must be present for the owner (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**GROUP = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for the owner's user group.

**GROUP = \*PARAMETERS(...)**

Access rights that must be present for the owner's user group (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

---

**OTHERS = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for all other users.

**OTHERS = \*PARAMETERS(...)**

Access rights that must be present for all other users (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**PROTECTION-ACTIVE = \*ANY / list-poss(3): \*LEVEL-0 / \*LEVEL-1**

The highest activated access control method (protection level) is used as a selection criterion. Only the files which have access protection at specified protection level are exported. Protection level 2 cannot be explicitly specified for EXPORT-FILE.

When the file is accessed, the highest activated protection level applies. The following table shows the method used for access control, the protection attributes, and the job variable protection hierarchy (protection levels):

Access control	Protection attribute	Prot. level
Standard access control	ACCESS and USER-ACCESS	0
Basic access control list	BASIC-ACL	1
Access control via guards	PASSWORD	2

Table 49: Hierarchy of access control methods

All other protection attributes of the file (e.g. passwords) are evaluated independently, without regard to the implemented protection level.

**PROTECTION-ACTIVE = \*ANY**

The access control method is not to be used as a selection criterion.

**PROTECTION-ACTIVE = \*LEVEL-0**

Only the files for which access is controlled via standard access control are to be exported.

**PROTECTION-ACTIVE = \*LEVEL-1**

Only the files for which access is controlled via a basic access control list (BASIC-ACL protection) are to be exported.

**ACCESS-COUNTER = \*ANY / <integer 0..2147483647> / \*INTERVAL(...)**

The access counter for the file is used as a selection criterion (see the *ACC-COUNT* output field of the SHOW-FILE-ATTRIBUTES command).

**ACCESS-COUNTER = \*ANY**

The access counter is not to be used as a selection criterion.

**ACCESS-COUNTER = <integer 0..2147483647>**

Only the files for which the access counter exactly matches the specified value are selected for export.

**ACCESS-COUNTER = \*INTERVAL(...)**

Only the files for which the access counter lies in the specified value range which follows are to be exported.

---

**FROM = 0 / <integer 0..2147483647>**

Only those files for which the access counter >= the specified value are exported.

**TO = 2147483647 / <integer 0..2147483647>**

Only those files for which the access counter <= the specified value are exported.

**HIGHEST-USED-PAGE = \*ANY / <integer 0..2147483647> / \*INTERVAL(...)**

The number of PAM pages used serves as a selection criterion here, i.e. the last page pointer points to the specified page (see also the *HIGH-US-PA* output field of the SHOW-FILE-ATTRIBUTES command).

**HIGHEST-USED-PAGE = \*ANY**

The number of PAM pages used is not used as a selection criterion.

**HIGHEST-USED-PAGE = <integer 0..2147483647>**

Only the files for which the specified number of PAM pages are used (i.e. files for which the last page pointer points to the specified page) are exported.

**HIGHEST-USED-PAGE = \*INTERVAL(...)**

Exports only those files which use a number of pages that falls within the specified range.

**FROM = 0 / <integer 0..2147483647>**

Only the files in which the number of used pages >= the specified number are exported.

**TO = 2147483647 / <integer 0..2147483647>**

Only the files in which the number of used pages <= the specified number are exported.

**TYPE-OF-FILES = \*ANY / list-poss(2): \*FILE / \*PLAM-LIBRARY**

Specifies whether files are to be selected on the basis of information specific to the file type. The files to be exported can be restricted to normal files or to PLAM libraries.

**TYPE-OF-FILES = \*ANY**

Exports files without taking the file type into account.

**TYPE-OF-FILES = \*FILE**

Only files are exported.

**TYPE-OF-FILES = \*PLAM-LIBRARY**

Only PLAM libraries are exported.

**DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*FILE-CHANGE / \*MORE-THAN-ONE-FILE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during the export process. A control dialog is only possible in dialog mode but, in this mode, may also be used in procedures. The only operand value that you can specify in batch mode is \*STD or \*NO.

The user can intervene with the following inputs:

- Y: the specified file or file set will then be exported.
- N: the specified file or file set will not be exported.
- T: processing of the command will be terminated.
- ?: the possible responses will be listed, with an explanation of each.

In addition, the following options can be specified, separated by commas:

- ,CHECK = NO  
The DIALOG-CONTROL mode will be changed to '\*NO'.

- ,CHECK = PVS  
The DIALOG-CONTROL mode will be changed to ‘\*CATALOG-CHANGE’.
- ,CHECK = MULTIPLE  
The DIALOG-CONTROL mode will be changed to ‘\*MORE-THAN-ONE-FILE’.
- ,CHECK = SINGLE  
SINGLE The DIALOG-CONTROL mode will be changed to ‘\*FILE-CHANGE’.
- ,CHECK = ERROR  
The DIALOG-CONTROL mode will be changed to ‘\*ERROR’.
- ,IGNORE = list-poss(3): RDPASS / WRPASS / EXPASS *Only privileged users may make this specification.*  
Specifies the type of password protection that is to be ignored on export. The specification only applies to a single file in the control dialog.
- ,PASSWORD = list-poss(3): <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>  
Enables password-protected files to be exported (maximum of 3 passwords). The specification only applies to a single file in the control dialog.

#### **DIALOG-CONTROL = \*STD**

The default \*STD setting is equivalent to \*MORE-THAN-ONE-FILE in an interactive dialog (when SYSCMD is connected to the terminal) and to \*NO in procedures and in batch mode.

#### **DIALOG-CONTROL = \*NO**

The user cannot intervene in EXPORT-FILE processing; all the specified files will be exported (without a verification dialog).

#### **DIALOG-CONTROL = \*ERROR**

If exporting of the selected files proceeds without error, they will be exported immediately, as when \*NO is specified (i.e. no verification dialog). However, if a user-correctable error occurs during export, then a verification dialog takes place as for DIALOG-CONTROL = \*FILE-CHANGE. DIALOG-CONTROL = \*ERROR applies implicitly if DIALOG-CONTROL = \*FILE-CHANGE is set. In the event of an error, the user may acknowledge the error message, abort EXPORT-FILE processing or attempt to rectify the error. If he wishes, he can also change the DIALOG-CONTROL mode (see also the possible forms of intervention listed under the first DIALOG-CONTROL operand).

#### **DIALOG-CONTROL = \*FILE-CHANGE**

For each file which is to be exported, the user has the intervention options described for the first of the DIALOG-CONTROL operands. For each file which is to be processed, the user can decide interactively whether it should be exported or not (response: YES/NO). If in the verification dialog he specifies protection attributes under “IGNORE”, or one or more passwords under “PASSWORD”, these will be taken into account for any selected file and, if satisfied, the file will be exported without further queries (“YES” must also be specified). The user can also abort EXPORT-FILE processing, or change the DIALOG-CONTROL mode.

The files which have been exported will be listed in alphanumeric order.

#### **DIALOG-CONTROL = \*MORE-THAN-ONE-FILE**

If exactly one file is specified, this will be exported immediately. If the file is specified in partially qualified form, which means that more than one file is selected, or if the file name contains wildcards, the user can decide, each time the catalog ID changes, whether files from the new catalog are to be exported (see the intervention options described for the first of the DIALOG-CONTROL operands). He must respond to the question issued by the system with “YES” or “NO”. DIALOG-CONTROL=\*MORE-THAN-ONE-FILE is useful if wildcards are specified for “catid” in the FILE-NAME. In the verification dialog, EXPORT-FILE processing can be terminated, or the DIALOG-CONTROL mode can be changed.

---

### **DIALOG-CONTROL = \*CATALOG-CHANGE**

As with DIALOG-CONTROL = \*MORE-THAN-ONE-FILE, the EXPORT-FILE processing routine branches to a verification dialog if files in different catalogs (pubsets) are affected. The user can determine whether the files in the current pubset should be exported (YES/NO), EXPORT-FILE processing should be terminated, or the DIALOG-CONTROL mode should be changed.

### **DIALOG-CONTROL = \*USER-ID-CHANGE**

Whenever the user ID is changed when deleting the catalog entries, a branch is made to guided dialog.

### **OUTPUT = \*STD / \*NO / \*SYSOUT**

The user can specify whether a message (DMS0800) with the name of the exported file is to be output to SYSOUT for each successfully exported file. The default setting \*STD is equivalent to OUTPUT=\*NO.

### **OUTPUT = \*NO**

No messages are output to SYSOUT for successfully exported files.

### **OUTPUT = \*SYSOUT**

For each file that is successfully exported, a message with the name of the file is output to SYSOUT.

### **IGNORE-PROTECTION = \*NONE / list-poss(3): \*WRITE-PASSWORD / \*READ-PASSWORD / \*EXEC-PASSWORD**

*Only privileged users may enter operand values other than \*NONE.* Systems support may specify that password protection is to be ignored. The specification IGNORE-PROTECTION in the EXPORT-FILE command thus makes it unnecessary to issue MODIFY-FILE-ATTRIBUTES commands to reset the protection attributes before the files can be exported.

### **IGNORE-PROTECTION = \*WRITE-PASSWORD**

System support staff are authorized to ignore the protection attribute **write password** when deleting the catalog entry.

### **IGNORE-PROTECTION = \*READ-PASSWORD**

System support staff are authorized to ignore the protection attribute **read password** when deleting the catalog entry.

### **IGNORE-PROTECTION = \*EXEC-PASSWORD**

System support staff are authorized to ignore the protection attribute **execute password** when deleting the catalog entry.

### **PASSWORDS-TO-IGNORE = \*NONE / \*SECRET / list-poss(3): <x-string 1..8> / <c-string 1..4> / <integer -2147483648..2147483647>**

The user can specify one or more passwords, which will permit files protected by these passwords to be exported. The passwords entered here are not recorded in the password table for the job, and are valid only for the current EXPORT-FILE processing. Up to 3 passwords may be specified in the form of a list.

In order to export a password-protected file, the password at the highest access level must be specified (see the ADD-PASSWORD command).

The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**PASSWORDS-TO-IGNORE = \*NONE**

No passwords are specified.

**SUPPRESS-ERRORS = \*NONE / list-poss(3): <alphanumeric 7..7>**

In procedures, the user can specify whether the spin-off mechanism or SDF-P error handling is to be triggered every time an error occurs (apart from syntax errors), or whether specific error conditions are to be ignored.

**SUPPRESS-ERRORS = \*NONE**

All errors will trigger the spin-off mechanism or SDF-P error handling.

**SUPPRESS-ERRORS = list-poss(3): <alphanumeric 7..7>**

The user can define which errors are to be ignored by means of their DMS error codes (alphanumeric 7..7). If the specified error occurs, the spin-off mechanism will not be triggered. A maximum of 3 error codes may be specified. DMS error code: 7 characters, of which the first three are always "DMS"; the last 4 characters identify the error; the digits 0..9 and letters A..F are permitted. When error codes are entered, no check is made to verify that valid error codes have been specified.

A detailed list of valid DMS error codes can be found on the manual server (URL: <http://bs2manuals.ts.fujitsu.com>) by means of an HTML application and on the "BS2000 SoftBooks" DVD.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
1	0	CMD0001	No action required
2	0	DMS05F7	File generation does not exist, but group entry is updated
2	0	DMS06D6	Error on deleting certain files
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Privilege errors
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0535	Specified file not shareable
	64	DMS055C	The catalog entry could not be found on the assigned volume
	64	DMS057B	Invalid operand for migrated file
	64	DMS057C	Processing not possible due to HSMS error

	64	DMS057D	File has been migrated and cannot be recalled without delay
	64	DMS057E	File has been migrated, and HSMS is not available
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS0609	Access to system file not permitted
	64	DMS06FF	BCAM connection severed
	130	DMS0524	System address space exhausted
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0594	Not enough virtual memory available

## Examples

For examples of using the EXPORT-FILE command see the IMPORT-FILE command.

## Notes

- If a file that is stored on a private disk or a Net-Storage volume is to be exported, then the device on which this disk is mounted will be requested for the job. After deletion of the file, the device will be returned to the system.
- For files stored on private disks, if OPTION=\*DESTROY-ALL or MOUNT=\*ALL-DISK is specified then all the volumes which hold the file must be already mounted at the time the command is executed. Otherwise, only the first volume which holds the file has to be mounted. The following volumes will not be requested until the command is being executed.

This rule also applies if a partially qualified file name is specified in the DELETE-FILE command, thus addressing a number of files. In this situation, it is not necessary that all the volumes for all the files are mounted simultaneously. The system will determine which of the files requires the most devices and will request the corresponding number of devices.

---

## 3.49 EXPORT-NODE-FILE

Delete catalog entry of node files (export node files)

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The EXPORT-NODE-FILE command deletes the catalog entries for node files (files of the type NODE-FILE) which are located on a Net-Storage volume. When a node file is exported, the catalog entry is removed from the file catalog (TSOSCAT) and from the catalog of the Net-Storage volume. The node files and their data are retained on the Net-Storage.

The IMPORT-NODE-FILE command enables the catalog entry to be recreated (the node files to be imported).

#### *Privileged functions*

System support staff may export files belonging to any user ID. It may ignore the passwords of protected files and also branch to guided dialog whenever the user ID is changed.

By default, systems support (TSOS privilege) is a co-owner of all the files (and can therefore export files under any user ID). When SECOS is used, this co-ownership can be restricted.

Systems support can generate files under any user ID (TSOS privilege). In conjunction with the SECOS software product, a user can allow other user IDs to act as co-owners. Co-owners of a user ID are then also allowed to export a file.

## Overview of functions

Function / Meaning	Level 1 operands	Level 2/3 operands
Identifier of the Net-Storage volume whose node files are to be exported	VOLUME =	
Name of the file to be exported	FILE-NAME =	
Selection criteria for the files to be deleted	SELECT = *BY-ATTRIBUTES(...)	
Date specification

```

---

**CREATION-DATE = \*ANY / \*NONE / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date> / \*INTERVAL(...)**

The user can select the files to be exported by their creation date. See also the *CRE-DATE* and *CRE-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

**CREATION-DATE = \*ANY**

The creation date is not to be used as a selection criterion.

**CREATION-DATE = \*NONE**

Only those files which have the value NONE entered in the CREATION-DATE field in their catalog entry are exported, i.e. files which have never been opened.

**CREATION-DATE = \*TODAY**

Only those files which have today's date entered in the CREATION-DATE field in their catalog entry are exported.

**CREATION-DATE = \*YESTERDAY**

Only those files which have yesterday's date entered in the CREATION-DATE field in their catalog entry are exported.

**CREATION-DATE = <integer -99999..991231>**

Only those files which have the specified date entered in the CREATION-DATE field in their catalog entry are exported. Here, the user can specify the creation date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0)

**CREATION-DATE = <date>**

Only those files which have the specified date entered in the CREATION-DATE field in their catalog entry are exported. The user can specify the creation date in the form [yy]yy-mm-dd.

**CREATION-DATE = \*INTERVAL(...)**

Only those files which were created within the specified time period are exported.

The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified using <integer> values).

It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for export can only be meaningful if the chosen lower limit ≤ the upper limit.

**FROM = \*EARLIEST / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Only those files which have been created since the specified date (i.e. CREATION-DATE ≥ specified date) are exported. If EARLIEST is specified, the system will use the earliest possible date.

**FROM = \*TODAY**

Exports only those files which were created on the current date.

**FROM = \*YESTERDAY**

Exports only those files which were created as of yesterday's date (i.e. files for which CREATION-DATE ≥ date of preceding day).

---

**FROM = <integer -99999..991231>**

Exports only those files which were created after the specified date (i.e. files for which CREATION-DATE >= specified date).

**FROM = <date>**

Exports only those files which were created after the specified date (i.e. files for which CREATION-DATE >= specified date).

**TO = \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Exports only those files which were created before the specified date (i.e. files for which CREATION-DATE <= specified date).

**TO = \*TODAY**

Exports only those files which were created up to today's date (i.e. files for which CREATION-DATE <= current date).

**TO = \*YESTERDAY**

Exports only those files which were created up to yesterday's date (i.e. files for which CREATION-DATE <= date of preceding day).

**TO = <integer -99999..991231>**

Exports only those files which were created before the specified date (i.e. files for which CREATION-DATE <= specified date).

**TO = <date>**

Exports only those files which were created before the specified date (i.e. files for which CREATION-DATE <= specified date).

**EXPIRATION-DATE = \*ANY / \*NONE / \*TOMORROW / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date> / \*INTERVAL(...)**

The user can select the files to be exported by their release date (expiration date). See also the *EXPIR-DATE* and *EXPIR-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

**EXPIRATION-DATE = \*ANY**

The expiration date is not to be used as a selection criterion.

**EXPIRATION-DATE = \*NONE**

Only those files which have no expiration date (i.e. the value NONE) entered in the EXPIRATION-DATE field in their catalog entry are exported.

**EXPIRATION-DATE = \*TOMORROW**

Only those files which have tomorrow's date entered as the EXPIRATION-DATE in their catalog entry are exported.

**EXPIRATION-DATE = \*TODAY**

Only those files which have today's date entered as the EXPIRATION-DATE in their catalog entry are exported.

**EXPIRATION-DATE = \*YESTERDAY**

Only those files which have yesterday's date entered as the EXPIRATION-DATE in their catalog entry are exported.

**EXPIRATION-DATE = <integer -99999..991231>**

Only those files which have the specified date entered as the EXPIRATION-DATE in their catalog entry are exported. Here, the user can specify the expiration date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits with preceding sign), the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0, TOMORROW corresponds to +1)

**EXPIRATION-DATE = <date>**

Only those files which have the specified date entered as the EXPIRATION-DATE in their catalog entry are exported. The user can specify the expiration date in the form [yy]yy-mm-dd.

**EXPIRATION-DATE = \*INTERVAL(...)**

Only those files for which the expiration date lies within the specified time period, i.e. files for which the retention period ends within the specified time period, will be exported. The range of dates covered by the specification includes the two end dates (see also the explanation of how dates are specified for EXPIRATION-DATE = <integer...>). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). Whichever of the operands is not specified will be replaced by the default value for use as the limit of the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = \*EARLIEST / \*TOMORROW / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

If EARLIEST is specified, the system will use the earliest possible date. Only those files for which the retention period expires on or after the specified date (EXPIRATION-DATE >= specified date) are exported.

**FROM = \*TOMORROW**

Exports only those files for which the EXPIRATION-DATE >= the next day.

**FROM = \*TODAY**

Exports only those files for which the EXPIRATION-DATE >= the current date.

**FROM = \*YESTERDAY**

Exports only those files for which the EXPIRATION-DATE >= the specified date.

**FROM = <integer -99999..991231>**

Exports only those files for which the EXPIRATION-DATE >= the specified date.

**FROM = <date>**

Exports only those files for which the EXPIRATION-DATE >= the specified date.

**TO = \*LATEST / \*TOMORROW / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Only files for which the retention period expires on or before the specified date (EXPIRATION-DATE <= specified date) will be exported.

**TO = \*TOMORROW**

Exports only those files for which the EXPIRATION-DATE <= the next day.

**TO = \*TODAY**

Exports only those files for which the EXPIRATION-DATE <= the current date.

**TO = \*YESTERDAY**

Exports only those files for which the EXPIRATION-DATE <= the specified date.

**TO = <integer -99999..991231>**

Exports only those files for which the EXPIRATION-DATE <= the specified date.

---

**TO = <date>**

Exports only those files for which the EXPIRATION-DATE <= the specified date.

**FILE-STRUCTURE = \*ANY / list-poss(3): \*PAM / \*SAM / \*NONE**

The user can select files for exporting according to the access method with which the file is to be created.

**FILE-STRUCTURE = \*ANY**

The access method is not to be used as a selection criterion.

**FILE-STRUCTURE = \*PAM**

Only PAM files are to be processed.

**FILE-STRUCTURE = \*SAM**

Only SAM files are to be processed.

**FILE-STRUCTURE = \*NONE**

Only those files will be imported which have been cataloged, but which contain no data, i.e. files which have not yet been opened or files whose storage space has been released (logically deleted) by using the OPTION=\*DATA operand in a DELETE-FILE command.

**LAST-ACCESS-DATE = \*ANY / \*NONE / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date> / \*INTERVAL(...)**

The user can select the files to be exported by the date when they were last accessed. See also the *ACC-DATE* and *ACC-TIME* output fields in the SHOW-FILE-ATTRIBUTES command.

**LAST-ACCESS-DATE = \*ANY**

The date of last access is not to be used as a selection criterion.

**LAST-ACCESS-DATE = \*NONE**

Exports only those files which have the value NONE entered in the LADATE field in their catalog entry, i.e. files which have never been opened.

**LAST-ACCESS-DATE = \*TODAY**

Exports only those files for which today's date has been entered as the LAST-ACCESS-DATE in the catalog entry.

**LAST-ACCESS-DATE = \*YESTERDAY**

Exports only those files for which yesterday's date has been entered as the LAST-ACCESS-DATE in the catalog entry.

**LAST-ACCESS-DATE = <integer -99999..991231>**

Exports only those files for which the specified date has been entered as the LAST-ACCESS-DATE in the catalog entry. Here, the user can specify the last access date in either of two ways:

1. as an *absolute date value*: (6 digits), a specific date in the form yymmdd (yy = year, mm = month, dd = day)
2. as a *relative date value*: (6 digits, with preceding sign) the number of days from today's date, in the form -n for dates in the past, and +n for dates in the future; (YESTERDAY corresponds to -1, TODAY corresponds to ±0)

**LAST-ACCESS-DATE = <date>**

Exports only those files for which the specified date has been entered as the LAST-ACCESS-DATE in the catalog entry. The user can specify the creation date in the form [yy]yy-mm-dd.

**LAST-ACCESS-DATE = \*INTERVAL(...)**

Only files which were last accessed within the specified time period will be exported. The range of dates

---

covered by the specification includes the two end dates (see also the explanation of how dates are specified using <integer> values). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit.

**FROM = \*EARLIEST / \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Only files which have been accessed since the specified date (i.e. for which LAST-ACCESS-DATE >= specified date) will be exported. If EARLIEST is specified, the system will use the earliest possible date.

**FROM = \*TODAY**

Exports only those files which have been accessed up to the date of the current date.

**FROM = \*YESTERDAY**

Exports only those files which have been accessed up to the date of the preceding day. Returns information on files for which the LAST-ACCESS-DATE >= the specified date.

**FROM = <integer -99999..991231>**

Exports only those files for which the LAST-ACCESS-DATE >= the specified date.

**FROM = <date>**

Exports only those files for which the LAST-ACCESS-DATE >= the specified date.

**TO = \*TODAY / \*YESTERDAY / <integer -99999..991231> / <date>**

Only those files which were last accessed on or before the specified date (i.e. files for which LAST-ACCESS-DATE <= the specified date) are exported.

**TO = \*TODAY**

Exports only those files which have been accessed up to the date of the current date.

**TO = \*YESTERDAY**

Exports only those files for which the LAST-ACCESS-DATE <= the date of preceding day.

**TO = <integer -99999..991231>**

Exports only those files for which the LAST-ACCESS-DATE <= the specified date.

**TO = <date>**

Exports only those files for which the LAST-ACCESS-DATE <= the specified date.

**SIZE = \*ANY / \*FREESIZE / <integer 0..2147483647> / \*INTERVAL(...)**

The user can select which files are to be exported by the EXPORT-NODE-FILE command on the basis of their size or the size of their reserved storage area (= number of PAM pages).

The value of the SIZE operand specifies the number of PAM pages: the upper and lower limits are both included in the range specified.

**SIZE = \*ANY**

The file size is not to be used as a selection criterion.

**SIZE = \*FREESIZE**

Only files for which storage space has been reserved but which do not yet occupy any of it (*HIGH-US-PA=0*) are to be exported.

**SIZE = <integer 0..2147483647>**

Only files for which the number of PAM pages reserved is exactly equal to the number specified here are to be exported.

---

**SIZE = \*INTERVAL(...)**

Only files for which the number of pages lies within the specified range are to be exported. The upper and lower limits are both included in the range specified (see description of SIZE=<integer...>). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit. Only files for which the number of PAM pages reserved is at least equal to the FROM value and at most equal to the TO value will be processed (FROM <= SIZE <= TO).

**FROM = 0 / <integer 0..2147483647>**

Only files for which the number of PAM pages reserved is at least equal to the specified number are to be exported (SIZE >= specified value).

**TO = 2147483647 / <integer 0..2147483647>**

Only files for which the number of PAM pages reserved is at most equal to the specified number are to be exported (SIZE <= specified value).

**NUMBER-OF-FREE-PAGES = \*ANY / \*SIZE / <integer 0..2147483647> / \*INTERVAL(...)**

The user can select the files to be processed according to their number of free PAM pages, i.e. the number of pages reserved but unused.

**NUMBER-OF-FREE-PAGES = \*ANY**

The number of free PAM pages is not to be used as a selection criterion.

**NUMBER-OF-FREE-PAGES = \*SIZE**

Only files which actually occupy no storage space are to be exported (i.e. no PAM page has been written yet).

**NUMBER-OF-FREE-PAGES = <integer 0..2147483647>**

Only files which have exactly the number of reserved but unused (=free) PAM pages specified by <integer...> are to be exported.

**NUMBER-OF-FREE-PAGES = \*INTERVAL(...)**

Selects all files for which the number of unused PAM pages lies within the specified range. The upper and lower limits are both included in the range specified (see description of NUMBER-OF-FREE-PAGES = <integer...>). It is also possible to specify limits using only the operand FROM (lower limit) or TO (upper limit). For whichever operand is not specified, the default value will be used as the limit for the range. The use of range limits for export can only be meaningful if the chosen lower limit <= the upper limit.

Only disk files which have at least as many free PAM pages as specified by the FROM value and at most as many as given by the TO value will be exported (FROM <= FREE <= TO).

**FROM = 0 / <integer 0..2147483647>**

Only files for which the number free PAM pages is at least equal to the specified number are to be exported (FREE >= integer).

**TO = 2147483647 / <integer 0..2147483647>**

Only files for which the number free PAM pages is at most equal to the specified number are to be exported (FREE <= integer).

**ACCESS = \*ANY / \*READ / \*WRITE**

The specified access type will be used as a selection criterion (ACCESS output field).

**ACCESS = \*ANY**

The ACCESS value is not to be used as a selection criterion.

---

**ACCESS = \*READ**

Only files for which write access is prevented by ACCESS=READ, i.e. for which only read access is permitted, will be exported.

**ACCESS = \*WRITE**

Only files for which write access is permitted will be exported.

**PASSWORD = \*ANY / list-poss(4): \*NONE / \*READ-PASSWORD / \*WRITE-PASSWORD / \*EXEC-PASSWORD**

The user can select files with specific password types for processing by the EXPORT-NODE-FILE command.

**PASSWORD = \*ANY**

Password protection is not to be used as a selection criterion.

**PASSWORD = \*NONE**

Only files for which there is no password protection are to be exported.

**PASSWORD = \*READ-PASSWORD**

Only files which are protected by a read password are to be exported.

**PASSWORD = \*WRITE-PASSWORD**

Only files which are protected by a write password are to be exported.

**PASSWORD = \*EXEC-PASSWORD**

Only files which are protected by an execute password are to be exported.

**USER-ACCESS = \*ANY / listposs(3): \*OWNER-ONLY / \*ALL-USERS / \*SPECIAL**

The user can select files using their access authorizations as a criterion.

**USER-ACCESS = \*ANY**

The access authorization is not to be used as a selection criterion.

**USER-ACCESS = \*OWNER-ONLY**

Only files which the owner alone may access are to be exported.

**USER-ACCESS = \*ALL-USERS**

Only files which can be accessed by all users are to be exported.

**USER-ACCESS = \*SPECIAL**

Only files which can be accessed by all user IDs including the maintenance IDs (i.e. user IDs with HARDWARE-MAINTENANCE privilege) are to be exported.

**BACKUP-CLASS = \*ANY / list-poss(5): \*A / \*B / \*C / \*D / \*E**

The user can select files for export by their BACKUP-CLASS level.

**BACKUP-CLASS = \*ANY**

The BACKUP-CLASS level is not to be used as a selection criterion.

**BACKUP-CLASS = \*A**

Only the files for which the value A is entered in the catalog as the BACKUP-CLASS (most frequent backup) are exported.

**BACKUP-CLASS = \*B**

Only the files for which the value B is entered in the catalog as the BACKUP-CLASS are exported.

---

**BACKUP-CLASS = \*C**

Only the files for which the value C is entered in the catalog as the BACKUP-CLASS are exported.

**BACKUP-CLASS = \*D**

Only the files for which the value D is entered in the catalog as the BACKUP-CLASS are exported.

**BACKUP-CLASS = \*E**

Only the files for which the value E is entered in the catalog as the BACKUP-CLASS are exported.

**BLOCK-CONTROL-INFO = ANY / list-poss(4): NONE / NO / WITHIN-DATA-BLOCK / WITHIN-DATA-2K-BLOCK / WITHIN-DATA-4K-BLOCK / PAMKEY / NK / NK2 / NK4**

The user can select files for export by their file format ( *BLK-CONTR* output field).

**BLOCK-CONTROL-INFO = \*ANY**

The BLOCK-CONTROL entry is not to be used as a selection criterion.

**BLOCK-CONTROL-INFO = \*NONE**

Only files for which no BLK-CNTRL value has been defined, i.e. files which have not yet been opened, are to be exported.

**BLOCK-CONTROL-INFO = \*NO**

Only files which contain no block control field are to be exported.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-BLOCK**

Only files which were created with BLOCK-CONTROL-INFO=WITHIN-DATA-BLOCK (i.e. files for which block control information is held in a block control field at the start and within the data block) are to be exported.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-2K-BLOCK**

Only files which were created with BLOCK-CONTROL-INFO=WITHIN-DATA-2K-BLOCK (i.e. files for which block control information is located at the start of each 2K block) are to be exported.

**BLOCK-CONTROL-INFO = \*WITHIN-DATA-4K-BLOCK**

Only files which were created with BLOCK-CONTROL-INFO=WITHIN-DATA-4K-BLOCK (i.e. files for which block control information is located at the start of each 4K block) are to be exported.

**BLOCK-CONTROL-INFO = \*PAMKEY**

Only files which use a separate PAM key for the block control field (i.e. the block control information is held in a separate key field, outside the PAM block) are to be exported.

**BLOCK-CONTROL-INFO = \*NK**

Only the NK files are to be exported, i.e. files which can also be stored on NK volumes (NK2 and NK4).

**BLOCK-CONTROL-INFO = \*NK2**

Only files which can also be stored on NK2 volumes (but not NK4 volumes) are to be exported.

**BLOCK-CONTROL-INFO = \*NK4**

Only files which can also be stored on NK4 volumes are to be exported.

**MIGRATE = ANY / list-poss(2): \*ALLOWED / \*INHIBITED / \*FORBIDDEN**

The user can specify which files are to be processed by the EXPORT-NODE-FILE command by the migration entry in the catalog (see the CREATE-FILE command, MIGRATE operand).

**MIGRATE = \*ANY**

The specified files are to be exported, irrespective of the value in the MIGRATE operand in each of their catalog entries.

---

**MIGRATE = \*ALLOWED**

Only files for which the catalog entry specifies the appropriate operand value, i.e. files which may be migrated to storage levels S1 and S2, are to be exported.

**MIGRATE = \*INHIBITED**

Only files for which the catalog entry specifies the appropriate operand value, i.e. files which may not be migrated, are to be processed.

**MIGRATE = \*FORBIDDEN**

Only files for which the catalog entry specifies the appropriate operand value are to be exported, i.e. files for which an intensified migration lock is declared. The files may not even be migrated for a brief period (e.g. for reorganization purposes).

**STATUS = \*ANY / \*PARAMETERS(...)**

The current file status is used as a selection criterion.

**STATUS = \*ANY**

The file status is not to be used as a selection criterion.

**STATUS = \*PARAMETERS(...)**

Only the files which have the specified status are selected for export. The following selection criteria are possible:

**i** The selection criteria within the \*PARAMETERS(...) structure are logically ORed.

**CLOSED-OUTPUT = \*ANY / \*YES / \*NO**

Specifies whether the "file closed" status is to be used as a selection criterion.

**CLOSED-OUTPUT = \*YES**

Only the files which have already been closed are exported.

**CLOSED-OUTPUT = \*NO**

Only the output files which have been opened in a program (OPEN OUTIN, INOUT or OUTPUT) and files which were not closed in an earlier system run or because a job was aborted are selected for export.

**REPAIR-NEEDED = \*ANY / \*YES**

Specifies whether files which were not closed in an earlier system run and not reconstructed with REPAIR-DISK-FILES are to be selected.

**REPAIR-NEEDED = \*ANY**

Exports files regardless of whether or not they need to be repaired.

**REPAIR-NEEDED = \*YES**

Only the files which were not closed in an earlier system run and which have not yet been reconstructed are selected for export.

**BASIC-ACL = \*ANY / \*NONE / \*YES / \*PARAMETERS(...)**

The BASIC-ACL entry in the file catalog is used as a selection criterion.

**BASIC-ACL = \*ANY**

The BASIC-ACL entry is not to be used as a selection criterion.

**BASIC-ACL = \*NONE**

Only the files that have no BASIC-ACL entry in the catalog are to be exported.

---

**BASIC-ACL = \*YES**

Only the files which have a BASIC-ACL entry in the catalog are to be exported.

**BASIC-ACL = \*PARAMETERS(...)**

Only the files which have the specified BASIC-ACL entry in the catalog are to be exported. NO-ACCESS means that no access rights were granted.

**i** Access rights specified with the OWNER, GROUP and OTHERS operands within the \*PARAMETERS(...) structure are logically ORed.

**OWNER = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights must already be defined for the owner.

**OWNER = \*PARAMETERS(...)**

Access rights that must be present for the owner (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**GROUP = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for the owner's user group.

**GROUP = \*PARAMETERS(...)**

Access rights that must be present for the owner's user group (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

**OTHERS = \*ANY / \*NO-ACCESS / \*PARAMETERS(...)**

Specifies which access rights should already be defined for all other users.

**OTHERS = \*PARAMETERS(...)**

Access rights that must be present for all other users (logically ORed together):

**READ = \*ANY / \*NO / \*YES**

Specifies whether read access authorization must be present.

**WRITE = \*ANY / \*NO / \*YES**

Specifies whether write access authorization must be present.

**EXEC = \*ANY / \*NO / \*YES**

Specifies whether execute access authorization must be present.

---

**PROTECTION-ACTIVE = \*ANY / list-poss(3): \*LEVEL-0 / \*LEVEL-1**

The highest activated access control method (protection level) is used as a selection criterion. Only the files which have access protection at specified protection level are exported. Protection level 2 cannot be explicitly specified for EXPORT-NODE-FILE. When the file is accessed, the highest activated protection level applies. The following table shows the method used for access control, the protection attributes, and the job variable protection hierarchy (protection levels):

Access control	Protection attribute	Prot. level
Standard access control	ACCESS and USER-ACCESS	0
Basic access control list	BASIC-ACL	1
Access control via guards	PASSWORD	2

Table 51: Hierarchy of access control methods

All other protection attributes of the file (e.g. passwords) are evaluated independently, without regard to the implemented protection level.

**PROTECTION-ACTIVE = \*ANY**

The access control method is not to be used as a selection criterion.

**PROTECTION-ACTIVE = \*LEVEL-0**

Only the files for which access is controlled via standard access control are to be exported.

**PROTECTION-ACTIVE = \*LEVEL-1**

Only the files for which access is controlled via a basic access control list (BASIC-ACL protection) are to be exported.

**ACCESS-COUNTER = \*ANY / <integer 0..2147483647> / \*INTERVAL(...)**

The access counter for the file is used as a selection criterion (see the *ACC-COUNT* output field of the SHOW-FILE-ATTRIBUTES command).

**ACCESS-COUNTER = \*ANY**

The access counter is not to be used as a selection criterion.

**ACCESS-COUNTER = <integer 0..2147483647>**

Only the files for which the access counter exactly matches the specified value are selected for export.

**ACCESS-COUNTER = \*INTERVAL(...)**

Only the files for which the access counter lies in the specified value range which follows are to be exported.

**FROM = 0 / <integer 0..2147483647>**

Only those files for which the access counter  $\geq$  the specified value are exported.

**TO = 2147483647 / <integer 0..2147483647>**

Only those files for which the access counter  $\leq$  the specified value are exported.

**HIGHEST-USED-PAGE = \*ANY / <integer 0..2147483647> / \*INTERVAL(...)**

The number of PAM pages used serves as a selection criterion here, i.e. the last page pointer points to the specified page (see also the *HIGH-US-PA* output field of the SHOW-FILE-ATTRIBUTES command).

**HIGHEST-USED-PAGE = \*ANY**

The number of PAM pages used is not used as a selection criterion.

---

**HIGHEST-USED-PAGE = <integer 0..2147483647>**

Only the files for which the specified number of PAM pages are used (i.e. files for which the last page pointer points to the specified page) are exported.

**HIGHEST-USED-PAGE = \*INTERVAL(...)**

Exports only those files which use a number of pages that falls within the specified range.

**FROM = 0 / <integer 0..2147483647>**

Only the files in which the number of used pages >= the specified number are exported.

**TO = 2147483647 / <integer 0..2147483647>**

Only the files in which the number of used pages <= the specified number are exported.

**DIALOG-CONTROL = \*STD / \*NO / \*ERROR / \*FILE-CHANGE / \*MORE-THAN-ONE-FILE / \*CATALOG-CHANGE / \*USER-ID-CHANGE**

Specifies whether and under what conditions a verification dialog is to be conducted with the user during the export process. A control dialog is only possible in dialog mode but, in this mode, may also be used in procedures. The only operand value that you can specify in batch mode is \*STD or \*NO.

The user can intervene with the following inputs:

- Y: the specified file or file set will then be exported.
- N: the specified file or file set will not be exported.
- T: processing of the command will be terminated.
- ?: the possible responses will be listed, with an explanation of each.

In addition, the following options can be specified, separated by commas:

- ,CHECK = NOT  
The DIALOG-CONTROL mode will be changed to '\*NO'.
- ,CHECK = PVSThe DIALOG-CONTROL mode will be changed to '\*CATALOG-CHANGE'.
- ,CHECK = MULTIPLE  
The DIALOG-CONTROL mode will be changed to '\*MORE-THAN-ONE-FILE'.
- ,CHECK = SINGLE  
SINGLE The DIALOG-CONTROL mode will be changed to '\*FILE-CHANGE'.
- ,CHECK = ERROR  
The DIALOG-CONTROL mode will be changed to '\*ERROR'.
- ,IGNORE = list-poss(3): RDPASS / WRPASS / EXPASS  
*Only privileged users may make this specification.* Specifies the type of password protection that is to be ignored on export. The specification only applies to a single file in the control dialog.
- ,PASSWORD = list-poss(3): <c-string 1..4> / <x-string 1..8> / <integer -2147483648..2147483647>  
Enables password-protected files to be exported (maximum of 3 passwords). The specification only applies to a single file in the control dialog.

**DIALOG-CONTROL = \*STD**

The default \*STD setting is equivalent to \*MORE-THAN-ONE-FILE in an interactive dialog (when SYSCMD is connected to the terminal) and to \*NO in procedures and in batch mode.

**DIALOG-CONTROL = \*NO**

The user cannot intervene in EXPORT-NODE-FILE processing; all the specified files will be exported (without a verification dialog).

---

### **DIALOG-CONTROL = \*ERROR**

If exporting of the selected files proceeds without error, they will be exported immediately, as when \*NO is specified (i.e. no verification dialog). However, if a user-correctable error occurs during export, then a verification dialog takes place as for DIALOG-CONTROL = \*FILE-CHANGE. DIALOG-CONTROL = \*ERROR applies implicitly if DIALOG-CONTROL = \*FILE-CHANGE is set. In the event of an error, the user may acknowledge the error message, abort EXPORT-NODE-FILE processing or attempt to rectify the error. If he wishes, he can also change the DIALOG-CONTROL mode (see also the possible forms of intervention listed under the first DIALOG-CONTROL operand).

### **DIALOG-CONTROL = \*FILE-CHANGE**

For each file which is to be exported, the user has the intervention options described for the first of the DIALOG-CONTROL operands. For each file which is to be processed, the user can decide interactively whether it should be exported (response: YES/NO). If in the verification dialog he specifies protection attributes under "IGNORE", or one or more passwords under "PASSWORD", these will be taken into account for any selected file and, if satisfied, the file will be exported without further queries ("YES" must also be specified). The user can also abort EXPORT-NODE-FILE processing, or change the DIALOG-CONTROL mode.

The files which have been exported will be listed in alphanumeric order.

### **DIALOG-CONTROL = \*MORE-THAN-ONE-FILE**

If exactly one file is specified, this will be exported immediately. If the file is specified in partially qualified form, which means that more than one file is selected, or if the file name contains wildcards, the user can decide, each time the catalog ID changes, whether or not files from the new catalog are to be exported (see the intervention options described for the first of the DIALOG-CONTROL operands). He must respond to the question issued by the system with "YES" or "NO". DIALOG-CONTROL=\*MORE-THAN-ONE-FILE is useful if wildcards are specified for "catid" in the FILE-NAME. In the verification dialog, EXPORT-NODE-FILE processing can be terminated, or the DIALOG-CONTROL mode can be changed.

### **DIALOG-CONTROL = \*CATALOG-CHANGE**

As with DIALOG-CONTROL = \*MORE-THAN-ONE-FILE, the EXPORT-NODE-FILE processing routine branches to a verification dialog if files in different catalogs (pubsets) are affected. The user determines whether the files in the current subset should be exported (YES/NO), EXPORT-NODE-FILE processing should be terminated, or the DIALOG-CONTROL mode should be changed.

### **DIALOG-CONTROL = \*USER-ID-CHANGE**

Whenever the user ID is changed when deleting the catalog entries, a branch is made to guided dialog.

### **OUTPUT = \*STD / \*NO / \*SYSOUT**

The user can specify whether a message (DMS0800) with the name of the exported file is to be output to SYSOUT for each successfully exported file. The default setting \*STD is equivalent to OUTPUT=\*NO.

### **OUTPUT = \*NO**

No messages are output to SYSOUT for successfully exported files.

### **OUTPUT = \*SYSOUT**

For each file that is successfully exported, a message with the name of the file is output to SYSOUT.

### **IGNORE-PROTECTION = \*NONE / list-poss(5): \*ACCESS / \*EXPIRATION-DATE / \*WRITE-PASSWORD / \*READ-PASSWORD / \*EXEC-PASSWORD**

The user can specify whether any defined file protection against write access or any defined retention period is to be ignored. Systems support staff can also ignore password protection.

The specification IGNORE-PROTECTION in the EXPORT-NODE-FILE command thus makes it unnecessary to issue the MODIFY-FILE-ATTRIBUTES command to reset the protection attributes before the files can be deleted.

---

**IGNORE-PROTECTION = \*NONE**

The protection attributes “read-only” (ACCESS=READ or no write access with BASIC-ACL or GUARDS protection) and “retention period” (EXPIRATION-DATE) will be observed during export.

**IGNORE-PROTECTION = \*ACCESS**

Files for which write access by the owner is not allowed at the highest activated protection level may still be exported (see the selection criterion PROTECTION-ACTIVE, ACCESS, BASIC-ACL or GUARDS).

**IGNORE-PROTECTION = \*EXPIRATION-DATE**

Files which are still within their retention period (*EXPIR-DATE* > current date) may also be exported.

**IGNORE-PROTECTION = \*WRITE-PASSWORD**

System support staff are authorized to ignore the protection attribute **write password** when deleting the catalog entry.

**IGNORE-PROTECTION = \*READ-PASSWORD**

System support staff are authorized to ignore the protection attribute **read password** when deleting the catalog entry.

**IGNORE-PROTECTION = \*EXEC-PASSWORD**

System support staff are authorized to ignore the protection attribute **execute password** when deleting the catalog entry.

**PASSWORDS-TO-IGNORE = \*NONE / \*SECRET / list-poss(3): <x-string 1..8> / <c-string 1..4> / <integer -2147483648..2147483647>**

The user can specify one or more passwords, which will permit files protected by these passwords to be exported. The passwords entered here are not recorded in the password table for the job, and are valid only for the current EXPORT-NODE-FILE processing. Up to 3 passwords may be specified in the form of a list.

In order to export a password-protected file, the password at the highest access level must be specified (see the ADD-PASSWORD command).

The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**PASSWORDS-TO-IGNORE = \*NONE**

No passwords are specified.

**SUPPRESS-ERRORS = \*NONE / list-poss(3): <alphanum-name 7..7>**

In procedures the user can specify whether the spin-off mechanism or SDF-P error handling is to be triggered every time an error occurs (apart from syntax errors), or whether specific error conditions are to be ignored.

**SUPPRESS-ERRORS = \*NONE**

All errors will trigger the spin-off mechanism or SDF-P error handling.

**SUPPRESS-ERRORS = list-poss(3): <alphanum-name 7..7>**

The user can define which errors are to be ignored by means of their DMS error codes (alphanum-name 7..7). If the specified error occurs, the spin-off mechanism will not be triggered. A maximum of 3 error codes may be specified. DMS error code: 7 characters, of which the first three are always “DMS”; the last 4 characters identify the error; the digits 0..9 and letters A..F are permitted. When error codes are entered, no check is made to verify that valid error codes have been specified.

A detailed list of valid DMS error codes can be found on the manual server (URL: <http://bs2manuals.ts.fujitsu.com>) by means of an HTML application and on the “BS2000 SoftBooks” DVD.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
1	0	CMD0001	No action required
2	0	DMS06D6	Error on exporting certain files Guaranteed messages: DMS0800, DMS0801, DMS06D5, DMS0666, DMS05C6, DMS05BF, DMS05C3, DMS053F
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Privilege errors
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset Guaranteed message: DMS051B
	64	DMS051C	User not authorized to access pubset Guaranteed message: DMS051C
	64	DMS0535	Specified file not shareable
	64	DMS055C	The catalog entry could not be found on the assigned volume
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS05FC	Specified user ID not in home pubset
	64	DMS0609	No access to system file
	64	DMS06FF	BCAM connection severed
	130	DMS0524	System address space exhausted
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system

---

	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0594	Not enough virtual memory available

---

## 3.50 EXPORT-PUBSET

Export previously imported pubset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS OPERATING
<b>Routing code:</b>	R

### Function

The EXPORT-PUBSET command enables systems support personnel to remove a pubset as a resource from the local system. In a shared pubset network based on HIPLEX MSCF, a choice can be made as to whether exporting the shared pubset on the master system also entails exporting it on the slave systems, or whether the master function should pass to one of the slave systems.

Under control of the calling task, the command generates its own (new) task. This task performs EXPORT processing **asynchronously** to the calling task.

Successful generation of the EXPORT task and its messages are logged at the operator terminal.

During the export phase, the number of tasks that are still using the pubset is output. The TSN of the tasks involved can be determined using the SHOW-PUBSET-OCCUPATION command (and also the SHOW-PUBSET-PARAMETERS command) and used to force the tasks to terminate their activities.

The user catalog (SYSSRPM file) is closed. The information currently stored in the main memory regarding user IDs and disk storage occupancy is transferred. If this information cannot be transferred, reconstruction of the F5 label is initiated the next time the IMPORT-PUBSET command is issued.

The home pubset may not be exported using this command. The home pubset is exported automatically at system termination.

## Format

### EXPORT-PUBSET

