

How do I register my workstations in a workgroup environment?

[Pastel Partner](#) and [Xpress](#) has a **server-based registrations functionality**, in which case you need to register the server by entering the registration code. A network must be in place.

- All workstations should be appropriately **mapped to the server PC**
- The **server should be registered first** in order for the server and workstations to connect to the server.
- Once the server is registered, you should follow the registration process on each workstation by choosing the [Workstation registration](#) option on the **registration wizard**.
- The new registration code will pull through from the server.

Note that should a user work from home or on the road, i.e. disconnected from the network, the registration will be lost.