```
PUBSET = <cat-id 1..4>
,USE = *STD / *BY-REMOTE
,SHARER-TYPE = *STD / *SLAVE / *MASTER(...)
    *MASTER(...)
        | MASTER-CHANGE = *NO / *YES
,TERMINATE-JOBS = *NO / YES
,MONJV = *NONE / <filename 1..54 without-gen-vers>
,JV-PASSWORD = *NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483639..2147483639>
```

## Operands

### **PUBSET** = <cat-id 1..4>

Catalog ID of the pubset to be exported.

### **USE** = \*STD / \*BY-REMOTE

Specifies the status that the pubset being exported has to have.

### **USE** = \*STD

The pubset cannot be exported unless it is in “imported” or “remote imported” status.

If the local system has imported the pubset as master in a shared pubset network, then exporting it with the setting “MASTER-CHANGE=\*NO” causes all slave systems to export it as well.

### **USE** = \*BY-REMOTE

The pubset cannot be exported unless it is in “remote-imported” status (i.e., only catalog accesses are possible).

### **SHARER-TYPE** = \*STD / \*SLAVE / \*MASTER(...)

Specifies which type of sharer as defined on pubset import will be accepted on pubset export.

### **SHARER-TYPE** = \*STD

The pubset will be exported regardless of sharer type.

### **SHARER-TYPE** = \*SLAVE

The pubset will be exported only if the local system imported the pubset as a slave sharer.

### **SHARER-TYPE** = \*MASTER(...)

The pubset will be exported only if the local system is a temporary owner of the pubset (master).

### **MASTER-CHANGE** = \*NO

Exporting the pubset implies a request to all slave sharers to export the pubset as well.

---

**MASTER-CHANGE = \*YES**

An automatic change of master is to be initiated. The system defined as the backup master is to take over the role of master. The slave sharers are not forced to export the pubset. If no backup master is defined, or if the system defined as backup master is not active, pubset export is rejected.

Use of MASTER-CHANGE=\*YES is conditional on the presence of a version >= BS2000/OSD-BC V2.0 on all systems in the network.

**TERMINATE-JOBS = \*NO / \*YES**

Terminates the tasks that are using the pubset or waits until their allocations are cleared.

**TERMINATE-JOBS = \*NO**

The pubset is made inaccessible. If the pubset is still allocated when this command is entered, the command does not take effect until all active allocations are cleared. New allocations are rejected.

**TERMINATE-JOBS = \*YES**

Export processing cancels all tasks that are using the pubset. Note however that system tasks which are using the pubset cannot be terminated. That means that the system administration must ensure that all such allocations are cleared before EXPORT-PUBSET is called. Otherwise, export processing cannot be completed.

Processing is continued once all allocations are cleared. This must be preceded by an EXPORT-PUBSET command with TERMINATE-JOBS=NO. The wait state of an export job previously initiated with the TERMINATE-JOBS=NO operand is also canceled once all allocations have been cleared.

**MONJV = \*NONE / <filename 1..54 without-gen-vers>**

Specifies whether a monitoring job variable is set. This operand should only be specified if the JV software product is used. The job variable is set to the following values:

\$E during export processing

\$T after successful completion of export processing

\$A if export processing was terminated with /CANCEL-PUBSET-EXPORT or because of an error.

The job variable must already be cataloged, otherwise it is not set. However, EXPORT processing is continued even if no job variables have been defined.

**JV-PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> /<integer -2147483639..2147483639>**

Password of the monitoring job variable.

The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	DMS0355	Same export already active
1	0	DMS0364	Pubset currently unavailable
	1	CMD0202	Syntax error
	32	DMS035C	Invalid operands
	32	DMS0363	MRSCAT access error
	64	DMS035C	IMPORT-PUBSET required
	64	DMS0360	No authorization for command
	64	DMS0366	Export attempt for home pubset
	64	DMS036D	Invalid operand sequence
	130	DMS0351	Other import/export task active
	130	DMS035C	Maximum number of tasks reached
	130	DMS0362	Class 4 memory error

---

## Notes

During system termination, all imported pubsets are always exported, in the following order:

1. During termination of HIPLEX MSCF, all shared imported pubsets are exported. A pubset imported as master is imported with the MASTER-CHANGE option set to \*YES.
2. Export all nonshared imported pubsets (except the home pubset):
  - EXPORT-PUBSET with TERMINATE-JOBS=\*YES
  - wait until all pubsets have been exported (maximum approx. 1 minute)
  - FORCE-PUBSET-EXPORT for the pubsets that have not yet been exported
  - wait until all pubsets have been exported (maximum 1 minute)
3. Export the home pubset:
  - EXPORT-PUBSET with the TERMINATE-JOBS=\*YES
  - wait until the pubset has been exported (maximum 1 minute)
  - FORCE-PUBSET-EXPORT if the home pubset has not yet been exported
  - wait until the home pubset has been exported (maximum 1 minute)

The generated task executes in 2 phases:

*Phase 1: Wait until all files of the pubset are closed.*

This state only occurs if, in addition to the open system files (e.g. the user catalog), other files of this pubset are open. This also implicitly involves the private files that are addressed via this pubset.

If only the system files are opened, the wait state does not occur. The system files are open for each imported pubset and are not closed until the pubset is actually exported. If the wait state occurs, the number of tasks that are still using the pubset is output. The tasks involved can be displayed by means of the SHOW-PUBSET-OCCUPATION command (and also the SHOW-PUBSET-PARAMETERS command) and be forced to terminate their activities. By default, the wait state is canceled once all files (except the system files) are closed and Phase 2, the export phase proper, is initiated. In addition, the following events may cause the wait state to be canceled:

- CANCEL-PUBSET-EXPORT command  
The wait state is canceled immediately. The EXPORT task terminates with an error message and the pubset remains available.
- EXPORT-PUBSET command with the TERMINATE-JOBS=\*YES operand. An attempt is made to terminate all jobs that are still using the pubset. Once all allocations are cleared, the wait state is canceled and the second phase - the export phase - is initiated. The EXPORT task acknowledges the command.
- FORCE-PUBSET-EXPORT command  
The wait state is canceled. The export task acknowledges the command and Phase 2 - the export phase - is initiated, even though not all the files of this pubset are closed.

---

*Phase 2: Export pubset*

The pubset is made inaccessible. SPOOL is informed and all spoolout jobs whose files to be output are cataloged on the pubset involved are moved from TYPE5/AC to TYPE5/KP. The system files are closed and all resources are released.

Although wait states may occur during this phase, they are limited to approximately 10 minutes. The FORCE-PUBSET-EXPORT command reduces the wait state to 1 minute.

If an export job, with options for terminating occupying tasks or waiting for their allocations to be cleared, is issued at the master processor in shared pubset mode in a multiprocessor network, it is also effective at all the slave processors in the network. FORCE-PUBSET-EXPORT commands, however, are only effective at the local processor, i.e. they are not passed on to all the slave processors in the network.

---

## 3.51 EXTEND-PAGING-AREA

Extend paging area

**Component:** BS2000 OSD/BC

**Functional area:** System control and optimization

**Domain:** SYSTEM-MANAGEMENT  
SYSTEM-TUNING

**Privileges:** TSOS  
OPERATING

**Routing code:** R

### Function

The EXTEND-PAGING AREA command enables systems support to extend the paging area to a maximum size of 4 Tbytes by adding one or more paging files (paging areas).

A paging file is either specified directly via the volume on which it is located or via the catalog ID of the pubset to which the volume belongs. The specification via pubset is only possible for SF pubsets. The specification refers to all paging files on the volumes of the respective SF pubset.

### Format

#### EXTEND-PAGING-AREA

**VOLUME** = \*NONE / \*ALL / \*PUBSET(...) / list-poss(256): <vsn 1..6>

\*PUBSET(...)

| **PUBSET** = list-poss(256): <cat-id 1..4>

,**UTILIZATION** = \*MEDIUM / \*HIGH / \*LOW

,**LATER-REDUCTION** = \*NOT-REQUESTED / REQUESTED

### Operands

**VOLUME** = \*NONE / \*ALL / \*PUBSET(...) / list-poss(256): <vsn 1..6>

Specifies the paging files to be attached. The default value is \*NONE, i.e. no paging file is attached.

**VOLUME** = \*ALL

All unused paging files that belong to the imported, exclusively occupied pubsets are attached.

**VOLUME** = \*PUBSET(...)

Specifies one or more SD pubsets. All paging files on the volumes of the specified SF pubsets are attached.

**PUBSET** = list-poss(256): <cat-id 1..4>

Specifies the SF pubsets via their catalog ID.

---

**VOLUME = list-poss(256): <vsn 1..6>**

Specifies the volume serial number (VSN) of the disk on which the paging file being added is located. Up to 256 disks can be specified.

Up to 256 disks can be listed.

**UTILIZATION = \*MEDIUM / \*HIGH / \*LOW**

Specifies how a paging file is to be utilized. This affects both use of the paging file and the duration and I/O rate of a reduction of the paging files.

Paging management takes this specification into account as far as possible, but it cannot guarantee that a paging file will be utilized in the desired manner. This ultimately depends on the actual paging rate and on the behavior of the paging load over time.

**UTILIZATION = \*MEDIUM**

*This default setting should be changed only in exceptional circumstances.*

The paging file is to be used in accordance with the paging strategy, which means that paging files will be utilized evenly in proportion with their size.

**UTILIZATION = \*HIGH**

*This setting should be selected only in exceptional circumstances.*

The paging file is to be utilized more intensively than envisaged in the paging strategy (the paging file will hold pages more frequently). This is typically helpful with small paging files, as it is a way to reduce the load on disks with large files, allowing the paging files to be utilized evenly, irrespective of size. It is also possible to cut the time required for the reduction of large paging files.

**UTILIZATION = \*LOW**

*This setting should be selected only in exceptional circumstances.*

The paging file is to be utilized less intensively than envisaged in the paging strategy (the paging file will hold pages less frequently). This setting is particularly advisable if the paging file is intended to be removed from the paging area (reduction) or if frequent DMS I/O is to be expected on a paging disk in addition to the paging I/O (primarily applies to paging files in the home pubset).

UTILIZATION=\*LOW applies to the paging files in the home pubset if they are added to the paging area at system startup. Paging files that are not on the home pubset and that are added to the paging area via the paging parameter service are covered by UTILIZATION=\*MEDIUM.

**LATER-REDUCTION = \*NOT-REQUESTED / \*REQUESTED**

This operand specifies how likely it is that the paging area will subsequently be reduced by removal of the paging files. This specification is evaluated when the paging files attached by this command are detached.

**LATER-REDUCTION = \*NOT-REQUESTED**

*This default setting should be changed only in exceptional circumstances.*

Subsequent reduction of the paging area by removal of the paging files is not intended. If reduction is carried out nonetheless, the acceleration mechanism will not be used (no additional resources will be requested).

**LATER-REDUCTION = \*REQUESTED**

*This setting should be selected only in exceptional circumstances.*

It is possible that the paging area will later be reduced by removal of the paging files attached by this command. When assigning this operand value you should bear in mind that main memory utilization will be greater the whole time that the paging file is in the paging area if later reduction of the paging area is envisaged (performance accelerated by requesting additional resources) and that this is very likely to result in a higher paging rate, which in turn may have a negative impact on the overall performance of the system. Consequently, it is possible that extension of the paging area will have to be rejected. So \*REQUESTED should be used with caution.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed successfully
1		CMD0001	The paging area on the specified magnetic disk is already in use Guaranteed messages: EMM2830
	32	EMM2800	The function cannot be executed because of an internal error. Guaranteed messages: EMM2818, EMM2828
	64	EMM2802	The specified magnetic disk is unknown, the paging file does not have the required file attributes or the paging file is larger than 2048 GB..... Guaranteed messages: EMM2817, EMM2837, EMM2316, EMM2841
	64	EMM2803	The pubset is a shared pubset. Guaranteed message: EMM2834, EM2816
	64	EMM2804	There is no paging file on the volume or pubset Guaranteed messages: EMM2832
	64	EMM2805	The pubset has not been imported, the SM pubset has not been imported completely, the pubset's MRSCAT entry is missing, the disk cannot be occupied, a disk error occurred or the paging file cannot be processed because of an input /output error Guaranteed messages: EMM2820, EMM2824, EMM2825, EMM2836, EMM2838, EMM2839
	64	EMM2806	The paging file specified means that the size of the paging area exceeds the 4 TB limit or the maximum permitted number of 4096 paging files has been reached Guaranteed messages: EMM2840, EMM2842
	128	EMM2807	The function cannot be executed because of a lack of resources Guaranteed messages: EMM2819, EMM2829

**i** If a list is specified command processing is aborted in the event of an error with a return code of EMM2800, EMM2806 or EMM2807. In all other cases, processing continues.

## Notes

Message EMM2301 is issued for each paging file added. On completion of command processing, message EMM2850 is issued. This message indicates the current availability of paging space and the current paging space requirements.

The pubset to which the disk containing the paging file belongs must have been imported. It may not be a shared pubset.

The disk from which the paging file is taken may also be a DRV (Dual Recording by Volume) disk, but in this case, the pages will be written just once to one of the two DRV disks.

---

## Examples

Adding the paging file on the disk with the volume serial number 2OSW.0 to the paging area:

```
/EXTEND-PAGING-AREA VOLUME=2OSW.0
```

---

## 3.52 EXTEND-TAPE-SET

Extend volume serial number set (tape set)

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING  
**Routing code:** \$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The EXTEND-TAPE-SET command allows a set of VSNs, which can be used for the creation of tape files, to be extended by the user. The use of this command implies that all the files which are linked to the same TAPE-SET-NAME use the same tape set. The set of VSNs is recorded in the tape set table (TST). Within the TST, the TAPE-SET-NAME has the same function as the file link name within the TFT.

A TST entry can hold no more than 5455 VSNs.

### Format

#### EXTEND-TAPE-SET

```
TAPE-SET-NAME = <alphanum-name 1..4>  
,VOLUME = [*ANY](...) / list-poss(255): <alphanum-name 1..6>  
    [*ANY](...  
        | NUMBER-OF-DEVICES = 1 / <integer 1..9>  
,DEVICE-TYPE = *TAPE / <device>
```

### Operands

**TAPE-SET-NAME** = <alphanum-name 1..4>

The name of the tape set.

**i** The tape set name may not be used simultaneously as a file link name within the same task.

**VOLUME** = \***ANY**(...) / list-poss(255): <alphanum-name 1..6>

The VSNs of the additional tapes which are to be allocated to the existing tape set.

**VOLUME** = \***ANY**(...)

Allows the operator, or MAREN if available, to mount any tape on the specified device type (no particular VSN is required).

**NUMBER-OF-DEVICES** = 1 / <integer 1..9>

Number of tapes required.

---

**DEVICE-TYPE = \*TAPE / <structured-name 1..8>**

The device type to which the tapes are assigned.

The value to be specified is the "volume type" of the tapes, from which the Device Management System determines the device type which is to be made available for the tape processing.

Only device types or volume types known in the system are accepted. In interactive mode, DEVICE-TYPE=? calls up a list of the available device and volume types.

The default value is TAPE, i.e. for tape processing the devices to be used should support a recording density of 6250 bpi (bytes per inch). Other permissible specifications can be found in [section "Device types for DMS tape processing"](#).

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS06DD	Tape set not found
	64	DMS06FF	BCAM connection severed
	130	DMS0524	System address space exhausted
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0594	Not enough virtual memory available

---

## 3.53 FORCE-DESTROY-CACHE

Force a PCA cache area to be deleted

**Component:** BS2000 OSD/BC  
**Functional area:** Caching media control Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT  
**Privileges:** TSOS

### Function

Using this command, the system administration can force a PCA cache area in a cache medium to be deleted. As part of the "PFA concept" (Performant File Access) the user is given the possibility of using the DMS interfaces to provide buffer storage for files ("caching" them). The cache medium supported via the PFA interfaces is: main memory (MM). The DAB subsystem is required as the cache handler driver software for the use of the cache medium.

The FORCE-DESTROY-CACHE command enables systems support to force PFA cache areas to be deleted without writing the data in the cache out to disk. No allowance is made for resultant data inconsistency on the disks which are affected. Hence, the command is intended only for exceptional circumstances (such as disk or cache defects) in which the buffered data can no longer be transferred to disk by a STOP-PUBSET-CACHING or EXPORT-PUBSET command.

Before the command is executed a dialog (message ECC0501) asks if the action is really to be performed in spite of the risk of data inconsistency. Once the command has executed successfully, message ECC0502 is sent to SYSOUT and the console.

The effect of the command is global; i.e. it applies to all the systems which are attached to the cache area.

The command should be applied only to exported pubsets. FORCE-DESTROY-CACHE cannot be used to delete ADM-PFA cache areas. These areas can be released using the FORCE-STOP-DAB-CACHING command (see the "DAB" manual [5]).

### Format

<b>FORCE-DESTROY-CACHE</b>
<b>CACHE-MEDIUM = *MAIN-MEMORY</b>
<b>,CACHE-ID = &lt;alphanum-name 1..4&gt;</b>

### Operands

#### **CACHE-MEDIUM =**

Identifies the storage medium which is used as the buffer store for the data.

The cache area to be deleted is in main memory. If the identifier of the cache area is not found in this medium, the command is rejected with an error message.

### CACHE-ID = <alphanum-name 1..4>

The identifier of the cache area which is to be deleted from the specified cache medium (corresponds to the ID of the pubset whose data is being buffered).

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD2201	Error at the interface between SDF and the command server
	3	CMD2203	SDF version is not supported
	32	ECC0001	Internal error
	64	CMD0216	No authorization to call command
	64	ECC0301	Cache area does not exist
	64	ECC0302	Cache area could not be destroyed
	64	ECC0006	Cache handler DAB not loaded
	64	ECC0502	Cache area was destroyed
	64	ECC0005	Command withdrawn by the user

### Example

Cache area ABCD (the pubset ID of a pubset which is attached to the computer) is in main memory:

```
/force-destroy-cache cache-medium=*main-mem,cache-id=abcd
```

```
% ECC0501 DO YOU REALLY WANT TO DESTROY THE CACHE WITH CACHE-ID 'ABCD'?  
REPLY (YES; NO)
```

**yes**

```
% ECC0502 CACHE WITH CACHE-ID 'ABCD' HAS BEEN DESTROYED
```

---

## 3.54 FORCE-JOB-CANCEL

Cancel user job

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** TSOS  
OPERATING

**Routing code:** P

### Function

The FORCE-JOB-CANCEL command forces a user job to terminate. The user job addressable by its TSN or a monitoring job variable is immediately canceled, without waiting for privileged system routines being used to run to completion. This procedure may in some circumstances lead to inconsistencies in some system tables. Hence, it is advisable to use the FORCE-JOB-CANCEL command only if the CANCEL-JOB command is unsuccessful and continuation of the session depends on cancellation of the job. Please note the following:

- Use FORCE-JOB-CANCEL only as a last resort (if there is the risk of a deadlock).
- Leave at least 10 minutes between CANCEL-JOB and FORCE-CANCEL-JOB.
- Run SHOW-JOB-STATUS beforehand to check the status of the job.
- Answer all unanswered messages at the console.
- FORCE-JOB-CANCEL may also be applied to jobs in a PASS-LOOP (Q13, Pendcode 04). However, this should be preceded by a thorough check that the correct job is being aborted: Waiting jobs usually do not cause but are affected by lock conflicts.

Execution of the command leads to termination of the task with the message

```
CAN0KIL: ABNORMAL TASK TERMINATION ENFORCED BY COMMAND
```

and, in the case of privileged applications, to a system dump which is generated without any prior query to the operator.

**i** Use of the command by the operator can be forbidden by means of the system parameter NRTKILL.

---

## Format

**FORCE-JOB-CANCEL**

**JOB-IDENTIFICATION** = \*TSN(...) / \*MONJV(...)

\*TSN(...)

|     **TSN** = <alphanum-name 1..4>

\*MONJV(...)

|     **MONJV** = <filename 1..54 without-gen-vers>

,**TEXT** = \***NO** / <c-string 1..72>

## Operands

**JOB-IDENTIFICATION = \*TSN(...) / \*MONJV(...)**

Selection of the job identification.

**JOB-IDENTIFICATION = \*TSN(...)**

The job is addressed by its TSN.

**TSN = <alphanum-name 1..4>**

The TSN of the job in question.

**JOB-IDENTIFICATION = \*MONJV(...)**

The job is not addressed by its TSN but via a monitoring job variable.

**MONJV = <filename 1..54 without gen-vers>**

Monitoring job variable of the job in question.

**TEXT = \*NO / <c-string 1..72>**

Specifies whether a text should be output to SYSOUT, and if so which text, before the job is terminated. The specified string may be up to 72 characters in length. If the job which is to be terminated is monitored by a monitoring job variable, the first 51 characters are embedded in it (see the CANCEL-JOB command).

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	CMD0002	Command executed with a warning
	1	CMD0202	Syntax error
	64	JMS0630	Semantic error
	64	JMS0640	MONJV error, illegal access or invalid time of call
	130	JMS0660	Repeat command later

---

## 3.55 FORCE-PUBSET-EXPORT

Force pubset export

**Component:** BS2000 OSD/BC

**Functional area:** Pubset and MRSCAT management

**Domain:** MULTI-CATALOG-AND-PUBSET-MGMT

**Privileges:** TSOS  
OPERATING

**Routing code:** R

### Function

The FORCE-PUBSET-EXPORT command forces a pubset to be exported.

The specified pubset is exported without taking into account open files that cannot be restored until the next session. This command should therefore be used only in exceptional cases, since it cannot be guaranteed that the pubset involved can be imported again. This command cannot cancel the wait states for termination of the occupying tasks; it simply limits the wait time involved.

The command is logged with the message DMS0379 on the console.

The command is rejected if it was not preceded by an EXPORT-PUBSET command with the operand TERMINATE-JOBS=\*YES.

### Format

**FORCE-PUBSET-EXPORT**

**PUBSET** = <cat-id 1..4>

,**MONJV** = \***NONE** / <filename 1..54 without-gen-vers>

,**JV-PASSWORD** = \***NONE** / <c-string 1..4> / <x-string 1..8> / <integer -2147483639..2147483639>

### Operands

**PUBSET** = <cat-id 1..4>

Catalog ID of the pubset to be exported.

**MONJV** = \***NONE** / <filename 1..54 without-gen-vers>

Specifies whether a monitoring job variable is set.

This operand should only be specified if the JV software product is used.

### Note

The job variable must already be cataloged, otherwise it is not set. However, EXPORT processing is continued even if the job variable is not set.

---

**JV-PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483639..2147483639>**

Password of the monitoring job variable, if this variable is protected by a write password. The operand has the following special characteristics:

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password .

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	DMS0355	Same export already active
1	0	DMS0364	Pubset already unavailable
	1	CMD0202	Syntax error
	32	DMS035C	Invalid operands
	32	DMS0363	MRSCAT access error
	64	DMS035C	IMPORT-PUBSET required
	64	DMS0360	No authorization for command
	64	DMS0366	Export attempt for home pubset
	64	DMS036D	Invalid operand sequence
	64	DMS036E	FORCE attempt without TERMINATE
	130	DMS0351	Other import/export task active
	130	DMS035C	Maximum number of tasks reached
	130	DMS0362	Class 4 memory error

---

## 3.56 GET-JOB-FROM-VIRTUAL-DEVICE

Request print job from virtual printer

**Component:** SPOOL

**Functional area:** Controlling spoolout job

**Domain:** SPOOL-PRINT-SERVICES

**Privileges:** STD-PROCESSING  
PRINT-SERVICE-ADMINISTRATION

### Function

The GET-JOB-FROM-VIRTUAL-DEVICE command requests a new print job from the virtual device. It is executed in batch mode only.

By default, the original user file is copied into the calling task's user ID, and a definition of the print job is generated in a metadata file. Both files are created with a default name which contains the identification number of the print job as a name component. This identification number is stored in the specified S variable.

Optionally a user-specific file name prefix can be defined for each of the files. Creation of the files and S variable can also be suppressed.

The command is part of a set of four commands which enable an application to be created in the form of an S procedure (for an example, see the OPEN-VIRTUAL-DEVICE-DIALOG command). These commands manage the dialog between a virtual device and the application which was started in batch mode as an S procedure:

- OPEN-VIRTUAL-DEVICE-DIALOG
- GET-JOB-FROM-VIRTUAL-DEVICE
- RETURN-JOB-TO-VIRTUAL-DEVICE
- CLOSE-VIRTUAL-DEVICE-DIALOG

### Format

<b>GET-JOB-FROM-VIRTUAL-DEVICE</b>
<b>FILE-PREFIX</b> = <u>*STD</u> / *NONE / <partial-filename 1..25>
<b>,METADATA-PREFIX</b> = <u>*STD</u> / *NONE / <partial-filename 1..25>
<b>,OUTPUT-DOC-ID</b> = <u>*STD</u> / *NONE / <structured-name 1..20>

### Operands

**FILE-PREFIX** = \*STD / \*NONE / <partial-filename 1..25>

Specifies whether the original user file is to be copied and which prefix should be assigned to the name of the copy.

**FILE-PREFIX** = \*STD

The original user file is copied under the following file name:

`<userid>.S.VIRTUAL.DOC.<document-id>.000`

where `<userid>` is the user ID of the calling task and `<document-id>` is the identification number of the print job (see the OUTPUT-DOC-ID operand).

**FILE-PREFIX = \*NONE**

The original user file is not to be copied.

**FILE-PREFIX = <partial-filename 1..25>**

The original user file is copied with a prefix under the following file name:

`<userid>.<file-prefix>.<document-ID>.000`

where `<userid>` is the user ID of the calling task and `<document-id>` is the identification number of the print job (see the OUTPUT-DOC-ID operand).

**METADATA-PREFIX = \*STD / \*NONE / <partial-filename 1..25>**

Specifies whether metadata of the print job is to be created and which prefix should be assigned to the metadata file.

**METADATA-PREFIX = \*STD**

The metadata of the print job is to be created in a file with the following name: `<userid>.<metadata.prefix>.`

`<document-id>`

where `<userid>` is the user ID of the calling task and `<document-id>` is the identification number of the print job (see the OUTPUT-DOC-ID operand).

**METADATA-PREFIX = \*NONE**

No file containing the metadata of the print job is to be created.

**METADATA-PREFIX = <partial-filename 1..25>**

The metadata of the print job is to be created in a file with the specified prefix in the name: `<userid>.<metadata-prefix>.<document-id>`

where `<userid>` is the user ID of the calling task and `<document-id>` is the identification number of the print job (see the OUTPUT-DOC-ID operand).

**OUTPUT-DOC-ID = \*STD / \*NONE / <structured-name 1..20>**

Specifies whether the identification number of the print job is to be output in an S variable.

**OUTPUT-DOC-ID = \*STD**

The identification number of the print job is generated in the DOC-ID variable.

**OUTPUT-DOC-ID = \*NONE**

The identification number of the print job is not generated.

**OUTPUT-DOC-ID = <structured-name 1..20>**

The identification number of the print job is generated in the specified S variable.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error; command successfully processed
	32	SCP0974	Unexpected command
5	32	SCP0974	Memory request error

---

## Notes

1. If the original user file was copied (value of the FILE-PREFIX operand not equal to \*NONE), normalization of this file takes place in the target file. This means that the original user file is copied into a SAM file (conversion, library member is extracted, etc.). This file is stored as not shareable under the calling task's user ID.
2. The user ID assigned to the application (i.e. the user ID under which the calling application task is executed) corresponds to the user ID (default: SYSSPOOL) specified for the device record (PROGRAM-NAME operand).
3. The metadata file is created as an ISAM file with the file attributes KEY-POS=5, KEY-LEN=64, BUF-LEN=STD (2) and USER-ACC=OWNER-ONLY. The ISAM key (64 characters) corresponds to the attribute name and the field (consisting of 1024 characters) corresponds to the attribute value.
4. If the dialog cannot be initialized, the command is rejected and a return code is set.
5. If no initialization took place (OPEN-VIRTUAL-DEVICE-DIALOG command), the command is rejected and a return code is set.
6. If the print job has already been returned (RETURN-JOB-TO-VIRTUAL-DEVICE command), the command is rejected and a return code is set.
7. This command can only be used in batch mode.
8. Spin-off processing is activated each time an error is detected.

## Output in S variable

Output information	Name of the S variable	T	Contents	Condition
Identification number of the associated print job	var(*LIST).DOC-ID	S	<document-id>	

---

## 3.57 GOTO

Branch to specified destination (S procedure)

<b>Component:</b>	SDF-P-BASYS
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SECURITY-ADMINISTRATION SAT-FILE-MANAGEMENT SAT-FILE-EVALUATION

### Function

GOTO is an SDF-P control flow command.

A GOTO command within an *S procedure* causes a branch to a specified destination. Command processing resumes with the command introduced by the specified label, which may only occur once within the relevant procedure. Only labels in SDF-P format (S labels) may be used.

Branches are only possible within the same command block or, in the case of block nesting, in a command block on a lower nesting level.

The GOTO command corresponds to the SKIP-COMMANDS command (without conditions) in a *non-S procedure*.

#### *Restrictions*

Users with SECURITY-ADMINISTRATION, SAT-FILE-EVALUATION or SAT-FILE-MANAGEMENT privilege can use the command in procedures only.

### Format

<b>GOTO</b>
<b>LABEL</b> = <structured-name 1..255>

### Operands

**LABEL = <structured-name 1..255>**

This defines the branch destination. Specification takes the form of a label in SDF-P format (S label). Command processing resumes with the command line introduced by this label.

---

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SDP0118	Command in incorrect context
	1	SDP0223	Incorrect environment
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	130	SDP0099	No further address space available

---

## 3.58 HELP-MSG-INFORMATION

Display text of system message

**Component:** MIP

**Functional area:** Job processing  
Message processing

**Domain:** JOB  
MESSAGE-PROCESSING

**Privileges:** STD-PROCESSING  
TSOS  
HARDWARE-MAINTENANCE  
OPERATING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** @

### Function

The HELP-MSG-INFORMATION command displays the text of a system message on SYSOUT. In addition, the user can request explanations of messages and specify the language in which message texts should be issued.

### Format

<b>HELP-MSG-INFORMATION</b>	Alias: <b>HP / HPMSGI</b>
<b>MSG-IDENTIFICATION</b> = * <u>LAST</u> / <alphanum-name 4..7>	
, <b>INFORMATION-LEVEL</b> = * <u>MAXIMUM</u> / * <u>MEDIUM</u> / * <u>MINIMUM</u>	
, <b>LANGUAGE</b> = * <u>STD</u> / <name 1..1>	

### Operands

**MSG-IDENTIFICATION = \*LAST / <alphanum-name 4..7>**

Number of the system message to be displayed.  
Both 4-digit and 7-digit message numbers are permitted.  
See "Note".

**MSG-IDENTIFICATION = \*LAST**

Repeats the system message last issued by the system during the current job. This does not include system messages previously requested with HELP-MSG-INFORMATION.

**INFORMATION-LEVEL =**

Amount of information to be displayed.

**INFORMATION-LEVEL = \*MAXIMUM**

Displays the system message in unabbreviated form; in addition, an explanation of the message text is given.

---

**INFORMATION-LEVEL = \*MEDIUM**

Displays the system message in unabbreviated form.

**INFORMATION-LEVEL = \*MINIMUM**

Displays the system message in coded form.

**LANGUAGE = \*STD / <name 1..1>**

Language identifier. The system message is to be given in the language assigned to the language identifier (D = German, E = English).

**LANGUAGE = \*STD**

The default value defined by the MSGLPRI system parameter applies unless a different value has meanwhile been set using the MODIFY-MSG-ATTRIBUTES command.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	No error Guaranteed message: NMH1120
2	0	NMH9006	Warning Guaranteed messages: NMH1165, NMH1166
	1	NMH1174	Syntax error Guaranteed message: NMH1155
	32	NMH1121	Internal error
	64	CMD0216	Semantic error
	64	NMH1155	Semantic error Guaranteed message: NMH1155
	64	NMH1199	Semantic error

**Note**

If MIP itself sent the message to SYSOUT, any inserts in the message will have been replaced by current values. If it was some other system component, not MIP, that sent the message to SYSOUT, the insert texts in the message are those that MIP placed in the message when the other system component requested the message text. These values may also be internal labels set by the requester for future processing.

---

## Example

**/cpf xx.dummy,aaaaa** \_\_\_\_\_ (1)

```
% DMS0812 '0533' DMS ERROR CODE OCCURRED DURING EXECUTION OF THE JOB FOR THE FILE NAME ':2OSG:$USER1.XX.DUMMY' WITH THE FILE NAME ':2OSG:$USER1.AAAAA'. FURTHER INFORMATION: /HELP-MSG DMS0533

```

- (1) The system issues message DMS0812 in response to an invalid COPY-FILE command.
- (2) The message last issued by the system is to be displayed together with an explanation in German. The message text is output in unabbreviated form.
- (3) The German message text of message DMS0533 is to be displayed. Here, the command does not refer to the message last issued by the system and therefore may be entered at any point in the job.
- (4) The message last issued by the system is requested in its German form: DMS0812. Message DMS0533 is not considered since the other message was explicitly requested.

---

## 3.59 HELP-SDF

Provide information on SDF

<b>Component:</b>	SDF
<b>Functional area:</b>	SDF control
<b>Domain:</b>	SDF
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The HELP-SDF command displays information regarding SDF.

The information available is subdivided into sections that can be accessed via the individual operands of the command.

When the user enters HELP-SDF without operands or only with the preset operand values, a brief introduction to SDF is displayed (for a description see "[HELP-SDF with preset operand values](#)").

Entering /HELP-SDF? displays the operand form for the command (temporarily guided dialog), and the information required can be selected.

## Format

<b>HELP-SDF</b>	Alias: <b>HPSDF</b>
<b>GUIDANCE-MODE</b> = <u>*NO</u> / *YES	
, <b>SDF-COMMANDS</b> = <u>*NO</u> / *YES	
, <b>ABBREVIATION-RULES</b> = <u>*NO</u> / *YES	
, <b>GUIDED-DIALOG</b> = <u>*YES</u> (...)	
<u>*YES</u> (...)	
<b>SCREEN-STEPS</b> = <u>*NO</u> / *YES	
, <b>SPECIAL-FUNCTIONS</b> = <u>*NO</u> / *YES	
, <b>FUNCTION-KEYS</b> = <u>*NO</u> / *YES	
, <b>NEXT-FIELD</b> = <u>*NO</u> / *YES	
, <b>UNGUIDED-DIALOG</b> = <u>*YES</u> (...) / *NO	
<u>*YES</u> (...)	
<b>SPECIAL-FUNCTIONS</b> = <u>*NO</u> / *YES	
, <b>FUNCTION-KEYS</b> = <u>*NO</u> / *YES	

## Operands

**GUIDANCE-MODE** = \*NO / \*YES

Type of dialog guidance (output see *"HELP-SDF with GUIDANCE-MODE=\*YES"*).

**SDF-COMMANDS** = \*NO / \*YES

SDF-specific commands (output see *"HELP-SDF with SDF-COMMANDS=\*YES"*).

**ABBREVIATION-RULES** = \*NO / \*YES

Abbreviation rules for the command syntax (output see *"HELP-SDF with ABBREVIATION-RULES=\*YES"*).

**GUIDED-DIALOG** = \*YES(...) / \*NO

Use of guided dialog (output see *"HELP-SDF with GUIDED-DIALOG=\*YES(SCREEN-STEPS=\*YES)"*).

**GUIDED-DIALOG** = \*YES(...)

The description of guided dialog is subdivided into 4 blocks of information which can be accessed individually as follows:

**SCREEN-STEPS** = \*NO / \*YES

Sequence and contents of the menus (application domain menu, command menu, operand form, subform; output see *"HELP-SDF with GUIDED-DIALOG=\*YES(SCREEN-STEPS=\*YES)"*).

---

**SPECIAL-FUNCTIONS = \*NO / \*YES**

Special functions within the menu (output see *"HELP-SDF with GUIDED-DIALOG=\*YES(SPECIAL-FUNCTIONS=\*YES)"*).

**FUNCTION-KEYS = \*NO / \*YES**

Function keys for menu control (output see *"HELP-SDF with GUIDED-DIALOG=\*YES(FUNCTION-KEYS=\*YES)"*).

**NEXT-FIELD = \*NO / \*YES**

Input in the NEXT line for menu control (output see *"HELP-SDF with GUIDED-DIALOG=\*YES(NEXT-FIELD=\*YES)"*).

**UNGUIDED-DIALOG = \*NO / \*YES(...)**

Use of unguided dialog (output see *"HELP-SDF with UNGUIDED-DIALOG=\*YES(SPECIAL-FUNCTIONS=\*YES)"*).

**UNGUIDED-DIALOG = \*YES(...)**

The description of unguided dialog is subdivided into 2 blocks of information which can be accessed individually as follows:

**SPECIAL-FUNCTIONS = \*NO / \*YES**

Special functions within the unguided dialog menu (output see *"HELP-SDF with UNGUIDED-DIALOG=\*YES(SPECIAL-FUNCTIONS=\*YES)"*).

**FUNCTION-KEYS = \*NO / \*YES**

Function keys for controlling the unguided dialog menu (output see *"HELP-SDF with UNGUIDED-DIALOG=\*YES(FUNCTION-KEY=\*YES)"*).

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
1	32	CMD0500	Syntax description in current syntax file invalid
1	64	CMD0810	Error during execution. Guaranteed messages: CMD0500, CMD0810

---

## Information displayed with HELP-SDF:

### *HELP-SDF with preset operand values*

```
%  
% Introduction  
%  
% SDF is a convenient command interpreter and dialogue manager  
% If the user desires, input can be entered as before.  
% But the user can also utilize the advantages of SDF:  
% - Abbreviation mechanism  
% - Block input  
% - Guided dialogue  
% - Command bufferization (history)  
% - Definition of task-specific default values  
%  
% In addition, a more comprehensible command language has  
% has been developed:  
% The names of commands, operands and constant operand  
% values were chosen so as to indicate clearly their function.  
% Similar features (for example, the name of a file) are  
% named accordingly similar naming rules (for example, FILE-NAME=  
% or FROM-FILE= or TO-FILE=).  
% Incorrect input is presented for correction along with  
% a message.  
% Commands which are part of the old commando language (ISP)  
% can be input in the form "<old cmd>?". The new SDF-command  
% is then displayed with its new syntax, i.e. a menu driven  
% dialog allows to set the appropriate operand values.  
% For further information, the user may enter "HELP-SDF?".  
% The operand form for the command will then be displayed.  
% Further information for an operand may then be obtained  
% by setting that operand to "YES".  
%
```

```
%  
% Types of dialogue:  
%  
% 1. Guided dialogue  
% Guided dialogue : supplies menus in the following order :  
% Domain menu, Command menu, Operand form menu, sub-form menu.  
% The extent of information offered in a menu can be controlled via  
% the GUIDANCE operand of the MODIFY-SDF-OPTIONS command :  
% - GUIDANCE=*MAXIMUM all operand values with options (limit  
% values etc.); help texts for commands  
% and operands  
% - GUIDANCE=*MEDIUM all operand values;  
% help texts only for commands  
% - GUIDANCE=*MINIMUM only default values for operands;  
% no options; no help texts.  
%  
%  
% 2. Unguided dialogue  
% Unguided dialogue : no menus. There are 2 types of unguided  
% dialogue, which can be controlled via the GUIDANCE operand  
% of the MODIFY-SDF-OPTIONS cmd :  
% - GUIDANCE=*NO: the system requests command input with  
% "%CMD:"; syntax error dialogue : correction  
% of incorrect input without repetition  
% of the entire command, detailed error  
% messages; grouped command input :  
% several commands, separated by logical  
% end-of-line characters (LZE), can be issued  
% at one time.  
% - GUIDANCE=*EXPERT: the system requests command input with "/",  
% no syntax error dialogue, detailed error  
% messages; grouped command input.ch.  
%
```

---

*HELP-SDF with SDF-COMMANDS=\*YES*

```
%  
% SDF-specific commands:  
%  
% - HELP-SDF  
%   Displays information about SDF.  
% - MODIFY-SDF-OPTIONS  
%   Changes the task-specific SDF options.  
% - REMARK  
%   Inserts remarks into the command files.  
% - RESET-INPUT-DEFAULTS  
%   Deletes task-specific default values.  
% - RESTORE-SDF-INPUT  
%   Reprompts a previous input.  
% - SHOW-CMD  
%   Displays the syntax description of a command to SYSOUT/SYSLST.  
% - SHOW-SDF-OPTIONS  
%   Displays the task-specific information for the SDF options.  
% - SHOW-INPUT-DEFAULTS  
%   Outputs the task-specific default values.  
% - SHOW-INPUT-HISTORY  
%   Displays the list of the latest inputs.  
% - SHOW-SYNTAX-VERSIONS  
%   Displays information about the contents of the active  
%   syntax files.  
% - WRITE-TEXT  
%   Writes text to SYSOUT/SYSLST.
```

```
%
% Abbreviation rules for the command syntax:
%
% - Command name, operand name and constant operand values
% (not basic data types) may be abbreviated as follows:
% - Characters may be dropped from right to left
%   e.g.: TRANSFER-FILE abbreviated to TRANS
% - Characters may be dropped from right to left
%   within the name elements.
%   e.g.: TRANSFER-FILE abbreviated to T-F
%       Restriction : Abbreviations must be unambiguous;
%       e.g.: CREATE as an abbreviation is ambiguous
%       between CREATE-FILE,CREATE-FILE-GENERATION,
%       CREATE-FILE-GROUP and CREATE-JV.
%
% - Operand values may also be specified without the
% corresponding operand names (positional operands).
% Here the following must be observed:
% - A comma must be given for each omitted operand
%   preceding the positional operand.
% - If, in the series of operands for a command,
%   an operand is specified completely (operand name and
%   operand value), subsequent operands may no longer be
%   specified as positional operands.
%
% - Guided dialogue: Operands for a structure need not be
% in a sub-form, but may instead be entered in the operand
% form. They must be enclosed in parentheses and must directly
% follow the operand value introducing the structure.
%
% - Guided dialogue: In the NEXT line of the menu, complete
% commands can also be entered. If a command name ends with
% a question mark (<command>?), the operand form for the
% specified command appears. It lists the operand values that
% have already been specified (temporary guided dialogue).
% If the specified command has no operands, the command help
% text is displayed.
%
% - Ambiguity menus: entering a command name containing wildcards
% and ending with a question mark causes SDF to display a menu
% listing the commands which match the wildcard pattern.
%
```

*HELP-SDF with GUIDED-DIALOG=\*YES(SCREEN-STEPS=\*YES)*

```
%  
% Guided dialogue: Order and content of the menus  
%  
% Domain menu      : Lists all domains (commands are assigned  
%                   to particular domains according to their  
%                   function). A domain can be selected by  
%                   number or name. The domain *ALL-COMMANDS lists all  
%                   the commands.  
% Command menu    : Lists all commands of the selected domain.  
%                   A command can be selected by number or name  
%                   A command followed by ! has no operands.  
% Operand form    : Lists the operands of the selected command.  
%                   The operand values desired are to be  
%                   specified.  
% Sub-form        : Lists the operands of a structure  
%                   If an operand value introducing a structure  
%                   is specified in an operand form, a sub-form  
%                   for the corresponding structure is  
%                   displayed.  
% Command menu    : If a command has been executed or aborted,  
%                   the current command menu appears again.  
%
```

*HELP-SDF with GUIDED-DIALOG=\*YES(SPECIAL-FUNCTIONS=\*YES)*

```
%  
% ? as operand value:  
%     Supplies help text and options (limit values, etc.)  
%     for the operand; in addition, detailed error  
%     messages in the case of incorrect input.  
% ?? as operand value:  
%     calls up a help text, a display of the range of  
%     values for the relevant operand and an help text  
%     giving information about the data types associated  
%     with the operand.  
% ! as operand value:  
%     Enters the default value for the operand.  
  
% ( following an operand value introducing a structure:  
%     Displays the sub-form for the structure associated  
%     with the operand value.  
% () following an operand value introducing a structure:  
%     Suppresses the sub-form and enters the default  
%     values for the operands of the structure.  
% - as the last character in an input line:  
%     A continuation line is displayed.  
% LZF key :  
%     Deletes all characters in the input line, starting  
%     at the cursor.  
%
```

## 3.60 HOLD-ALIAS-SUBSTITUTION

Suspend substitution functions of alias catalog

**Component:** ACS

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The HOLD-ALIAS-SUBSTITUTION command halts alias substitutions for the current task. The prefix insertion and SPOOL-FILE-PUBSET functions of ACS are not affected by this command.

The user can cancel the effect of this command and resume alias substitution with the RESUME-ALIAS-SUBSTITUTION command.

The HOLD-ALIAS-SUBSTITUTION command can be specified several times in sequence, but each HOLD-ALIAS-SUBSTITUTION command must be canceled with a separate RESUME-ALIAS-SUBSTITUTION command.

### Format

<b>HOLD-ALIAS-SUBSTITUTION</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed normally
2	0	ACS0042	Command has no effect: HOLD counter overflow
	128	ACS0018	ACS is not available
	130	ACS0036	Resource bottleneck

## Example

*Interrupting the replacement function, preventing replacement*

**/show-alias-cat** \_\_\_\_\_ **(1)**

```

- (1) The SHOW-ALIAS-CATALOG-ENTRY command displays all entries of the task-local alias catalog.
- (2) The HOLD-ALIAS-SUBSTITUTION command is used to halt the ACS substitution function.
- (3) The SHOW-ACS-OPTIONS command shows the current ACS settings for the task. The output field *STATUS* has the value *IN HOLD*, which means that the ACS substitution function has been interrupted.
- (4) The specified file name *SF.SDF* in the SHOW-FILE-ATTRIBUTES command is not replaced, despite the fact that it matches a defined alias. A file with the actual name *SF.SDF* does not exist.
- (5) The COPY-FILE command copies the contents of the file *SF.ROBAR* to the file *SF.SDF*. The alias *SF.SDF* is not replaced in this case either, but a file with the actual name *SF.SDF* is created.
- (6) In the SHOW-FILE-ATTRIBUTES command is used the specified file name *SF.SDF*.
- (7) The interrupted ACS substitution function is resumed with the RESUME-ALIAS-SUBSTITUTION command.
- (8) The defined actual file name *\$TSOS.SYS.SDF.SYSTEM.SYNTAX* is now substituted for the alias *SF.SDF* in the SHOW-FILE-ATTRIBUTES command before that command is executed.
- (9) In order to retrieve the catalog entry for the file *SF.SDF*, the file name is specified along with the user ID (*\$USER1.SF.SDF*). No substitution takes place in this case since the specified name differs from that of the alias due to the user ID. Such differentiation can also be achieved by specifying the catalog ID or the complete path name.

For further examples see the commands ADD-ALIAS-CATALOG-ENTRY, LOAD-ALIAS-CATALOG, and SET-FILE-NAME-PREFIX.

---

## 3.61 HOLD-HARDWARE-AUDIT

Suspend AUDIT mode

**Component:** BS2000 OSD/BC  
**Functional area:** AUDIT mode control  
**Domain:** PROGRAM  
**Privileges:** STD-PROCESSING  
TSOS

### Function

The HOLD-HARDWARE-AUDIT command suspends AUDIT mode, which was switched on using the START-HARDWARE-AUDIT command. The hold function always acts on the user's own job, i.e. the AUDIT mode was switched on with SCOPE=\*OWN-JOB.

The AUDIT tables are retained.

AUDIT mode may be resumed by entering the RESUME-HARDWARE-AUDIT command.

#### *Privileged functions*

Systems support personnel (TSOS privilege) can suspend hardware AUDIT mode for the privileged processor state TPR (STATE=\*SYSTEM).

### Format

<b>HOLD-HARDWARE-AUDIT</b>
----------------------------

<b>STATE = *USER / *SYSTEM</b>
--------------------------------

### Operands

#### **STATE =**

Processor state for which the AUDIT mode is to be suspended.

If the hardware AUDIT mode is to be deactivated for both processor states, the command has to be issued twice.

#### **STATE = \*USER**

The hardware AUDIT mode is to be suspended for the nonprivileged processor state TU. The hardware AUDIT table and the backup table, if there is one, are retained.

#### **STATE = \*SYSTEM**

*This operand value is reserved for privileged users.*

The hardware AUDIT mode is to be suspended for the privileged processor state TPR. The hardware AUDIT table is retained.

---

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	64	CMD0216	User does not have authorization
	64	IDA0001	Hardware is not active
	64	IDA0011	Privilege error
	64	IDA0023	Hardware AUDIT is not available because of missing authorization in the user entry
	64	IDA0024	Hardware AUDIT is not available because of the test options currently set for the active task

---

## 3.62 HOLD-JOB

Put user job on hold

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** TSOS  
OPERATING

**Routing code:** J

### Function

This command places a user job that has not yet been started in the wait state HELD-BY-COMMAND.

The specified job, identified by its TSN or a defined job variable, is skipped by the job scheduler when it selects the jobs to be started. This wait state can only be revoked by the RESUME-JOB command or by changing the start attributes to START=\*IMMEDIATE (MODIFY-JOB command). Information on the jobs in wait state can be retrieved using the SHOW-JOB-STATUS command. In this case, the wait state HELD-BY-COMMAND is displayed as TYPE1 /HO.

Successful processing of the HOLD-JOB command is indicated at the console. The command is rejected in the following situations:

- The job scheduler has already released the job for starting; jobs which have already started can be placed in the wait state by means of the HOLD-TASK command.
- The job to be placed in the wait state is an interactive or transaction job (category DIA or TP).
- The job to be placed in the wait state has the START=\*IMMEDIATE attribute.

### Format

#### HOLD-JOB

**JOB-IDENTIFICATION** = \*TSN(...) / \*MONJV(...) / <alphanum-name 1..4>

\*TSN(...)

| **TSN** = <alphanum-name 1..4>

\*MONJV(...)

| **MONJV** = <filename 1..54 without-gen-vers>

### Operands

#### **JOB-IDENTIFICATION =**

The batch job can be identified by means of either its TSN or a defined monitoring job variable.

#### **JOB-IDENTIFICATION = \*TSN(...)**

The job is identified by means of its TSN.

---

**TSN = <alphanum-name 1..4>**

TSN of the job to be placed in the wait state.

**JOB-IDENTIFICATION = \*MONJV(...)**

The job to be suspended is addressed by means of a monitoring job variable.

**MONJV = <filename 1..54 without-gen-vers>**

Defined job variable for the job to be placed in the wait state.

**JOB-IDENTIFICATION = <alphanum-name 1..4>**

The job number of the job to be suspended.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	32	CMD0221	system error
	64	JMS0630	Semantic error
	64	JMS0640	Command cannot be executed

## Notes

Calendar and repeat jobs should not be placed in the wait state. If it is still unavoidable, note the following:

- In case of calendar jobs, the complete execution is put in the wait state. If further execution dates are reached while in the HOLD state, these will be omitted.
- In the case of repeat jobs, the command only applies to the directly following repetition.
- If the start time of the suspended repetition is reached, its successor will still be created.
- The successor does not adopt the HOLD attribute. It will, however, only be started once the current job is terminated, that is only after the HOLD state is terminated via /RESUME-JOB or /CANCEL-JOB.
- If the system is started anew, the whole repeat job is reconstructed from its successor. This may cause the HOLD state to be lost.

---

## 3.63 HOLD-JOB-CLASS

Put job class on hold

**Component:** BS2000 OSD/BC  
**Functional area:** Job processing  
**Domain:** JOB  
**Privileges:** TSOS  
OPERATING  
**Routing code:** J

### Function

The HOLD-JOB-CLASS command puts a job class on hold.

Batch jobs for the suspended job class are placed in the job queue of the responsible job scheduler but are not released for starting. The command affects only job classes in which batch jobs are assembled; the system job class \$SYSJC is also permitted.

The HOLD status is temporary and can be canceled by means of the RESUME-JOB-CLASS command. Successful execution of the command is acknowledged in a message issued at the console. The SHOW-SYSTEM-STATUS provides an overview of the job classes currently on hold.

### Format

<b>HOLD-JOB-CLASS</b>
<b>CLASS-NAME</b> = <name 1..8>

### Operands

**CLASS-NAME = <name 1..8>**

Name of the job class to be placed on hold.

The system administration defines the name using the JMU statement DEFINE-JOB-CLASS.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JMS0630	Semantic error
	64	JMS0640	Command cannot be executed

---

## Notes

- The command is also accepted for system job class \$SYSJC.
- If the particular job scheduler is inactive at the time the command is issued, the command is rejected with an error message.
- Batch jobs submitted for a suspended job class are entered to the job queue of the appropriate job scheduler. These jobs are not released for starting.

---

## 3.64 HOLD-JOB-STREAM

Put job stream on hold

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** TSOS  
OPERATING

**Routing code:** J

### Function

The HOLD-JOB-STREAM command places a job stream on hold. The job scheduler that was active in the suspended job stream cannot carry out its function until the HOLD state has been canceled by means of the RESUME-JOB-STREAM command. During this time user jobs for the job classes assigned to the job stream continue to be accepted but are not released for starting.

The HOLD-JOB-STREAM command is also permitted for the system job stream \$SYSJS, for which a total of 16 job streams can be managed.

The job stream is terminated normally if it takes place during the HOLD phase, and a message to this effect is issued at the operator terminal (see the STOP operand of the JMU statement DEFINE-JOB-STREAM in the "Utility Routines" manual [9]).

If a job stream cannot be placed in the wait state, a message to that effect is issued at the operator terminal.

The SHOW-SYSTEM-STATUS command can be used to show which job streams are in the HOLD state (INFORMATION operand, value \*JOB-STREAM).

### Format

<b>HOLD-JOB-STREAM</b>
<b>STREAM-NAME</b> = <name 1..8>

### Operands

**STREAM-NAME = <name 1..8>**

Name of the job stream to be placed on hold.

The system administration defines the name using the JMU statement DEFINE-JOB-STREAM.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	32	CMD0221	System error
	64	JMS0630	Semantic error
	64	JMS0640	Command cannot be executed

---

## 3.65 HOLD-LINKAGE-AUDIT

Suspend linkage AUDIT mode

**Component:** BS2000 OSD/BC  
**Functional area:** AUDIT mode control  
**Domain:** PROGRAM  
**Privileges:** STD-PROCESSING  
TSOS

### Function

The HOLD-LINKAGE-AUDIT command suspends the linkage AUDIT mode which had earlier been activated by a START-LINKAGE-AUDIT command. The hold function always relates to its own job, i.e. the linkage AUDIT mode was activated with SCOPE=OWN-JOB. The linkage AUDIT table and the backup table if there is one are retained.

The linkage AUDIT mode can be resumed with the RESUME-LINKAGE-AUDIT command.

#### *Privileged functions*

Systems support personnel (TSOS privilege) can suspend linkage AUDIT mode for the privileged processor state TPR (STATE=\*SYSTEM).

### Format

<b>HOLD-LINKAGE-AUDIT</b>
<b>STATE = *<u>USER</u> / *SYSTEM</b>

### Operands

#### **STATE =**

Processor state for which the linkage AUDIT mode is to be suspended.

If the linkage AUDIT mode is to be suspended for both processor states at the same time, the command has to be issued twice.

#### **STATE = \*USER**

The linkage AUDIT mode is to be suspended for the nonprivileged processor state TU. The linkage AUDIT table is retained.

#### **STATE = \*SYSTEM**

*This operand value is reserved for privileged users.*

The linkage AUDIT mode is to be suspended for the privileged TPR processor state. The linkage AUDIT table and, if appropriate, the backup table are retained.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	64	CMD0216	User does not have authorization
	64	IDA0052	Linkage AUDIT is not available because of missing authorization in the user entry
	64	IDA0053	Linkage AUDIT is not available because of the test options currently set for the active task
	64	IDA0060	AUDIT functions are not available on the entire system in this session

---

## 3.66 HOLD-PRINT-JOB

Suspend active spoolout job

<b>Component:</b>	SPOOL
<b>Functional area:</b>	Controlling spoolout job
<b>Domain:</b>	SPOOL-PRINT-ADMINISTRATION
<b>Privileges:</b>	STD-PROCESSING OPERATING PRINT-SERVICE-ADMINISTRATION SAT-FILE-MANAGEMENT SAT-FILE-EVALUATION SECURITY-ADMINISTRATION
<b>Routing code:</b>	O

### Function

The HOLD-PRINT-JOB command suspends or resumes an active spoolout job.

The following comments apply to replay jobs assigned with START-TAPE-REPLAY and the operand value OUTPUT-MODE=\*DIRECT:

- The tape containing the output file is positioned at the desired point, and output is resumed immediately via the specified device.
- Current output is stopped. All the spoolout jobs are written back to the SR.vsn file and provided with information relevant for resuming interrupted output. Resumption may then only be initiated by means of the START-TAPE-REPLAY command.

**i** Starting with BS2000 OSD/BC V11.0, printers that are connectable to the channel are no longer supported. However, print jobs for “local” printers defined in SPOOL are still accepted and can be forwarded to real, LAN-connected high performance printers by using a SPOOL add-on product (e.g. ROUTER by Océ).  
This forwarding cannot be put on hold by /HOLD-PRINT-JOB. The command may therefore now only be used for RSO printers and virtual devices.

### *Privileged functions*

RSO device administrators and spool and cluster administrators can suspend or resume any print job scheduled for printing on any device that they manage. For more information on these user groups see the manuals “RSO” [32], “SPOOL” [43] and “Dprint” [10].

---

## Format

### HOLD-PRINT-JOB

**DEVICE-NAME** = <alphanum-name 1..8> / <alphanum-name 2..2>

,**RESUME-CONDITION** = \***IMMEDIATE** / \***BY-PRIORITY**(...) / \***BY-OPERATOR**

**BY-PRIORITY**(...)

| **PRIORITY** = \***UNCHANGED** / <integer 30..255>

,**RESTART-POSITION** = \***BEGIN-OF-SPOOL** / \***CURRENT-PAGE** / \***LAST-CHECKPOINT** /

\***PREVIOUS-CHECKPOINT** / \***PAGE**(...) / \***BACK**(...)

\***PAGE**(...)

| **PAGE-NUMBER** = <integer 1..10000000>

\***BACK**(...)

| **PAGES** = <integer 1..10000000>

## Operands

**DEVICE-NAME** = <alphanum-name 1..8>

RSO device name of the printer on which the SPOOLOUT job is to be suspended.

**DEVICE-NAME** = <alphanum-name 2..2>

This specification can no longer be used from BS000 OSD/BC V11.0 onwards.

**RESUME-CONDITION** = \***IMMEDIATE** / \***BY-PRIORITY**(...) / \***BY-OPERATOR**

The spoolout job is to be resumed immediately, resumed after a delay or suspended.

**RESUME-CONDITION** = \***IMMEDIATE**

The spoolout job is to be resumed immediately.

**RESUME-CONDITION** = \***BY-PRIORITY**(...)

The spoolout job is to be resumed after a delay.

**PRIORITY** = <integer 30..255>

Priority for the delayed resumption of the spoolout job.

**PRIORITY** = \***UNCHANGED**

The spoolout job is placed in the job queue with its original priority (TYPE 4).

**RESUME-CONDITION** = **BY-OPERATOR**

The spoolout job is to be suspended until a RESUME-SPOOLOUT command is issued.

**RESTART-POSITION** =

Determines the point from which the file is to be output in the event of a restart. The restart point for a particular printer after a printer fault must not be confused with the CHECKPOINT-INTERVAL value from the SPOOL parameter file (M-S-P) which is the restart point after a SPOOL or system crash.

---

**RESTART-POSITION = \*BEGIN-OF-SPOOLOUT**

The spoolout job is to be repeated from the file start.

**RESTART-POSITION = \*CURRENT-PAGE**

The spoolout job is to be restarted from the page which was being output at the time of the interruption.

**RESTART-POSITION = \*LAST-CHECKPOINT**

The spoolout job is to be restarted from the last checkpoint. System administration uses the MODIFY-SPOOL-PARAMETERS statement in the SP SERVE utility routine to define the number of print pages after which a checkpoint is to be set.

**RESTART-POSITION = \*PREVIOUS-CHECKPOINT**

The spoolout job is to be restarted from the last checkpoint but one.

**RESTART-POSITION = \*PAGE(...)**

The spoolout job is to be restarted from a particular page; all print pages preceding this one are skipped.

**PAGE-NUMBER = <integer 1..1000000>**

Number of the page.

**RESTART-POSITION = BACK (...)**

The spoolout job is to be restarted from the specified number of pages back from the current page.

**PAGES = <integer 1..1000000>**

Number of pages.

*Note*

With SPS jobs it is not permissible to specify the operand values \*PAGE(...) and \*BACK(...).

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SCP0973	Semantic error
	32	SCP0974	System error. Command rejected
	64	SCP0975	No authorization for command
	64	SCP0976	Invalid operand value

## 3.67 HOLD-PROCEDURE

Suspend procedure run to allow command input

**Component:** SYSFILE

**Functional area:** Procedures

**Domain:** PROCEDURE

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The HOLD-PROCEDURE command suspends a procedure and issues a message:

```
TASK IS IN ESCAPE MODE AT LEVEL NUMBER i
```

where i = number of the current procedure level

The user can then enter commands at the terminal. This interrupt state is called ESCAPE mode. ESCAPE mode is maintained until it is terminated with a CANCEL-PROCEDURE or RESUME-PROCEDURE command.

The HOLD-PROCEDURE command is not permitted in batch mode. In interactive mode, it may be given only in procedure files, and so does not appear in the menu.

### Format

<b>HOLD-PROCEDURE</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	SSM2015	Command not permitted in batch mode
2	0	SSM2016	Command cannot be entered from the interactive terminal
	32	SSM1013	System error during command execution

### Notes

- Nested interrupts are allowed (see Examples). A procedure called in ESCAPE mode can also be interrupted with HOLD-PROCEDURE. In this case, the first interrupt is not lost (see Example 3 on [section "HOLD-PROCEDURE"](#)).

- In ESCAPE mode the symbolic operands that were defined in the interrupted procedure are available to the user and can be used from the terminal. However, a command with a symbolic operand that was replaced by the corresponding value is logged only if logging was requested for the interrupted procedure (see Example 4 on section "HOLD-PROCEDURE").

## Examples

Example 1: Execution of an EXIT-PROCEDURE command in ESCAPE mode

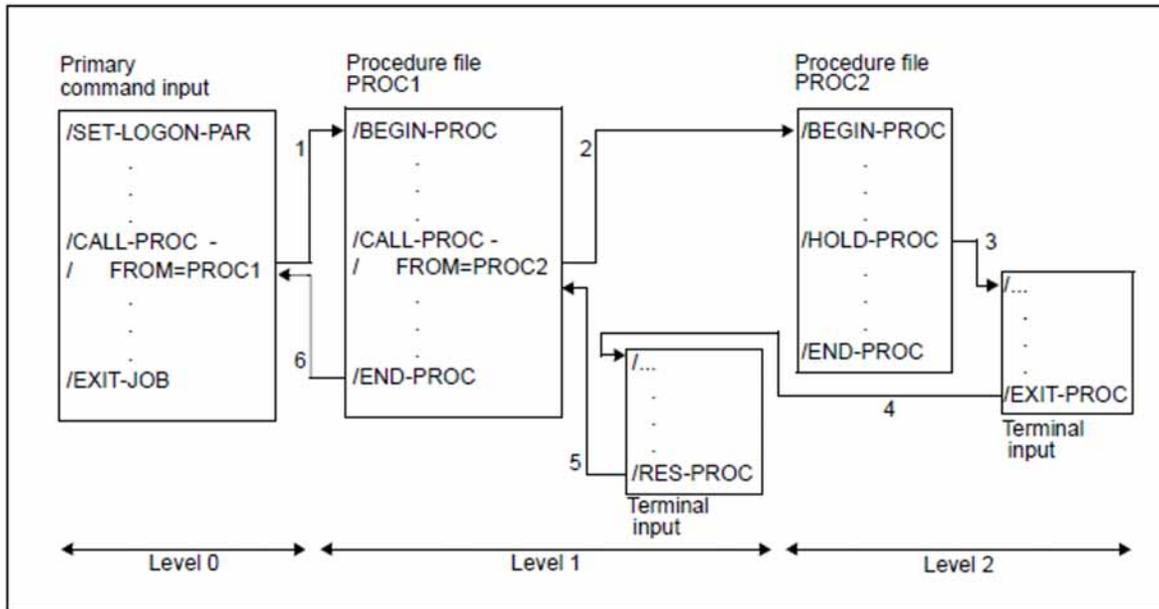

Figure 5: EXIT-PROCEDURE command in ESCAPE mode

The arrows indicate the sequence in which commands are processed (SYSCMD):

1. The command `/CALL-PROC FROM=PROC1` assigns SYSCMD to the procedure file PROC1.
2. The command `/CALL-PROC FROM=PROC2` assigns SYSCMD to the procedure file PROC2.
3. The command `/HOLD-PROC` activates ESCAPE mode: SYSCMD is assigned to the terminal. ESCAPE mode can also be activated by pressing [K2] if this is allowed in the procedure. However, in this case it is not possible to precisely determine the interrupt point in advance.
4. EXIT-PROCEDURE causes a shift from procedure level 2 to procedure level 1; ESCAPE mode is maintained. (Note: If an RESUME-PROCEDURE command were entered instead of the EXIT-PROCEDURE command, PROC2 would be continued from the point of interruption.)
5. The RESUME-PROCEDURE command cancels ESCAPE mode. SYSCMD is again assigned to the procedure file PROC1.
6. SYSCMD is again assigned to primary command input.

Example 2: Execution of a CALL-PROCEDURE command in ESCAPE mode

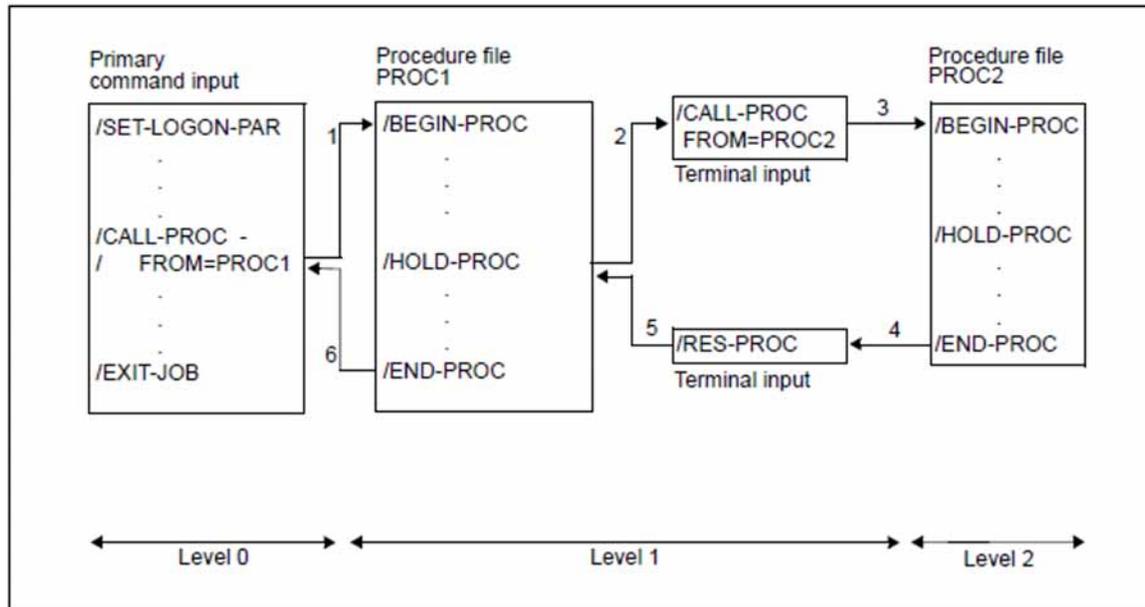

Figure 6: CALL-PROCEDURE command in ESCAPE mode

The arrows indicate the sequence in which commands are processed (SYSCMD):

1. The command `/CALL-PROC FROM=PROC1` assigns SYSCMD to the procedure file PROC1.
2. The command `/HOLD-PROC` activates ESCAPE mode: SYSCMD is assigned to the terminal. ESCAPE mode can also be activated by pressing [K2] if this is allowed in the procedure. However, in this case it is not possible to precisely determine the interrupt point in advance.
3. The command `/CALL-PROC FROM=PROC2` assigns SYSCMD to the procedure file PROC2.
4. `END-PROC` causes a shift from procedure level 2 to procedure level 1; ESCAPE mode is still activated, i.e. SYSCMD is assigned to the terminal.
5. The `RESUME-PROCEDURE` command cancels ESCAPE mode. SYSCMD is again assigned to the procedure file PROC1.
6. SYSCMD is again assigned to primary command input.

Example 3: Nesting of ESCAPE levels

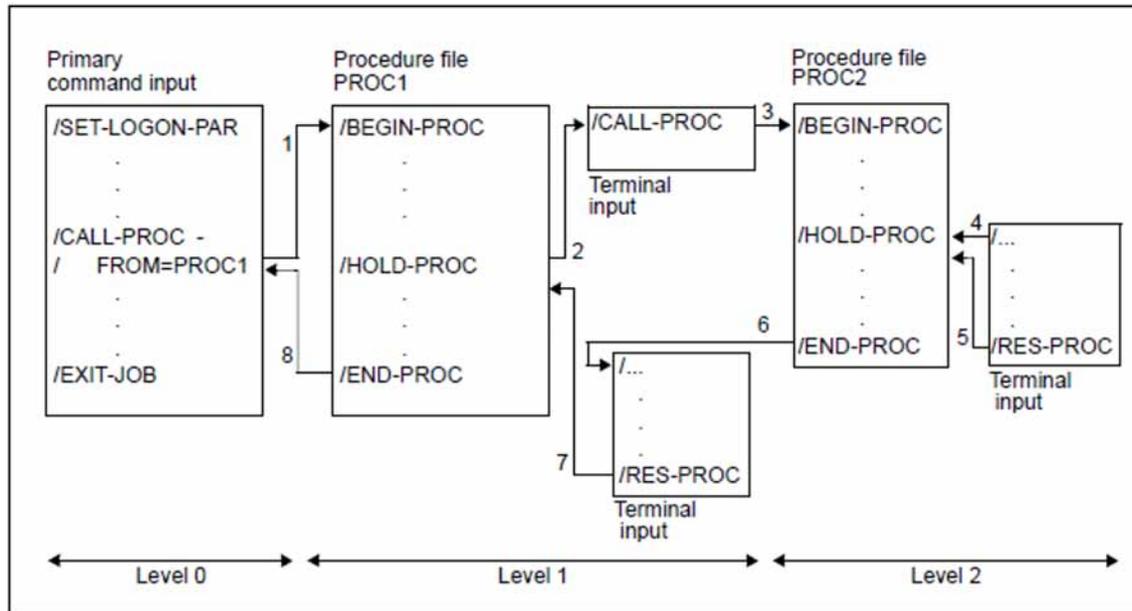

Figure 7: Nesting of ESCAPE levels

The arrows indicate the sequence in which commands are processed (SYSCMD):

1. The command `/CALL-PROC FROM=PROC1` assigns SYSCMD to the procedure file PROC1.
2. The command `/HOLD-PROC` activates ESCAPE mode: SYSCMD is assigned to the terminal. ESCAPE mode can also be activated by pressing [K2] if this is allowed in the procedure. However, in this case it is not possible to precisely determine the interrupt point in advance.
3. The command `/CALL-PROC FROM=PROC2` assigns SYSCMD to the procedure file PROC2.
4. The command `/HOLD-PROC` activates ESCAPE mode: SYSCMD is assigned to the terminal. ESCAPE mode can also be activated by pressing [K2] if this is allowed in the procedure. However, in this case it is not possible to precisely determine the interrupt point in advance.
5. SYSCMD is assigned to the procedure file PROC2.
6. SYSCMD is assigned to the terminal (ESCAPE mode is still activated at level 1).
7. The RESUME-PROCEDURE command causes SYSCMD to again be assigned to the procedure file PROC1.
8. SYSCMD is assigned to primary command input.

Example 4: Use of symbolic operands in ESCAPE mode

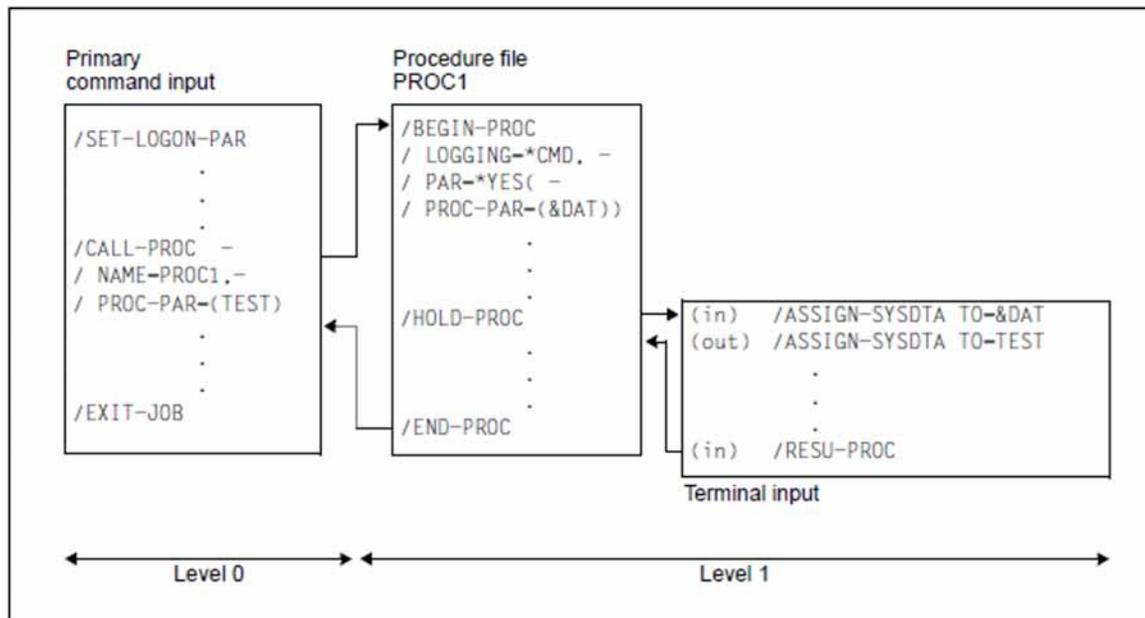

Figure 8: Input of symbolic operands in ESCAPE mode

The arrows indicate the sequence in which commands are processed (SYSCMD).

The file name TEST is entered for the symbolic operand "&DAT" when the procedure PROC1 is called with the CALL-PROCEDURE command. After leaving procedure mode with the HOLD-PROC command, an ASSIGN-SYSDTA command is issued at the terminal using the symbolic operand "&DAT". Since logging of commands on SYSOUT was requested for the procedure file PROC1 (the operand LOGGING=\*CMD specified in the BEGIN-PROCEDURE command), this command (supplied with the appropriate value TEST) is also logged on SYSOUT in ESCAPE mode.

---

## 3.68 HOLD-PROGRAM

Suspend program to allow command input

**Component:** SYSFILE  
**Functional area:** Program control  
**Domain:** PROGRAM  
**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The HOLD-PROGRAM command suspends a program waiting for input data and permits the input of commands. This is only possible within a procedure or a batch job. In an interactive dialog the command will be rejected. The command RESUME-PROGRAM terminates command input and effects a return to program mode.

### Format

<b>HOLD-PROGRAM</b>

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	64	EXC0100	HOLD-PROGRAM or BREAK command in SYSDTA data stream

---

## 3.69 HOLD-SUBSYSTEM

Put subsystem on hold

**Component:** DSSM

**Functional area:** Subsystem management

**Domain:** SYSTEM-MANAGEMENT

**Privileges:** OPERATING  
SUBSYSTEM-MANAGEMENT

**Routing code:** R

### Function

The HOLD-SUBSYSTEM command enables any required subsystem to be put on hold.

No new connection is permitted to the specified subsystem; the required resources (holder task, address space) remain available. In addition, the FORCED operand enables the system to wait for all the connected tasks to be disconnected or the subsystem to be put on hold immediately. Once the deinitialization phase is complete, the subsystem is on hold; this status can be canceled using the RESUME-SUBSYSTEM command.

The HOLD-SUBSYSTEM command is rejected if SUBSYSTEM-HOLD=\*FORBIDDEN was specified when the subsystem was defined.

**i** In order to ensure a high degree of parallelism and data integrity, time-consuming administration tasks are not performed under control of the calling task; instead, they are transferred to a DSSM task. As a rule, only the check of the requested function is carried out **synchronously** (i.e. contingent upon a wait state for the calling task). DSSM carries out the actual processing **asynchronously** and independent of the calling task.

### Format

**HOLD-SUBSYSTEM**

**SUBSYSTEM-NAME** = <structured-name 1..8>

,**VERSION** = **\*STD** / <product-version mandatory-man-corr> / <product-version without-man-corr> / **\*HIGHEST**

,**SUBSYSTEM-PARAMETER** = **\*NONE** / <c-string 1..254>

,**FORCED** = **\*NO** / **\*YES**

,**SYNCHRONOUS** = **\*NO** / **\*YES**

---

## Operands

**SUBSYSTEM-NAME = <structured-name 1..8>**

Name of the subsystem to be put on hold.

**VERSION = \*STD / <product-version mandatory-man-corr> /  
<product-version without-man-corr> / \*HIGHEST**

Specifies the version number.

If a version number is specified, the format specified here must be identical to the format used when the subsystem was defined (release and correction status mandatory or not allowed; see the description of the data type "[product-version](#)" in section "[SDF syntax representation](#)" in chapter "[Volume 1: General Part](#)").

**VERSION = \*STD**

If there is only **one** loaded version of the subsystem, this version is selected. If there are **several** suitable versions, the version must be specified.

**VERSION = \*HIGHEST**

Selects the highest version of the subsystem.

**SUBSYSTEM-PARAMETER = \*NONE / <c-string 1..254>**

Specifies whether special parameters, which can be evaluated only by the specified subsystem, are to be processed.

**FORCED =**

Determines the mode and urgency of command processing.

**FORCED = \*NO**

The system waits for all tasks connected to the subsystem to be disconnected. When a task releases its connection depends on the subsystem. A connection to a nonprivileged subsystem (e.g. EDT) is released as soon as the program terminates.

Processing and hence normal termination of all the tasks accessing this subsystem is allowed to take its normal course.

**FORCED = \*YES**

The subsystem is halted immediately.

In the case of a privileged subsystem, this can lead to system dumps of the tasks which are still connected; in the case of a nonprivileged subsystem, this can lead to user dumps or to the execution of the STXIT error handling routine which is offered by DSSM. Tasks that are connected to a nonprivileged subsystem can exit by means of the STXIT error handling routine which is offered by DSSM.

**SYNCHRONOUS =**

Enables synchronous or asynchronous processing to be selected.

**SYNCHRONOUS = \*NO**

The command is to be processed asynchronously, i.e. there is no need to wait for it to execute before making another entry. Once the syntax of the command has been checked, the calling task is sent message ESM0216. No error messages relating to execution of the command will be output.

**SYNCHRONOUS = \*YES**

The command must first be executed before another entry can be made. Accompanying error messages are output.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
1	0	CMD0001	No action necessary
	1	ESM0414	Syntax error: invalid version specified
	32	ESM0224	Command not processed
	32	ESM0228	Command terminated abnormally

---

## 3.70 HOLD-TASK

Put active batch task on hold

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** SYSTEM-TUNING

**Privileges:** TSOS  
OPERATING

**Routing code:** J

### Function

The HOLD-TASK command puts a batch job that has already been started on hold. During this time, the devices reserved by the task remain allocated.

The task remains on hold until it is released explicitly using the RESUME-TASK command. Only after this release the job can be terminated with the CANCEL-JOB command if desired. The HOLD-TASK command is rejected in the case of interactive jobs, spoolout, ARCHIVE or transaction tasks.

The HOLD-TASK command refers exclusively to batch jobs which have already been started; jobs which have not yet been started can be managed by a HOLD-JOB command.

### Format

#### HOLD-TASK

**JOB-IDENTIFICATION** = **\*TSN** (...) / **\*MONJV**(...)

**\*TSN**(...)

| **TSN** = <alphanum-name 1..4>

**\*MONJV**(...)

| **MONJV** = <filename 1..54 without-gen-vers>

### Operands

#### **JOB-IDENTIFICATION =**

The batch job which is to be put on hold can be identified by either its task sequence number (TSN) or a declared monitoring job variable (MONJV), as preferred.

#### **JOB-IDENTIFICATION = \*TSN(...)**

Preset value: the job is identified by its task sequence number.

**TSN = <alphanum-name 1..4>**

Task sequence number of the batch task to be placed in the wait state.

#### **JOB-IDENTIFICATION = \*MONJV(...)**

The job is identified by its monitoring job variable.

---

**MONJV = <filename 1..54 without-gen-vers>**

Specifies the monitoring job variable for the batch job which is to be put into the wait state.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	EXC0708	HOLD-TASK command already being processed
12	64	EXC0707	Task is in process of LOGOFF (EXIT-JOB)
12	64	EXC0710	Task is a transaction task (TP)
12	64	EXC0711	Specified job number (TSN) not found
12	64	EXC0715	Command not allowed for this type of task

---

## 3.71 IF

Start IF block

<b>Component:</b>	SDF-P-BASYS
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SECURITY-ADMINISTRATION  SAT-FILE-MANAGEMENT SAT-FILE-EVALUATION

### Function

IF is an SDF-P control flow command.

The IF command initiates an IF block within an *S procedure*. Depending on the value of a logical expression (see [section "SDF-P-BASYS"](#)), the IF block makes it possible to execute alternative command sequences. The IF block is terminated by the END-IF command.

If the logical expression is true, all subsequent commands until the associated ELSE-IF, ELSE or END-IF command are processed.

If the logical expression is false, the associated ELSE-IF conditions are checked. If they are also false, processing resumes with the ELSE command.

If the IF block does not contain an ELSE-IF command block, control branches to the ELSE command block. If there is no ELSE command block either, the IF block is exited, i.e. processing resumes with the command following the END-IF command.

The ELSE-IF command is only available with the chargeable SDF-P subsystem.

#### *Restrictions*

Users with SECURITY-ADMINISTRATION, SAT-FILE-EVALUATION or SAT-FILE-MANAGEMENT privilege can use the command in procedures only.

### Format

IF
<b>CONDITION</b> = <text 0..1800 with-low <i>bool-expr</i> >

### Operands

**CONDITION** = <text 0..1800 with-low *bool-expr*>

Logical expression whose value determines processing in the IF block. The rules governing the formation of logical expressions are described in "SDF-P-BASYS" [34].

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SDP0118	Command in incorrect context
	1	SDP0223	Incorrect environment
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	64	SDP0091	Semantic error
	130	SDP0099	No further address space available

## Example

```
/COND-1:      IF ( A = B )  
/              commandsequence1      "executed if condition true"  
/              .  
/              .  
/              .  
/      ELSE  
/              commandsequence2      "executed if condition false"  
/              .  
/              .  
/              .  
/      END-IF
```

Command sequence 1 is executed if variable A equals variable B. Otherwise command sequence 2 is executed.

---

## 3.72 IF-BLOCK-ERROR

Start IF-BLOCK-ERROR block

<b>Component:</b>	SDF-P-BASYS
<b>Functional area:</b>	Procedures
<b>Domain:</b>	PROCEDURE
<b>Privileges:</b>	STD-PROCESSING OPERATING HARDWARE-MAINTENANCE SECURITY-ADMINISTRATION SAT-FILE-MANAGEMENT SAT-FILE-EVALUATION

### Function

IF-BLOCK-ERROR is an SDF-P control flow command.

The IF-BLOCK-ERROR command initiates block-specific error handling within an *S procedure*. The command block initiated in this way must be terminated by an END-IF command.

#### *Restrictions*

Users with SECURITY-ADMINISTRATION, SAT-FILE-EVALUATION or SAT-FILE-MANAGEMENT privilege can use the command in procedures only.

#### *Type of error handling*

The type of error handling in an S procedure depends on the setting of the ERROR-MECHANISM operand of the SET-PROCEDURE-OPTIONS command.

If nothing is specified in the procedure with regard to ERROR-MECHANISM or ERROR-MECHANISM=\*SPIN-OFF-COMPATIBLE is defined, SDF-P activates error handling if a command supplies spin-off. Error handling in this instance does **not** on the command return code.

This error mechanism is the default case and means that S procedures do not change their behavior in the event of errors if commands contained in such procedures supply a command-specific command return code for the first time in a future version (whereas previously this was formed by SDF by analogy with spin-off).

If ERROR-MECHANISM=\*BY-RETURNCODE is defined, SDF-P activates error handling when a command returns a command return code with a nonzero subcode 1. Error handling is in this case **not** dependent on the spin-off behavior of the command.

This error mechanism must be defined explicitly.

#### *SDF-P Error handling*

Command processing resumes with the *next* IF-BLOCK-ERROR command; only the current command block, or in the case of nested blocks also the higher-level command blocks, is/are searched in the direction of the end of the file. If no IF-BLOCK-ERROR block is found, the procedure terminates when the end of the procedure file is reached. The error is passed on to the caller. The error situation is terminated when an IF-BLOCK-ERROR block or procedure level 0 is reached.

For compatibility reasons the error situation is also terminated when a SET-JOB-STEP command is encountered.

---

*Note*

Error handling can be performed for the command currently being terminated with the aid of the IF-CMD-ERROR command (contained in the chargeable SDF-P subsystem).

In *non-S procedures*, error handling continues to be controlled by the spin-off (see error handling using the SET-JOB-STEP command).

## Format

<b>IF-BLOCK-ERROR</b>

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
	1	CMD0202	Syntax error
	1	SDP0118	Command in incorrect context
	1	SDP0223	Incorrect environment
	3	CMD2203	Incorrect syntax file
	32	CMD0221	System error (internal error)
	130	SDP0099	No further address space available

## Example

Error recovery in an S procedure is illustrated using the *PROC.SORT2* procedure.

*Contents of procedure PROC.SORT2:*

```
/BEG-PAR-DECL
/  DECL-PAR  INPUT-FILE-1  (INIT = *PROMPT)
/  DECL-PAR  OUTPUT-FILE-1 (INIT = *PROMPT)
/END-PAR-DECL

%     38 1 /ELSE
%     39 1 /WRITE-TEXT 'WORK-1 terminated without errors!'
WORK-1 terminated without errors!
%     40 1 /END-IF
%           1 /EXIT-PROCEDURE ERROR=*NO
```

A new output file is generated because the input file was also specified as the output file. Processing is error-free, i. e. when an error handling block is reached, the ELSE branch is processed.

*Case 2:*

```
/call-proc proc.sort2,log=*yes
```

```
%          1  1 /BEG-PAR-DECL
%          2  1 /DECL-PAR   INPUT-FILE-1  (INIT = *PROMPT)
%          3  1 /DECL-PAR   OUTPUT-FILE-1 (INIT = *PROMPT)
%          4  1 /END-PAR-DECL
%INPUT-FILE-1: abk.v111
%          5  1 /INPUT-FILE-EXIST:
%          5  1 /   SHOW-FILE-ATTRIBUTES  ABK.V111
% DMS0533 REQUESTED FILE NOT CATALOGED IN PUBSET '2OSG'. COMMAND TERMINATED
% SDP0004 ERROR DETECTED AT COMMAND LINE:          5 IN PROCEDURE ':2OSG:$USER
1.ALF.PROC.SORT2'
%          34 1 /WORK-1-ERROR:
%          34 1 /   IF-BLOCK-ERROR
%          35 1 /WRITE-TEXT 'Input file does not exist or'
Input file does not exist or
%          36 1 /WRITE-TEXT 'Error in WORK-1:  SC1 = 64'
Error in WORK-1:  SC1 = 64
%          37 1 /HELP-MSG  DMS0533
% DMS0533 REQUESTED FILE NOT CATALOGED IN PUBSET '(&00)'. COMMAND TERMINATED
% ? This message is issued by DMS commands. The requested file is not
%   cataloged in the requested pubset.
% RESPONSE : NONE
%          40 1 /END-IF
%          1  /EXIT-PROCEDURE ERROR=*NO
```

The input file *ABK.V111* does not exist and leads to an error upon *SHOW-FILE-ATTRIBUTES*. A branch is made to the next error handling block, in this case the command block initiated with the tag *WORK-1-ERROR*. The error handling blocks in the subordinate IF block (IF and ELSE-branches) are **not** taken into account. Since the error was “handled” the procedure is implicitly terminated with *ERROR=\*NO*.

Case 3:

```
/call-proc proc.sort2,log=*yes
```

```
%      1 1 /BEG-PAR-DECL
%      2 1 /DECL-PAR   INPUT-FILE-1  (INIT = *PROMPT)
%      3 1 /DECL-PAR   OUTPUT-FILE-1 (INIT = *PROMPT)
%      4 1 /END-PAR-DECL
%INPUT-FILE-1: abk.v110
%      5 1 /INPUT-FILE-EXIST:
%      5 1 /   SHOW-FILE-ATTRIBUTES  ABK.V110
%      99 :2OSG:$USER1.ABK.V110
%:2OSG: PUBLIC:      1 FILE RES=      99 FRE=      1 REL=      0 PAGES
%      6 1 /COND-1:
%      6 1 /   IF ( INPUT-FILE-1 = OUTPUT-FILE-1 )
%OUTPUT-FILE-1: abk.v110.sort
%      18 1 /ELSE   "Input file unequal output file"
%      19 1 /SHOW-FILE-ATTRIBUTES  ABK.V110.SORT
%     138 :2OSG:$USER1.ABK.V110.SORT
%:2OSG: PUBLIC:      1 FILE RES=     138 FRE=     40 REL=     39 PAGES
%     20 1 /ERR-2:
%     20 1 /           IF-BLOCK-ERROR
%     23 1 /ELSE
%     24 1 /WRITE-TEXT 'Output file already exists. Cancel'
Output file already exists. Cancel
%     25 1 /EXIT-PROC  ERROR=*YES
```

The output file exists already. The SHOW-FILE-ATTRIBUTES command for file *ABK.V110.SORT* does not lead to an error. Consequently, the ELSE branch in the subsequent error handling block (at *ERR-2*) is processed (explicit EXIT-PROCEDURE with ERROR=\*YES).

---

## 3.73 IMPORT-FILE

Create catalog entry for files (file import)

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE FILE-GENERATION-GROUP
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The IMPORT-FILE command creates the catalog entries for files which are contained on private volumes or Net-Storage volumes (i.e. imports them). The catalog entries for files held on private volumes or Net-Storage volumes can be deleted (i.e. they can be exported) using the EXPORT-FILE command. If there is already a catalog entry for a file on private disk Net-Storage volume, it can be updated on the basis of the F1 label of the private disk or the file catalog of the Net-Storage volume (SUPPORT=\*BY-FILENAME(...)).

When importing file generation groups with generations stored on different disks, it should be noted that generations will be cataloged only if the group entry already exists in the system catalog or is kept on the first disk to be imported. Otherwise, the catalog entries for the generations imported before the group entry will be missing. These generations must then be cataloged afterwards using an IMPORT-FILE command.

#### *Privileged functions*

For catalog entries on private volumes or Net-Storage volumes systems support (TSOS privilege) can use the NEW-USER operand to specify a user ID under which the files are to be cataloged.

**i** If the IMPORT-FILE command with SUPPORT=\*DISK is entered without a file name being explicitly specified (this corresponds to FILE-NAME=\*ALL), unlike with nonprivileged users the entire F1 label of the private disk or the entire catalog of the Net-Storage volume is imported.

By default, systems support (TSOS privilege) is a co-owner of all the files (and can, therefore, create files under all user logons). When SECOS is used, this co-ownership can be restricted for permanent files.

Systems support can generate files under any user ID (TSOS privilege). In conjunction with the SECOS software product a user can allow other user IDs to act as co-owners. Co-owners of a user ID are then also allowed to import files under that ID.

#### *Notes*

- The functions of the commands IMPORT-FILE and EXPORT-FILE are not exact opposites: When a volume is exported, DMS deletes the catalog entries for all files which occupy storage space on this volume.

- If the same volume is re-imported, DMS creates catalog entries only for those files which begin on the volume (i.e. files which were given space on this volume by their primary allocation).

The IMPORT-FILE command can be used, for example, to catalog files which were created under the user ID of the calling job and which are contained on private disks or Net-Storage volumes. DMS copies the file attributes from the F1 label of the private disk or the catalog of the Net-Storage volume into the catalog entry. Partially qualified file names can be processed, so that one command can be used to import a number of files.

- Locked entries can be imported from the F1 label or from the catalog of the Net-Storage volume. However, if entries in the user catalog have to be replaced (REPLACE-OLD-FILES=\*YES/\*ABS), the entries must not be locked and write access must be permitted.
- When importing or exporting file generation groups which are stored on private disks, the following must be noted:
  - An IMPORT-FILE command will only catalog generations for which there is a group entry, either on the designated disk or already present in the system catalog. For a file generation group which is split across several disks and is not yet cataloged, this has the following consequences: If the first disk which is imported is not the one containing the group entry, and this latter is only subsequently imported, then the catalog entries for the generations held on the first disk will be missing. Remedy: issue an IMPORT-FILE command for each of the volumes affected, or for the uncataloged generations.
  - If a private disk only holds individual generations from a file generation group, but not the group entry, then when this volume is exported, “gaps” can result in the file generation group (i.e. if the VOLUME operand specifies a private disk which contains the file generation but not its group entry). This gap affects only the catalog entry, the file generation group remains complete on the disk.

|
|     | FORM-NAME = *STD / *FILE-NAME

```

## Operands

**SUPPORT = \*DISK(...)/ \*TAPE(...)/ \*BY-FILE-NAME(...)**

Specifies whether the files are to be imported from disk or from tape, or whether the catalog entries of the files on private disk or Net-Storage volumes are to be updated using the catalog entry.

**SUPPORT = \*DISK(...)**

The files to be imported are stored on private disk or on a Net-Storage volume.

---

**VOLUME = <alphanum-name 1..6>**

Volume serial number (VSN) of the volume on which the files to be imported are stored.

**DEVICE-TYPE = \*BY-VOLUME-CATALOG / <device>**

Identifies the type of device on which the volume is to be mounted.

Only device types known within the system are accepted. In interactive mode, the possible device types are displayed with DEVICE-TYPE=?.

The volume type NETSTOR must be specified for Net-Storage volumes.

Every specification of a disk device type is known in the system is handled like the STDDISK specification.

The permissible specifications for DEVICE-TYPE can also be found in the device table in [section "Device type table"](#) (device type column). The devices available on the system can be listed with the SHOW-DEVICE-CONFIGURATION command.

**DEVICE-TYPE = \*BY-VOLUME-CATALOG**

The device type is determined via the MAREN device substitution function if the MAREN subsystem is available.

**FILE-NAME = \*ALL / <partial-filename 2..50 without-cat-id> / <filename 1..51 without-cat-id>**

Specifies the files, file generation groups or file generations which are to be cataloged. When the default FILE-NAME=\*ALL is specified, DMS catalogs all files, etc. which are stored under the user ID of the current job on the volume specified in the VOLUME operand. For privileged users, see ["Privileged functions"](#).

**i** For file generations/file generation groups, create the group entry before cataloging the generations!

Only files contained on the volume specified in VOLUME will be imported.

**FILE-NAME = \*ALL**

All the files contained on the volume specified in VOLUME will be imported.

**TYPE-OF-FILE = \*ANY(...)**

Specifies whether the file generations from the specified file generation group are to be imported also. It is only meaningful to use this operand if no file generation is to be imported (GENERATIONS=\*NO).

**GENERATIONS = \*YES / \*NO**

*For file generation groups* GENERATIONS specifies whether only the group entry is to be cataloged, or the file generations stored on the same private disk are also to be cataloged.

**GENERATIONS = \*YES**

If the group entry is on the private disk, DMS will catalog the FGG and all its generations which begin on this disk. If there is no group entry on the disk or in the user catalog, no file generations will be cataloged.

**GENERATIONS = \*NO**

DMS transfers just the group entry for the FGG to the catalog.

**REPLACE-OLD-FILES = \*NO / \*YES / \*ABS**

Specifies whether an existing "old" catalog entry is to be overwritten.

**REPLACE-OLD-FILES = \*NO**

DMS does not overwrite the existing catalog entry.

**REPLACE-OLD-FILES = \*YES**

The old catalog entry will be deleted if it does not match the details specified in the IMPORT-FILE command.

---

The following situations should be distinguished:

- The cataloged file is stored on a public disk: the catalog entry is overwritten, which means that the public file is deleted (providing the protection attributes permit this and the file is not locked; otherwise, the old catalog entry is left unchanged).
- The cataloged file is stored on a Net-Storage volume. A file with the same name on the same Net-Storage volume is not imported and the catalog entry is not deleted.
- The cataloged file is stored on a Net-Storage volume. A file on private disk, on a different Net-Storage volume or on the same Net-Storage volume but with a different name (not a node file) is imported. The catalog entry is overwritten and the file therefore deleted (providing the protection attributes permit this and the file is not locked; otherwise, the old entry remains unchanged). In this case, deleting the file means:
  - A BS2000 file on Net-Storage is also deleted on the Net-Storage volume.
  - A node file on the Net-Storage volume is retained.

**i** In contrast to BS2000 files, node files cannot be imported to another user ID as the owner of a node file may not be changed.

- The cataloged file is on private disk, but begins on a volume other than the one specified in the VOLUME operand: the catalog entry is overwritten (exported) (providing the protection attributes permit this and the file is not locked; otherwise, the old entry remains unchanged).
- The cataloged file is on private disk, and begins on the disk specified in the VOLUME operand: The catalog entry will *not* be deleted (exported). A file with the same name will *not* be imported.

### **REPLACE-OLD-FILES = \*ABS**

The old catalog entry is overwritten even if the catalog entry and the specifications in the IMPORT-FILE command match. Special return codes show whether the entry was overwritten (special return code 8) or whether a file lock prevented overwriting (special return code 3).

The following situations should be distinguished:

- The cataloged file is stored on a public disk: the catalog entry is overwritten, which means that the public file is deleted (providing the protection attributes permit this and the file is not locked; otherwise, the old catalog entry is left unchanged).
- The cataloged file is stored on a Net-Storage volume. Difference to the operand value \*YES: A file with the same name on the Net-Storage volume is imported. The catalog entry is overwritten. If a file lock or the protection attributes prevent this, the old entry is retained.
- The cataloged file is stored on a Net-Storage volume. A file on private disk, on another Net-Storage volume or with a different name on the same Net-Storage volume (not a node file) is imported: the catalog entry is overwritten and the file is consequently deleted. If a file lock or the protection attributes prevent this, the old entry is retained.

**i** In contrast to BS2000 files, node files cannot be imported to another user ID as the owner of a node file may not be changed.

- The cataloged file is on private disk, but begins on a volume other than the one specified in the VOLUME operand: the catalog entry is overwritten (providing the protection attributes permit this and the file is not locked; otherwise, the old entry remains unchanged).

- 
- The cataloged file is on private disk, and begins on the disk specified in the VOLUME operand. Difference to the operand value \*YES: The catalog entry is overwritten (providing the protection attributes permit this and the file is not locked; otherwise the old catalog entry remains unchanged). Even if there is a file with the same name, the file will be imported.

**OUTPUT = \*SYSLST / \*SYSOUT / \*ALL / \*NO**

Specifies how the execution of the command is to be logged.

**OUTPUT = \*SYSLST**

The execution of commands will be logged on SYSLST; this log contains the special return codes and message texts (see [table "Special return codes and messages for SUPPORT=\\*DISK"](#)).

**OUTPUT = \*SYSOUT**

The execution of commands will be logged on SYSOUT; only the special return codes and file names are output in this log (see [table "Special return codes and messages for SUPPORT=\\*DISK"](#)).

**OUTPUT = \*ALL**

The execution of commands will be logged on SYSLST and SYSOUT (see the OUTPUT=\*SYSLST and OUTPUT=\*SYSOUT operands).

**OUTPUT = \*NO**

No return information on the execution of the command will be output.

**NEW-USER = \*NONE / <name 1..8>**

User ID under which the file is to be cataloged.

A new user ID is assigned to a file on a private disk both in the file catalog and in the F1 label of the disk. The new user ID is assigned to a BS2000 file on a Net-Storage volume both in the file catalog and in the catalog of the Net-Storage volume. A node file, on the other hand, cannot be cataloged under the new user ID as the owner of a node file may not be changed. In this case, the import is rejected with return code D.

**PUBSET = \*STD / <cat-id 1..4>**

Specifies the pubset on which the files are to be cataloged. If none is specified, the catalog entries are created in the file catalog of the default pubset for the user's ID.

If a Net-Storage volume is specified in the VOLUME operand, the Net-Storage volume must be assigned to the pubset specified here. Only in this case is the file catalog of the specified pubset updated on the basis of the catalog entries of the Net-Storage volume.

**PUBSET = \*STD**

The default setting is \*STD, i.e. the catalog entries are set up under the file catalog of the default pubset of the user ID (see the output field `DEFAULT-PUBSET` in the `SHOW-USER-ATTRIBUTES` command).

**PUBSET = <cat-id 1..4>**

Specifies the pubset on which the files are to be cataloged.

**SUPPORT = \*TAPE(...)**

Specifies that the file to be imported is located on a tape or tape cartridge.

**VOLUME = list-poss(255): <alphanum-name 1..6> / \*ANY**

The VSN of the tape on which the file to be imported is stored.

**VOLUME = \*ANY**

The volume is determined via the MAREN volume substitution function if the MAREN subsystem is available.

**DEVICE-TYPE = \*BY-VOLUME-CATALOG / <device>**

The device type to which the required tape is assigned. Only device types or volume types known within the

---

system are accepted. In interactive mode, the possible device and volume types are displayed with DEVICE-TYPE=?.

**DEVICE-TYPE = \*BY-VOLUME-CATALOG**

The device type is determined via the MAREN device substitution function if the MAREN subsystem is available.

**FILE-NAME = <filename 1..54>**

The file will only be imported if it is held on the specified tape.

**PREMOUNT-LIST = \*NONE / list-poss(255): <integer 0..255>**

The tape sequence number of the tape to be mounted.

**PREMOUNT-LIST = \*NONE**

The first of the volumes specified in the VOLUME operand will be requested.

**PREMOUNT-LIST = list-poss(255): <integer 0..255>**

Issues a MOUNT message on the console requesting the mounting of tapes or suppresses the request. The tape sequence numbers specified here relate to the VSNs listed in the VOLUME operand. Specifying PREMOUNT-LIST=0 has the effect that no tapes will be requested. Otherwise, use: PREMOUNT-LIST=(n[, n+1][,n+2]...) with n=1.

**SUPPORT = \*BY-FILE-NAME(...)**

Specifies for which files on private disk or Net-Storage volumes the catalog entry in the TSOSCAT is to be updated on the basis of the entry on the volume (F1 label or catalog of the Net-Storage volume).

**FILE-NAME = <filename 1..54 without-vers>**

The name of the file whose catalog attributes are to be copied from the F1 label of a private disk or the catalog of the Net-Storage volume. If the entry in the F1 label of the private disk or the catalog of the Net-Storage volume no longer exists, the catalog entry is deleted.

Only the catalog entry is output for a file on public disk.

**INFORMATION = \*NAME-AND-SPACE / \*SPACE-SUMMARY / \*ALL-ATTRIBUTES / \*PARAMETERS(...) / \*STATISTICS / \*MINIMUM**

Type of information to be displayed.

**INFORMATION = \*NAME-AND-SPACE**

For the selected files, the number of PAM pages used will be output with the file name, in alphabetical order of file name. This is the only possible operand value if the output is **not** routed to SYSOUT (see the OUTPUT operand).

**INFORMATION = \*SPACE-SUMMARY**

Provides information on the storage space allocation of the files and file generations identified in the current command.

**INFORMATION = \*ALL-ATTRIBUTES**

Returns all the information that is contained in the catalog (NAME-AND-SPACE, PARAMETERS) for the selected files. The output fields are listed in alphabetical order with a further explanation of their possible values in the table "Meaning of the output fields" at the end of the operand description section.

**INFORMATION = \*PARAMETERS(...)**

Returns only the selected information for the files in question. The information from the catalog is logically arranged into information blocks. Only those information blocks which are explicitly selected by the user are output. Total lines with the overall storage space allocation for each selected file are shown at the end of the returned information (see INFORMATION=SPACE-SUMMARY).

---

**STANDARD = \*NO / \*YES**

Specifies whether standard information is to be output.

**i** The STANDARD operand is only supported for compatibility reasons. It is not offered in guided dialog. STANDARD=\*YES is equivalent to INFORMATION=\*PAR ( ORGANIZATION=\*YES , ALLOCATION=\*YES ) .

**PROTECTION = \*NO / \*YES**

Specifies whether information concerning the file protection and expiration date is to be output.

**i** The PROTECTION operand is only supported for compatibility reasons. It is not offered in guided dialog. PROTECTION=\*YES is equivalent to INFORMATION=\*PAR ( ORGANIZATION=\*YES , SECURITY=\*YES , BACKUP=\*YES ) .

**FILE = \*NO / \*YES**

Output: storage space used in PAM pages, and file attributes.

**i** The FILE operand is only supported for compatibility reasons. It is not offered in guided dialog. FILE=\*YES is equivalent to INFORMATION=\*PAR ( ORGANIZATION=\*YES , ALLOCATION=\*YES ) .

**PASSWORDS = \*NO / \*YES**

Specifies whether the information on passwords is to be output. A header line with the title "PASSWORDS" and a line with the information on file passwords (which corresponds to the first information line of the security block) are output.

**PASSWORDS = \*NO**

No PASSWORD information is to be output.

**PASSWORDS = \*YES**

The first line of the security block is output.

This line provides information on the types of passwords which protect a file or file generation group. The passwords themselves are not shown. If a user forgets a file password, only the system administrator can help him. The following attributes are output:

Header line with the word "PASSWORDS"

*EXEC-PASS* protection with execution password

*READ-PASS* protection with read password

*WRITE-PASS* protection with write password

**ALLOCATION = \*NO / \*YES**

Outputs the allocation block for the selected files, i.e. all file attributes that affect the allocation of storage space. The allocation block contains the following attributes:

Header line with the word "ALLOCATION"

*DEVICE-TYPE* device type for volume

---

<i>EXTENTS</i>	total number of extents for the file
<i>HIGH-US-PA</i>	highest used PAM page
<i>NUM-OF-EXT</i>	Number of extents
<i>S-ALLOC</i>	secondary allocation for file extension
<i>SUPPORT</i>	type of volume
<i>VOLUME</i>	volume serial number

**BACKUP = \*NO / \*YES**

Outputs the backup block for the selected files, i.e. all file attributes that affect backups. The backup block contains the following attributes:

Header line with the word "BACKUP"

<i>BACK-CLASS</i>	backup level for ARCHIVE or HSMS
<i>MIGRATE</i>	indicates whether the file may be migrated
<i>SAVED-PAG</i>	indicates whether the file must always be fully saved
<i>VERSION</i>	internal attribute for incremental saving with the ARCHIVE or HSMS utility routine.

**HISTORY = \*NO / \*YES**

Outputs the history block for the selected files, i.e. all file attributes related to the file history. The history block contains the following attributes:

Header line with the word "HISTORY"

<i>ACC-COUNT</i>	access counter
<i>ACC-DATE</i>	date of last access
<i>ACC-TIME</i>	time of last access
<i>CHANG-DATE</i>	date the file was last changed (written to)
<i>CHANG-TIME</i>	time the file was last changed (written to)
<i>CRE-DATE</i>	creation date
<i>CRE-TIME</i>	time of creation
<i>S-ALLO-NUM</i>	number of secondary allocations

**ORGANIZATION = \*NO / \*YES**

Outputs the organization block for the selected files, i.e. all file attributes related to the structure of the file. The organization block contains the following attributes:

<i>AVAIL</i>	availability
<i>BLK-CONTR</i>	Block control information
<i>BUF-LEN</i>	block type (standard or nonstandard block)

---

<i>COD-CH-SET</i>	coded character set (CCS) with XHCS support
<i>FILE-STRUC</i>	access method when the file was created
<i>KEY-LEN</i>	Length of ISAM key
<i>KEY-POS</i>	position of ISAM key
<i>LOG-FL-LEN</i>	length of logical ISAM flag
<i>PROPA-VAL</i>	propagation of ISAM flag
<i>REC-FORM</i>	Record format
<i>REC-SIZE</i>	Record length
<i>VAL-FL-LEN</i>	length of ISAM value flag

The information block for file generation groups begins with the header line *GENERATION-INFO* and contains the following attributes:

<i>BASE-NUM</i>	base value for relative generation numbers
<i>DEVICE-TYPE</i>	device type for volume
<i>FIRST-GEN</i>	most recent or last cataloged file generation
<i>LAST-GEN</i>	oldest existing file generation
<i>MAXIMUM</i>	maximum number of simultaneously cataloged generations
<i>OVERFL-OPT</i>	overflow option when maximum number is reached
<i>VOLUME</i>	volume serial number

**SECURITY = \*NO / \*YES**

Outputs the security block for the selected files, i.e. all file attributes related to the file security. The security block contains the following attributes:

Header line with the word "SECURITY"

<i>ACCESS</i>	type of access (standard access control)
<i>ACL</i>	file protection with ACL (only supported for reasons of compatibility)
<i>AUDIT</i>	file monitoring
<i>DESTROY</i>	data automatically destroyed on deletion
<i>ENCRYPTION</i>	encryption method
<i>EXEC-PASS</i>	protection with execution password
<i>EXPIR-DATE</i>	date on which the file may be changed again
<i>EXPIR-TIME</i>	time relative to <i>EXPIR-DATE</i>

---

<i>FREE-DEL-D</i>	free-for-deletion date
<i>FREE-DEL-T</i>	time relative to free-for-deletion date
<i>GUARD-READ</i>	read protection using a guard
<i>GUARD-WRIT</i>	write protection using a guard
<i>GUARD-EXEC</i>	protection with execute guard
<i>GROUP</i>	access rights of user class "group" (BASIC-ACL)
<i>OTHERS</i>	access rights of user class "others" (BASIC-ACL)
<i>OWNER</i>	access rights of file owner (BASIC-ACL)
<i>READ-PASS</i>	protection with read password
<i>SP-REL-LOCK</i>	type of access (standard access control)
<i>USER-ACC</i>	file protection with ACL (only supported for reasons of compatibility)
<i>WRITE-PASS</i>	file monitoring

#### **INFORMATION = \*STATISTICS**

Returns information on storage space allocation for all selected files. The storage space allocations for files and file generation groups are output separately and include additional information for each type of volume (public disks, private disks, and tapes). Files for which no entry has been made in the volume list are indicated in the output for public disks (NO VSN).

#### **INFORMATION = \*MINIMUM**

Outputs a line of information with the most important file attributes in summarized form for each selected file. This line contains brief information on the FILE-STRUCTURE, passwords, highest activated access protection level, the number of reserved PAM pages, and the file name. The brief information is indicated as follows:

- the access method with which the file was created: indicated by the first letter in the value of FILE-STRUCTURE;
- information for read, write, and execute passwords: shown in each case with "Y" or "N" to indicate whether the corresponding password was assigned;
- information on the highest activated access control method: see the PROTECTION-ACTIVE operand.
- When standard access control is the highest protection:
  - USER-ACCESS with "Y" for ALL-USERS or SPECIAL, or with "N" for OWNER-ONLY
  - ACCESS with "W" for write access or "R" for read access only.
- When the basic access control list (BASIC-ACL) is the highest protection: the access rights assigned for each of the user groups OWNER, GROUP and OTHERS are shown ("RWX" or "-" for an access right that has not been set).
- When access control using GUARDS is the highest protection: the value "GUARDS" and the protected access mode ("RWX" or "-" for an access mode not granted) are shown.

#### **OUTPUT = \*SYSOUT / \*NONE / \*SYSLST(...) / \*PRINTER(...) / <filename 1..54 without-gen-vers>(…)**

Defines the destination to which the information is output.

**OUTPUT = \*NONE**

Suppresses the output of information. This specification is typically useful when only the command return code is to be evaluated in a procedure.

**OUTPUT = \*SYSOUT**

The information will be presented in tabular form on SYSOUT.

**OUTPUT = \*SYSLST(...)**

The information will be presented in tabular form on SYSLST. SYSLST will automatically be output on a printer at the end of the job. The format of the output will be determined as follows:

**FORM-NAME = \*STD / \*FILE-NAME**

The default value is \*STD, i.e. the information will be presented in tabular form. If \*FILE-NAME is specified, then a simple list of file names will be output.

**OUTPUT = \*PRINTER(...)**

The information will be presented in tabular format and output to printer (as an immediate SPOOL job, which will be output with CONTROL-CHARACTERS= \*EBCDIC).

**FORM-NAME = \*STD / \*FILE-NAME**

The default value is \*STD, i.e. the information will be presented in tabular form. If \*FILE-NAME is specified, then a simple list of file names will be output.

**OUTPUT = <filename 1..54 without-gen-vers>(...)**

The information will be written to the specified file; the format of the output can be determined as follows.

**FORM-NAME = \*STD / \*FILE-NAME**

The default value is \*STD, i.e. the information will be presented in tabular form. If \*FILE-NAME is specified, then a simple list of file names will be output.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed
2	0	DMS051E	Inconsistency in private disk pool or operand error detected
2	0	DMS054A	Insufficient disk space or access to disk not possible
2	0	DMS05B6	Invalid time conversion from UTC to LT
	1	CMD0202	Syntax or semantic error in command
	32	DMS0584	A state that does not allow the function to continue was reported during processing
	32	DMS05C7	Unexpected internal error in DMS
	64	CMD0216	Privilege errors
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset Guaranteed message: DMS051B

	64	DMS051C	User not authorized to access pubset Guaranteed message: DMS051C
	64	DMS0533	Requested file not cataloged in pubset Guaranteed message: DMS0533
	64	DMS0535	Specified file not shareable
	64	DMS053E	File already cataloged on private volume
	64	DMS0555	Specified file name already cataloged
	64	DMS055C	Catalog entry not found on the specified private disk or Net-Storage volume
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS0586	It is not possible to access or reserve a volume at present
	64	DMS0587	Use of the specified command has been restricted by the system administrator
	64	DMS05F8	DMS error reported
	64	DMS05FC	Specified user ID not in HOME pubset
	64	DMS05FE	Requested file(s) not found
	64	DMS06C4	File generation group not yet cataloged
	64	DMS06CC	No file corresponding to specified operands
	64	DMS06D0	Specified file generation does not exist
	64	DMS06FF	BCAM connection severed
	128	DMS0506	Function not executed due to change in master
	130	DMS0524	System address space exhausted
	130	DMS053C	Insufficient space for catalog file on pubset
	130	DMS0582	File is currently locked or being used and cannot be processed
	130	DMS0585	Error detected when processing catalog or multiprocessor system Guaranteed message: DMS053C
	130	DMS0586	It is not possible to access or reserve a volume at present
	130	DMS0594	Not enough virtual memory available
	130	DMS05C8	Maximum permitted number of files reached

## Special return codes and messages for SUPPORT=\*DISK

The following codes (SYSOUT) or messages (SYSLST) can be output :

Code on SYSOUT	Message on SYSLST	Meaning
0	FILE DID NOT EXIST	There was no file with the same name and a new catalog entry has been created.
1	FILE HAS BEEN ERASED	A file of the same name already existed and has been overwritten.
2	FILE EXISTS / REPLACE-OLD-FILES=*NO	A file of the same name existed but was not overwritten; the REPLACE-OLD-FILES operand had the value *NO.
3	FILE IS PROTECTED (ERASE ERROR OR FILE IS IN USE)	A file of the same name existed and could not be deleted because of active protection functions (ACCESS=READ, password protection etc.) or the file is locked because it is being processed.
4	ERROR ON CATALOG ACCESS	System error during catalog access.
5	FILE ALREADY ON PRIVATE	The file is already cataloged and is stored on the volume specified in the VOLUME operand.
6	ERROR ON VTOC ACCESS	System error when accessing the F1 label of the private disk or the catalog of the Net-Storage volume.
7	GENERATION OUT OF RANGE	Invalid attempts to import a file generation: the absolute generation number of the generation to be imported conflicts with the limits defined in the group entry.
8	C.E. HAS BEEN REPLACED	A catalog entry already existed for the specified disk and has been replaced.
A	INVALID FILENAME	<p>The path name for the file to be imported (including pvsid and userid) is more than 54 characters long.</p> <p>Pathname = :catid\$.userid:filename</p> <p>It should be noted that the pathname is made up from details taken from two <i>different</i> operands in the command.</p> <p>The file name is specified in the FILE-NAME operand, the catalog ID in the PUBLIC-VOLUME-SET operand.</p> <p>For a 1-character catalog ID, the file name must not be longer than 51 characters. For a 4-character catalog ID, the file name may be up to 84 characters long.</p>

T	ERROR ON NET-STORAGE ACCESS	System error during Net-Storage access.
C	LARGE FILE NOT ALLOWED	The file to be imported is larger than 32 GB, but the pubset specified does not permit files larger than 32 GB.
D	RENAME OF NODE-FILES NOT ALLOWED	The importing of node files to a foreign user ID is not permitted.

Table 52: IMPORT-FILE: Special return codes and messages

## Examples

### Example 1: Importing files from private disks

```
/imp-file sup=disk(vol=work01,dev-type=d3435,file-name=*all,
                output=*sysout) _____ (1)
```

```
% 0 :20S2:$USER1.MAX.LIB
% 0 :20S2:$USER1.MAX.PRIV-FILE.1
% 0 :20S2:$USER1.MAX.PRIV-FILE.2
% 0 :20S2:$USER1.MAX.PRIV-FILE.3
```

```
/show-file-attr max.,select=(support=*priv) _____ (2)
```

```
%      210*:20S2:$USER1.MAX.LIB
%      3*:20S2:$USER1.MAX.PRIV-FILE.1
%      3*:20S2:$USER1.MAX.PRIV-FILE.2
%      3*:20S2:$USER1.MAX.PRIV-FILE.3
%:20S2: PRDISC:      4 FILES RES=      219 FRE=      29 REL=      21 PAGES
```

- (1) All files of the user *USER1* on the private disk *WORK01* (device type *D3435*) are to be imported. The messages output during the process are to be sent to *SYSOUT*.
- (2) The output indicates that four files were successfully imported (as is evident from the return code *0* in each case). The command causes the catalog entries for files which have names beginning with *MAX.* and which are stored on private disk to be shown (the files which were previously imported).

*Example 2: Exporting and importing tape files*

**/show-file-attr support=\*tape,inf=(alloc=\*yes,org=\*yes)** \_\_\_\_\_ (1)

% REC-FORM = (V,N) REC-SIZE = 2044
% CODE = EBCDIC LABEL = (STD,1) FILE-SEQ = 2
% BLK-OFFSET = 4
%:2OS2: TAPE : 1 FILE
```

- (1) Output of all catalog entries for tape files of the user ID *USER1* showing information on the file organization and volume allocation. Two tape files exist on the magnetic tape cartridge *D2326K*. The file *MAX.TAPE-FILE.2* follows the file *MAX.TAPE-FILE.1* (see the *FILE-SEQ* output fields).

- 
- (2) The tape files on the tape cartridge *D2326K* are exported. Messages are output to SYSOUT.
  - (3) Since more than one file is involved here, a prompt is issued to request confirmation. When this prompt is confirmed with *Y*, the catalog entries for the tape files *MAX.TAPE-FILE.1* and *MAX.TAPE-FILE.2* are deleted.
  - (4) No catalog entries for tape files exist at this point.
  - (5) Imports the tape file *MAX.TAPE-FILE.1* from the tape cartridge *D2326K*.
  - (6) Imports the tape file *MAX.TAPE-FILE.2* from the tape cartridge *D2326K*.
  - (7) Output of the catalog entries for the tape files showing information on the file organization and volumes. Only the catalog entries have been created so far (as if with CREATE-FILE). The file attributes have not yet been entered (value NONE or 0). The volume *D2326K* has only been registered (the value is still in parentheses). See also the output under step.
  - (8) The tape file *MAX.TAPE-FILE.1* is now accessed with the COPY-FILE command. The file is read and its contents are copied into the temporary file *#COPY.TAPE-1*.
  - (9) The catalog entry for the tape file *MAX.TAPE-FILE.1*
  - (10) A TFT entry with the default link name *DMCOPY11* is created for the tape file *MAX.TAPE-FILE.2*. This file is then opened by COPY-FILE as the input file. Since *MAX.TAPE-FILE.2* is the second file on the tape cartridge *D2326K*, FILE-SEQUENCE=2 was defined in the TFT entry. Without this specification, FILE-SEQUENCE=1 would have been assumed as in the case of *MAX.TAPE-FILE.1*.
  - (11) The tape file *MAX.TAPE-FILE.2* is now accessed with the COPY-FILE command. The file is read and its contents are copied into the temporary file *#COPY.TAPE-2*.
  - (12) The catalog entry for the tape file *MAX.TAPE-FILE.2*

Example 3: Updating catalog entries for files on private disk

**/show-file-attr select=(sup=\*priv,gen=\*yes),inf=\*all** \_\_\_\_\_ (1)

```

- (1) Returns information on all catalog entries for files on private disk. The private disk *WORK01* contains the file generation group *MAX.GROUP.1* with generation \*0004. The group entry was created on 18.01.2012. Generation \*0004 is merely cataloged. It has not yet been opened with OPEN=\*OUTPUT.
- (2) Output of the current date using WRITE-TEXT to replace an expression in the output text of the builtin DATE ( ) function (a component of the software product SDF-P) in order to indicate the date in German. The date is 18.03.2012.
- (3) The private disk *WORK01* was made available to the user by the system administration only for the month of January. At the start of February, all the data on this disk was deleted in an VOLIN run, but the entry in the file catalog was not updated. The entry in the catalog file was not updated in the process. The IMPORT-FILE command is now used in order to update the entry for generation \*0004 of the file generation group *MAX.FILE.GROUP.1* from the VTOC of the private disk. Since the VTOC of the private disk *WORK01* does not contain an entry for this generation, the catalog entry is also deleted, and message *DMS0533* is output.
- (4) The IMPORT-FILE command updates the group entry of the file generation group *MAX.FILE.GROUP.1* from the VTOC of the private disk: Since the VTOC of the private disk *WORK01* does not contain an entry for this generation, the catalog entry is also deleted, and message *DMS0533* is output.
- (5) The output shows that there are no catalog entries for files whose name starts with *MAX.GROUP*.

---

## 3.74 IMPORT-NODE-FILE

Create catalog entry for node files (import node files)

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION TSOS
<b>Routing code:</b>	\$ (with NBCONOPI=N) or E (with NBCONOPI=Y)

### Function

The IMPORT-NODE-FILE command creates the catalog entries for node files (files of the type NODE-FILE) which are located on a Net-Storage volume (import). DMS creates the catalog entry for a node file in TSOSCAT and in the file catalog of the Net-Storage volume on the basis of the Node attributes on the NFS server.

Optionally the catalog entries of already imported node files can be updated on the basis of the node attributes on the NFS server (REPLACE=\*NODE-FILE-UPDATE operand).

Catalog entries of node files can be deleted again with the EXPORT-NODE-FILE command (export).

#### *Privileged functions*

System support staff may export files belonging to any user ID. It may ignore the passwords of protected files and also branch to guided dialog whenever the user ID is changed.

By default, systems support (TSOS privilege) is a co-owner of all the files (and can therefore export files under any user ID). When SECOS is used, this co-ownership can be restricted.

Systems support can generate files under any user ID (TSOS privilege). In conjunction with the SECOS software product a user can allow other user IDs to act as co-owners. Co-owners of a user ID are then also allowed to export a file.

## Format

### IMPORT-NODE-FILE

**VOLUME** = <vsn 6..6>

**,FILE-NAME** = <filename 1..54 without-cat-gen with-wild(80)>

**,FILE-STRUCTURE** = **\*STD** / **\*PAM** / **\*SAM**

**,REPLACE** = **\*NO** / **\*YES** / **\*NODE-FILE-UPDATE**

**,IGNORE-PROTECTION** = **\*NO** / **\*YES**

**,REPORTING** = **\*ERROR** / **\*FULL**

**,OUTPUT** = list-poss(2): **\*NONE** / **\*SYSLST** / **\*SYSOUT**

**,PUBSET** = **\*STD** / <cat-id 1..4>

**VOLUME** = <vsn 6..6>

Volume serial number (VSN) of the Net-Storage volume on which the node files to be imported are stored.

**FILE-NAME** = <filename 1..54 without-cat-gen with-wild(80)>

Specifies the node files which are to be cataloged.

For privileged users, see "[Privileged functions](#)".

**FILE-STRUCTURE** = **\*STD** / **\*PAM** / **\*SAM**

Specifies the FILE-STRUCTURE attribute of the node file which is entered in the file catalog in accordance with the REPLACE operand.

**FILE-STRUCTURE** = **\*STD**

The following applies when REPLACE=\*NO/\*YES: A node file is imported into BS2000 as a PAM file if the file size on the NFS file system is not equal to zero. If the file size on the NFS file system is equal to zero, the imported file is assigned the default attributes of a file generated with CREATE-FILE.

The following applies when REPLACE=\*NODE-FILE-UPDATE: The catalog entries are updated on the basis of the node attributes. Both the catalog entries of PAM and SAM files are updated.

**FILE-STRUCTURE** = **\*PAM**

The following applies when REPLACE=\*NO/\*YES: A node file is imported into BS2000 as a PAM file irrespective of the file size on the NFS file system.

The following applies when REPLACE=\*NODE-FILE-UPDATE: The catalog entries are updated on the basis of the node attributes. Only the catalog entries of PAM files are updated.

**FILE-STRUCTURE** = **\*SAM**

For REPLACE=\*NO/\*YES the following applies: a node file will be imported into BS200 as a SAM file, irrespective of the file size on the NFS file system.

If REPLACE=\*NODE-FILE-UPDATE, the catalog entries of SAM node files are updated in BS2000.

**i** When accessing a SAM node file in BS2000, the NET-CODED-CHAR-SET file attribute determines whether and, if yes, how the characters of the file have to be converted for display and processing in BS2000.

---

**REPLACE = \*NO / \*YES / \*NODE-FILE-UPDATE**

Specifies whether files which already exist in BS2000 are replaced or whether only the catalog entry is updated on the basis of the node attributes on the NFS server.

**REPLACE = \*NO**

Files which already exist are not replaced, nor are their catalog entries updated.

**REPLACE = \*YES**

Files which already exist on the pubset are replaced by the specified node files. Files on public space and on Net-Storage are deleted and files are exported to private disk. When the node files are imported, the entries in TSOSCAT and in the file catalog of the Net-Storage volume are created again.

**REPLACE = \*NODE-FILE-UPDATE**

In the case of files which already exist, the entries in TSOSCAT and in the file catalog of the Net-Storage volume are updated on the basis of the node attributes on the NFS server. The FILE-STRUCTURE operand determines that only catalog entries for files with the specified file structure are updated. FILE-STRUCTURE= \*STD specifies that both PAM and SAM files are updated.

**IGNORE-PROTECTION = \*NO / \*YES**

*The operand value \*YES is reserved for privileged users.* Systems support can determine whether the protection attributes should be ignored for existing files when REPLACE=\*YES is specified.

**REPORTING = \*ERROR / \*FULL**

Determines the scope of the processing log which can be requested in the OUTPUT operand.

**REPORTING = \*ERROR**

Only files which could not be imported are listed. The reason is displayed by means of a message code.

**REPORTING = \*FULL**

All files are listed. In the case of files which could not be imported, the reason is displayed with a message code.

**OUTPUT = \*NONE / list-poss(2): \*SYSOUT / \*SYSLST**

Specifies whether a processing log is to be output.

**OUTPUT = \*NONE**

No processing log is output.

**OUTPUT = \*SYSOUT**

A processing log is output to SYSOUT.

**OUTPUT = \*SYSLST**

A processing log is output to SYSLST.

**PUBSET = \*STD / <cat-id 1..4>**

Specifies the catalog ID of the pubset in which the files are to be cataloged. The Net-Storage volume specified in the VOLUME operand must be assigned to the pubset specified here.

The default setting is \*STD, i.e. the catalog entries are set up under the file catalog of the default pubset of the user ID (see the output field DEFAULT-PUBSET in the SHOW-USER-ATTRIBUTES command).

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD05EE	Path name too long after completion
	1	CMD0624	File name invalid
	32	DMS0578	Internal error in file protection check
	32	DMS05C7	DMS internal error
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Privilege error
	64	DMS0512	Requested catalog not found
	64	DMS051B	Requested user ID not in pubset
	64	DMS051C	User not authorized to access pubset
	64	DMS0535	No access authorization on the catalog entry of the file
	64	DMS0594	Not enough virtual memory available
	64	DMS05FC	Specified user ID not in home pubset
	64	DMS0610	Function execution supplied a return code for at least one of the selected file names
	64	DMS0640	Access to Net-Storage is rejected by the ONETSTOR subsystem because of communication problems with the net client
	64	DMS0642	Large files not permitted on pubset
	64	DMS0643	Net client reports access error
	64	DMS0644	Net client reports internal error
	64	DMS0645	File does not exist on Net-Storage
	64	DMS0649	Net server reports POSIX-ACL error
	64	DMS064A	Net client reports that access to files is forbidden on the Net-Storage volume
	64	DMS064B	Access to node files not supported by the net client
	64	DMS064C	Directory of the specified user ID does not exist on Net-Server
	64	DMS064D	File is not a node file
	64	DMS064E	Node file is not located on the specified Net-Storage volume

---

	64	DMS064F	FCB type of the file and specified file structure do not match
	64	DMS0650	No node file found to import
	64	DMS0651	File exists, import not possible
	64	DMS06CC	No file matches selection criteria

---

## 3.75 IMPORT-PUBSET

Import pubset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Pubset and MRSCAT management
<b>Domain:</b>	MULTI-CATALOG-AND-PUBSET-MGMT
<b>Privileges:</b>	TSOS OPERATING
<b>Routing code:</b>	R

### Function

This command creates a separate task under the control of the calling task. This task performs IMPORT processing asynchronously to the calling task. This task requests all the resources.

Each volume set of an SM pubset is imported separately.

The F5 labels are read in and reconstructed if necessary. The mnemonic names of the disks belonging to the pubset are entered or updated in the SVL of the system disk (pubres). The name of the system disk is stored in the pubset's MRSCAT entry. The user catalog is opened and the specified pubset is set to "accessible". The user tables that contain the current user information are set up in the memory. Access to this pubset is then permitted.

Depending on the specifications made by system support staff in the ADD-MASTER-CATALOG-ENTRY command, automatic start of SPEEDCAT with or without task switching is supported. SPOOL is notified and the spoolout jobs are transferred to TYPE5/KP or TYPE4. User jobs in the wait state HELD-BY-CALENDAR or HELD-BY-PUBSET because the imported pubset was previously unavailable are released.

When a pubset is imported with ACTUAL-JOIN=\*FIRST all files and job variables of the user ID TSOS are retained. Files and job variables of all other users are deleted.

The change in the availability of a pubset is notified to all active processors in the network.

A number of different pubsets can be imported to a processor.

## Format

### IMPORT-PUBSET

**PUBSET** = <cat-id 1..4>

,**ACTUAL-JOIN** = **\*STD** / **\*ZIP** / **\*FIRST**

,**MONJV** = **\*NONE** / <filename 1..54 without-gen-vers>

,**JV-PASSWORD** = **\*NONE** / <c-string 1..4> / <x-string 1..8> / <integer -2147483639..2147483639>

,**RESIDENT-BUFFERS** = **\*STD** / **\*NO** / **\*YES**

,**NUMBER-OF-BUFFERS** = **\*STD** / <integer 1..255>

,**USE** = **\*STD** / **\*SHARE** / **\*EXCLUSIVE(...)** / **\*FROM-REMOTE(...)**

- \*EXCLUSIVE(...)**
  - | **CONVERT-VOLUME-SET** = **\*NO** / **\*YES**
- \*FROM-REMOTE(...)**
  - | **HOST-NAME** = **\*NONE** / <alphanum-name 1..8>

,**SHARER-TYPE** = **\*STD** / **\*SLAVE** / **\*MASTER(...)**

- \*MASTER(...)**
  - | **MASTER-CHANGE** = **\*NO** / **\*YES**

,**SESSION-CHECK-MSG** = **\*YES** / **\*NO**

,**RECONSTRUCT-USERCAT** = **\*NO** / **\*RESET** / **\*BY-BACKUP(...)**

- \*BY-BACKUP(...)**
  - | **SCOPE** = **\*ALL** / **\*BACKUP** / **\*TSOSCAT**

,**RECONSTRUCT-F5-LABEL** = **\*NO** / **\*YES**

,**DEFECT-VOLUME-SET** = **\*NONE** / list-poss(256): <cat-id 1..4>

,**IN-HOLD-VOLUME-SET** = **\*NONE** / list-poss(256): <cat-id 1..4>

,**REPAIR-TSOSCAT** = **\*NO** / **\*YES**

,**CHECK-PUBSET-MIRRORS** = **\*NO** / **\*YES**

---

## Operands

### **PUBSET = <cat-id 1..4>**

Catalog ID of the pubset to be imported.

### **ACTUAL-JOIN = \*STD / \*ZIP / \*FIRST**

Specifies handling of the user catalog during import.

### **ACTUAL-JOIN = \*STD**

The effect of this operand is governed by the RECONSTRUCT-USERCAT operand. With RECONSTRUCT-USERCAT=\*NO, the existing user catalog (\$TSOS.SYSSRPM) is opened. The effect of the \*RESET and \*BACKUP operand values is described under the RECONSTRUCT-USERCAT operand.

### **ACTUAL-JOIN = \*ZIP**

This operand value may only be specified in the event of disk storage space bottlenecks to prevent a log file and the BACKUP file for the user catalog being generated by user administration. Apart from that, this operand value is treated in exactly the same way as \*STD, in other words, processing is governed by the value of the RECONSTRUCT-USERCAT operand.

### **ACTUAL-JOIN = \*FIRST**

Creates a new user catalog containing only the system user IDs. The TSOS user IDs remain intact. The RECONSTRUCT-USERCAT operand is ignored.

**i** This operand value may only be specified when a pubset is imported for the first time after generation. If the pubset already exists, the files and job variables of all users except TSOS will be lost!

### **MONJV = \*NONE / <filename 1..54 without-gen-vers>**

Specifies whether a monitoring job variable is set. This variable is set to the following values during import:

- \$I at the start of import
- \$R at the end of import if the entire pubset has been successfully imported
- \$A import was terminated due to an error
- \$W if a shared pubset has been imported and the availability of the master processor has not yet been confirmed

This operand should only be specified if the JV software product is used.

### *Notes*

- The specified job variable only becomes the monitoring job variable if the pubset has not been imported.
- The job variable must already be cataloged, otherwise it is not set. However, IMPORT processing continues even if the job variable is not defined.

---

**JV-PASSWORD = \*NONE / <c-string 1..4> / <x-string 1..8> / <integer -2147483639..2147483639>**

Password of the job variable if this is write-protected.

The operand JV-PASSWORD is defined as "secret":

- The password entered is not logged.
- The input field is automatically blanked out in the guided dialog.
- In unguided dialog and foreground procedures, the entry \*SECRET or ^, SDF provides a blanked out input field for inputting the password.

**RESIDENT-BUFFERS = \*STD / \*NO / \*YES**

Specifies whether resident or nonresident buffers are to be created (also see "Notes").

**RESIDENT-BUFFERS = \*STD**

The value specified in the MRSCAT entry applies.

**RESIDENT-BUFFERS = \*NO**

A nonresident buffer is created.

**RESIDENT-BUFFERS = \*YES**

A resident buffer is created.

**NUMBER-OF-BUFFERS = \*STD / <integer 1..255>**

Defines the number of buffers.

**NUMBER-OF-BUFFERS = \*STD**

The value specified in the MRSCAT entry applies.

**NUMBER-OF-BUFFERS = <integer 1..255>**

The specified number of buffers (minimum 6; see "Notes") is created.

**USE = \*STD / \*SHARE / \*EXCLUSIVE(...) / \*FROM-REMOTE(...)**

Defines the mode of access to the imported pubset. Please observe the relevant conditions and requirements.

**USE = \*STD**

The value specified in the MRSCAT entry applies.

**USE = \*SHARE**

*Specifying this operand only makes sense if the MRSCAT is configured for shareability.* The pubset is to be imported as a shared pubset.

**USE = \*EXCLUSIVE(...)**

The pubset is to be imported as an exclusive pubset. A volume set can also be imported in order to perform recovery.

**CONVERT-VOLUME-SET = \*NO / \*YES**

Specifies whether a normal import is to be performed or whether the volume set of a destroyed SM pubset is to be converted into an SF pubset.

**CONVERT-VOLUME-SET = \*NO**

A normal import is to be performed.

---

**CONVERT-VOLUME-SET = \*YES**

A volume set that is to be converted into an SF pubset was specified in the PUBSET operand. This function can be used to re-establish the accessibility of data in the volume sets of an SM pubset whose control volume set has become inoperative. Please take account of the notes on "[IMPORT-PUBSET](#)".

**USE = \*FROM-REMOTE(...)**

Makes the catalog of a "remote-imported" pubset available if MRSCAT entries were defined after HIPLEX MSCF network startup.

**HOST-NAME = \*NONE / <alphanum-name 1..8>**

BCAM name of the partner host owning the pubset. There has to be an MSCF link to the computer.

**SHARER-TYPE = \*STD / \*SLAVE / \*MASTER(...)**

*Specifying this operand only makes sense if the MRSCAT is configured for shareability or if the USE operand is set to \*SHARE.* Defines the ownership of the pubset. Please observe the relevant conditions and requirements.

**SHARER-TYPE = \*STD**

The system selects the system automatically on the basis of the pubset's attributes:

- If the shared pubset already has a master or another system is explicitly predefined as the master (with /SET-PUBSET-ATTRIBUTES), the system selects SHARER-TYPE=\*SLAVE.
- In all other cases it selects SHARER-TYPE=\*MASTER.

**SHARER-TYPE = \*SLAVE**

The home system is to be a slave sharer.

**SHARER-TYPE = \*MASTER(...)**

The home system is to take over the as yet unassigned ownership of the pubset being imported.

**MASTER-CHANGE = \*NO**

The home system is to take over the as yet unassigned ownership of the pubset being imported. The command is rejected if the pubset has already been imported.

**MASTER-CHANGE = \*YES**

Systems support can initiate an explicit master change from a slave system following the failure of the master or after the EXPORT-PUBSET command was issued with MASTER-CHANGE=\*YES from the master.

An explicit master change is not possible in the case of BACKUP-MASTER=\*NONE and ALTERNATE-BACKUP=\*NONE (see the SET-PUBSET-ATTRIBUTES command). An explicit master change can be used in the following situations:

- The master change initiated automatically by watchdog at a specified backup master was rejected with an error.
- An automatic master change is hindered by BACKUP-MASTER=\*NONE and ALTERNATE-BACKUP=\*BY-OPERATOR.

**SESSION-CHECK-MSG = \*YES / \*NO**

Specifies whether a message is to be output if, during import processing, a check reveals that the pubset involved has already been imported on another system or that the last session was terminated abnormally.

**SESSION-CHECK-MSG = \*YES**

If the check reveals that the pubset has already been imported on another system or that the last session was terminated abnormally, message DMS038C is output.

---

**SESSION-CHECK-MSG = \*NO**

The check is deactivated during an import job for a data pubset; output of message DMS038C is suppressed. System support staff should only use this option, however, if the system was loaded with automatic startup.

**RECONSTRUCT-USERCAT = \*NO / \*RESET / \*BY-BACKUP(...)**

This operand enables the caller to reconstruct the user catalog, either in full on the basis of a backup copy or from scratch on the basis of the user IDs included in TSOSCAT. The operand is evaluated only in conjunction with the settings ACTUAL-JOIN=\*STD/\*ZIP; it is ignored with ACTUAL-JOIN=\*FIRST.

**RECONSTRUCT-USERCAT = \*NO**

No reconstruction is performed.

**RECONSTRUCT-USERCAT = \*RESET**

The user catalog is reconstructed. The user IDs are taken from the current TSOSCAT. The entries are reset.

**RECONSTRUCT-USERCAT = \*BY-BACKUP(...)**

The user catalog is reconstructed on the basis of a backup user catalog

(\$TSOS.SYSSRPM.BACKUP) saved earlier with ARCHIVE and restored to the system.

**SCOPE = \*ALL / BACKUP / \*TSOSCAT**

These specifications define how to deal with user IDs which are included only in the backup or only in TSOSCAT.

**SCOPE = \*ALL**

All the entries are copied from the backup. Any additional entries included in TSOSCAT are recreated.

**SCOPE = BACKUP**

The entries in the backup determine which user IDs are set up. Files belonging to user IDs not included in the backup are deleted.

**SCOPE = \*TSOSCAT**

The entries in TSOSCAT determine which user IDs are set up. Only the user IDs which are included in it are copied from the backup or recreated.

**RECONSTRUCT-F5-LABEL = \*NO / \*YES**

Specifies whether the reconstruction of the F5 label is to be initiated explicitly.

**RECONSTRUCT-F5-LABEL = \*NO**

Reconstruction of the F5 label is not initiated explicitly. However, the system can initiate a reconstruction internally, regardless of this (e.g. following a system crash). Reconstruction will also take place if a check of the TSOSCAT user chain is requested (operand REPAIR-TSOSCAT=\*YES).

**RECONSTRUCT-F5-LABEL = \*YES**

Reconstruction of the F5 label is performed in any case. This covers all volume set belonging to an SM pubset.

**DEFECT-VOLUME-SET = \*NONE / list-poss(256): <cat-id 1..4>**

*This operand is only evaluated for SM (System-Managed) pubsets which are imported exclusively or as master.*

The operand defines which volume sets are defective and are to be removed from the SM pubset. These volume sets are also to be removed from the pubset configuration file and from MRSCAT. The control volume set cannot be removed.

**DEFECT-VOLUME-SET = \*NONE**

All the volume sets listed in the pubset configuration file are imported. If one or more volume sets are found to be defective, the import process aborts. The catalog name of each volume set found to be defective is displayed. The import process must then be repeated, naming all the defective volume sets.

---

**DEFECT-VOLUME-SET = list-poss(256): <cat-id 1..4>**

Specifies the catalog names of those volume sets which are no longer to be part of the SM pubset and are to be removed from the pubset configuration file and from MRSCAT. All the files in a defective volume set are removed from the file index of the SM pubset in question and added to a file named \$TSOS.SYS.PUBSET.DEFECT.<volset-id>.<date>.<time>, where <date> is in yyyy-mm-dd format and <time> is in hhmmss format. The file names added to this file form the basis for subsequent reconstruction using the HSMS utility.

**IN-HOLD-VOLUME-SET = \*NONE / list-poss(256): <cat-id 1..4>**

*This operand is only evaluated for SM (System-Managed) pubsets which are imported exclusively or as master.*

The operand defines which volume sets are to be placed in the IN-HOLD status when they are imported, i.e. these volume sets are temporarily flagged as not operable. They can be activated again with the MODIFY-PUBSET-RESTRICTIONS command. A volume set that is exported while IN-HOLD, is implicitly reactivated when imported if it was not named explicitly in the IN-HOLD-VOLUME-SET operand.

**IN-HOLD-VOLUME-SET = \*NONE**

None of the volume sets is put IN-HOLD.

**IN-HOLD-VOLUME-SET = list-poss(256): <cat-id 1..4>**

Specifies the volume sets that are put IN-HOLD while being imported.

**REPAIR-TSOSCAT = \*NO / \*YES**

Specifies whether the TSOSCAT user chains are repaired during the CMS start phase of the import.

**REPAIR-TSOSCAT = \*NO**

TSOSCAT user chains are not repaired.

**REPAIR-TSOSCAT = \*YES**

*This specification should only be entered if the import was not possible because of a defective TSOSCAT. Catalog entries can be lost when the repair process takes place.*

TSOSCAT user chains are analyzed in the CMS start phase of the import, and they are repaired, if necessary. Defective blocks are removed. If a file's catalog entry was on a defective block, that file is no longer accessible. For further information on the reconstruction of file catalogs, see the "Introduction to System Administration" [14]. An F5 label reconstruction for the entire pubset is performed.

**CHECK-PUBSET-MIRRORS = \*NO / \*YES**

Determines whether the homogeneity of the pubset is to be checked. In the case of a pubset which is not mirrored a check is also made to see whether only individual disks are mirrored. A pubset is homogeneous when all volumes of the pubset have the same mirroring properties.

The homogeneity check is performed for the currently supported full replication forms (see the respective manual "SHC-OSD" [37]).

**CHECK-PUBSET-MIRRORS = \*NO**

No homogeneity check is performed.

**CHECK-PUBSET-MIRRORS = \*YES**

A homogeneity check is performed.

## Return codes

(SC2)	SC1	Maincode	Bedeutung
	0	CMD0001	Command executed without error
1	0	DMS0350	Pubset already available
	1	CMD0202	Syntax error
	32	DMS0352	Error while accessing MRSCAT entry
	64	DMS0360	No authorization for command
	64	DMS036B	Missing MRSCAT entry, wrong type
	64	DMS037B	Import as shared PVS not possible
	64	DMS13C9	Pubset has already been remotely imported; import mode cannot be changed
	130	DMS0351	Other import/export task active
	130	DMS035A	Maximum task number reached
	130	DMS0362	Class-4 memory error

## Notes

- The home pubset cannot be imported explicitly. The home pubset is imported automatically during system initialization (startup phase).
- The IMPORT-PUBSET command generates a new task, the IMPORT task, and starts it. Actual importing is performed by this IMPORT task asynchronously with the calling task. After successful generation of the IMPORT task, the following message is output on the console:

```
DMS035B IMPORT PUBSET TASK WITH TSN '(&00)' FOR PUBSET WITH PUBSET ID '(&01)' HAS BEEN CREATED AND STARTED.
```

All messages output by the IMPORT job are sent to the console.

- Specifications made via `RESIDENT-BUFFERS` and `NUMBER-OF-BUFFERS` can indirectly influence the working set or paging rate of the system. If, for example, a large number of resident buffers are created on a small system, the cataloging operations will be faster but the paging rate for all other applications will increase. On the other hand, a class 4 memory bottleneck can occur for nonresident buffers. If no buffer specifications are made, the system's default values are used. The following 3-level hierarchy applies:

1. Explicit parameter specifications in the IMPORT-PUBSET command.
2. Specifications via the ADD- OR MODIFY-MASTER-CATALOG-ENTRY command.

If only one of the parameters `RESIDENT-BUFFERS` or `NUMBER-OF-BUFFERS` is specified, the default value applies to the other one (`RESIDENT-BUFFERS= *NO`, `NUMBER-OF-BUFFERS=32`).

3. Specification via class 2 system parameters `CATBUFR` and `BMTNUM`

- 
- For reasons of performance and reliability, a minimum number of CMS buffers is defined by the system. If a smaller number is specified explicitly in the NUMBER-OF-BUFFERS operand, the minimum number defined by the system is set.
  - If the pubset to be imported is still locked due to a previous system crash, the operator can cancel this lock by means of the UNLOCK-DISK command. However, the operator must first ensure that the pubset is not being used by another system which is currently active.
  - The MRSCAT of the pubset must contain a static definition of how import processing is to react in the event of an error during a new reservation of a cache area (see also the MODIFY-PUBSET-CACHE-ATTRIBUTES command) because the cache area cannot be made available in the required size:
    1. Import processing continues using the remaining buffer available.
    2. Import processing is aborted.

Whenever a new MRSCAT entry is added, the default value, i.e. cancelation in the event of an error, applies.

## Notes on importing a volume set with conversion to an SF pubset

The function “import and convert volume set” (see the USE=\*EXCLUSIVE(CONVERT-VOLUME-SET=\*YES) operand on “[IMPORT-PUBSET](#)”) is a basic function for the recovery of SM pubsets whose control volume set has failed: converting the remaining intact volume sets into SF pubsets makes the data present on them available again and it is then possible to recover the SM pubset using SMPGEN (see also the “System Managed Storage” User Guide [\[45\]](#)).

The conversion of volume sets results in operable SF pubsets. Consequently, this function should not be used for anything other than the recovery of SM pubsets without very careful consideration. The specific problem of the maximum length of file names will be examined in the following. In all cases, it is necessary to remember that in an SM pubset, the files processed by an application are not necessarily all located in the same volume set. Following the subdivision of an SM pubset into SF pubsets by means of the import/convert function it is therefore no longer possible to address the files belonging to an application uniquely via defcat or a **single** catalog ID. The corresponding metadata is also no longer available in full.

The procedure described in the chapter “SMPGEN” of the “Utility Routines” User Guide [\[9\]](#) largely applies to the preparation of an SMPGEN run performed in order to recover an SM pubset. However, the FDDRL backup of the volumes in question should be performed within a recovery scenario **before** the “conversion import” step in order to ensure that this step is also protected by a physical backup.

When performing conversion, the following points relating to the control volume set, the length of file names, file generations and DAB caches should be considered:

### *Control volume set*

It is not possible to convert control volume sets, and such an operation would also have no point, since the function “import and convert” is used for recovery purposes on the failure of a control volume set. The metadata stored on the failed control volume set must be recovered from a backup or other source following restoration of the SM pubset by SMPGEN.

### *File name length*

On conversion, the catalog ID of the volume set is taken over as the catalog ID of the resulting SF pubset. If the length of this catalog ID is greater than the length of the (previously valid) catalog ID of the SM pubset then it is necessary to ensure that the maximum possible file name length (54 characters) is not exceeded. To this end, when

conversion is performed, any files whose names would exceed the maximum permitted length are renamed. A message, which requests operator confirmation, is issued at the console in order to query whether renaming should be performed. The names of the renamed files have the following structure:

```
:<catid>:$<userid>.S.RENAME.<timestamp>.<tempfile_indicator>.<counter>
```

The name sections have the following meanings:

<catid>	Catalog ID of the SF pubset
<userid>	user ID
<timestamp>	Time stamp in ISO4 format
<tempfile_indicator>	Displays whether a temporary file is concerned:
	T: temporary file
	N: "normal" file

Any file renaming operations that are performed are logged in an ISAM file on the home pubset. The name of the file is:

```
:<catid_home>:$TSOS.TSOSCAT.CONV.<catid>.<timestamp>
```

where <catid\_home> indicates the catalog ID of the home pubset, <catid> the catalog ID of the SF pubset created as a result of the conversion and <timestamp> the time stamp in ISO4 format.

The log records indicate the allocation of the file names generated during conversion to the original file names. It is particularly important to ensure that file generations which have excessively long file names are also renamed. When they are renamed, they are also assigned the default name as described above and lose the "file generation" property.

### Example

The SM pubset K contains a volume set F64K. Following an error in the control volume set, the remaining volume sets, including F64K, are initially converted into SF pubsets. This requires certain files to be renamed. The log file is located on the home pubset A:

```
:A:$TSOS.TSOSCAT.CONV.F64K.2011-10-05.112950
```

Contents of the log file:

```
:F64K:$USER1234.S.RENAME.2011-12-06-090300.N.000002
, :F64K:$USER1234.FILEA9012345678901234567890123456789012345678901234
:F64K:$USER1234.S.RENAME.2011-12-06-090300.N.000004
, :F64K:$USER1234.FILEGROUP3456789012345678901234567 (*0001)
:F64K:$USER1234.S.RENAME.2011-12-06-090300.N.000005
, :F64K:$USER1234.FILEGROUP3456789012345678901234567 (*0003)
:F64K:$USER1234.S.RENAME.2011-12-06-090300.T.000003
, :F64K:$USER1234.FILEXXX1234567890123456789012345678901234
:F64K:$USER1234.S.RENAME.2011-12-06-090300.N.000001
, :F64K:$USER1234.FILE8901234567890123456789012345678901234
'BLANK' 'BLANK'
, :F64K:$USER1234.FGG1 (*0002)
```

---

Following restoration of the SM pubset, the renamed files can be given their original names again with the help of the logging file. How to proceed in the case of file generation groups is described in the next paragraph ("File generation groups"). **Once recovery has been performed successfully and the original file names have been restored it is essential to delete the log files**, after backing them up if necessary. If this is not done, name conflicts may occur when importing and converting volume sets with the same name and, in some cases, may result in faulty operation.

### *File generation groups*

In the case of SM pubsets, the file group's catalog entry is located on the control volume set while the catalog entries for the individual file generations can be distributed across the volume sets as required. Consequently, after the volume sets have been converted into SF pubsets, the individual file generations and associated catalog entries are present whereas group entries are not. The question of renaming file generations with "excessively long" file names during the conversion process has already been addressed. The names of the remaining file generations are logged without being renamed. When this is done, the log file contains spaces in place of the new file name (see example, "IMPORT-PUBSET").

New catalog entries must be created for the file generation groups before these can be accessed. The following procedure is recommended:

The group entry is created for each corresponding individual generation with the number <n>:

```
/CREATE-FILE-GROUP <filename>, *GENERATION-PARAMETER (MAXIMUM=1,  
FIRST-GENERATION=<n>, LAST-GENERATION=<n>)
```

The content of the file generation is then copied to a file for which any required file name can be specified. The name of the file generation and the target file are logged. This file generation group is then deleted.

Once the SM pubset has been restored, it is possible to recover the file generation groups: The group entry is recreated. After this, the files that were created during conversion or manually from file generations are again added to the group as file generations by means of the MODIFY-FILE-ATTRIBUTES command. It should be noted that file generations that were stored on the control volume set of the original SM pubset are lost. This may result in discontinuities in the version numbers of the generation. This consideration should be borne in mind when performing the recovery.

### *DAB caches*

When caching is performed with DAB (see also the "DAB" User Guide [5]) it is necessary to distinguish between ADM-PFA caching and (user) PFA caching. In both cases, synchronization with any existing cache data is performed as part of pubset import involving volume set conversion.

#### 1. ADM-PFA caching

ADM-PFA caching can be set for entire SM or SF pubsets, volume sets or individual files as required. When this is done, DAB uses the volumes in question and the names of the buffered files as the metadata. It is necessary to distinguish between the following three scenarios when an SM pubset's control volume set fails:

##### a. Export of the intact volume set is possible and is performed

In this case, the data from the volume sets is written back. Only control volume set data may be present in the cache. In order to prepare for pubset recovery it is necessary to terminate DAB caching for the objects in question using /STOP-DAB-CACHING and also, if the cache contains data belonging to the defective control volume set, /FORCE-STOP-DAB-CACHING. When this is done, a list of the "pinned" files is created.

##### b. Import with conversion and cache present in the current session

This is the situation that occurs if the cache is not cleared in case a). However, in this situation the cache contains no data. Caching of the data ranges in question is prohibited due to the import/conversion of the

---

volume set. Due to the fact that after import and conversion, the file names administered by DAB no longer correspond to the data present in the pubset, it is essential to clear the cache areas in question with /STOP-DAB-CACHING.

## 2. User PFA

In the case of user PFA, a cache area is always assigned to one volume set (for SM pubsets). It will probably not be possible to clear the cache area for the defective control volume set and this will have to be terminated with the /FORCE-DESTROY-CACHE command. In the case of all other volume sets, the assigned cache area is cleared correctly following an export due to a failed control volume set. No new cache area is set up when the volume sets are subsequently imported and converted.

## Using the "Import with homogeneity check" function

The homogeneity check with regard to SRDF and/or BCV mirroring for a pubset which is to be imported is executed by specifying the CHECK-PUBSET-MIRRORS = \*YES operand.

If in the course of an import a volume is detected which has different mirroring properties from volumes which have already been processed, the answerable message DMS1369 is output on the console. Depending on the operator's answer, one of the following procedures is selected:

- Pubset import is aborted.
- Import processing is continued despite the fact that the volume of the pubset which has just been processed has been recognized as inhomogeneous. In this case the message DMS136B is issued on the console for every further volume which has different mirroring properties.

---

## 3.76 INCLUDE-DEVICE-CONNECTION

Attach virtual connections

**Component:** BS2000 OSD/BC  
**Functional area:** Device management  
**Domain:** DEVICE  
**Privileges:** OPERATING  
**Routing code:** G

### Function

This command enables the operator to attach virtual connections between the hardware units (CHN, CTL, DVC), i. e. permit the operating system to use these connections.

*Effect of the INCLUDE-DEVICE-CONNECTION command:*

1. If the connections specified were in the state “removed explicitly”, they assume the state “included”. The connections can be used again.
2. If the outer units associated with this connection were in the state “detached implicitly”, they assume the state “attached”. These hardware units can be used again.
3. In the outer hardware units which have assumed the state “attached” as per point 2, the outward connections are checked: if the connections were in the state “removed implicitly”, they assume the state “included”. These connections can be used again.
4. In the case of disk and tape devices which are capable of forming path groups, the newly attached paths are included in the path group.

## Format

### INCLUDE-DEVICE-CONNECTION

**FROM** = \*CHANNEL(...) / \*CONTROLLER(...) / list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

\*CHANNEL(...)

| CHANNEL-PATH-ID = list-poss(8): <x-text 2..2>

\*CONTROLLER(...)

| CONTROLLER-UNIT = list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

,**TO** = \*CHANNEL(...) / \*CONTROLLER(...) / list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

\*CHANNEL(...)

| CHANNEL-PATH-ID = list-poss(8): <x-text 2..2>

\*CONTROLLER(...)

| CONTROLLER-UNIT = list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

,**SCOPE** = \*OWN-SYSTEM-ONLY / \*VM2000-GLOBAL

## Operands

### FROM =

Defines the virtual connection to be attached in terms of one of the delimiting hardware units. The direction in which the virtual connection is attached is not prescribed. FROM therefore does not have to be the inner and TO the outer unit.

### FROM = \*CHANNEL(...)

Defines the virtual connection to be attached in terms of a specific channel.

**CHANNEL-PATH-ID = list-poss(8): <x-text 2..2>**

Specifies the channel path ID of the channel that delimits the virtual connection. A maximum of 8 channels can be specified.

### FROM = \*CONTROLLER(...)

Defines the virtual connection to be attached in terms of a specific controller.

**CONTROLLER-UNIT = list-poss(8): <alphanum-name 2..2> / <x-text 4..4>**

Specifies the mnemonic device code (MN) of the controller that delimits the virtual connection. A maximum of 8 controllers can be specified.

### FROM = list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

Defines the virtual connection to be attached in terms of a specific device. A maximum of 8 devices (mnemonic device codes) can be specified.

### TO = \*CHANNEL(...) / \*CONTROLLER(...) / list-poss(8): <alphanum-name 2..2> / <x-text 4..4>

Defines the virtual connection to be attached in terms of the other delimiting hardware unit. This unit represents the second element of the pair and is specified according to the FROM operand. A maximum of 8 units can be specified.

---

**SCOPE =**

Specifies how the command is to be executed under VM2000.

**SCOPE = \*OWN-SYSTEM-ONLY**

The command is only executed in the local system.

**SCOPE = \*VM2000-GLOBAL**

If entered at the VM Monitor System (VM1) the command is executed at all the guest systems running BS2000 /OSD >= V5.0.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
4	64	NKR0...	Path already attached
12	64	NKR0...	Internal check negative
16	64	NKR0...	Caller error
20	64	NKR0...	Software error

*Note*

If there is an error in command termination, the maincode contains the message code of the message output during command processing.

**Example**

Attach the connection between device L1 and channel 12:

```
/INCLUDE-DEVICE-CONNECTION FROM=L1, TO=*CHANNEL(12) or  
/INCL-DEV-CONN FROM=L1, TO=*CH(12)
```

---

## 3.77 INFORM-ALL-JOBS

Send message to all active user tasks

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** JOB  
**Privileges:** OPERATING  
TSOS  
**Routing code:** E

### Function

The INFORM-ALL-JOBS command enables systems support to send a message to all interactive users currently connected to the system. The system adds the date and time of day to the message.

#### *Note*

To send a message to a specific interactive user, systems support must use the INFORM-JOB command.

### Format

<b>INFORM-ALL-JOBS</b>
<b>MSG</b> = <c-string 1..72 with-low>

### Operands

**MSG = <c-string 1..72 with-low>**

A text string up to 72 characters long is sent to all active user tasks.

### Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
2	0	NBR0725	Warning: The message could not be sent to all interactive tasks
2	32	NBR0727	Internal error: Error in \$PSTMS call (incorrect UNIT, FUNCTION or VERSION)
	64	CMD0216	User does not have the required privilege
	130	EXC0061	Class 4 memory request failed; command processing aborted

---

## Example

Systems support input:

```
/inform-all-jobs msg = ???'Attention SHUTDOWN in 15 minutes.'
```

Output on terminals of interactive users:

```
% BCST Attention SHUTDOWN in 15 minutes. :14:53:38 :12-01-26026
```

---

## 3.78 INFORM-JOB

Send message to specific user task

**Component:** BS2000 OSD/BC  
**Functional area:** Operator terminal control  
**Domain:** JOB  
**Privileges:** OPERATING  
TSOS  
**Routing code:** E

### Function

The INFORM-JOB command enables systems support to send a message to a specific batch or interactive job. The system adds the date and time of day to the message. The message is written to SYSOUT.

If the job has not yet been started (queue type 1) or has already terminated, the INFORM-JOB command will not be executed and the command submitter will be informed.

#### *Note*

The precise output format of the message is controlled by the NBMESLG system parameter.

### Format

#### INFORM-JOB

**MSG** = <c-string 1..151 with-low>

**,JOB-IDENTIFICATION** = \*TSN (...) / \***TERMINAL**(...)

\*TSN (...)

| **TSN** = <alphanum-name 1..4>

\***TERMINAL**(...)

| **PROCESSOR** = <name 1..8>

| **,STATION** = <name 1..8>

### Operands

**MSG** = <c-string 1..151 with-low>

This operand represents the message to be transmitted.

Its maximum length is 151 characters. This length limitation does not apply to the date and time of day, which are added by the system.

---

**JOB-IDENTIFICATION = \*TSN(...) / \*TERMINAL(...)**

Specifies where the message is to be sent. The message can be sent either to a job identified by its task sequence number (TSN) or to an interactive task identified by processor and station name.

**JOB-IDENTIFICATION = \*TSN(...)**

The message is to be sent to a job identified by its TSN.

**TSN = <alphanum-name 1..4>**

TSN (up to 4 alphanumeric characters) of the job to which the message is to be sent.

**JOB-IDENTIFICATION = \*TERMINAL(...)**

The message is to be sent to an interactive task on a terminal.

**PROCESSOR = <name 1..8>**

BCAM name of the processor to which the terminal is connected.

**STATION = <name 1..8>**

BCAM name of the terminal to which the message is to be sent.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
2	0	EXC0064	Warning. Specified task has temporarily suppressed message function
1	1	EXC0240	Syntax error
2	64	EXC0080	Specified task does not exist
3	64	EXC0062	Specified task cannot receive message
4	64	EXC0081	Invalid task type
5	64	EXC0109	Semantic error; command ignored
	130	EXC0061	Not enough class 4 memory; command aborted

**Example**

Systems support input:

```
/inform-job msg = '*** Please release reserved tape devices?***' ,  
    tsn = 0FC3
```

Output on terminal of interactive task 0FC3:

```
%MESS *** Please release reserved tape devices' *** :14:53:38 :12-01-26026
```

---

## 3.79 INFORM-OPERATOR

Send message to operator terminal

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB  
PROGRAM

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The INFORM-OPERATOR command sends a message to the operator terminal. The message is by default sent to the recipient defined by the MSGDEST system parameter.

If the message text starts with the "<" character, the next character is checked. If this character is a valid authorization code (no distinction is made between uppercase/lowercase) then the message is sent to all the terminals to which this authorization code is assigned. If the next character is not defined as an authorization code, the message is also sent in accordance with the MSGDEST system parameter.

The user can also request a response from the operator (WAIT-RESPONSE operand). The task is put on hold until the response arrives.

### Format

<b>INFORM-OPERATOR</b>
<b>MSG</b> = <c-string 1..230 with-low>
<b>,WAIT-RESPONSE</b> = *NO / *YES

### Operands

**MSG = <c-string 1..230 with-low>**

Text of the message which is to be sent to the operator terminal.

If the first character in the message is the character "<", the next character is interpreted as a routing code to which the message is to be sent.

**WAIT-RESPONSE = \*NO / \*YES**

Specifies whether the task is to wait for a response from the operator.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	64	EXC0090	Out of space

---

## 3.80 INFORM-PROGRAM

Send message to program (STXIT routine)

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job processing Program control
<b>Domain:</b>	JOB PROGRAM
<b>Privileges:</b>	STD-PROCESSING OPERATING TSOS HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The INFORM-PROGRAM command enables a nonprivileged user to send a message to an interrupted program in the user's own task.

The interrupted program is continued at the address defined in the STXIT macro for the event: "message to the program". If the program does not contain a STXIT routine for this event, the INFORM-PROGRAM command is rejected and an error message is issued. The occurrence of the "message to the program" event is independent of a message that the user can additionally specify in the MSG operand.

A message specified in the MSG operand will, if specified in the STXIT macro, be transferred to an area in the program defined expressly for that purpose.

The STXIT mechanism is described in the "Executive Macros" manual [22].

#### *Privileged functions*

Systems support (TSOS or OPERATING privilege) can also use the command to send a message to a loaded program in a noninteractive task.

If the program does not have an STXIT routine for this event, the command is accepted but has no effect. If there is no program loaded in the task, the command is rejected.

Using this privileged function, systems support can among other things terminate specific database applications gracefully before system shutdown by informing them that the "message to the program" event has occurred. If the database has been programmed to process the event, it can take steps to shut itself down.

---

## Format

<b>INFORM-PROGRAM</b>	Alias: <b>IFPG</b>
<b>MSG</b> = <b>*NO</b> / <c-string 1..64 with-low>	
, <b>JOB-IDENTIFICATION</b> = <b>*OWN</b> / <b>*TSN(...)</b> / <b>*MONJV(...)</b>	
<b>*TSN(...)</b>	
<b>TSN</b> = <alphanum-name 1..4>	
<b>*MONJV(...)</b>	
<b>MONJV</b> = <filename 1..54 without-gen-vers>	

## Operands

**MSG = \*NO / <c-string 1..64 with-low>**

Text of the message to be sent to the program.

The default is \*NO, which means that no message will be sent.

The length of the message is limited to 64 characters. Shorter messages have a null byte appended to the right to indicate end-of-text in the receive area. If no area for message transfer was defined in the STXIT macro, the specified message is ignored. If no message is specified although an area has been defined, a null byte is transferred.

**JOB-IDENTIFICATION = \*OWN / \*TSN(...)** / **\*MONJV(...)**

Indicates the form of identification used for the task in which the target program is running. An interrupted program in the user's task (\*OWN) or in some other noninteractive task (\*TSN or \*MONJV) is to be informed that the "message to the program" event has occurred. Additionally, the user can send a message comprising up to 64 characters to the program (see MSG operand).

**JOB-IDENTIFICATION = \*OWN**

The user informs an interrupted program running in his own task.

**JOB-IDENTIFICATION = \*TSN(...)**

*Only privileged users (OPERATING or TSOS privilege) are allowed to select this value.*

The task in which the target program is running is identified by its TSN. The target must not be an interactive task.

**TSN = <alphanum-name 1..4>**

Task sequence number.

**JOB-IDENTIFICATION = \*MONJV(...)**

*Only privileged users (OPERATING or TSOS privilege) are allowed to select this value.*

The task in which the target program is running is identified by its monitoring JV. The target must not be an interactive task.

**MONJV = <filename 1..54>**

Name of the job variable monitoring the job.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No errors
	64	EXC0920	Specified job ID invalid
	64	EXC0921	Command not permitted for interactive tasks
	64	EXC0922	No program loaded
	64	EXC0923	No STXIT interface defined for this event in specified program
	64	EXC0924	No STXIT routine defined for this event in specified program
	64	EXC0925	STXIT routine already activated
	64	EXC0090	Insufficient storage space

---

## 3.81 LIST-CATALOG-ENTRY

Write catalog entry to file

**Component:** BS2000 OSD/BC  
**Functional area:** Pubset and MRSCAT management  
**Domain:** MULTI-CATALOG-AND-PUBSET-MANAGEMENT  
**Privileges:** TSOS

### Function

The LIST-CATALOG-ENTRY command is designed to facilitate diagnosis of errors in a catalog entry. Systems support can have the entire catalog entry, including the extents, written to file for a particular file or job variable.

The command can be entered from any system in the network for shared pubsets.

### Format

<b>LIST-CATALOG-ENTRY</b>
<b>NAME</b> = <filename 1..54> <b>,OBJECT</b> = *FILE / *JV <b>,OUTPUT</b> = <filename 1..54>

### Operands

**NAME = <filename 1..54>**

Name of the file or job variable whose catalog entry is to be output. The name must contain the catalog and user IDs.

**OBJECT = \*FILE / \*JV**

Specifies whether the command is to be executed for the catalog entry of a file or job variable.

**OUTPUT = <filename 1..54>**

Name of the file to which the catalog entry is to be written.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed without error
	32	CMD0221	Internal error
	64	DMS0501	Catalog is not available in the system
	64	DMS0505	Error in computer communication
	64	DMS0512	Catalog is not known in the system
	64	DMS1343	A change of master is currently running for the pubset
	64	DMS0333	File not cataloged
	64	JVS0433	JV not cataloged

## Format of the output

A header contains the fully qualified file name, a flag for the file or job variable, the pubset type and the catalog name (important for SM pubset).

Subsequently, the catalog entry is output in hexadecimal, printable form together with its extents, contiguous parts being output contiguously.

---

## 3.82 LIST-FILE-FROM-SNAPSET

Provide information about files on a Snapset

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE  
SNAPSET

**Privileges:** STD-PROCESSING  
TSOS

### Function

The LIST-FILE-FROM-SNAPSET command enables the user to obtain information about files which were saved on a Snapset when a pubset was backed up. The information relates to whether files can be restored (using the RESTORE-FILE-FROM-SNAPSET command). The associated pubset must be imported.

Nonprivileged users can obtain information about all files which they can access (as with SHOW-FILE-ATTRIBUTES, which supplies information from the current file catalog).

The Snapsets are temporarily not available if the SHC-OSD subsystem was not active when the pubset was imported. In this case, the command is aborted with DMS0622. As soon as SHC-OSD is active, the Snapsets are subsequently activated when the SHOW-SNAPSET-CONFIGURATION command is called.

#### *Privileged functions*

Systems support (TSOS privilege) can obtain information on the files of all user IDs. Wildcards are not permitted in the user ID here.

### Format

#### LIST-FILE-FROM-SNAPSET

**FILE-NAME** = <filename 1..54 with-wild(80)>

,**SNAPSET** = **\*LATEST** / **\*ALL** / <name 1..1 with-low> / <integer -52..-1> / **\*INTERVAL(...)**

**\*INTERVAL(...)**

| **OLDEST** = **-52** / <integer -52..-1>

| **NEWEST** = **-1** / <integer -52..-1>

,**INFORMATION** = **\*NAME-AND-SPACE** / **\*ALL**

,**OUTPUT** = list-poss(2): **\*SYSOUT** / **\*SYSLST**

---

## Operands

### **FILE-NAME = <filename 1..54 with-wild(80)>**

Selects the files which are to be listed. The files must satisfy the following requirements:

- They must be cataloged when the Snapset is created.
- The pubset on which they are cataloged must be imported locally.

Aliases may be specified. Individual file generations can be specified. When a file generation group is specified, the file generations are also output.

### **SNAPSET = \*LATEST / \*ALL / <name 1..1 with-low> / <integer -52..-1> / \*INTERVAL(...)**

Specifies the Snapset from which the file information is to be output.

Information about all existing Snapsets for a pubset can be obtained using the SHOW-SNAPSET-CONFIGURATION command.

### **SNAPSET = \*LATEST**

The information is to be output from the latest Snapset (i.e. from the most up-to-date pubset backup).

### **SNAPSET = \*ALL**

The information from all existing Snapsets is output.

### **SNAPSET = <name 1..1 with-low>**

Specifies the Snapset explicitly by means of the Snapset ID. The maximum of 52 pubsets are distinguished by means of Snapset IDs specified which comprise letters from the 26 lowercase letters a to z and the 26 uppercase letters A to Z.

### **SNAPSET = <integer -52..-1>**

Specifies the Snapset explicitly by means of the relative age. The value -1 specifies the latest Snapset.

### **SNAPSET = \*INTERVAL(...)**

Information on all Snapsets which lie in the specified age range is output:

#### **OLDEST = -52 / <integer -52..-1>**

Specifies the oldest Snapset; the range begins with this Snapset.

#### **NEWEST = -1 / <integer -52..-1>**

Specifies the newest Snapset; the range ends with this Snapset.

### **INFORMATION = \*NAME-AND-SPACE / \*ALL**

Determines the type and scope of the information to be output.

### **INFORMATION = \*NAME-AND-SPACE**

For each cataloged file name, one line is output which contains the file size in PAM pages and the file name. Work files (WORK-FILE=\*YES) and migrated files as well as files on Net-Storage or on private disk are also flagged.

Tape files are listed without file size or identification.

### **INFORMATION = \*ALL**

Two lines are output for each cataloged file name. The first line has the same format as with INFORMATION=\*NAME-AND-SPACE. The second line contains the creation date, date of modification and the file status. The file status indicates whether the file was open in write mode when the backup took place (STATE=OPENED or CLOSED). In the case of files which cannot be restored (e.g. files with the backup frequency BACKUP-CLASS=E or special system files, work files, files on Net-Storage or on private disk), STATE=NOEST is displayed.

---

**OUTPUT = list-poss(2): \*SYSOUT / \*SYSLST**

Specifies whether the information is to be directed to SYSOUT (default) and/or SYSLST.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
1	0	CMD0001	Interrupt the output with the K2 key
2	0	DMS05B6	Incorrect conversion of UTC to LT
2	0	DMS0616	Volume set in SM pubset might not be available
	1	CMD0202	Too many operands, syntax error Guaranteed message: DMS0598
	1	CMD0202	Syntax error in Snapset specification Guaranteed message: DMS06F7
	1	CMD0202	Path name too long Guaranteed message: DMS05EE
	32	DMS05C7	Unexpected internal error in DMS
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Specified user ID not in home pubset Guaranteed message: DMS051B
	64	DMS051C	User does not have permission to access pubset Guaranteed message: DMS051C
	64	DMS051D	Logon and pubset passwords different
	64	DMS0535	Catalog entry not accessible
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS05FC	Specified user ID not in home pubset
	64	DMS0616	Volume set not accessible in SM pubset
	64	DMS0622	Snapset not available
	64	DMS0684	File does not exist
	64	DMS06CC	No file name corresponds to specified wildcard string
	130	DMS0585	Error detected when processing catalog or multiprocessor system
	130	DMS0594	Not enough virtual memory available

## 3.83 LIST-JV-FROM-SNAPSET

Provide information about job variables on a Snapset

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	Job variables
<b>Domain:</b>	JOB-VARIABLES SNAPSET
<b>Privileges:</b>	STD-PROCESSING TSOS

### Function

The LIST-JV-FROM-SNAPSET command enables the user to obtain information about job variables which were saved on a Snapset when a pubset was backed up. The information relates to whether job variables can be restored (using the RESTORE-JV-FROM-SNAPSET command). The associated pubset must be imported.

Nonprivileged users can obtain information about all job variables which they can access (as with SHOW-JV-ATTRIBUTES, which supplies information from the current file catalog).

The Snapsets are temporarily not available if the SHC-OSD subsystem was not active when the pubset was imported. In this case the command is aborted with DMS0622. As soon as SHC-OSD is active, the Snapsets are subsequently activated when the SHOW-SNAPSET-CONFIGURATION command is called.

#### *Privileged functions*

Systems support (TSOS privilege) can obtain information on the job variables of all user IDs. Wildcards are not permitted in the user ID here.

### Format

#### LIST-JV-FROM-SNAPSET

**JV-NAME** = <filename 1..54 without-gen-vers with-wild(80)>

,**SNAPSET** = **\*LATEST** / **\*ALL** / <name 1..1 with-low> / <integer -52..-1> / **\*INTERVAL(...)**

**\*INTERVAL(...)**

| **OLDEST** = **-52** / <integer -52..-1>

| **,NEWEST** = **-1** / <integer -52..-1>

,**INFORMATION** = **\*NAME-AND-SIZE** / **\*ALL**

,**OUTPUT** = list-poss(2): **\*SYSOUT** / **\*SYSLST**

---

## Operands

### **JV-NAME = <filename 1..54 without-gen-vers with-wild(80)>**

Selects the job variables which are to be listed. The job variables must satisfy the following requirements:

- They must be cataloged when the Snapset is created.
- The pubset on which they are cataloged must be imported locally.

Aliases may be specified.

### **SNAPSET = \*LATEST / \*ALL / <name 1..1 with-low> / <integer -52..-1> / \*INTERVAL(...)**

Specifies the Snapset from which the file information is to be output.

Information about all existing Snapsets for a pubset can be obtained using the SHOW-SNAPSET-CONFIGURATION command.

### **SNAPSET = \*LATEST**

The information is to be output from the latest Snapset (i.e. from the most up-to-date pubset backup).

### **SNAPSET = \*ALL**

The information from all existing Snapsets is output.

### **SNAPSET = <name 1..1 with-low>**

Specifies the Snapset explicitly by means of the Snapset ID. The maximum of 52 Snapsets for a pubset are distinguished by means of Snapset IDs specified which comprise letters from the 26 lowercase letters a to z and the 26 uppercase letters A to Z.

### **SNAPSET = <integer -52..-1>**

Specifies the Snapset explicitly by means of the relative age. The value -1 specifies the latest Snapset.

### **SNAPSET = \*INTERVAL(...)**

Information on all Snapsets which lie in the specified age range is output:

#### **OLDEST = -52 / <integer -52..-1>**

Specifies the oldest Snapset; the range begins with this Snapset.

#### **NEWEST = -1 / <integer -52..-1>**

Specifies the newest Snapset; the range ends with this Snapset.

### **INFORMATION = \*NAME-AND-SIZE / \*ALL**

Determines the type and scope of the information to be output.

### **INFORMATION = \*NAME-AND-SIZE**

For each cataloged job variable one line is output which contains the length of its value and its name.

### **INFORMATION = \*ALL**

Two lines are output for each cataloged job variable. The first line has the same format as with INFORMATION=\*NAME-AND-SPACE. The second line contains the creation date and release date.

### **OUTPUT = list-poss(2): \*SYSOUT / \*SYSLST**

Specifies whether the information is to be directed to SYSOUT (default) and/or SYSLST.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without errors
1	0	CMD0001	Interrupt the output with the K2 key
2	0	DMS05B6	Incorrect conversion of UTC to LT
2	0	DMS0616	Volume set in SM pubset might not be available
	1	CMD0202	Syntax or semantic error Guaranteed messages: DMS0598, DMS06F7, DMS05DE, DMS05EE
	32	DMS05C7	Unexpected internal error in DMS
	64	DMS0501	Requested catalog not available
	64	DMS0512	Requested catalog not found
	64	DMS051B	Specified user ID not in home pubset Guaranteed message: DMS051B
	64	DMS051C	User does not have permission to access pubset
	64	DMS051D	Logon and pubset passwords different
	64	DMS0535	Catalog entry not accessible
	64	DMS0585	Error detected when processing catalog or multiprocessor system
	64	DMS05FC	User ID does not exist
	64	DMS0616	Volume set not accessible in SM pubset
	64	DMS0622	Snapset not available
	64	DMS0682	Error while accessing job variable (e.g. it does not exist); for more detailed information on the cause of the error, see the insert of the SYSOUT message Guaranteed message: DMS0682
	130	DMS0585	Error detected when processing catalog or multiprocessor system
	130	DMS0594	Not enough virtual memory available

---

## Example

```
/list-jv-from-snapset :x:,inf=*all
```

```

## 3.84 LIST-NET-DIRECTORIES

Display directories released for Net-Storage

**Component:** BS2000 OSD/BC

**Functional area:** Net-Storage administration

**Domain:** DEVICE  
STORAGE-MANAGEMENT

**Privileges:** TSOS  
OPERATING

**Routing code:** G

### Function

The LIST-NET-DIRECTORIES command provides information on all directories of a net server which are released for use as Net-Storage. The listed directories or also the directories beneath them can be connected to BS2000 as Net-Storage (see the MOUNT-NET-STORAGE command).

Fundamental information on the use of Net-Storage in BS2000 is provided in the "Introduction to System Administration" [14]. How to work with files on Net-Storage is described in the "Introductory Guide to DMS" [13].

### Format

#### LIST-NET-DIRECTORIES

```
SERVER = <composed-name 1..256 with-under> / <c-string 1..256 with-low> / *IP-ADDRESS(...)  
    *IP-ADDRESS(...  
        |   IP-ADDRESS = <composed-name 7..15> / <c-string 2..39>  
,CLIENT = <composed-name 1..8 with-under> / <c-string 1..8> / *DNS(...) / *IP-ADDRESS(...)  
    *DNS(...  
        |   DNS-NAME = <c-string 1..256 with-low>  
    *IP-ADDRESS(...  
        |   IP-ADDRESS = <composed-name 7..15> / <c-string 2..39>  
,SELECT = *ALL / *MOUNTED / *NOT-MOUNTED
```

### Operands

#### **SERVER =**

Determines the Net-Server whose released directories are to be listed.

**SERVER = <composed-name 1..256 with-under> / <c-string 1..256 with-low>**

Host name or fully qualified domain name of a net server.

---

**SERVER = \*IP-ADDRESS(...)**

IP address of the net server.

**IP-ADDRESS = <composed-name 7..15> / <c-string 2..39>**

Specifies the IP address of the net server in IPv4 or IPv6 format.

**CLIENT =**

Specifies the Net-Client that is to be used to determine the released directories of the net server. The directories can be mounted via the net client, using the MOUNT-NET-STORAGE command.

**CLIENT = <composed-name 1..8 with-under> / <c-string 1..8>**

Internal BCAM name of the net client.

**CLIENT = \*DNS(...)**

Domain name of the net client.

**DNS-NAME = <c-string 1..256 with-low>**

Specifies the fully qualified domain name of the net client.

**CLIENT = \*IP-ADDRESS(...)**

IP address of the net client.

**IP-ADDRESS = <composed-name 7..15> / <c-string 2..39>**

Specifies the IP address of the net client in IPv4 or IPv6 format.

**SELECT = \*ALL / \*MOUNTED / \*NOT-MOUNTED**

Determines which of the released directories are displayed.

**SELECT = \*ALL**

All directories are displayed which are released for the specified net client and are thus available for use as Net-Storage.

**SELECT = \*MOUNTED**

All directories are displayed which are already mounted on the specified net client and connected to BS2000.

**SELECT = \*NOT-MOUNTED**

All directories are displayed which have been released for the specified net client but have not yet been mounted and connected to BS2000.

**Return codes**

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed without error
	1	NKAN003	Syntax error in the input
	32	NKAN004	Error in command execution
	64	NKAN015	No relevant information available

---

## Output format

### *Sample output*

```
/list-net-directories server=*ip(172.17.65.103),client=*ip(192.168.138.12)
```

```
- NET-SERVER:  IPV4: 172.17.65.103 _____ (1)
- NET-CLIENT:  IPV4: 192.168.138.12 _____ (2)
*****
- NET-DIRECTORY: /nas/100/fgqa/SQ200/test (MOUNT-ID = 1) _____ (3)
*****
- NET-DIRECTORY: /nas/100/fgqa/HNC42 (MOUNT-ID = 2)
*****
- NET-DIRECTORY: /export/nas/100/fgqa (NOT MOUNTED)
*****
- NET-DIRECTORY: /nas/100/fgqa (NOT MOUNTED)
*****
- NET-DIRECTORY: /export (NOT MOUNTED)
*****
```

- (1) `NET-SERVER` displays the name or IP address of the net server as specified in the command. For an IP address, the `IPV4` or `IPV6` format is also displayed.
- (2) `NET-CLIENT` displays the name or IP address of the net client as specified in the command. For an IP address, the `IPV4` or `IPV6` format is also displayed.

The following information is output in a separate information block for each released directory:

- (3) `NET-DIRECTORY` displays the path name of the released directory and the status. The status can assume the following values:
  - `(NOT MOUNTED)` The directory is not connected.
  - `(MOUNT-ID = <n>)` If the directory is connected, the mount ID is displayed.

## Output in S variable

Output information	Name of the S variable	T	Contents	Condition
Directory name of the Net-Storage released on the net server	var(*LIST).DIR(*LIST).NAME	S	<name 1..64> "	
Mount ID of the Net-Storage (0: volume not connected)	var(*LIST).DIR(*LIST).MOUNT-ID	I	<integer>	
Name of the net server	var(*LIST).DIR(*LIST).SERVER.NAME <sup>1</sup>	S	<name 1..256> "	
IP address of the net server in IPv4 format	var(*LIST).DIR(*LIST).SERVER.IPV4 <sup>1</sup>	S	<name 7..15> "	
IP address of the net server in IPv6 format	var(*LIST).DIR(*LIST).SERVER.IPV6 <sup>1</sup>	S	<name 15..39> "	
Name of the net client	var(*LIST).DIR(*LIST).CLIENT.NAME <sup>1</sup>	S	<name 1..256> "	
DNS name of the net client	var(*LIST).DIR(*LIST).CLIENT.DNS <sup>1</sup>	S	<name 1..256> "	
IP address of the net client in IPv4 format	var(*LIST).DIR(*LIST).CLIENT.IPV4 <sup>1</sup>	S	<name 7..15> "	
IP address of the net client in IPv6 format	var(*LIST).DIR(*LIST).CLIENT.IPV6 <sup>1</sup>	S	<name 15..39> "	

<sup>1</sup> Status-dependent output: empty string if the information is unavailable.

---

## 3.85 LIST-NODE-FILES

List node files on Net-Storage volume

**Component:** BS2000 OSD/BC

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
HARDWARE-MAINTENANCE  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

**Routing code:** @

### Function

The LIST-NODE-FILES command lists node files (files of the type NODE-FILE) which are located on a Net-Storage volume and can be imported with the IMPORT-NODE-FILE command. This comprises all node files with a BS2000-compliant name which are stored directly in the user-specific directory on the Net-Storage volume. Directories and files located below it are not taken into account.

The command supports structured output in S variables (see "[Output in S variable](#)").

#### *Privileged functions*

Systems support (TSOS privilege) can have node files from all user-specific directories listed.

### Format

#### **LIST-NODE-FILES**

**VOLUME** = <vsn 6..6>

,**USER-DIRECTORY** = \*OWN / \*ALL / <name 1..8>

,**NODE-FILE-NAME** = <filename 1..54 without-cat-gen-vers with-wild(80)>

,**INFORMATION** = \*STD / \*SUMMARY

,**OUTPUT** = \*SYSOUT / list-poss(2): \*SYSOUT / \*SYSLST

---

## Operands

### **VOLUME = <vsn 6..6>**

VSN of the Net-Storage volumes whose node files are to be listed.

### **USER-DIRECTORY = \*OWN / \*ALL / <name 1..8 >**

Directory of the user ID from which the node files are listed. The directory name is the same as the user ID. Only those files are listed which reside directly below this directory on the Net-Storage volume. Directories contained in the directory are ignored. Nonprivileged users can only obtain information on node files for their own user ID.

### **USER-DIRECTORY = \*OWN**

Lists node files from the directory of the user's own user ID.

### **USER-DIRECTORY = \*ALL**

*This operand value is reserved for privileged users.* Lists node files from all user directories of the Net-Storage volume.

### **USER-DIRECTORY = <name 1..8 >**

Lists node files from the specified user directory. The name of the directory corresponds to the user ID.

Nonprivileged users can only specify their own user ID.

### **NODE-FILE-NAME = <filename 1..54 without-cat-gen-vers with-wild(80)>**

File names of the node files which are to be listed. Only files with BS2000-compliant file names are listed, i.e. node files which can be imported.

### **INFORMATION = \*STD / \*SUMMARY**

Controls the scope of the information to be output.

### **INFORMATION = \*STD**

Outputs a line of information with the most important file attributes in summarized form for each node file. The line of information contains brief information about the file access rights, file size, change date and file name. Up to 74 characters are displayed.

### **INFORMATION = \*SUMMARY**

For each specified user directory, outputs the number of node files and the total number of bytes which these occupy in this directory.

### **OUTPUT =**

Specifies where the information is to be output.

### **OUTPUT = \*SYSOUT**

The output is directed to SYSOUT.

### **OUTPUT = \*SYSLST**

Output is written to SYSLST.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	64	CMD0102	Interrupted by K2 key
	64	CMD0216	Privilege errors
	64	DMS051B	Requested user ID not in pubset
	64	DMS0594	Not enough virtual memory available
	64	DMS0586	It is not possible to access or reserve a volume at present
	32	DMS05C7	DMS internal error
	64	DMS0607	Error when generating S variables
	64	DMS0640	ONETSTOR reports communication problem with net client
	64	DMS0643	Net client reports access error
	64	DMS0644	Net client reports internal error
	64	DMS06CC	No file matches selection criteria

## Output format

### *Sample output*

```
/list-node-files volume=ck68@0,user-dir=*own,node-file-name=*
CK68@0/USER1/ _____ (1)
-rw----- 10k Sep 12 14:27 NNDF1 _____ (2)
-rw----- 2M May 21 01:10 NNDF2
-rw----- 1M May 21 01:15 NNDF3
-rw----- 2M May 21 01:20 NNDF4
```

### *Explanation of the output*

The following information is output for each specified user-specific directory:

- (1) Path name of the user-specific directory containing the displayed node files.
- (2) The following file attributes are displayed for each file of the user-specific directory:
  - The read, write and execute access rights for the file owner, the user's group and the other users in UNIX format: r=read permission, w=write permission, x=execute permission and "-" when no authorization is available.
  - The file size in bytes (without suffix), in KB (suffix "k"), in MB (suffix "M") or in GB (suffix "G").
  - Date and time of the last change.

- Name of the file.

## Output in S variable

The INFORMATION operand identifies the S variables which are to be created.

Output information	Name of the S variable	T	Contents	Condition
Name of the file	var(*LIST).F-NAME	S	" <filename>	INF=*STD
File size, depending on size in bytes (without suffix), in KB (suffix "k"), in MB (suffix "M") or in GB (suffix "G")	var(*LIST).F-SIZE	I	" <integer 0.. 1023> <integer 0.. 1023>k <integer 0.. 1023>M <integer 0.. 1023>G	INF=*STD
Execute permission for GROUP	var(*LIST).GROUP.EXEC	S	" NO / YES	INF=*STD
Read permission for GROUP	var(*LIST).GROUP.READ	S	" NO / YES	INF=*STD
Write permission for GROUP	var(*LIST).GROUP.WRITE	S	" NO / YES	INF=*STD
Date of last file modification	var(*LIST).LAST-CHA-DATE	S	" <yyyy-mm- dd>	INF=*STD
Time of last file modification	var(*LIST).LAST-CHA-TIME	S	" <hh:mm>	INF=*STD
Number of node files in the directory	var(*LIST).NUM-OF-F	I	" <integer 0.. 1023>	INF=*SUM
Execute permission for OTHERS	var(*LIST).OTHERS.EXEC	S	" NO / YES	INF=*STD
Read permission for OTHERS	var(*LIST).OTHERS.READ	S	" NO / YES	INF=*STD
Write permission for OTHERS	var(*LIST).OTHERS.WRITE	S	" NO / YES	INF=*STD
Execute permission for OWNER	var(*LIST).OWNER.EXEC	S	" NO / YES	INF=*STD

Read permission for OWNER	var(*LIST).OWNER.READ	S	" NO / YES	INF=*STD
Write permission for OWNER	var(*LIST).OWNER.WRITE	S	" NO / YES	INF=*STD
UNIX file type	var(*LIST).UNIX-F-TYPE	S	" FILE	INF=*STD
UNIX path name: directory of the node file	var(*LIST).UNIX-PATHNAME	S	" <filename>	INF=*STD/ *SUM
Sum of the storage space of the node files in the directory	var(*LIST).USED-BYTES	I	" <integer 0.. 1023> <integer 0.. 1023>k <integer 0.. 1023>M <integer 0.. 1023>G	INF=*SUM
user ID	var(*LIST).USER-ID	S	" <userid>	INF=*STD

---

## 3.86 LOAD-ALIAS-CATALOG

Load entries from file into alias catalog

**Component:** ACS

**Functional area:** File processing

**Domain:** FILE

**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT  
SECURITY-ADMINISTRATION

### Function

The LOAD-ALIAS-CATALOG command enables the user to load an alias catalog file (also called an AC file) into the task-local alias catalog. If no alias catalog exists for the task, an alias catalog is created for it automatically the first time an AC file is loaded.

The AC file contains the assignments of aliases to actual file or job variable names. When the alias substitution function is active, ACS substitutes the actual file or job variable name for the aliases that are specified by the user in commands. The alias substitution function has priority over the prefix insertion function and prevents the insertion of prefixes.

The ACS administrator can provide the user with one or more AC system files containing predefined alias definitions for specific software configurations (e.g. compilers, utilities, etc.). The names of the available AC system files can be displayed by means of the SHOW-ACS-SYSTEM-FILES command. The name of the default AC system file is identified by the character ">" in the output of this command.

If desired, the user may also load a personally created AC file containing user-specific alias definitions (see also the STORE-ALIAS-CATALOG command).

The alias catalog that is local to the task can be extended by loading additional AC files (see the MODE=\*MERGE operand) or by adding individual alias definitions to it with the ADD-ALIAS-CATALOG-ENTRY command.

Entries in the alias catalog that is local to the task can be displayed by the user with the SHOW-ALIAS-CATALOG-ENTRY command.

The commands HOLD-ALIAS-CATALOG and RESUME-ALIAS-CATALOG can be used to halt and resume alias substitution, respectively.

The user can save the current alias catalog in an AC file by using the STORE-ALIAS-CATALOG command (only the user entries are saved), or delete it with the PURGE-ALIAS-CATALOG command.

The alias catalog is automatically deleted at the end of the task.

#### *Loading errors*

Syntactically incorrect or invalid AC entries cannot be loaded into the alias catalog and are not logged, but message ACS0003 is output. **Five** such errors will cause the load operation to abort.

The existing alias catalog, if any, will be restored to its original state if loading is aborted.

## Format

**LOAD-ALIAS-CATALOG**

Alias: **LDAC**

**ALIAS-CATALOG-ID** = **\*STD** / <composed-name 1..20> / **\*OWN(...)**

**\*OWN(...)**

| **FROM-FILE** = <filename 1..54 without-gen-vers>

,**MODE** = **\*MERGE** / **\*REPLACE**

,**SELECT** = **\*ALL-ENTRIES** / **\*BY-ALIAS-NAME(...)**

**\*BY-ALIAS-NAME(...)**

| **USER-IDENTIFICATION** = **\*ANY** / **\*OWN** / **\*NONE** / **\*DEFAULT-USERID**

,**SUCCESS-MSG** = **\*STD** / **\*YES** / **\*NO**

## Operands

**ALIAS-CATALOG-ID = \*STD / <composed-name 1..20> / \*OWN(...)**

Names the AC file from which the alias catalog is to be loaded. The user must have execution rights for the AC file.

**ALIAS-CATALOG-ID = \*STD**

The alias catalog is loaded from the default AC system file. This file is identified in the output of the SHOW-AC-SYSTEM-FILES command by the character ">".

**ALIAS-CATALOG-ID = <composed-name 1..20>**

Identification of an AC system file. The available AC system files can be determined by the user with the SHOW-AC-SYSTEM-FILES command.

**ALIAS-CATALOG-ID = \*OWN(...)**

The alias catalog is loaded from the AC file that is specified by the user.

**FROM-FILE = <filename 1..54 without-gen-vers>**

File name of the AC file.

**MODE = \*MERGE / \*REPLACE**

Specifies whether the alias catalog to be generated is to overwrite or extend an existing alias catalog.

**MODE = \*MERGE**

The existing alias catalog, if any, is retained, and entries from the specified AC system file or the user-specific AC file are appended to it. Existing entries with the same alias are overwritten.

**MODE = \*REPLACE**

Previous entries in the alias catalog are deleted. The new alias catalog will only have the entries contained in the AC system file or AC file.

**SELECT = \*ALL-ENTRIES / \*BY-ALIAS-NAME(...)**

Determines whether all entries in the specified AC system file or AC file are to be loaded into the task-specific alias catalog.

---

**SELECT = \*ALL-ENTRIES**

All entries are loaded into the alias catalog of the task.

**SELECT = \*BY-ALIAS-NAME(...)**

Only the entries specified in the selection which follows are loaded into the task-local alias catalog. The selection criterion used is the name of the alias.

**USER-IDENTIFICATION =**

The entries to be loaded are selected on the basis of the user ID that was specified in the alias.

**USER-IDENTIFICATION = \*ANY**

The user ID does not serve as a selection criterion (equivalent to SELECT=\*ALL-ENTRIES).

**USER-IDENTIFICATION = \*OWN**

Only the entries which have the user's own user ID in the alias are loaded.

**USER-IDENTIFICATION = \*NONE**

Only the entries without a user ID in the alias are loaded.

**USER-IDENTIFICATION = \*DEFAULT-USERID**

Only the entries with the system default ID in the alias are loaded. The alias *\$file* is equivalent to *\$.file* if *file* does not contain a period.

**SUCCESS-MSG = \*STD / \*YES / \*NO**

Specifies whether a message is to be output after the AC system file or AC file is successfully loaded.

**SUCCESS-MSG = \*STD**

The success message depends on the global settings or the setting which are local to the task (see the MODIFY-ACS-OPTIONS command). The currently applicable settings can be determined from the output of the SHOW-ACS-OPTIONS command.

**SUCCESS-MSG = \*YES**

Message ACS0001 is output after successful loading.

**SUCCESS-MSG = \*NO**

Message ACS0001 is suppressed.

## Return codes

(SC2)	SC1	Maincode	Meaning/Guaranteed messages
	0	CMD0001	Command executed normally Guaranteed message: ACS0001 (if logging is enabled; see SUCCESS-MSG operand)
1	0	CMD0001	No action (e.g. no default ACSF)
2	0	ACS0003	Warning: invalid record in ACF ignored
	32	CMD0221	Internal error
	64	ACS0004	Aborted due to invalid records in ACF
	64	ACS0011	Error when accessing file
	64	ACS0012	ACSF not found
	64	ACS0029	Command not permitted
	128	ACS0018	ACS is not available
	130	ACS0036	Resource bottleneck

## Example

*Creating the alias catalog and loading entries from the AC file*

```
/add-alias-cat alias=bsp,file=max.file.3 _____ (1)
```

```
% ACS0020 ALIAS CATALOG ACTIVATED
```

```
/add-alias-cat alias=max,file=max.file.3 _____ (2)
```

```
/add-alias-cat alias=sf.sdf,file=$tsos.sys.sdf.system.syntax,range=*file - (3)
```

```
/show-alias _____ (4)
```

```
% ALIAS FILE NAME -> FILE NAME
%UB : BSP -> MAX.FILE.3
%UB : MAX -> MAX.FILE.3
%UF : SF.SDF -> $TSOS.SYS.SDF.SYSTEM.SYNTAX
% ACS0037 NUMBER OF ALIAS CATALOG ENTRIES: 3 (FOR SYSTEM: 0, FOR USER: 3)
```

```
/load-alias-cat alias-cat=*own(acs.a1),mode=*replace _____ (5)
```

```
% ACS0001 ALIAS CATALOG 'USER1AC' LOADED (DESCRIPTOR='V0001A', DATE=2014-02-11, NUMBER OF ENTRIES=3)
```

---

**/show-alias** \_\_\_\_\_ (6)

```
% ALIAS FILE NAME -> FILE NAME
%UF : ASS -> $.ASSEMBH
%UB : BSP -> LST.BSP.2
%UF : SF.SDF -> $TSOS.SYS.SDF.SYSTEM.SYNTAX
% ACS0037 NUMBER OF ALIAS CATALOG ENTRIES: 3 (FOR SYSTEM: 0, FOR USER: 3)
```

**/>rem-alias alias=ass** \_\_\_\_\_ (7)

**/add-alias alias=max,file=max.file.3** \_\_\_\_\_ (8)

**/show-alias** \_\_\_\_\_ (9)

```
% ALIAS FILE NAME -> FILE NAME
%UB : BSP -> LST.BSP.2
%UB : MAX -> MAX.FILE.3
%UF : SF.SDF -> $TSOS.SYS.SDF.SYSTEM.SYNTAX
% ACS0037 NUMBER OF ALIAS CATALOG ENTRIES: 3 (FOR SYSTEM: 0, FOR USER: 3)
```

**/load-alias-cat alias=\*own(acs.a1),mode=\*merge** \_\_\_\_\_ (10)

```
% ACS0001 ALIAS CATALOG 'USER1AC' LOADED (DESCRIPTOR='V0001A', DATE=2014-02-11, NUMBER
OF ENTRIES=3)
```

**/show-alias** \_\_\_\_\_ (11)

```
% ALIAS FILE NAME -> FILE NAME
%UB : ASS -> $.ASSEMBH
%UB : BSP -> LST.BSP.2
%UB : MAX -> MAX.FILE.3
%UF : SF.SDF -> $TSOS.SYS.SDF.SYSTEM.SYNTAX
% ACS0037 NUMBER OF ALIAS CATALOG ENTRIES: 4 (FOR SYSTEM: 0, FOR USER: 4)
```

**/purge-alias-cat** \_\_\_\_\_ (12)

**/show-alias** \_\_\_\_\_ (13)

```
% ACS0017 ALIAS CATALOG NOT AVAILABLE. COMMAND REJECTED
```

- (1) The command ADD-ALIAS-CATALOG-ENTRY creates an entry in the task-local alias catalog to define the alias *EXP* for the file *MAX.FILE.3*. Since no alias catalog had been activated for the task, the alias catalog in question is activated in the process.
- (2) The command ADD-ALIAS-CATALOG-ENTRY creates an entry in the task-local alias catalog to define the alias *MAX* for the file *MAX.FILE.3* (thus defining a second alias).
- (3) The command ADD-ALIAS-CATALOG-ENTRY creates an entry in the task-local alias catalog to define the alias *SF.SDF* for the file *\$TSOS.SYS.SDF.SYSTEM.SYNTAX* (because RANGE=\*FILE the entry here applies only for files).

- 
- (4) Output of the entries contained in the alias catalog.
  - (5) The entries of the AC file *ACS.A1* are loaded into the alias catalog, and all previously existing entries are removed (`MODE=REPLACE`) in the process.
  - (6) The output of the `SHOW-ALIAS-CATALOG-ENTRY` command shows the three user entries that were saved in the AC file *ACS.A1* by means of the `STORE-ALIAS-CATALOG-ENTRY` command. All entries made earlier were removed or replaced by new entries for the same alias. For example, the alias *EXP* now addresses the file *LST.EXP.2*.
  - (7) Deletes the entry with the alias *ASS*.
  - (8) Adds an entry with the alias *MAX* for the file *MAX.FILE.3*.
  - (9) Output of the current entries in the alias catalog.
  - (10) The entries of the AC file *ACS.A1* are loaded into the alias catalog. All previously made entries are to be retained in this case (`MODE=MERGE`), but entries with the same alias are to be overwritten. The same result could be obtained by the user with the `ADD-ALIAS-CATALOG-ENTRY` commands for all entries of the alias catalog.
  - (11) Output of the current entries in the alias catalog.
  - (12) The task-local alias catalog is deleted by using the `PURGE-ALIAS-CATALOG` command. This also ends the ACS substitution function.
  - (13) The command `SHOW-ALIAS-CATALOG-ENTY` indicates that no task-local alias catalog is loaded.

For further examples, see the `ADD-ALIAS-CATALOG-ENTRY` and `HOLD-ALIAS-SUBSTITUTION` commands.

---

## 3.87 LOAD-EXECUTABLE-PROGRAM

Load executable program (LLM, load, object module)

<b>Component:</b>	BLSSERV
<b>Functional area:</b>	Program control System control and optimization
<b>Domain:</b>	PROGRAM
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

### Function

The LOAD-EXECUTABLE-PROGRAM command has two functions:

- It calls the dynamic binder loader DBL and defines the primary input. DBL links LLMs or OMs into a load unit, which it then loads into main memory. The DBL loads an LLM which has already been linked by the BINDER into a load unit and stored in a PAM file (PAM-LLM) only in main memory.
- It calls the static loader ELDE. A program (load module) previously linked by the TSOSLNK linkage editor is loaded by ELDE into main memory.

The loaded load unit or program is not started until a RESUME-PROGRAM command is executed.

If the user wants to load *and* start the load unit or program, the START-EXECUTABLE-PROGRAM command can be used instead of the LOAD-EXECUTABLE-PROGRAM and RESUME-PROGRAM commands.

In the case of operands which have \*DBL-PARAMETERS as their default value, the MODIFY-DBL-DEFAULTS command can be used to modify the default DBL parameters which apply when the task is started. The parameters can be configured separately for calls to the LOAD- and START-EXECUTABLE-PROGRAM commands on the one hand and for the BIND macro call on the other. The SHOW-DBL-DEFAULTS command lists the values which are currently set. The RESET-DBL-DEFAULTS command can be used to return the settings to the DBL defaults.

**i** Structure-implicit notation is guaranteed for the PROGRAM-MODE, REP-FILE and ALTERNATE-LIBRARIES operands (see [section "Abbreviation of names"](#)).

### *Restrictions*

Users with SAT-FILE-EVALUATION, SAT-FILE-MANAGEMENT and SECURITY-ADMINISTRATION privileges can only use the command in procedures.

## Format

LOAD-EXECUTABLE-PROGRAM

Alias: LDX

**FROM-FILE** = <filename 1..54 without-gen> / \*OMF / [\*LIBRARY-ELEMENT](...)

```

---

## Operands

### **FROM-FILE =**

Determines the input source from which the program is to be loaded.

### **FROM-FILE = <filename 1..54 without-gen>**

Name of the PAM file that contains a load module or PAM-LLM.

**i** If the file/library name is specified without a catalog/user ID and if it is not cataloged in the user ID, the system tries to access a file or library of the same name in the system default ID. (For information on this “secondary read” function see the “Introductory Guide to DMS” [13].)

### **FROM-FILE = \*OMF**

The input source is the EAM object module file. This contains object modules only.

### **FROM-FILE = \*LIBRARY-ELEMENT(...)**

The input source is a program library from which modules are retrieved. Either the dynamic binder loader DBL or the static loader ELDE is called depending on the element type.

#### **LIBRARY =**

Specifies the input source from which modules (LLMs, load modules or object modules) are to be retrieved. The input source must generally be a program library. If the input source is an object module library (OML) then the following conditions must be fulfilled:

- Only object modules (OM, TYPE=R) may be loaded
- A value other than the default value ELEMENT must be specified for the NAME-SCOPE operand.

Whether other libraries are searched depends on the specification in the [ALTERNATE-LIBRARIES operand](#).

#### **LIBRARY = \*DBL-DEFAULT**

The setting in the last MODIFY-DBL-DEFAULTS command applies. \*BLSLIB is set by default on task start.

#### **LIBRARY = \*BLSLIB**

The input source is the **standard library** with the file link name BLSLIB.

#### **LIBRARY = <filename 1..54 without-gen>**

File name of a library serving as input source.

#### **LIBRARY = \*LINK(...)**

File link name of the library serving as input source.

#### **LINK-NAME = <structured-name 1..8>**

File link name of the library.

#### **ELEMENT-OR-SYMBOL =**

Specifies the modules that are to be retrieved from the specified input source.

In the case of an object module, the start address is dependent on the specifications in the END record as follows:

- If a start address is specified in the END record then this address is used.
- If no start address is specified in the END record then the address of the first CSECT in the module is used.

- If an external reference (EXTRN or WXTRN) is specified in the END record then the module is started at the address of the symbol that resolves this reference. If no symbol that resolves the reference is found then
  - in the case of an unresolved EXTRN, loading is aborted,
  - in the case of an unresolved WXTRN, the module is started at the address of the first CSECT.

An LLM is started at the address that was taken over by the BINDER when the LLM was stored.

**ELEMENT-OR-SYMBOL = <composed-name 1..64 with-under>(…)**

Name of the object module (element type R), load module (element type C) or LLM (element type L). The possible element types are specified in the TYPE operand. Depending on the specification in the NAME-SCOPE operand, a CSECT name, ENTRY name or element name from a module may be specified.

**VERSION =**

Specifies the element version.

**VERSION = \*HIGHEST-EXISTING**

The default value for the highest element version in program libraries is taken over (see the “LMS” manual [21]).

**VERSION = <composed-name 1..24 with-under>**

Explicit specification of the element version.

**NAME-SCOPE =**

Specifies whether the name entered in ELEMENT-OR-SYMBOL can be an element name or also a CSECT or ENTRY name.

**NAME-SCOPE = \*ELEMENT**

Only elements in PLAM libraries are searched for.

**NAME-SCOPE = \*SYMBOL**

Only CSECT or ENTRY names are searched for. If the specified name is longer than 32 characters, the command is rejected.

For the search order, see section “Linkage process” in the “BLSSERV” User Guide [3].

**NAME-SCOPE = \*STD**

Both element names (with the exception of type C) and CSECT/ENTRY names are searched for. If the specified name is longer than 32 characters, the command is rejected.

For the search order, see section “Linkage process” in the “BLSSERV” User Guide [3].

**ELEMENT-OR-SYMBOL = <c-string 1..32 with-low *symbol*>**

Specifies a symbol as a C string (pay attention to uppercase/lowercase). For the search order, see section “Linkage process” in the “BLSSERV” User Guide [3].

**TYPE = (L,C,R) / list-poss(3): L / C / R**

Specifies the element type. When a list is specified, the order of the specified element types also determines the search order. The default setting (L,C,R) specifies that the element is first searched for in the LLMs, then in the load modules and finally in the OMs. In the case of NAME-SCOPE=\*SYMBOL/\*STD, the specification of element type C is ignored.

The following applies for element names > 41 characters:

- If element type C is specified as an individual value, the command is rejected.
- If multiple element types are specified, element type C is ignored.

---

The operand is only evaluated for the input source (LIBRARY), not for alternate libraries for which the order L, R applies.

**PROGRAM-PARAMETERS = \*NONE / <c-string 1..1800 with-low>**

Parameters can be specified only if the chargeable SDF-P subsystem is in use.

Program parameters which read in the called program from the S variable SYSPARAM or via the C function *getopt*. The default value is \*NONE, i.e. no parameters are passed to the program. In such cases, an existing SYSPARAM is deleted.

**DBL-PARAMETERS = \*STD / \*PARAMETERS(...)**

*This operand is not evaluated for load modules (element type C).*

Designates all the parameters that are set by default in DBL or whose default setting can be modified using the MODIFY-DBL-DEFAULTS command. \*STD is set by default, i.e. the command is called with the current DBL parameters. It is possible to declare explicit values for the command call by specifying \*PARAMETERS(...).

**DBL-PARAMETERS = \*PARAMETERS(...)**

Explicit specification of the DBL parameters for this command call.

**LOADING = \*PARAMETERS(...)**

Specifies the parameters for the load operation.

**PROGRAM-MODE=**

Specifies in which part of the address space (above or below the 16-Mbyte boundary) the modules of the load unit are to be loaded. For the addressing mode, see the "BLSSERV" User Guide [3].

**PROGRAM-MODE = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is 24.

**PROGRAM-MODE = \*ANY**

The modules of the load unit may be loaded above or below the 16-Mbyte boundary.

**PROGRAM-MODE = \*24**

The entire load unit is loaded below the 16-Mbyte boundary.

**LOAD-INFORMATION =**

Specifies the loading information for the load unit.

**LOAD-INFORMATION = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*DEFINITIONS.

**LOAD-INFORMATION = \*DEFINITIONS**

Loads an ESD containing the program definitions of all the modules in the load unit. Program definitions include program sections (CSECTs), entry points (ENTRYs), COMMON areas and external dummy sections (XDSECS-D).

**LOAD-INFORMATION = \*REFERENCES**

Loads an ESD containing not only the program definitions, but also the satisfied references of all the modules in the load unit.

References include external references (EXTRNs), V-type constants, conditional external references (WXTRNs) and external dummy sections (XDSECS-R).

---

**LOAD-INFORMATION = \*MAP**

Only one ESD required for the generation of the DBL list is *temporarily* loaded. The ESD is unloaded as soon as the DBL list has been generated.

**LOAD-INFORMATION = \*NONE**

The external symbols dictionary (ESD) is not loaded with LLMs and is only loaded temporarily with OMs.

- With LLMs, the ESD is not read at all and consequently is also not used to resolve references within the generated load unit.
- With OMs, the ESD is read and is temporarily available during the loading process.

If external references need to be resolved between LLMs and OMs of the generated load unit, the minimum specification is \*DEFINITIONS or \*MAP.

**REP-FILE = \*DBL-DEFAULT / \*NONE / <filename 1..54 without-gen>**

Specifies whether REP records are to be applied to the modules of a load unit. Default: The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*NONE, i. e. no REP records are used.

If the user specifies a file name, the DBL attempts to process REP records from this file. The REP records must have the standard format that is processed by the RMS utility routine (see the "Utility Routines" manual [9]). Should an error occur during REP record processing, a message (warning) is output, the invalid REP record is skipped and REP processing is then continued.

**IGNORE-ATTRIBUTES =**

Specifies which CSECT attributes are ignored on loading.

**IGNORE-ATTRIBUTES = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*NONE.

**IGNORE-ATTRIBUTES = \*NONE**

No CSECT attributes are ignored on loading.

**IGNORE-ATTRIBUTES = \*READ-ONLY**

The CSECT attribute READ-ONLY is ignored on loading. The CSECT is loaded into a readable/writable main memory page. This enables breakpoints to be set when testing with AID, for example.

**AMODE-CHECK = \*DBL-DEFAULT / \*STD / \*ADVANCED**

Determines whether additional checks of the addressing mode should take place during loading.

**AMODE-CHECK = \*DBL-DEFAULT**

The setting of the last MODIFY-DBL-DEFAULTS command applies. When the task begins, \*STD is the default.

**AMODE-CHECK = \*STD**

Only the checks compatible with BLSSERV < V2.5 are executed.

**AMODE-CHECK = \*ADVANCED**

The same checks as for AMODE-CHECK = \*STD are performed.

During loading, a check is also performed to see whether inconsistencies can occur while resolving external references because of the load unit's addressing mode.

**RESOLUTION = \*PARAMETERS(...)**

Specifies how external references are to be handled.

---

**SHARE-SCOPE =**

*This specification is ignored for a PAM-LLM (SHARE-SCOPE=\*NONE applies implicitly). Specifies whether, and if so, which portion of the shared code (see section “Shareable programs (shared code)” in the “BLSSERV” User Guide [3]) is included in the search for modules of the load unit and for unresolved external references. On the system level, system administration can make available frequently used programs or modules to users in class 4/5 memory (as nonprivileged subsystems). The nonprivileged user can also make available programs or modules to users in class 6 memory (in a memory pool). If a user uses modules from the available shared code, these modules need not be created in the task’s class 6 memory. The references to modules already loaded as shared code suffice.*

The shared code is searched in the following order:

1. Search of the shared code in class 6 memory (Common Memory Pools). If DBL finds the symbol it is searching for, it passes the load address, connects the task to the memory pool and terminates the load operation.
2. Search of the system’s shared code, i.e. search of all nonprivileged subsystems that have been loaded into class 3/4 and class 5 memory. If DBL finds the symbol it is searching for, it passes the load address, connects the task to the memory pool and terminates the load operation.

**SHARE-SCOPE = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*SYSTEM-MEMORY.

**SHARE-SCOPE = \*SYSTEM-MEMORY**

Only the shared code made available in class 3/4 and class 5 memory is included in the search.

**SHARE-SCOPE = \*NONE**

Shared code is not included in the search.

**SHARE-SCOPE = \*ALL**

Both the shared code made available in class 3/4 and class 5 memory (system memory) and that made available in class 6 memory (memory pools) is included in the search.

**SHARE-SCOPE = \*MEMORY-POOL(...)**

The user shared code available in class 6 memory is included in the search, i.e. memory pools with the specified scope are included.

**SCOPE =**

Scope of the memory pools to be included.

**SCOPE = \*ALL**

All memory pools which the task can access are included.

**SCOPE = \*USER-ID**

Only memory pools which were set up for the user ID of the calling task are included, i.e. memory pools which are shareable for all tasks under this user ID.

**SCOPE = \*USER-GROUP**

Only memory pools which were set up for the user group to which the calling task belongs are included, i.e. memory pools which are shareable for all tasks of this user group.

**SCOPE = \*HOST-SYSTEM**

Only memory pools which were set up globally are included, i.e. memory pools which can be used by all tasks.

---

**PROGRAM-VERSION =**

Specifies the program version that DBL is to use. With regard to DBL, a program version is the version of a load unit which is about to be or has already been loaded.

**PROGRAM-VERSION = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*STD.

**PROGRAM-VERSION = \*STD**

The load unit produced by the load call is assigned the version of the loaded library element as its program version.

If the symbol specified in the load call has already been loaded, the command looks for the program version defined in the SELECT-PROGRAM-VERSION command. If no program version has yet been defined, DBL uses the first symbol it finds.

**PROGRAM-VERSION = \*BLANK**

The program version is disregarded. If the load unit specified in the call is not yet loaded, the load unit being loaded is not assigned a version.

**PROGRAM-VERSION = <composed-name 1..24 with-underscore>**

Version of the program looked for among the programs which are already loaded. If this program version has not yet been loaded, the load unit being loaded is assigned this version.

**ALTERNATE-LIBRARIES = \*DBL-DEFAULT / \*NONE / list-poss(2) \*TASKLIB / \*BLSLIB##**

*This specification is ignored for a PAM-LLM (ALTERNATE-LIBRARIES=\*NONE applies implicitly).*

Specifies whether alternate libraries are to be searched for symbols. They are also used for the DBL autolink function (see also the AUTOLINK operand).

If a list is specified then the libraries are searched in the specified order.

When the alternate libraries are searched, then the fixed type order L,R applies irrespective of the TYPE operand. In this case, only symbols are searched for, not element names.

**ALTERNATE-LIBRARIES = \*DBL-DEFAULT**

The setting in the last MODIFY-DBL-DEFAULTS command applies. \*NONE is set by default at task start.

**ALTERNATE-LIBRARIES = \*NONE**

No alternate libraries are searched.

**ALTERNATE-LIBRARIES = \*TASKLIB**

The system and/or user Tasklibs are searched in the following order:

1. The library that was assigned using the SET-TASKLIB command
2. The library \$userid.TASKLIB or, if this does not exist  
The TASKLIB library under the system default ID (DEFLUID ID)

**ALTERNATE-LIBRARIES = \*BLSLIB##**

The libraries assigned with the file link name BLSLIBnn or \$BLSLIBnn (00<=nn<=99) are searched.

Files with the file link name \$BLSLIBnn are alternate system libraries that are internally assigned by the system depending on the components that are required by the runtime system.

**AUTOLINK =**

*This specification is ignored for a PAM-LLM (AUTOLINK=\*NO applies implicitly).* Specifies whether the DBL autolink function is to be used.

---

**AUTOLINK = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*YES.

**AUTOLINK = \*YES**

The DBL autolink function is used and both the input source and any alternate libraries are searched.

**AUTOLINK = \*NO**

The DBL autolink function is not used.

**AUTOLINK = \*ALTERNATE-LIBRARIES**

The DBL autolink function is used for alternate libraries only if alternate library searching has been enabled (ALTERNATE-LIBRARIES=\*TASKLIB/\*BLSLIB##).

**ERROR-PROCESSING = \*PARAMETERS(...)**

Specifies how any errors that occur are to be handled.

**NAME-COLLISION =**

Specifies how name collisions between symbols of the same name are to be handled. Name collisions are discovered only if the symbols are *not* masked.

**NAME-COLLISION = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*STD.

**NAME-COLLISION = \*STD**

Name collisions between nonmasked symbols are indicated by warning messages. The module containing the symbol with the same name is loaded. The new occurrence of the symbol is masked, i.e. it is no longer used to satisfy external references.

**NAME-COLLISION = \*ABORT**

Loading of the current load unit is aborted if a name collision between nonmasked symbols is discovered.

**UNRESOLVED-EXTRNS =**

*This specification is ignored for a PAM-LLM (UNRESOLVED-EXTRNS=\*STD applies implicitly).*

Specifies how unresolved external references are to be handled. All unresolved external references are output to the symbol file SYSOUT, with unresolved external dummy sections (XDSECS-R) listed separately.

**UNRESOLVED-EXTRNS = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*STD.

**UNRESOLVED-EXTRNS = \*STD**

Unresolved external references are assigned an address specified in the ERROR-EXIT operand.

**UNRESOLVED-EXTRNS = \*DELAY**

Unresolved external references are satisfied at a later time. This operand is permissible only when LOAD-INFORMATION=\*REFERENCES.

The DBL stores the unresolved external references in the link context. After the next load unit is loaded into the context, the DBL attempts to satisfy the stored external references with CSECTS and ENTRYs from this new load unit. This process is repeated whenever further load units are loaded for as long as the context continues to exist. External dummy sections (XDSECS-R) cannot be stored.

---

When stored in the context, the unresolved external references are assigned a (preliminary) address, which is specified in the ERROR-EXIT operand.

**UNRESOLVED-EXTRNS = \*ABORT**

All external references must be resolved. If not, the current load unit is aborted.

**ERROR-EXIT = \*DBL-DEFAULT / \*NONE / <x-string 1..8>**

Defines the address that unresolved external references are to be assigned if the operands UNRESOLVED-EXTRNS=\*STD / \*DELAY are specified.

Default: The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*NONE.

If \*NONE is specified, external references are left unresolved (equivalent to specifying X'FFFFFFFF').

**REPORTING = \*PARAMETERS(...)**

Specifies how the load operation is to be logged.

**MESSAGE-CONTROL =**

Specifies the lowest message class at which messages are to be output.

**MESSAGE-CONTROL = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*INFORMATION.

**MESSAGE-CONTROL = \*INFORMATION**

Outputs messages of all message classes.

**MESSAGE-CONTROL = \*WARNING**

Outputs messages of the WARNING and ERROR message classes only; messages of the INFORMATION message class are not output.

**MESSAGE-CONTROL = \*ERROR**

Outputs messages of the ERROR message class only.

**MESSAGE-CONTROL = \*NONE**

No messages are to be output.

**PROGRAM-MAP =**

Specifies whether a DBL list is to be output and defines the output destination for the DBL list.

**PROGRAM-MAP = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*NO.

**PROGRAM-MAP = \*NONE**

No DBL list is to be output.

**PROGRAM-MAP = \*SYSLST(...)**

The output destination is the SYSLST system file.

**SYSLST-NUMBER =**

Specifies the number of the SYSLST system file from the set SYSLST00 to SYSLST99.

**SYSLST-NUMBER = \*STD**

The output destination is the system file SYSLST[00]

---

**SYSLST-NUMBER = <integer 1..99>**

The output destination is a SYSLST system file from the set SYSLST01 to SYSLST99.

**PROGRAM-MAP = \*SYSOUT**

The output destination is the SYSOUT system file.

**PROGRAM-MAP = \*BOTH(...)**

The system files SYSOUT and SYSLST are both output destinations.

**SYSLST-NUMBER =**

Specifies the number of the SYSLST system file from the set SYSLST00 to SYSLST99.

**SYSLST-NUMBER = \*STD**

The output destination is the system file SYSLST[00]

**SYSLST-NUMBER = <integer 1..99>**

The output destination is a SYSLST system file from the set SYSLST01 to SYSLST99.

**MONJV = \*NONE / <filename 1..54 without-gen-vers>**

Name of the job variable that is to monitor the program.

While the program is executing, the system sets the JV to one of the following values:

\$R program executing

\$T program terminated

\$A program abnormally terminated

This operand is available only to users who have the JV software product (see also the "Job Variables" manual [20]).

**CPU-LIMIT = \*JOB-REST / <integer 1..32767 seconds>**

Maximum CPU time, in seconds, allowed for execution of the program.

If the execution of the program exceeds the specified time, in interactive mode the program is interrupted and message EXC0075 is output. The user can request a dump, abort the program or continue the program. If a STXIT routine is defined in the program for the event of reaching the CPU time limit, this routine is executed and the program terminated.

In batch mode the program is terminated. See also [section "Time limits in BS2000"](#).

**CPU-LIMIT = \*JOB-REST**

If the job was started with a time limit, the remaining CPU time will be used as the time limit for the program.

Otherwise, the program executes without a time limit.

**TEST-OPTIONS =**

Specifies whether symbolic addresses in the program may be used in testing (with AID). Symbolic addresses can only be used to debug programs for which debugging and diagnostic information (LSD/list for symbolic debugging) was generated at compile time. This entails setting certain compiler options when compiling the source program (see the appropriate compiler user guide).

**TEST-OPTIONS = \*DBL-DEFAULT**

The setting from the last MODIFY-DBL-DEFAULTS command applies. At the start of a task, the preset value is \*NONE.

**TEST-OPTIONS = \*NONE**

The local symbolic address table/the internal symbolic address table is not used.

## TEST-OPTIONS = \*AID

This operand is required for testing with AID.

This specification permits the use of symbolic addresses when testing the program with AID commands. For this, a local symbolic address table or an internal symbolic address table must have been generated when the program was compiled.

This specification is only possible for OMs (element type R) and LLMs (element type L) if LOAD-INFORMATION=\*DEFINITIONS/\*REFERENCES is also specified.

## RESIDENT-PAGES = \*PARAMETERS(...)

Number of resident memory pages required for the program run.

This operand must be specified if, in the program, pages are to be made resident with a CSTAT macro (see the “Executive Macros” manual [22]). The permissible number of resident memory pages can be controlled by the operator.

If the operand is omitted (MIN=\*STD,MAX=\*STD), the memory requirements are taken from the start record of the program, which requires the file to be opened.

**MINIMUM = \*STD / <integer 0..2147483647 4Kbyte >**

Minimum number of resident memory pages required.

**MAXIMUM = \*STD / <integer 0..2147483647 4Kbyte >**

Maximum number of resident memory pages required.

## VIRTUAL-PAGES = \*STD / <integer 0..32767 4Kbyte >

*The operand is evaluated only if a load module (element type C) is loaded.*

Number of pageable memory pages which must be available for the program run. If the specified number exceeds the number of pages available on the computer, the command is rejected.

## VIRTUAL-PAGES = \*STD

The memory requirements are taken from the start record of the program.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	BLS0150	Warning on loading of the program (see the message on SYSOUT)
	32	BLS0152	Loading of the program aborted due to system error
	64	CMD0216	The user is not authorized to use the command
	64	BLS0153	Loading of the program aborted due to an unrecoverable error (see the SYSOUT message for the reason)

## Notes

- Further information on loading programs can be found in the description of the loaders in the “BLSSERV” User Guide [3].
- DBL does not lock any libraries or library elements during the program run.
- Calling DBL with START-/LOAD-EXECUTABLE-PROGRAM always corresponds to a call with START-/LOAD-PROGRAM and RUN-MODE=\*ADVANCED. The functionality of RUN-MODE=\*STD is only available with the earlier commands START-/LOAD-PROGRAM.

- Some DBL functions are not available for an LLM that has already been linked into a load unit with BINDER and stored in a PAM file (PAM-LLM). Explicit specifications for the operands involved are ignored and the command is executed implicitly with the following values:
- SHARE-SCOPE=\*NONE
- ALTERNATE-LIBRARIES=\*NONE
- AUTOLINK=\*NO
- UNRESOLVED-EXTRNS=\*STD
- If multiple identical element types (TYPE operand) or alternate libraries (ALTERNATE-LIBRARIES operand) are specified, command execution is aborted with a warning.
- If NAME-SCOPE=\*SYMBOL/\*STD or ELEMENT-OR-SYMBOL= <c-string> is specified then:
  - if only element type C is declared (TYPE operand), command execution is aborted with an error message.
  - if element type C and at least one other element type are declared (TYPE operand) then element type C is ignored and the command is executed. If NAME-SCOPE=\*STD then a warning is issued if an existing C element is skipped.
- As the specification of an element name > 32 characters in the ELEMENT-OR-SYMBOL operand cannot refer to a CSECT or ENTRY name (up to 32 characters), the following applies:
  - When NAME-SCOPE=\*SYMBOL is specified the command is rejected.
  - When NAME-SCOPE=\*STD is specified the search is restricted just to element names without a warning.
- As the specification of an element name > 41 characters in the ELEMENT-OR-SYMBOL operand cannot refer to a load module (element type C with up to 41 characters), the following applies:
  - When TYPE=C is specified the command is rejected.
  - If in addition to C at least one other element type is specified in the TYPE operand, element type C is ignored without a warning.
- DBL defines the following names for the context and the load unit:
  - the default name "LOCAL#DEFAULT" for the context
  - the default name "%UNIT" for the load unit
- Execution of programs cannot be nested. If a LOAD-EXECUTABLE-PROGRAM or LOAD-PROGRAM command is issued when a program is already loaded, the loaded program is unloaded and the new command is executed. No error message appears; however, an ABEND-STXIT routine defined in the unloaded program is first activated, unless the LOAD-PROGRAM command is called via the CMD macro (see the "Executive Macros" manual [22]).
- Program monitoring (see also the "Job Variables" manual [20]):
  - The status indicator in the job variable monitoring the program is set to "\$R" when the program is started.
  - If a program is already loaded or a started program is interrupted by a HOLD-PROGRAM command or depression of the [K2] key, the status indicator in the program-monitoring job variable is set to "\$A".
  - If the JV is not accessible at the time the command is processed, an error message is issued to SYSOUT and command processing is continued.

## Examples

See the START-EXECUTABLE-PROGRAM command.

---

## 3.88 LOAD-PROGRAM

Load program (load or object module)

<b>Component:</b>	BLSSERV
<b>Functional area:</b>	Program control
<b>Domain:</b>	PROGRAM
<b>Privileges:</b>	STD-PROCESSING SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION

**i** As of BLSSERV V2.3, the LOAD-PROGRAM command has been replaced by LOAD-EXECUTABLE-PROGRAM. However, LOAD-PROGRAM continues to be supported for reasons of compatibility. Despite this, the LOAD-EXECUTABLE-PROGRAM command should be used for new applications. The section below simply contains a short functional description, the syntax format, and the command return codes.

### Function

The LOAD-PROGRAM command has two functions:

- It calls up the dynamic binder loader DBL and defines the primary input. The DBL then links LLMs (link and load modules) or OMs (object modules) to create a load unit, which it then loads into memory.
- It calls up the static loader ELDE. ELDE then loads a program (load module) linked by the TSOSLNK linkage editor into memory.

When calling with LOAD-PROGRAM, only the checks of the addressing mode compatible with BLSSERV < V2.5 are performed. This corresponds to specifying AMODE-CHECK=\*STD in the START- or LOAD-EXECUTABLE-PROGRAM command. Execution of the loaded program or load unit does not begin until it is requested by means of a RESUME-PROGRAM command. If users wish to load *and* start the load unit or program with just one command, they may issue the START-EXECUTABLE-PROGRAM (or START-PROGRAM) command in place of the LOAD-PROGRAM and RESUME-PROGRAM commands.

In the case of operands which have \*DBL-PARAMETERS as their default value, the MODIFY-DBL-DEFAULTS command can be used to modify the default DBL parameters which apply when the task is started. The parameters can be configured separately for calls to the LOAD- and START-... commands on the one hand and for the BIND macro call on the other. The SHOW-DBL-DEFAULTS command lists the values which are currently set. The RESET-DBL-DEFAULTS can be used to return the settings to the original DBL defaults.

#### *Restrictions*

Users with SECURITY-ADMINISTRATION, SAT-FILE-EVALUATION or SAT-FILE-MANAGEMENT privilege can use the command in procedures only.

## Format

### LOAD-PROGRAM

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
2	0	BLS0150	Warning on program loading (see message to SYSOUT)
	32	BLS0152	Program loading aborted due to system error
	64	CMD0216	User has no authorization for command
	64	BLS0153	Program loading aborted due to unrecoverable error (for cause, see SYSOUT message)

---

## 3.89 LOCK-FILE-LINK

Lock file link name against deletion

**Component:** BS2000 OSD/BC  
**Functional area:** File processing  
**Domain:** FILE  
**Privileges:** STD-PROCESSING  
SAT-FILE-EVALUATION  
SAT-FILE-MANAGEMENT

### Function

The LOCK-FILE-LINK command locks an entry in the task file table (TFT), so that any subsequent REMOVE-FILE-LINK command for this TFT entry will be ineffective until an UNLOCK-FILE-LINK command is issued with the associated file link name.

If the file link name is amended by a CHANGE-FILE-LINK command, the TFT entry will remain locked, but now under the new file link name.

The ADD-FILE-LINK command can be used at any time to amend a TFT entry which has been locked by LOCK-FILE-LINK, but the lock will remain in effect.

Volumes from a TFT entry that is locked using LOCK-FILE-LINK are not released by the SECURE-RESOURCE-ALLOCATION command.

### Format

<b>LOCK-FILE-LINK</b>
<b>LINK-NAME</b> = * <b>FIRST-BLANK</b> / <filename 1..8 without-gen>

### Operands

**LINK-NAME = \*FIRST-BLANK / <filename 1..8 without-gen>**

The file link name of the TFT entry which is to be locked.

If there is no TFT entry with this file link name, an entry will be created. This entry can then be allocated to a file by an ADD-FILE-LINK command or via the FCB and have its contents written into it.

**LINK-NAME = \*FIRST-BLANK**

If \*FIRST-BLANK is specified, the first TFT entry whose file link name consists of spaces (blanks) will be processed.

**LINK-NAME = <filename 1..8 without-gen>**

File link name of the TFT entry which is to be locked.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed
	1	CMD0202	Syntax or semantic error in command
	32	DMS05C7	Unexpected internal error in DMS
	64	DMS06FF	BCAM connection severed
	130	DMS0594	Not enough virtual memory available

## Example

*Locking file link names to prevent deletion*

```

/add-file-link link=sortin,file-name=max.file.10 _____ (1)
/add-file-link link=sortout,file-name=max.file.10.sort-1 _____ (2)

% DMS05E1 TASK FILE TABLE (TFT) NOT AVAILABLE OR SPECIFIED FILE NOT IN 'TFT'.
OPERATION NOT PROCESSED
```

- (1) Creates a TFT entry for the file *MAX.FILE.10* under the link name *SORTIN*. This link name is used by the SORT utility routine as the default link name for an input file.
- (2) Creates a TFT entry for the file *MAX.FILE.10.SORT-1* under the link name *SORTOUT*. This link name is used by the SORT utility routine as the default link name for an output file.
- (3) Output of the TFT entries using SHOW-FILE-LINK.
- (4) The SORT-FILE command is used to sort records of the file *MAX.FILE.10* into the file *MAX.FILE.SORT-10*. This command is a component of the SORT utility routine and provides specific sort functions at the command level (see the "SORT" manual [40]). The command was called without operands, i.e. with default values, so the complete record is sorted; the input file is determined from the TFT entry with the link name *SORTIN*, and the output file from the TFT entry with the link name *SORTOUT*.
- (5) The output of TFT entries shows that the entry with the link name *SORTIN* was automatically released after sorting (implicit REMOVE-FILE-LINK).
- (6) A TFT entry with the link name *SORTIN* is created again for the file *MAX.FILE.10*.
- (7) The TFT entry with the link name *SORTIN* is now locked with the LOCK-FILE-LINK command. This means that the TFT entry cannot be deleted so long as the lock remains in effect. The file *MAX.FILE.10* may be used as an input file more than once for sort runs.

- 
- (8) Output of the TFT entries with the status of the file link.
  - (9) The command SORT-FILE is called again (as in step 4).
  - (10) Output of the TFT entries with the status of the file link. The TFT entry for *SORT//* still exists. The value of *YES* in the *REM-F-LINK* output field indicates that a REMOVE-FILE-LINK was issued for this entry (in this case, the implicit REMOVE-FILE-LINK of SORT).
  - (11) Creates a new TFT entry for the file *MAX.FILE.10.SORT-2* with the link name *SORTOUT*. This file is to be used as the new output file for a sort run.
  - (12) The SORT-FILE command is called. The input file is still *MAX.FILE.10*, but the output file is now *MAX.FILE.10.SORT-2*. In this sort run, only selected parts of records are to be sorted and transferred to the output file (selective sort): 6 bytes as of the first data byte (record length field + 1 = 5) are sorted in ascending order. The second sort criterion selects 15 bytes of the record, starting with the 17th byte, and to be sorted in descending order.
  - (13) Output of the TFT entries with the status of the file link (as in step 10).
  - (14) The lock for the TFT entry with the link name *SORT//* is released by the UNLOCK-FILE-LINK command.
  - (15) (implicit) REMOVE-FILE-LINK commands were executed only after the lock was removed.
  - (16) The TFT entry for *SORTOUT* is released explicitly with the REMOVE-FILE-LINK command.
  - (17) No further TFT entries exist.

---

## 3.90 LOCK-PRODUCT-VERSION

Lock product version

**Component:** IMON-GPN  
**Functional area:** System control and optimization  
**Domain:** SYSTEM-MANAGEMENT  
**Privileges:** SUBSYSTEM-MANAGEMENT

### Function

Systems support can use the LOCK-PRODUCT-VERSION command to lock the product version of an installation unit. The product version is then no longer available for nonprivileged users. The locked product version remains available for privileged users, (SUBSYSTEM-MANAGEMENT privilege) provided that the version is specified in the form <product-version mandatory-man-corr>.

Locking a product version may also affect the product's START command: if the START command is called with VERSION=\*STD then the highest unlocked version is invoked.

The command cannot be executed unless product installation items are entered into the SCI. This requirement is satisfied in the following cases:

- The product was supplied as standard software by Fujitsu Technology Solutions using the SOLIS2 shipment procedure and was correctly installed in the system using IMON.
- The product takes the form of customer-specific software which was registered in the SCI using an in-house SYSSII file (see the "IMON" User Guide [19]).

A product version lock cannot extend beyond the current system run at the latest. It is released on the following system start. A lock is also set during product installation. The UNLOCK-PRODUCT-VERSION command can also be used to release the lock during the current system run.

### Format

#### LOCK-PRODUCT-VERSION

**PRODUCT-NAME** = <text 1..30 without-sep>(…)

<text 1..30 without-sep>(…)

| **VERSION** = <product-version mandatory-man-corr>

### Operands

**PRODUCT-NAME** = <text 1..30 without-sep>(…)

Specifies the name of the IMON installation unit for the software product that is to be locked.

**VERSION** = <product-version mandatory-man-corr>

Specifies the product version. The specification must include the release version and correction status.

---

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed successfully
	32	IMO9101	Command terminated abnormally (system error in external call; internal error in IMON-GPN)
	64	CMD0216	Privileges error
	64	IMO9100	Product or version not found, invalid product name

---

## 3.91 LOCK-USER

Lock access to system for user

**Component:** SRPMNUC  
**Functional area:** User management  
**Domain:** USER-ADMINISTRATION  
**Privileges:** STD-PROCESSING  
USER-ADMINISTRATION  
**Routing code:** \$

### Function

This command can be used to prevent a user from accessing the system. The access lock for the user is entered in the user catalog of the specified pubset.

If this declaration is made for the home pubset in which logon validation is performed, the user is also denied access to the system.

This temporary access lock can be canceled with the UNLOCK-USER command.

If the definition applies to a data pubset, the access lock is filed there and evaluated only in the event that this pubset assumes the role of the home pubset.

The LOCK-USER command is not permitted

- for the user ID TSOS
- for the ID of the user issuing the command

#### *Restriction*

The only nonprivileged users (STD-PROCESSING privilege) authorized to issue this command are those designated as group administrators. The actions a group administrator can take are defined by the system support personnel. On setting up and managing user groups see the "SECOS" manual [35].

### Format

<b>LOCK-USER</b>
<b>USER-IDENTIFICATION</b> = <name 1..8> , <b>PUBSET</b> = <u>*HOME</u> / <cat-id 1..4>

### Operands

**USER-IDENTIFICATION** = <name 1..8>

Identifies the user whose access is to be locked.

**PUBSET** = \*HOME / <cat-id 1..4>

Enters the access lock for the user in the user catalog of the specified pubset.

## PUBSET = \*HOME

Specifies the user catalog of the home pubset, thus denying the user access to the system. Logon attempts by the user are rejected with a message.

## Return codes

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	No error
2	0	SRM6001	Command executed with a warning
	1	SRM6010	Syntax error
	32	SRM6020	System error during command processing
	64	SRM6040	Semantic error
	130	SRM6030	Command temporarily cannot be executed

## Example

```
/lock-user cognibs3
```

```
% SRM2201 DO YOU WANT TO LOCK USER ID 'COGNIBBS3' ON PUBSET 'LOSH' ? REPLY (Y=YES; N=NO)?  
Y
```

```
/show-user-attr cognibs3
```

```

User ID *COGNIBS3* is temporarily barred from accessing the system. This is indicated by the value \*YES in the USER-LOCKED output field of the user entry displayed by the SHOW-USER-ATTRIBUTES command.

---

## 3.92 LOGOFF

Terminate current job

**Component:** BS2000 OSD/BC

**Functional area:** Job processing

**Domain:** JOB

**Privileges:** All privileges

### Function

The LOGOFF command terminates the current job. Subsequently, the virtual memory pages and devices occupied by the job are released and the output system files made available for output.

If new file generations were created during the job, the system lists the names of the file generations involved, their base number as well as the names of the first and the current file generation.

**i** The LOGOFF command is now supported only for reasons of compatibility; the EXIT-JOB command should be used to terminate the job. The EXIT-JOB command offers the user expanded functionality.

### Format

<b>LOGOFF</b>
<b>KEEP-CONNECTION</b> = <b>*NO</b> / <b>*YES</b>
<b>,SYSTEM-OUTPUT</b> = <b>*STDOUT</b> / <b>*PRINT</b> / <b>*DELETE</b> / <b>*TAPE-OUTPUT</b>

### Operands

#### **KEEP-CONNECTION =**

Specifies whether the connection to the computer is to be kept so that a new job can be started immediately. This operand is permitted only in interactive mode; in batch mode it is ignored.

#### **KEEP-CONNECTION = \*NO**

Clears the connection.

#### **KEEP-CONNECTION = \*YES**

Maintains the connection with the computer. A new job can be started immediately.

#### **SYSTEM-OUTPUT =**

Specifies whether system files are to be output and defines the output medium. SYSLST and SYSOUT are not output if they are empty.

#### **SYSTEM-OUTPUT = \*STDOUT**

Depending on the setting of the system parameter SSMOUT, the system files SYSLST and SYSOUT (batch mode) are output to printer or transferred by email. Transfer by email can be requested explicitly using the EXIT-JOB command.

---

**SYSTEM-OUTPUT = \*PRINT**

Outputs the system files SYSLST and SYSOUT (in batch mode) to printer.

An additional list of dialog jobs can be output if the value NO-SPOOL is set for the system parameter SSMLGOF1.

**SYSTEM-OUTPUT = \*DELETE**

Output of the system file is suppressed.

**SYSTEM-OUTPUT = \*TAPE-OUTPUT**

Outputs the system files on tape.

SYSLST and SYSOUT (batch mode) are written to tape in the file: *TAPE.TSNnnnn*, where *nnnn* is the task sequence number of the job ended with LOGOFF.

**Return codes**

(SC2)	SC1	Maincode	Meaning
	0	CMD0001	Command executed <sup>1)</sup>
	1	CMD0202	Syntax error
	32	CMD0221	System error; no message is sent to SYSOUT

<sup>1)</sup>Cannot be evaluated since in this case the task is terminated!

**Note**

If a LOGOFF command is issued while a program is loaded, any ABEND-STXIT routine that may have been defined is activated. This is not the case when the LOGOFF command is called via the CMD macro (see the "Executive Macros" manual [22]).

---

## 4 MAIL-FILE - MOVE-TASK-TO-CATEGORY

The manual "Commands" is divided into the following chapters:

- General Part
- ACTIVATE-SNAPSHOT - DECRYPT-FILE
- DELETE-ALTERNATE-INDEX - LOGOFF
- MAIL-FILE - MOVE-TASK-TO-CATEGORY
- OPEN-VARIABLE-CONTAINER - SHOW-DSSM-INFORMATION
- SHOW-FILE - SHOW-PUBSET-SPACE-DEFAULTS
- SHOW-RESOURCE-ALLOCATION - WRITE-TEXT

---

## 4.1 MAIL-FILE

Send file by email

<b>Component:</b>	BS2000 OSD/BC
<b>Functional area:</b>	File processing
<b>Domain:</b>	FILE
<b>Privileges:</b>	STD-PROCESSING HARDWARE-MAINTENANCE SAT-FILE-EVALUATION SAT-FILE-MANAGEMENT SECURITY-ADMINISTRATION TSOS

### Function

The MAIL-FILE command sends a file as an attachment to an email. A user ID is specified as the receiver of the email. The sender is the user ID of the calling task. MAIL-FILE takes over the email address entered in the EMAIL-ADDRESS field of these user entries. How you ascertain the receiver and sender addresses, in particular when an address list is used, is described in the section "[Selecting email addresses by means of the job name](#)".

A PLAM library element, a SAM or ISAM file and the contents of the system file SYSLST or SYSOUT can be sent. A PAM file can be sent only if its content is in PDF format. The file attribute CCS name is evaluated in the case of automatic character set conversion. Optionally the caller can specify that the file is to be deleted automatically after it has been sent.

To execute the command the "Mail-Sender" function of the software product interNet-Services must be available, and at least one email address must be entered in the user entry of the TSOS system ID.

The command is rejected if no email address is entered in the receiver's user entry. If no email address is entered for the caller, the address of the receiver or TSOS is entered instead as the sender.

If the email cannot be delivered (e.g. because the address is invalid), a bounce mail is sent to the email address of TSOS to request systems support to check the incorrect address. If more than one email address is entered for TSOS, the first address is used for the bounce mail.

The MAIL-FILE functionality is also used by other components of BS2000 to send log files:

- At job termination  
In the EXIT-JOB (or LOGOFF), CANCEL-JOB and ENTER-PROCEDURE commands, transfer to SYSLST or SYSOUT at job termination can be requested instead of a printout. The default value \*STDOUT directs output to the output medium defined in the system parameter SSMOUT (printer or email).
- In the case of errors in the MSCF cluster  
In the MSCF configuration systems support can specify that a user ID will be notified by email if a critical situation (e.g. loss of connection) occurs.
- In the case of outputs from utility routines  
Currently, HSMS and MAREN support the transfer of output information and logs.

## Format

### MAIL-FILE

**FILE-NAME** = <filename 1..54> / \*SYSLST(...) / \*SYSOUT / \*LIBRARY-ELEMENT(...)

\*SYSLST(...)

| **SYSLST-NUMBER** = \*STD / <integer 1..99>

\*LIBRARY-ELEMENT(...)

| **LIBRARY** = <filename 1..54 without-vers>

| **ELEMENT** = <composed-name 1..64 with-under>

| <composed-name 1..64> with-under(...)

| | **VERSION** = \*HIGHEST-EXISTING / \*UPPER-LIMIT / <composed-name 1..24 with-under>

| **TYPE** = <alphanum-name 1..8>

,**TO** = \*USER(...)

\*USER(...)

| **USER-IDENTIFICATION** = \*OWN / <name 1..8>

,**SUBJECT** = \*STD / <c-string 1..256 with-low>

,**DELETE-FILE** = \*NO / \*YES / \*DESTROY

## Operands

**FILE-NAME** = <filename 1..54> / \*SYSLST(...) / \*SYSOUT / \*LIBRARY-ELEMENT(...)

Selects the file to be sent.

**FILE-NAME** = <filename 1..54>

Name of the file to be sent:

- The file is a SAM or ISAM file. A PAM file is sent only if its content is in PDF format.
- The file may not be empty.
- The name may specify a single file generation but not a file generation group.
- It can also be a temporary file.
- The file may not be only accessible via an RFA connection.

**FILE-NAME** = \*SYSLST(...)

Specifies the system file SYSLST.

**SYSLST-NUMBER** = \*STD

Specifies the system file SYSLST. The specification is rejected in the following cases:

- SYSLST is empty.

- 
- The DUMMY file, a temporary file, a PLAM library member or an S variable is assigned.
  - The assigned file or file generation is not resident on disk or was not created using the access method SAM.

**SYSLST-NUMBER = <integer 1..99>**

Specifies a SYSLST file from the set SYSLST01 through SYSLST99. This specification is possible only if the SYSLST file is assigned a file or file generation on disk which was created using the access method SAM. The specification is rejected in the following cases:

- The assigned file is still empty.
- The SYSLST file has the primary allocation.
- The DUMMY file, a temporary file, a PLAM library member or an S variable is assigned.

**FILE-NAME = \*SYSOUT**

Specifies the system file SYSOUT. This specification is possible only if the SYSOUT file is assigned a file or file generation on disk which was created using the access method SAM. The specification is rejected in the following cases:

- The assigned file is still empty.
- The SYSOUT file has the primary allocation.
- The DUMMY file, a temporary file, a PLAM library member or an S variable is assigned.

**FILE-NAME = \*LIBRARY-ELEMENT(...)**

An element of a PLAM library is to be sent. All user record types (1 to159) are sent.

**LIBRARY = <filename 1..54 without-vers>**

Name of the PLAM library.

**ELEMENT = <composed-name 1..64 with-under>(...)**

Name of the element.

**VERSION =**

Specifies the version of the element.

**VERSION = \*HIGHEST-EXISTING**

Selects the highest existing version.

**VERSION = \*UPPER-LIMIT**

Selects the highest possible version.

**VERSION = <composed-name 1..24 with-under>**

Selects the specified version.

**TYPE = <alphanum-name 1..8>**

Specifies the element type.
